This By-law is printed under and by authority of the Council of the City of Vancouver

July 23, 2019
BY-LAW NO. 12511

A By-law to regulate the construction of buildings
and related matters

THE COUNCIL OF THE CITY OF VANCOUVER, in public meeting, enacts the following:

SECTION 1
BUILDING BY-LAW ESTABLISHED

SHORT TITLE
1.1 The name of this By-law, for citation, is the “Building By-law”.

PARTS OF BY-LAW
1.2 The Building By-law shall consist of two parts: Book I (General) and Book II (Plumbing Systems) which are attached as Schedule 1 and Schedule 2.

1.3 The table of contents for this By-law is for convenient reference only, and is not for use in interpreting or enforcing this By-law.

SEVERABILITY
1.4 A decision by a court that any part of this By-law is illegal, void, or unenforceable severs that part from this By-law, and is not to affect the balance of this By-law.

SECTION 2
REPEAL AND ENACTMENT

REPEAL AND TRANSITION
2.1 Council repeals By-law No. 10908 as amended from time to time, except that the provisions of By-law No. 10908, with respect to matters other than administration, continue to apply as if unrepealed in respect of permits applied for under By-law No. 10908 before November 1, 2019 for work which complies with the provisions of Section 3.3. of Part 3, of Division C of Book I (General) and Book II (Plumbing Systems) of this By-law.
2.2 This By-law is to come into force and take effect on the 1st day of November, 2019.

ENACTED by Council this 23rd day of July, 2019

Signed “Kennedy Stewart”
Mayor

Signed “Katrina Leckovic”
City Clerk
Schedule 1
Book I (General)
Preface

The 2019 Building By-law (hereinafter the “Building By-law”) is an objective-based code which identifies the minimum standard in the City of Vancouver for buildings to which this By-law applies. These address the same objectives of the Building By-law’s parent codes.

The Building By-law establishes standards for building materials, products and assemblies. Some standards are explicitly provided in the Building By-law while others are incorporated by reference to existing standards for materials products and assemblies which are developed and published by specialist organizations.

The Building By-law is substantially based on Book I (General) and Book II (Plumbing Systems) of the British Columbia Building Code, which in turn is substantially based on the model National Building Code of Canada 2015 and the model National Plumbing Code of Canada 2015. This model of adoption of national model codes helps promote consistency among building codes.

This Building By-law replaces the 2014 Building By-law and also contains certain transition provisions which apply to permits issued under the 2014 Building By-law. The Building By-law is regularly updated and users should ensure that the By-law is current.

Code Development

Development of Codes Canada
The Canadian Commission on Building and Fire Codes (CCBFC) is responsible for the content of the National Model Codes. The CCBFC is an independent body made up of volunteers from across the country and from all facets of the code-user community. Members of the CCBFC and its standing committees include builders, engineers, skilled trade workers, architects, building owners, building operators, fire and building officials, manufacturers and representatives of general interests.

Codes Canada (formerly named the Canadian Codes Centre) of the National Research Council (NRC) provides technical and administrative support to the CCBFC and its standing committees. NRC publishes Codes Canada and periodic revisions to the Codes to address pressing issues. However, such periodic revisions do not have legal effect until adopted into law.

British Columbia Building Code
In British Columbia, the 2018 Building Code is the legal adoption of National Model Building and Plumbing Codes under the authority of the government of the Province of British Columbia. This includes much of the National Model Codes as amended from time to time, but also includes provincially applicable requirements to address provincial priorities and concerns.

Vancouver Building By-law
This By-law consists of two Books, that set out the minimum standard for the design and construction of new buildings as applicable. It also applies to the alteration, change of use and demolition of existing buildings.

The By-law is substantially based upon the British Columbia Building Code and establishes requirements to address five objectives, which are fully described in Division A of the By-law.

General Requirements
Building By-law - Book I (General) requirement must address at least one of the Code’s five stated objectives:

- safety
- health
- accessibility for persons with disabilities
- fire and structural protection of buildings
- environment

Code provisions do not necessarily address all the characteristics of buildings that might be considered to have a bearing on the Code’s objectives. The design of a technically sound building depends upon many factors beyond simple compliance with building regulations. Such factors include the availability of knowledgeable practitioners who have received appropriate education, training and experience and who have some degree of familiarity with the principles of good building practice and experience using textbooks, reference manuals and technical guides.

The Building By-law does not list acceptable proprietary building products. It establishes the criteria that building materials, products and assemblies must meet. Some of these criteria are explicitly stated in the By-law while others are incorporated by reference to material or product standards published by standards development organizations. Only those portions of the standards related to the objectives of this By-law are mandatory.

**Plumbing Requirements**

Book II (Plumbing Systems) of the Building By-law sets out technical provisions for the design and installation of new plumbing systems. It also applies to the extension, alteration, renewal and repair of existing plumbing systems. Book II (Plumbing Systems) establishes requirements to address the following four objectives, which are fully described in Division A of the Code:

- safety
- health
- protection of buildings and facilities from water and sewage damage
- environment

Code provisions do not necessarily address all the characteristics of buildings and facilities that might be considered to have a bearing on the Code’s objectives. It is not a textbook on plumbing system design or installation. The design of a technically sound plumbing system depends upon many factors beyond simple compliance with plumbing regulations. Such factors include the availability of knowledgeable practitioners who have received appropriate education, training and experience and who have some degree of familiarity with the principles of good plumbing practice and experience using textbooks, reference manuals and technical guides.

The Building By-law does not list acceptable proprietary plumbing products. It establishes the criteria that plumbing materials, products and assemblies must meet. Some of these criteria are explicitly stated in the By-law while others are incorporated by reference to material or product standards published by standards development organizations. Only those portions of the standards related to the objectives of this By-law are mandatory.

**Additional Information**

**Numbering System**
A consistent numbering system has been used throughout this By-law. The first number indicates the Part of the By-law: the second, the Section in the Part; the third, the Subsection; and the fourth, the Article in the Subsection. The detailed provisions are found at the Sentence level (indicated by numbers in brackets), and Sentences may be broken down into Clauses and Subclauses. This structure is illustrated as follows:

- **B** Division
- **3** Part
- **3.5.** Section
- **3.5.2.** Subsection
- **3.5.2.1.** Article
- **3.5.2.1.(2)** Sentence
- **3.5.2.1.(2)(a)** Clause
- **3.5.2.1.(2)(a)(i)** Subclause

**Change Indication**
Where a technical change or addition has been made relative to the Building By-law National Building Code (NBC) and National Plumbing Code (NPC) 2010 edition, a vertical line has been added in the margin next to the affected provision to indicate the approximate location of new or modified content. No change indication is provided for renumbered or deleted content.

In addition to the above noted vertical lines, which indicate a change to the NBC or NPC that has been included in the British Columbia Building Code (BCBC), further technical changes or additions relative to the 2012 edition of the BCBC are identified. These changes are underlined, wherever practical. The vertical lines and underlining are for convenience only and have no legal effect. No change indication is provided for renumbered or deleted provisions.

The term “reserved” is included in place of certain deleted National Codes content which has not been adopted. The term “reserved” is generally used so that the numbering structure of the BCBC is aligned with the model National Codes, easing comparability and possible future harmonization.

**Unique to Vancouver Indication**
All text in the By-law that is unique to Vancouver is provided with a grey background wherever practical. This identifier was utilized to provide the user of the By-law with a means by which to differentiate the Vancouver provisions of this By-law from those of the 2018 British Columbia Building and Plumbing Codes. Where the provisions of Vancouver have required the deletion of the 2018 British Columbia Building and Plumbing Code text, and no Vancouver text has replaced the deleted text, the word “deleted” has been used to alert the user that a deletion has been made and that there is a difference from the 2018 British Columbia Building and Plumbing Codes text.

**Meaning of the words “and” and “or” between the Clauses and Subclauses of a Sentence**
Multiple Clauses and Subclauses are connected by the word “and” or “or” at the end of the second last Clause or Subclause in the series. Although this connecting word appears only once, it is meant to apply to all the preceding Clauses or Subclauses within that series.

For example, in a series of five Clauses – a) to e) – in a By-law Sentence, the appearance of the word “and” at the end of Clause d) means that all Clauses in the Sentence are connected to each other with the word “and.” Similarly, in a series of five Clauses – a) to e) – in a By-law Sentence, the appearance of the word “or” at the end of Clause d) means that all Clauses in the Sentence are connected to each other with the word “or.”

In all cases, it is important to note that a Clause (and its Subclauses, if any) must always be read in conjunction with its introductory text appearing at the beginning of the Sentence.
Metric Conversion
All values in this By-law, other than nominal sizes, are given in metric units. A conversion table of imperial equivalents for the most common units used in plumbing system design and installation is located at the end of the By-law.

Parts in Division B and Professional Disciplines
Division B is organized into Parts that are largely related to disciplines. However, this does not mean that persons of a certain discipline who are executing the design or construction of a particular building component can necessarily deal with only one Part of the Code in isolation since provisions related to that building component may be found in more than one Part.

For example:
- provisions that deal with fire safety issues related to heating, ventilating and air-conditioning systems are located in Part 3 of Division B, Fire Protection, Occupant Safety and Accessibility, and not in Part 6, Heating, Ventilating and Air-conditioning;
- structural requirements related to loads on handrails and grab bars are located in Part 3 of Division B, Fire Protection, Occupant Safety and Accessibility, while structural requirements related to loads on guards and handrails are located in Part 4, Structural Design.

For this reason, the part-based structure of Division B is not well suited for use as the basis for allocating responsibilities to different professions or as the basis for contractual arrangements.

**Relationship of the Building By-law to Standards Development and Conformity Assessment**

The development of many provisions in this By-law and the assessment of conformity to those provisions are supported by several of the member organizations of Canada’s National Standards System (NSS).

The NSS is a federation of accredited organizations concerned with standards development, certification, testing, inspection, personnel and management systems registration that is established under the auspices of the Standards Council of Canada Act. Activities of the NSS are coordinated by the Standards Council of Canada (SCC), which has accredited 8 standards development organizations, 36 certification organizations, 21 registration organizations, and 344 calibration and testing laboratories.

The SCC is a federal non-profit Crown corporation responsible for the coordination of voluntary standardization in Canada. It also has responsibilities for Canada’s activities in voluntary international standardization.

**Canadian Standards**
The By-law contains many references to standards published by accredited standards development organizations in Canada. As part of the accreditation requirements, these organizations adhere to the principles of consensus. This
generally means substantial majority agreement of a committee comprising a balance of producer, user and general interest members, and the consideration of all negative comments. The organizations also have formal procedures for the second-level review of the technical preparation and balloting of standards prepared under their auspices. (The Canadian Commission on Building and Fire Codes (CCBFC) follows these same principles of consensus in the operation of its Code development process.)

The following organizations are accredited as standards development organizations in Canada:

- American Society for Testing and Materials International (ASTM)
- Bureau de normalisation du Québec (BNQ)
- Canadian General Standards Board (CGSB)
- Canadian Standards Association (CSA)
- ULC Standards (ULC)
- Underwriters’ Laboratories (UL)

Table 1.3.1.2. of Division B lists the standards referenced in this By-law. Standards proposed to be referenced in this By-law are reviewed to ensure their content is compatible with the Code. Thereafter, referenced standards are reviewed as needed during each Code cycle. Standards development organizations are asked to provide information on any changes in the status of their standards referenced in this By-law – withdrawals, amendments, new editions, etc. This information is passed on to the CCBFC, its standing committees, the provinces and territories, and interested stakeholders on particular issues, all of whom are given the opportunity to identify any problems associated with the changes. These bodies do not necessarily review in detail the revised standards; rather, the approach relies on the consensus process involved in the maintenance of the standards and on the extensive knowledge and backgrounds of committee members, provincial or territorial staff, NRC staff, and consulted stakeholders to identify changes in the standards that might create problems in the By-law.

Non-Canadian Standards
A number of subject areas for which the Canadian standards development organizations have not developed standards are covered in this By-law. In these cases, the Code often references standards developed by organizations in other countries, such as the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) and the National Fire Protection Association (NFPA). These standards are developed using processes that may differ from those used by the Canadian standards development organizations; nevertheless, these standards have been reviewed by the relevant standing committees and found to be acceptable in the context in which they are referenced by this By-law.

Conformity Assessment
This By-law establishes minimum measures, either within its own text or that of referenced standards. However, this By-law does not deal with the question of who is responsible for assessing conformity to the measures or how those with this responsibility might carry it out.

In Vancouver, the Chief Building Official is authorized to, by bylaw, regulate construction and to enforce the requirements of this By-law.

Those persons responsible for ensuring that a material, appliance, system or equipment meets the performance requirements of this By-law have several means available to assist them. These means vary from on-site inspection to the use of certification services provided by accredited third-party organizations. Test reports or mill certificates provided by manufacturers or suppliers can also assist in the acceptance of products. Engineering reports may be required for more complex products.
Requirements for Registered Professionals are located in Division C of this By-law.

Testing
The accreditation programs of the SCC include many organizations accredited for testing and calibration that are capable of reliably testing building products to specified standards. The test results produced by these organizations can be used in the evaluation, qualification and certification of building products to Code provisions. The SCC’s Web site (www.scc.ca) lists accredited certification bodies and allows users to search the scope of accreditation for each of these organizations.

Certification
Certification is the confirmation by an independent organization that a product or service meets a requirement. Certification of a product, process, or system entails physical examination, testing as specified in the appropriate standards, plant examination, and follow-up unannounced plant inspections. This procedure leads to the issuing of a formal assurance or declaration, by means of a certification mark or certificate, that the product, process or system is in full conformity with specified provisions.

In some cases, a product for which no standard exists can be certified using procedures and criteria developed by the accredited certifying organization and specifically designed to measure the performance of that product. Certification bodies publish lists of certified products and companies.

Registration
Quality Registration Organizations assess a company’s conformance to quality assurance standards like the International Organization for Standardization ISO 9000.

Evaluation
An evaluation is a written opinion by an independent professional organization that a product will perform its intended function in a building. An evaluation is very often done to determine the ability of an innovative product, for which no standards exist, to satisfy the intent of a By-law requirement. Follow-up plant inspections are not normally part of the evaluation process. Several organizations, including the Canadian Construction Materials Centre (CCMC), offer such evaluation services. While the development of such an evaluation is useful to establish a basis for acceptance, this it does not mean that there will be an automatic assumption of By-law compliance by the Chief Building Official for any given material, product or assembly covered by this evaluation or that will necessarily be deemed applicable in every situation.

Qualification
The qualification of building products also evaluates the ability of a product to perform its intended function by verifying that it meets the requirements of a standard. Qualification normally includes some follow-up plant inspection. Some organizations publish lists of qualified products that meet the specified requirements. Some organizations qualify manufacturing and/or testing facilities for building products for compliance with the By-law and relevant standards.
Division A
Compliance, Objective and Functional Statements
Part 1
Compliance

Section 1.1. General

1.1.1. Application of this By-law

1.1.1.1. Application of this By-law

1) This By-law applies to any one or more of the following:
   a) the design and construction of a new building,
   b) the occupancy of any building,
   c) a change in occupancy of any building,
   d) an alteration of any building,
   e) an addition to any building,
   f) the demolition of any building,
   g) the reconstruction of any building that has been damaged by fire, earthquake or other cause,
   h) the correction of an unsafe condition in or about any building,
   i) all parts of any building that are affected by a change in occupancy,
   j) the work necessary to ensure safety in parts of a building
      i) that remain after a demolition,
      ii) that are affected by but that are not directly involved in alterations, or
      iii) that are affected by but not directly involved in additions,
   k) except as permitted by the Fire By-law, the installation, replacement, or alteration of materials or equipment regulated by this By-law,
   l) the work necessary to ensure safety in a relocated or removed building during and after relocation or removal,
   m) safety during construction of a building, including protection of the public,
   n) the design, installation, extension, alteration, renewal or repair of plumbing systems,
   o) the alteration, rehabilitation and change of occupancy of heritage buildings,
   p) the design and construction of a marina,
   q) the alteration of a marina, and
   r) retaining structures greater than 1.2 m in height.

2) This By-law does not apply to the following:
   a) sewage, water, electrical, telephone, rail or similar public infrastructure systems located on, or in a street or a public transit right of way,
   b) utility towers and poles, and television, radio and other communication aerials and towers, except for loads resulting from their being located on or attached to buildings,
   c) mechanical or other equipment and appliances not specifically regulated in these regulations,
   d) flood control and hydro electric dams and structures,
   e) accessory buildings less than 10 m² in building area that do not create a hazard,
   f) with the permission of the authority having jurisdiction, temporary buildings including
      i) construction site offices,
      ii) seasonal storage buildings,
      iii) Deleted,
      iv) emergency facilities, and
      v) similar structures with the permission of the Chief Building Official,
Division A: Compliance, Objectives and Functional Statements

Part 1 – Compliance

1.1.1.2. Application to Existing Buildings

1) Where a building is altered, rehabilitated, renovated or repaired, or there is a change in major occupancy, the building shall be upgraded in accordance with Part 11 of Division B. (See Appendix A.)

1.1.2. Internal References to this By-law

1.1.2.1. Book I (General) of the By-law

1) This is the first of the two Books, Book I (General) and Book II (Plumbing Systems), that together form the Building By-law.

1.1.2.2. Internal References to the By-law

1) Unless a Book is specified, references to “the Vancouver Building By-law,” “the Building By-law,” “the By-law,” “this By-law” and the like shall be read as references to the Book in which they appear.
1.1.3. Appendices, Notes and Annotations

1.1.3.1. Appendices, Notes and References to Appendices and Notes have No Legal Effect

1) The Appendices and Notes of this By-law have no legal effect, except for the Appendices and Appendix Notes that are directly referenced in a Part of this By-law, being the following:
   a) the following Notes:
      i) A-1.4.1.2.(1) Designated flood plain of Division A, including Figures A-1.4.1.2.(1)-C, D and E,
      ii) A-1.4.1.2.(1) Flood construction level requirements of Division A,
      iii) A-Table 9.23.3.5.-B of Division B,
      iv) A-9.23.13. of Division B, including Table A-9.23.13., and
      v) A-11.2.1.2. of Division B,
   b) Appendix C of Division B, and
   c) Appendix D of Division B.

2) References in parentheses to the Appendices and Notes of this By-law have no legal effect.

Section 1.2. Compliance

1.2.1. Compliance with this By-law

1.2.1.1. Compliance with this By-law

1) Compliance with this By-law shall be achieved by
   a) complying with the applicable acceptable solutions in Division B (See Note A-1.2.1.1.(1)(a).), or
   b) except as required by Sentence (3), using alternative solutions, accepted by the Chief Building Official under Section 2.3 of Division C, that will achieve at least the minimum level of performance required by Division B in the areas defined by the objectives and functional statements attributed to the applicable acceptable solutions (See Note A-1.2.1.1.(1)(b)).

2) For the purposes of compliance with this By-law as required in Clause 1.2.1.1.(1)(b), the objectives and functional statements attributed to the acceptable solutions in Division B shall be the objectives and functional statements referred to in Subsection 1.1.2. of Division B.

3) An alternative solution shall not be used in place of an acceptable solution if the acceptable solution expressly requires conformance to a provincial enactment other than Book I (General) or Book II (Plumbing Systems) of the Building By-law.

1.2.1.2. Responsibility of Owner

1) Unless otherwise specified in this By-law, the owner of a building shall be the person responsible for carrying out the provisions of this By-law in relation to that building.

2) The owner of a building is in no way relieved of full responsibility for complying with this By-law by the Chief Building Official
   a) granting a building permit,
   b) approving drawings or specifications, or
   c) carrying out inspections.

1.2.2. Materials, Appliances, Systems and Equipment

1.2.2.1. Characteristics of Materials, Appliances, Systems and Equipment

1) All materials, appliances, systems and equipment installed to meet the requirements of this By-law shall possess the necessary characteristics to perform their intended functions when installed in or serving a building.
1.2.2.2. Storage on the Building Site
1) All building materials, appliances and equipment on the building site shall be stored in such a way as to prevent the deterioration or impairment of their essential properties.

1.2.2.3. Used Materials, Appliances and Equipment
1) Unless otherwise specified, used materials, appliances and equipment are permitted to be reused when they meet the requirements of this By-law for new materials and are satisfactory for the intended use.

Section 1.3. Divisions A, B and C of this By-law

1.3.1. General

1.3.1.1. Scope of Division A
1) Division A contains the compliance and application provisions, objectives and functional statements of this By-law.

1.3.1.2. Scope of Division B
1) Division B contains the acceptable solutions of this By-law.

1.3.1.3. Scope of Division C
1) Division C contains the administrative provisions of this By-law.

1.3.1.4. Internal Cross-references
1) Where the Division of a referenced provision is not specified in this By-law, it shall mean that the referenced provision is in the same Division as the referencing provision.

1.3.2. Application of Division A

1.3.2.1. Application of Parts 1, 2 and 3
1) Parts 1, 2 and 3 of Division A apply to all buildings covered in this By-law. (See Article 1.1.1.1.)

1.3.3. Application of Division B

1.3.3.1. Application of Parts 1, 7, 8 and 10
1) Parts 1, 7, 8 and 10 of Division B apply to all buildings covered in this By-law. (See Article 1.1.1.1.)

1.3.3.2. Application of Parts 3, 4, 5 and 6
1) Parts 3, 4, 5, and 6 of Division B apply to all buildings described in Article 1.1.1.1. and
a) classified as post-disaster buildings,
b) used for major occupancies classified as
   i) Group A, assembly occupancies,
   ii) Group B, care, treatment or detention occupancies, or
   iii) Group F, Division 1, high-hazard industrial occupancies, or
c) exceeding 600 m² in building area or exceeding 3 storeys in building height used for major occupancies classified as
   i) Group C, residential occupancies,
   ii) Group D, business and personal services occupancies,
   iii) Group E, mercantile occupancies, or
   iv) Group F, Divisions 2 and 3, medium- and low-hazard industrial occupancies.
2) Part 4 applies to all buildings except buildings containing not more than two principal dwelling units and their ancillary residential units and accessory buildings.

3) Part 5 applies to all Group C multi-family buildings and Artist Live/Work Studios that are
   a) more than 2 storeys in building height, or
   b) more than 600 m² in building area excluding firewalls.

4) Notwithstanding Sentence (1), Section 3.8 applies to all Part 9 buildings.

1.3.3.3. Application of Part 9, 11 and 12
1) Except as provided in Sentences 1.3.3.2.(2) and (3), Part 9 of Division B applies to all buildings described in Article 1.1.1.1. of 3 storeys or less in building height, having a building area not exceeding 600 m², and used for major occupancies classified as
   a) Group C, residential occupancies (See Note A-9.1.1.1.(1) of Division B),
   b) Group D, business and personal services occupancies,
   c) Group E, mercantile occupancies, or
   d) Group F, Divisions 2 and 3, medium- and low-hazard industrial occupancies.

2) Part 11 applies to the alteration, rehabilitation, renovation, repair, addition or change of major occupancy of an existing building and as defined in Appendix Note A-11.2.1.2 of Division B.

3) Part 12 applies to the design and construction of all new marinas and float homes; and to existing marinas and existing float homes as defined in Article 11.2.1.11. of Division B.

1.3.3.4. Building Size Determination
1) Where a firewall divides a building, each portion of the building so divided shall be considered as a separate building, except when this requirement is specifically modified in other parts of this By-law. (See Note A-1.3.3.4.(1).

2) Except as permitted in Sentence (4), where portions of a building are completely separated by a vertical fire separation that has a fire-resistance rating of not less than 1 h and extends through all storeys and service spaces of the separated portions, each separated portion is permitted to be considered as a separate building for the purpose of determining building height, provided
   a) each separated portion is not more than 4 storeys in building height and is used only for assembly, residential, and business and personal services occupancies, and
   b) the unobstructed path of travel for a firefighter from the nearest street to one entrance of each separated portion is not more than 45 m.

(See Note A-1.3.3.4.(2) & (3)).

3) Except as permitted in Sentence (4), where portions of a building are completely separated by a distance of at least 3 m, each separated portion is permitted to be considered as a separate building for the purpose of determining building height, provided
   a) each separated portion complies with the requirements of Subsection 3.2.3. of Division B,
   b) all connecting construction is
      i) of noncombustible construction, and
      ii) contains only F3 occupancies, or uses and occupancies subsidiary to the remainder of the building,
   c) a vertical fire separation that has a fire-resistance rating of not less than 2 h and extends through all storeys and service spaces of the connecting construction, and
   d) the unobstructed path of travel for a firefighter from the nearest street to one entrance of each separated portion is not more than 45 m.

(See Note A-1.3.3.4.(2) & (3)).

4) The vertical fire separation referred to in Sentence (2) may terminate at the floor assembly immediately above a basement provided the basement conforms to Article 3.2.1.2. of Division B.

1.3.3.5. Air Space Subdivision
Where a subdivision of land creates an air space parcel boundary in or through a building, which otherwise complies with this By-law, such building or a portion of the building may, at the discretion of the Chief Building Official, be considered as a single building not requiring internal firewalls or party walls along air space parcel boundaries if legal agreements are registered against title to all air space parcels and the remainder whereby

   a) all relevant owners grant easements necessary to ensure common access to the fire and life safety systems and exits required for the building to function as a single building and to allow the owners to operate and maintain the building and its common systems, and

   b) all owners grant a covenant to the City on terms acceptable to its Director of Legal Services and the Chief Building Official whereby the owners

      i) acknowledge and agree that they have requested the Chief Building Official to treat the building as a single building,

      ii) release and indemnify the City and the Chief Building Official for, without limitation, all liability arising from the Chief Building Official agreeing to treat the building or a portion of the building as a single building for the purposes of this By-law, and

      iii) agree to inspect, test and keep in good repair and good working order all common fire and life safety systems, common utilities and shared exits located on their parcel and, to the extent necessary, use the easements referred to in Clause (1)(a) for that purpose.

1.3.3.6. Automatic Sprinkler Systems

1) Except for buildings described in Sentence (2), all newly constructed buildings shall be provided with an automatic sprinkler system designed and installed in accordance with Article 3.2.5.12. of Division B.

2) The following buildings are not required to be sprinklered:

   a) temporary buildings conforming to Subsection 1.6.8. of Division C, and tents and air-supported structures conforming to Subsection 3.1.6. of Division B,

   b) one storey non-residential storage buildings less than 100 m² in building area, and having a limiting distance on all sides of not less than 15 m,

   c) one storey detached residential garages and carports,

   d) one storey detached buildings which are accessory to a residential building containing not more than two dwelling units, and which are less than 50 m² in building area,

   e) industrial or hazardous occupancies where the Chief Building Official accepts that the installation of an automatic sprinkler system would represent a hazard to the occupants or would be incompatible with the use of the building,

   f) public concession stands and changing room buildings less than 100 m² in building area and having a limiting distance on all sides of not less than 15 m,

   g) ticket kiosks,

   h) bleachers which do not contain roofed occupancies,

   i) farm buildings, except farm buildings with caretaker residential suites,

   j) greenhouses used solely for the growing of plants where no public admittance is permitted, and

   k) one storey portable classroom buildings of less than 100 m² in building area with an occupancy classification of Group A Division 2 or Group D. (See Note A-1.3.3.6.(2)(k).)

1.3.4. Application of Division C

1.3.4.1. Application of Parts 1, 2 and 3

   1) Parts 1, 2 and 3 of Division C apply to all buildings covered in this By-law. (See Article 1.1.1.1.)
Section 1.4. Terms and Abbreviations

1.4.1. Definitions of Words and Phrases

1.4.1.1. Non-defined Terms

1) Words and phrases used in this By-law that are not included in the list of definitions in Article 1.4.1.2. shall have the meanings that are commonly assigned to them in the context in which they are used, taking into account the specialized use of terms by the various trades and professions to which the terminology applies.

2) Where objectives and functional statements are referred to in this By-law, they shall be the objectives and functional statements described in Parts 2 and 3.

3) Where acceptable solutions are referred to in this By-law, they shall be the provisions stated in Parts 3 to 10, and 12 of Division B.

4) Where alternative solutions are referred to in this By-law, they shall be the alternative solutions mentioned in Clause 1.2.1.1.(1)(b).

1.4.1.2. Defined Terms

1) The words and terms in italics in this By-law shall have the following meanings:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acceptable</td>
<td>means acceptable to the Chief Building Official.</td>
</tr>
<tr>
<td>Accepted</td>
<td>means accepted by the Chief Building Official.</td>
</tr>
<tr>
<td>Access or Accessible</td>
<td>means an area and its facilities, or both, as required by this By-law, which is easy to approach, enter, exit, operate, participate in, pass to and from, and use safely and independently by persons with disabilities. (See Note A-1.4.1.2.(1).)</td>
</tr>
<tr>
<td>Access to exit</td>
<td>means that part of a means of egress within a floor area that provides access to an exit serving the floor area.</td>
</tr>
<tr>
<td>Adaptable dwelling unit</td>
<td>means a dwelling unit designed and constructed to facilitate future modification to provide access.</td>
</tr>
<tr>
<td>Addition</td>
<td>means an alteration to any building which will increase the total aggregate floor area or the building height (in storeys).</td>
</tr>
<tr>
<td>Adfreezing</td>
<td>means the adhesion of soil to a foundation unit resulting from the freezing of soil water. (Also referred to as “frost grip.”)</td>
</tr>
<tr>
<td>Air barrier system</td>
<td>means the assembly installed to provide a continuous barrier to the movement of air.</td>
</tr>
<tr>
<td>Air space parcel</td>
<td>has the meaning assigned to it by the Land Title Act of British Columbia.</td>
</tr>
<tr>
<td>Air-supported structure</td>
<td>means a structure consisting of a pliable membrane which achieves and maintains its shape and support by internal air pressure.</td>
</tr>
<tr>
<td>Alarm signal</td>
<td>means an audible signal transmitted throughout a zone or zones or throughout a building to advise occupants that a fire emergency exists.</td>
</tr>
<tr>
<td>Alert signal</td>
<td>means an audible signal to advise designated persons of a fire emergency.</td>
</tr>
<tr>
<td>Alteration</td>
<td>means a change or extension to any matter or thing or to any occupancy regulated by this By-law.</td>
</tr>
<tr>
<td>Ancillary residential building</td>
<td>means a building entirely of residential occupancy, constructed on the same parcel and smaller than the primary residential building and containing not more than one dwelling unit and its subsidiary uses, such as a laneway house</td>
</tr>
<tr>
<td>Ancillary residential unit</td>
<td>means a self-contained dwelling unit that is located within a building of only residential occupancy that:</td>
</tr>
<tr>
<td></td>
<td>• with its primary dwelling unit constitute a single real estate entity, and</td>
</tr>
<tr>
<td></td>
<td>• is smaller than the principal dwelling unit.</td>
</tr>
</tbody>
</table>
**Apparent sound transmission class (ASTC)** means a single number rating of the airborne sound attenuation of building assemblies separating two adjoining spaces, taking into account both the direct and flanking sound transmission paths. (See Note A-1.4.1.2.(1).) (See also Note A-9.11. of Division B.)

**Appliance** means a device to convert fuel into energy and includes all components, controls, wiring and piping required to be part of the device by the applicable standard referred to in this By-law.

**Apprentice** means a regularly indentured apprentice under the provisions of the Industry Training Authority Act of British Columbia.

**Approved** (as used in Book II) means accepted.

**Area of refuge** means a space that facilitates a safe delay in egress, is sufficiently protected from fire conditions developing in the floor area, and provides direct access to an exit or firefighters’ elevator.

**Artesian groundwater** means a confined body of water under pressure in the ground.

**Artist Live/Work Studio** means an Artist Studio and a Residential Unit associated with and forming an integral part of an Artist Studio, as defined in the Zoning and Development By-law.

**Artist studio — Class A** means Artist studio-Class A as defined in the Zoning and Development By-law.

**Artist studio — Class B** means Artist studio-Class B as defined in the Zoning and Development By-law.

**Arts and culture indoor event** means an event of an artistic or cultural nature, including but not limited to visual, performing, media, literary, craft or interdisciplinary arts, for a maximum of 250 persons, with or without liquor service, which occurs no more than three days per month in a building or portion of a building not approved for assembly occupancy.

**Assembly occupancy** means the occupancy or the use of a building, or part thereof, by a gathering of persons for civic, political, travel, religious, social, educational, recreational or like purposes, or for the consumption of food or drink.

**Attic or roof space** means the space between the roof and the ceiling of the top storey or between a dwarf wall and a sloping roof.

**Basement** means a storey or storeys of a building located below the first storey.

**Bearing surface** means the contact surface between a foundation unit and the soil or rock upon which it bears.

**Boiler** means an appliance intended to supply hot water or steam for space heating, processing or power purposes.

**Braced wall band** means an imaginary continuous straight band extending vertically and horizontally through the building or part of the building, within which braced wall panels are constructed.

**Braced wall panel** means a portion of a wood-frame wall where bracing, sheathing, cladding or interior finish is designed and installed to provide the required resistance to lateral loads due to wind or earthquake.

**Breeching** means a flue pipe or chamber for receiving flue gases from one or more flue connections and for discharging these gases through a single flue connection.

**Building** means any structure used or intended for supporting or sheltering any use or occupancy, including any float home or marina and any retaining structures greater than 1.2 m in height.

**Building area** means the greatest horizontal area of a building above grade within the outside surface of exterior walls or within the outside surface of exterior walls and the centre line of firewalls.

**Building energy use** means non site-renewable energy used for space heating, cooking and/or operation of buildings intended for human occupancy.

**Building Envelope Professional** means a registered professional who is:

- a member or licensee of the Architectural Institute of British Columbia, or
- a member or licensee of the Association of Professional Engineers and Geoscientists of British Columbia qualified by virtue of training or experience to provide building enclosure services.

**Building height** (in storeys) means the number of storeys contained between the roof and the floor of the first storey.

**Business and personal services occupancy** means the occupancy or use of a building or part thereof for the transaction of business or the rendering or receiving of professional or personal services.

**Caisson** (See Pile).
Care means the provision of services other than treatment by or through care facility management to residents who require these services because of cognitive, physical or behavioural limitations.

Care occupancy means the occupancy or use of a building or part thereof where care is provided to residents. (See Note A-1.4.1.2.(1).)

Cavity wall means a construction of masonry units laid with a cavity between the wythes. The wythes are tied together with metal ties or bonding units, and are relied on to act together in resisting lateral loads.

Certified Professional means a Certified Professional as defined in the Certification of Professionals By-law.

Chief Building Official means the City Building Inspector, and any person authorized to act on behalf of the City Building Inspector.

Child Care Facility means a care facility within the meaning of the Child Care Licensing Regulation of the Community Care and Assisted Living Act.

Children means persons under the age of 13 years.

Chimney means a primarily vertical shaft enclosing at least one flue for conducting flue gases to the outdoors.

Chimney liner means a conduit containing a chimney flue used as a lining of a masonry or concrete chimney.

City means the City of Vancouver.

City Building Inspector means the person appointed as such by City Council pursuant to the provisions of the Vancouver Charter.

City Engineer means the person appointed as such by City Council pursuant to the provisions of the Vancouver Charter.

Clear-water waste means waste water with impurity levels that will not be harmful to health and may include cooling water and condensate drainage from refrigeration and air-conditioning equipment and cooled condensate from steam heating systems, but does not include storm water. (See Book II, Division A, Note A-1.4.1.2.(1).)

Closure means a device or assembly for closing an opening through a fire separation or an exterior wall, such as a door, a shutter, a damper, wired glass or glass block, and includes all components such as hardware, closing devices, frames and anchors.

Combustible means that a material fails to meet the acceptance criteria of CAN/ULC-S114, “Test for Determination of Non-Combustibility in Building Materials.”

Combustible construction means that type of construction that does not meet the requirements for noncombustible construction.

Combustible dusts means dusts and particles that are ignitable and liable to produce an explosion.

Combustible fibres means finely divided, combustible vegetable or animal fibres and thin sheets or flakes of such materials which, in a loose, unbaled condition, present a flash fire hazard, including cotton, wool, hemp, sisal, jute, kapok, paper and cloth.

Combustible liquid means a liquid having a flash point at or above 37.8°C and below 93.3°C.

Community Care Facility means Community Care Facility as defined in the Zoning & Development By-law.

Conditioned space means any space within a building the temperature of which is controlled to limit variation in response to the exterior ambient temperature by the provision, either directly or indirectly, of heating or cooling over substantial portions of the year.

Construction means, with respect to a building: erection, repair, alteration, enlargement, addition, demolition, deconstruction, removal and excavation.

Construction Safety Officer means a person who has been trained specifically to understand and apply safe construction practice as it relates to the worksite and as it affects the public, neighbouring properties and utilities, and who has been retained by the owner, or the owner's principal contractor or project manager, to coordinate all sub trade supervisors relating to construction safety at the project site.

Construction Safety Plan means a plan containing construction procedures and fire safety measures designed to protect workers on a project, neighbouring private property, public property, and members of the general public.
Constructor means a person who contracts with an owner or their authorized agent to undertake a project, and includes an owner who contracts with more than one person for the work on a project or undertakes the work on a project or any part thereof.

Contained use area means a supervised area containing one or more rooms in which occupant movement is restricted to a single room by security measures not under the control of the occupant.

Container means a metal transportable structure designed for the storage and transport of goods, the typical dimensions of which are 2.44 m in width, 2.59 m in height, and 6.1 m in length.

Contractor means a person who contracts with an owner or an authorized agent of an owner to undertake a project, and includes an owner who contracts with more than one person for the work on a project or undertakes the work on a project or any part thereof.

Cooktop means a cooking surface having one or more burners or heating elements.

Coordinating registered professional means a registered professional retained under Clause 2.2.7.2.(1)(a) of Division C to coordinate all design work and field reviews of the registered professionals who are required for a project.

Dangerous goods means products, materials or substances that are
(a) regulated by TC SOR/2008-34, “Transportation of Dangerous Goods Regulations (TDGR)” (See Table 3.2.7.1. of Division B of the Fire By-law), or
(b) classified as controlled products under HC SOR/2015-17, “Hazardous Products Regulations” (See Note A-Table 3.2.7.1. of Division B of the Fire By-law).
(See Note A-1.4.1.2.(1).)

Dead load means the weight of all permanent structural and non-structural components of a building.

Deconstruction means demolition by systematic disassembly of a building resulting in the reuse, recycling or recovery of not less than 75% of all building materials, excluding materials which are hazardous or banned from landfill.

Deep foundation means a foundation unit that provides support for a building by transferring loads either by end-bearing to soil or rock at considerable depth below the building, or by adhesion or friction, or both, in the soil or rock in which it is placed. Piles are the most common type of deep foundation.

Demolition means the action or process of demolishing a building, and includes deconstruction.

Designated flood means a flood which may occur in any given year, of such magnitude as to equal a flood having a 200 year return period.

Designated flood plain means those lands in the City which are hereby designated, for the purposes of section 306(1)(cc) of the Vancouver Charter, as flood plains susceptible to flooding and subject to flood construction level requirements, and those lands so designated include:
(a) lands located in the proximity to the natural boundary of the Burrard Inlet, English Bay, False Creek and the Fraser River, which are located within the areas shown shaded or crosshatched on the maps attached to this By-law as Diagrams A1 and A2. (See Figure A-1.4.1.2.(1)-C for Diagram A1: Burrard Inlet, English Bay, False Creek and Fraser River flood plains and Figure A-1.4.1.2.(1)-D for Diagram A2: Burrard Inlet, English Bay, False Creek and Fraser River flood plain, wave effect zone.); and
(b) lands located in the areas shown crosshatched on the map attached to this By-law as Diagram B. (See Figure A-1.4.1.2.(1)-E for Diagram B: Still Creek flood plain and flood construction levels.)

Designated Structural Engineer (Struct. Eng.) means a person who is registered or licensed to practice as a professional engineer under the Engineers and Geoscientists Act of British Columbia, and a person who is designated by the Association of Professional Engineers and Geoscientists of British Columbia as a Designated Structural Engineer.

Designer means the person responsible for the design.

Detention occupancy means the occupancy by persons who are restrained from or are incapable of evacuating to a safe location without the assistance of another person because of security measures not under their control.

Distillery means a process plant where distilled beverage alcohols are produced, concentrated or otherwise processed, and includes facilities on the same site where the concentrated products may be blended, mixed, stored or packaged.
**Distilled beverage alcohol** means a beverage that is produced by fermentation and contains more than 20% by volume of water-miscible alcohol.

**Direct-vented** (as applying to a fuel-fired space- or water-heating appliance) means an appliance and its venting system in which all the combustion air is supplied directly from the outdoors and the products of combustion are vented directly to the outdoors via independent, totally enclosed passageways connected directly to the appliance.

**Drainage system** means an assembly of pipes, fittings, fixtures, traps and appurtenances that is used to convey sewage, clear-water waste or storm water to a public sewer or a private sewage disposal system, but does not include subsoil drainage pipes. (See Book II, Division A, Figure A-1.4.1.2.(1)-F in Note A-1.4.1.2.(1).)

**Dwelling unit** means a suite operated as a housekeeping unit, used or intended to be used by one or more persons and usually containing cooking, eating, living, sleeping and sanitary facilities.

**Excavation** means the space created by the removal of soil, rock or fill for the purposes of construction.

**Exhaust duct** means a duct through which air is conveyed from a room or space to the outdoors.

**Existing building** means a building lawfully constructed and completed under a permit before submission of the current permit application.

**Exit** means that part of a means of egress, including doorways, that leads from the floor area it serves to a separate building, an open public thoroughfare, or an exterior open space protected from fire exposure from the building and having access to an open public thoroughfare. (See Note A-1.4.1.2.(1).)

**Exit level** means the level of an exit stairway at which an exterior exit door or exit passageway leads to the exterior.

**Exit storey** (as applying to Subsection 3.2.6. of Division B) means a storey having an exterior exit door.

**Exposing building face** means that part of the exterior wall of a building that faces one direction and is located between ground level and the ceiling of its top storey or, where a building is divided into fire compartments, the exterior wall of a fire compartment that faces one direction.

**Factory-built chimney** means a chimney consisting entirely of factory-made parts, each designed to be assembled with the other without requiring fabrication on site.

**Farm building** means a building or part thereof that does not contain a residential occupancy and that is associated with and located on land devoted to the practice of farming, and used essentially for the housing of equipment or livestock, or the production, storage or processing of agricultural and horticultural produce or feeds. (See Note A-1.4.1.2.(1).)

**Field review** means a review of the work

- at a building site, and
- where applicable, at locations where building components are fabricated for use at the building site that a registered professional in his or her professional discretion considers necessary to ascertain whether the work substantially complies in all material respects with the plans and supporting documents prepared by a registered professional.

**Fill** means soil, rock, rubble, industrial waste such as slag, organic material or a combination of these that is transported and placed on the natural surface of soil or rock or organic terrain. It may or may not be compacted.

**Fire block** means a material, component or system that restricts the spread of fire within a concealed space or from a concealed space to an adjacent space.

**Fire compartment** means an enclosed space in a building that is separated from all other parts of the building by enclosing construction providing a fire separation having a required fire-resistance rating.

**Fire damper** means a closure consisting of a damper that is installed in an air distribution system or a wall or floor assembly and that is normally held open but designed to close automatically in the event of a fire in order to maintain the integrity of the fire separation.

**Fire detector** means a device that detects a fire condition and automatically initiates an electrical signal to actuate an alert signal or alarm signal and includes heat detectors and smoke detectors.

**Fire load** (as applying to an occupancy) means the combustible contents of a room or floor area expressed in terms of the average weight of combustible materials per unit area, from which the potential heat...
Division A: Compliance, Objectives and Functional Statements

Part 1 – Compliance

Vancouver Building Bylaw 2019

liberation may be calculated based on the calorific value of the materials, and includes the furnishings, finished floor, wall and ceiling finishes, trim and temporary and movable partitions.

Fire-protection rating means the time in minutes or hours that a closure will withstand the passage of flame when exposed to fire under specified conditions of test and performance criteria, or as otherwise prescribed in this By-law.

Fire-resistance rating means the time in minutes or hours that a material or assembly of materials will withstand the passage of flame and the transmission of heat when exposed to fire under specified conditions of test and performance criteria, or as determined by extension or interpretation of information derived therefrom as prescribed in this By-law. (See D-1.2.1.(2) in Appendix D of Division B.)

Fire-retardant-treated wood means wood or a wood product that has had its surface-burning characteristics, such as flame spread, rate of fuel contribution and density of smoke developed, reduced by impregnation with fire-retardant chemicals.

Fire separation means a construction assembly that acts as a barrier against the spread of fire. (See Note A-1.4.1.2.(1).)

Fire stop means a system consisting of a material, component and means of support used to fill gaps between fire separations or between fire separations and other assemblies, or used around items that wholly or partially penetrate a fire separation.

Fire stop flap means a device intended for use in horizontal assemblies required to have a fire-resistance rating and incorporating protective ceiling membranes, which operates to close off a duct opening through the membrane in the event of a fire.

Firewall means a type of fire separation of noncombustible construction that subdivides a building or separates adjoining buildings to resist the spread of fire and that has a fire-resistance rating as prescribed in this By-law and has structural stability to remain intact under fire conditions for the required fire-rated time.

First storey means the uppermost storey having its floor level not more than 2 m above grade.

Fixture (as applying to plumbing) means a receptacle, appliance, apparatus or other device that discharges sewage or clear-water waste, and includes a floor drain.

Fixture outlet pipe means a pipe that connects the waste opening of a fixture to the trap serving the fixture. (See Book II, Division A, Figure A-1.4.1.2.(1)-H in Note A-1.4.1.2.(1).)

Flame-spread rating means an index or classification indicating the extent of spread-of-flame on the surface of a material or an assembly of materials as determined in a standard fire test as prescribed in this By-law.

Flammable liquid means a liquid having a flash point below 37.8°C and having a vapour pressure not more than 275.8 kPa (absolute) at 37.8°C as determined by ASTM D 323, "Vapor Pressure of Petroleum Products (Reid Method)."

Flash point means the minimum temperature at which a liquid within a container gives off vapour in sufficient concentration to form an ignitable mixture with air near the surface of the liquid.

Flight means a series of steps between landings. (See Note A-1.4.1.2.(1).)

Float home means any structure incorporating a floatation system, intended for use or occupancy or being used or occupied for residential purposes, containing one dwelling unit only, and not primarily intended for, or useable in, navigation, but does not include any water craft designed or intended for navigation.

Flood construction level means the minimum elevation of the underside of a floor system, or of the top of a concrete slab, of a building which is used or may be used for habitation, business, or for the storage of goods which may be damaged by flood water.

Flood construction level requirements means

(a) on the Burrard Inlet, English Bay, False Creek and Fraser River flood plains:
   (i) for buildings located within the areas shown shaded or crosshatched on the map attached to this By-law, the underside of a floor system or the top of a concrete slab of a buildings used for habitation, business or storage of goods, shall not be lower than 4.6m Greater Vancouver Regional District datum.

(See Figure A-1.4.1.2.(1)-C for Diagram A1: Burrard Inlet, English Bay, False Creek and Fraser...
River flood plains); and
(ii) for buildings located in the areas shown shaded or crosshatched on the map attached to this
By-law, an additional elevation allowance above 4.6 m may be required for wave run-up, at a
level as determined by a Professional Engineer and to the satisfaction of the Chief Building
Official. (See Figure A-1.4.1.2.(1)-D for Diagram A2: Burrard Inlet, English Bay, False Creek and
Fraser River flood plain wave effect zone); and

(b) on the Still Creek flood plain:
(i) the underside of a floor system or the top of a concrete slab of any buildings used for habitation,
business or storage of goods shall not be lower than the applicable elevation shown on the map
attached to this By-law. (See Figure A-1.4.1.2.(1)-E for Diagram B: Still Creek flood plain and flood
construction levels.)

Floor area means the space on any storey of a building between exterior walls and required firewalls,
including the space occupied by interior walls and partitions, but not including exits, vertical service
spaces, and their enclosing assemblies.

Floor drain means a fixture used to receive water from the floor of a building.

Flue means an enclosed passageway for conveying flue gases.

Flue collar means the portion of a fuel-fired appliance designed for the attachment of the flue pipe or
breaching.

Flue pipe means the pipe connecting the flue collar of an appliance to a chimney.

Forced-air furnace means a furnace equipped with a fan that provides the primary means for the
circulation of air.

Foundation means a system or arrangement of foundation units through which the loads from a building
are transferred to supporting soil or rock.

Foundation unit means one of the structural members of the foundation of a building such as a footing, raft
or pile.

Frost action means the phenomenon that occurs when water in soil is subjected to freezing which, because
of the water/ice phase change or ice lens growth, results in a total volume increase or the build-up of
expansive forces under confined conditions or both, and the subsequent thawing that leads to loss of soil
strength and increased compressibility.

Furnace means a space-heating appliance using warm air as the heating medium and usually having
provision for the attachment of ducts.

Gas vent means that portion of a venting system designed to convey vent gases to the outdoors from the
vent connector of a gas-fired appliance or directly from the appliance when a vent connector is not used.

General Manager, Park Board means the person appointed as such by the Park Board.

General Manager, Real Estate and Facilities Management means the person appointed as such by City
Council.

Grade means the lowest of the average levels of finished ground adjoining each exterior wall of a building,
except that localized depressions need not be considered in the determination of average levels of
finished ground. (See First storey and Note A-1.4.1.2.(1).)

Greenhouse gases has the meaning attributed to it in section 559 of the Vancouver Charter.

Green roof means a structure constructed on top of a roof, which is designed to support the growth of
vegetation and to capture rainwater.

Green roof assembly means the components of a green roof and includes a waterproof barrier which is
impervious to root migration, a filtering layer, roof drainage, soil or other growing medium and plants,
installed on top of a roof assembly.

Groundwater means a free standing body of water in the ground.

Groundwater level (groundwater table) means the top surface of a free standing body of water in the
ground.

Group Residence means Group Residence as defined in the Zoning & Development By-law.
Guard means a protective barrier around openings in floors or at the open sides of stairs, landings, balconies, mezzanines, galleries, raised walkways or other locations to prevent accidental falls from one level to another. Such a barrier may or may not have openings through it.

Heat detector means a fire detector designed to operate at a predetermined temperature or rate of temperature rise.

Heavy timber construction means that type of combustible construction in which a degree of fire safety is attained by placing limitations on the sizes of wood structural members and on the thickness and composition of wood floors and roofs and by the avoidance of concealed spaces under floors and roofs.

Heritage building is a building which is legally protected or officially recognized as a heritage property by the Provincial government or the City, or a building that in the opinion of the City Building Inspector, has sufficient heritage value or heritage character to justify its conservation. (See Note A-1.1.1.1.(5).)

High-hazard industrial occupancy (Group F, Division 1) means an industrial occupancy containing sufficient quantities of highly combustible and flammable or explosive materials which, because of their inherent characteristics, constitute a special fire hazard.

Horizontal exit means an exit from one building to another by means of a doorway, vestibule, walkway, bridge or balcony.

Horizontal service space means a space such as an attic, duct, ceiling, roof or crawl space oriented essentially in a horizontal plane, concealed and generally inaccessible, through which building service facilities such as pipes, ducts and wiring may pass.

Impeded egress zone means a supervised area in which occupants have free movement but require the release, by security personnel, of security doors at the boundary before they are able to leave the area, but does not include a contained use area.

Indirect service water heater means a service water heater that derives its heat from a heating medium such as warm air, steam or hot water.

Industrial flex space means an industrial use which is located in a new building containing Group C major occupancies.

Industrial occupancy means the occupancy or use of a building or part thereof for the assembling, fabricating, manufacturing, processing, repairing or storing of goods and materials.

Interconnected floor space means superimposed floor areas or parts of floor areas in which floor assemblies that are required to be fire separations are penetrated by openings that are not provided with closures.

Journeyman plumber means a person, other than an apprentice, who holds a certificate issued pursuant to the provisions of the Industry Training Authority Act of British Columbia authorizing the person to engage in the plumbing trade.

Lane means a public thoroughfare or way not more than 10.1 m in width which affords only a secondary means of access to a site, at the side or rear.

Limiting distance means the distance from an exposing building face to a property line, the centre line of a street, lane or public thoroughfare, or to an imaginary line between 2 buildings or fire compartments on the same property, measured at right angles to the exposing building face.

Live load means a variable load due to the intended use and occupancy that is to be assumed in the design of the structural members of a building. It includes loads due to cranes and the pressure of liquids in containers.

Liveaboard vessel means any water craft intended primarily for use in navigation and used for residential purposes.

Loadbearing (as applying to a building element) means subjected to or designed to carry loads in addition to its own dead load, excepting a wall element subjected only to wind or earthquake loads in addition to its own dead load.

Low-hazard industrial occupancy (Group F, Division 3) means an industrial occupancy in which the combustible content is not more than 50 kg/m² or 1200 MJ/m² of floor area.
**Division A:** Compliance, Objectives and Functional Statements

**Part 1 – Compliance**

**Major occupancy** means the principal occupancy for which a building or part thereof is used or intended to be used, and shall be deemed to include the subsidiary occupancies that are an integral part of the principal occupancy. The major occupancy classifications used in this By-law are as follows:

- **A1** – Assembly occupancies intended for the production and viewing of the performing arts
- **A2** – Assembly occupancies not elsewhere classified in Group A
- **A3** – Assembly occupancies of the arena type
- **A4** – Assembly occupancies in which the occupants are gathered in the open air
- **B1** – Detention occupancies in which persons are under restraint or are incapable of self-preservation because of security measures not under their control
- **B2** – Treatment occupancies
- **B3** – Care occupancies
- **C** – Residential occupancies
- **D** – Business and personal services occupancies
- **E** – Mercantile occupancies
- **F1** – High-hazard industrial occupancies
- **F2** – Medium-hazard industrial occupancies
- **F3** – Low-hazard industrial occupancies

**Marina** means any structure or installation, including marina walkways, which provides moorage space for water craft.

**Marina walkway** means any surface extending over navigable water used to accommodate pedestrian traffic, and used so that water craft and float homes may lie alongside to receive and discharge cargo and passengers.

**Marine toilet** means any toilet on or within a water craft.

**Masonry or concrete chimney** means a chimney of brick, stone, concrete or masonry units constructed on site.

**Means of egress** means a continuous path of travel provided for the escape of persons from any point in a building or contained open space to a separate building, an open public thoroughfare, or an exterior open space protected from fire exposure from the building and having access to an open public thoroughfare. Means of egress includes exits and access to exits.

**Mechanically vented** (as applying to a fuel-fired space- or water-heating appliance) means an appliance and its combustion venting system in which the products of combustion are entirely exhausted to the outdoors by a mechanical device, such as a fan, blower or aspirator, upstream or downstream from the combustion zone of the appliance, and the portion of the combustion venting system that is downstream of the fan, blower or aspirator is sealed and does not include draft hoods or draft control devices. (See Note A-1.4.1.2.(1).)

**Medium-hazard industrial occupancy** (Group F, Division 2) means an industrial occupancy in which the combustible content is more than 50 kg/m² or 1 200 MJ/m² of floor area and not classified as a high-hazard industrial occupancy.

**Mercantile occupancy** means the occupancy or use of a building or part thereof for the displaying or selling of retail goods, wares or merchandise.

**Mezzanine** means an intermediate floor assembly between the floor and ceiling of any room or storey and includes an interior balcony.

**Multi-family** means a residential occupancy with more than two principal dwelling units.

**Natural boundary** means the visible high water mark of any lake, river, stream or other body of water where the presence and action of the water are so common and usual, and so long continued in all ordinary years, as to mark on the soil of the bed of the body of water a character distinct from that of its banks, in vegetation, as well as in the nature of the soil itself.

**Noncombustible** means that a material meets the acceptance criteria of CAN/ULC-S114, “Test for Determination of Non-Combustibility in Building Materials.”

**Noncombustible construction** means that type of construction in which a degree of fire safety is attained by the use of noncombustible materials for structural members and other building assemblies.
Occupancy means the use or intended use of a building or part thereof for the shelter or support of persons, animals or property.

Occupant load means the number of persons for which a building or part thereof is designed.

Open-air storey means a storey in which at least 25% of the total area of its perimeter walls is open to the outdoors in a manner that will provide cross-ventilation to the entire storey.

Operating permit means permission or authorization in writing by the Chief Building Official to install or retain existing equipment or systems for which an operating permit is required under this By-law.

Owner means a registered owner, a holder of an agreement for sale and purchase and, in the case of Crown-owned lands, owner shall mean the occupier.

Partition means an interior wall 1 storey or part-storey in height that is not loadbearing.

Party wall means a wall jointly owned and jointly used by 2 parties under easement agreement or by right in law, and erected at or upon a line separating 2 parcels of land each of which is, or is capable of being, a separate real-estate entity.

Perched groundwater means a free standing body of water in the ground extending to a limited depth.

Permit means permission or authorization in writing by the Chief Building Official to perform work regulated by this By-law and, in the case of an occupancy permit, to occupy any building or part thereof, but does not include an operating permit.

Persons with disabilities means persons who have a permanent or temporary physical, mental, intellectual or sensory impairment which, in interaction with various barriers, may hinder their full and effective participation in society on an equal basis with others. (See Note A-1.4.1.2.(1).)

Pile means a slender deep foundation unit made of materials such as wood, steel or concrete or a combination thereof, that is either premanufactured and placed by driving, jacking, jetting or screwing, or cast-in-place in a hole formed by driving, excavating or boring. (Cast-in-place bored piles are often referred to as caissons in Canada.)

Plenum means a chamber forming part of an air duct system.

Plumbing contractor means a person licensed as a contractor pursuant to the License By-law and who is either a plumber or a person who employs a plumber on a full time basis.

Plumbing system means a drainage system, a venting system and a water system or parts thereof. (See Book II, Division A, Figure A-1.4.1.2.(1)-L in Note A-1.4.1.2.(1).)

Post-disaster building means a building that is essential to the provision of services in the event of a disaster, and includes

- hospitals, emergency treatment facilities and blood banks,
- telephone exchanges,
- power generating stations and electrical substations,
- control centres for air, land and marine transportation,
- public water treatment and storage facilities, and pumping stations,
- sewage treatment facilities,
- buildings having critical national defence functions, and
- buildings of the following types, except buildings exempted from this designation by the authority having jurisdiction:
  - emergency response facilities,
  - fire, rescue and police stations and housing for vehicles, aircraft or boats used for such purposes, and
  - communications facilities, including radio and television stations.
(See Note A-1.4.1.2.(1).)

Private sewage disposal system means a privately owned plant for the treatment and disposal of sewage (such as a septic tank with an absorption field).

Private water supply system means an assembly of pipes, fittings, valves, equipment and appurtenances that supplies water from a private source to a water distribution system.

Process plant means an industrial occupancy where materials, including flammable liquids, combustible liquids, or gases, are produced or used in a process. (See Table 3.2.7.1. of Division B of the Fire By-law)
Project means any construction, alteration or demolition operation.

Protected floor space means that part of a floor area protected from the effects of fire and used as part of a means of egress from an interconnected floor space.

Public bike share means a service that provides the general public with an opportunity to rent bicycles through an automated system, on a short term basis for use within the City as part of a network comprised of no fewer than 50 public bike share stations located on separate sites.

Public bike share station means a bicycle sharing facility where bicycles are stored and from which the general public may rent and return bicycles and other objects or equipment necessary for or appurtenant to the operation of a public bike share.

Public corridor means a corridor that provides access to exit from more than one suite. (See Note A-1.4.1.2.(1).)

Public way means a sidewalk, street, highway, square or other open space to which the public has access, as of right or by invitation, expressed or implied.

Pump-out facility means a device or method for the removal of sewage from a holding tank connected to a marine toilet or from a self-contained marine toilet.

Registered professional means
• a person who is registered or licensed to practise as an architect under the Architects Act, or
• a person who is registered or licensed to practise as a professional engineer under the Engineers and Geoscientists Act.

Registered professional of record means a registered professional retained to undertake design work and field reviews in accordance with Subsection 2.2.7. of Division C.

Re-occupancy permit means permission or authorization in writing by the Chief Building Official to re-occupy any building or part thereof in respect of which the Chief Building Official has issued an order to cease occupancy because of an unsafe condition.

Repair garage means a building or part thereof where facilities are provided for the repair or servicing of motor vehicles.

Residential occupancy means the occupancy or use of a building or part thereof by persons for whom sleeping accommodation is provided but who are not harboured for the purpose of receiving care or treatment and are not involuntarily detained.

Return duct means a duct for conveying air from a space being heated, ventilated or air-conditioned back to the heating, ventilating or air-conditioning appliance.

Rim joist means the outermost member in floor framing, other than blocking, be it parallel, perpendicular or on an angle to the floor joists. (See Note A-1.4.1.2.(1).)

Rock means that portion of the earth’s crust that is consolidated, coherent and relatively hard and is a naturally formed, solidly bonded, mass of mineral matter that cannot readily be broken by hand.

Row housing means a building of residential occupancy where no dwelling unit is located above another dwelling unit and there is no common interior or exterior means of egress.

Run means the horizontal distance between two adjacent tread nosings on a stair. (See Figure A-9.8.4.-B in Note A-9.8.4. of Division B.)

Sanitary drainage system means a drainage system that conducts sewage.

Service room means a room provided in a building to contain equipment associated with building services.

Service space means space provided in a building to facilitate or conceal the installation of building service facilities such as chutes, ducts, pipes, shafts or wires.

Service water heater means a device for heating water for plumbing services.

Sewage means any liquid waste other than clear-water waste or storm water.

Sewage sump means an approved airtight tank or pit which receives sewage or liquid waste and which is located below the normal grade of the gravity system and must be emptied by mechanical means.

Sewer means an underground drain or conduit to remove waste water and organic refuse.

Shallow foundation means a foundation unit that derives its support from soil or rock located close to the lowest part of the building that it supports.
Single room accommodation means a room designated as accommodation pursuant to the Single Room Accommodation By-law.

Small suite means a suite classified as a Group A Division 2, Group D, Group E, Group F Division 2 (wholesale showroom) or Group F, Division 3 occupancy where the occupant load for the entire suite does not exceed 60 persons.

Smoke alarm means a combined smoke detector and audible alarm device designed to sound an alarm within the room or suite in which it is located upon the detection of smoke within that room or suite.

Smoke detector means a fire detector designed to operate when the concentration of airborne combustion products exceeds a predetermined level.

Soil means that portion of the earth's crust that is fragmentary, or such that some individual particles of a dried sample may be readily separated by agitation in water; it includes boulders, cobbles, gravel, sand, silt, clay and organic matter.

Solid masonry means a single wythe or multi-wythe construction made of solid masonry units or semi-solid, cored, or hollow masonry units, the cells of which may or may not be filled with mortar or grout. In multi-wythe masonry construction, the space between the wythes consists of a mortar-filled collar joint or grout-filled space and the wythes may or may not be constructed of the same masonry materials.

Solid masonry unit means a concrete block or brick unit, a clay brick unit, or calcium silicate brick unit whose net solid area is at least 75% of its gross area. (See Note A-1.4.1.2.(1).)

Sound transmission class (STC) means a single number rating of the airborne sound attenuation of a building assembly separating two adjoining spaces, taking into account the direct sound transmission path. (See Note A-1.4.1.2.(1).) (See also Note A-9.11. of Division B.)

Space heater means a space-heating appliance for heating the room or space within which it is located, without the use of ducts.

Space-heating appliance means an appliance intended for the supplying of heat to a room or space directly, such as a space heater, fireplace or unit heater, or to rooms or spaces of a building through a heating system such as a central furnace or boiler.

Sprinkler contractor means a person licensed as a contractor pursuant to the License By-law and who is either a sprinkler system installer or a person who employs a sprinkler system installer on a full-time basis.

Sprinkler system means an automatic fire extinguishing system designed to the National Fire Protection Association 13, 13D or 13R standard and all applicable associated sprinkler standards, and which consists of a system of devices and equipment designed to automatically detect a fire and discharge water or another approved fire extinguishing agent in the area of or onto a fire.

Sprinkler system installer means a person who has successfully completed an accredited program as a Sprinkler System Installer under the Industry Training Authority Act and Industry Training Regulation of British Columbia.

Sprinklered (as applying to a building or part thereof) means that the building or part thereof is equipped with a system of automatic sprinklers.

Stage means a space that is designed primarily for theatrical performances with provision for quick change scenery and overhead lighting, including environmental control for a wide range of lighting and sound effects and that is traditionally, but not necessarily, separated from the audience by a proscenium wall and curtain opening.

Storage garage means a building or part thereof intended primarily for the storage or parking of motor vehicles and containing no provision for the repair or servicing of such vehicles. (See Note A-1.4.1.2.(1).)

Storage-type service water heater means a service water heater with an integral hot water storage tank.

Storey means that portion of a building that is situated between the top of any floor and the top of the floor next above it, and if there is no floor above it, that portion between the top of such floor and the ceiling above it.

Storm water means water that is discharged from a surface as a result of rainfall or snowfall.

Stove means an appliance intended for cooking and space heating.
**Street** means a public road, highway, bridge, viaduct, *lane*, and sidewalk, and any other way normally open to the use of the public, but does not include a private right-of-way on private property and, for the purposes only of Part 3 and Part 9 of this By-law, a street which is less than 9 m in width or a *lane* or sidewalk.

**Subsoil drainage pipe** means a pipe that is installed underground to intercept and convey subsurface water.

**Subsurface investigation** means the appraisal of the general subsurface conditions at a building site by analysis of information gained by such methods as geological surveys, in situ testing, sampling, visual inspection, laboratory testing of samples of the subsurface materials and *groundwater* observations and measurements.

**Suite** means a single room or series of rooms of complementary use, operated under a single tenancy, and includes *dwelling units*, individual guest rooms in motels, hotels, boarding houses, rooming houses and dormitories as well as individual stores and individual or complementary rooms for *business and personal services occupancies*. (See Note A-1.4.1.2.(1).)

**Sump** means a receptacle installed between the storm or *combined sewer* and the building storm system to intercept the flow of debris into the building or public sewer and to prevent the outflow of sewer gas.

**Supervisory staff** means those occupants of a building who have some delegated responsibility for the fire safety of other occupants under the fire safety plan.

**Supply duct** means a duct for conveying air from a heating, ventilating or air-conditioning *appliance* to a space to be heated, ventilated or air-conditioned.

**Temporary special event** means a presentation of an artistic or cultural nature, including but not limited to visual, performing, media, literary, craft or interdisciplinary arts, for a maximum of 250 people, with or without liquor service, which occurs not more than two days per month in a building not approved for *assembly occupancy*.

**Tapered tread** means a tread with non-parallel edges that increases or decreases its *run* uniformly over its width. (See Note A-1.4.1.2.(1).)

**Theatre** means a place of public assembly intended for the production and viewing of the performing arts or the screening and viewing of motion pictures, and consisting of an auditorium with permanently fixed seats intended solely for a viewing audience.

**Trades safety coordinator** means an agent, employee or officer of a company supplying, installing or using materials at a *construction* site who has been trained to understand and apply safe construction, installation or *demolition* techniques, as applicable, respecting those materials and their relationship to the worksite, neighbouring property, public utilities and the general public.

**Training school** means a School-Arts or Self-Improvement, School – Business, or School - Vocational or Trade, as defined in the Zoning & Development By-law.

**Trap** means a fitting or device that is designed to hold a liquid seal that will prevent the passage of gas but will not materially affect the flow of a fluid.

**Treatment** means the provision of medical or other health-related intervention to persons, where the administration or lack of administration of these interventions may render them incapable of evacuating to a safe location without the assistance of another person. (See Note A-1.4.1.2.(1).)

**Treatment occupancy** means the *occupancy* or use of a building or part thereof for the provision of treatment, and where overnight accommodation is available to facilitate the treatment. (See Note A-1.4.1.2.(1).)

**Unit heater** means a suspended space heater with an integral air-circulating fan.

**Unprotected opening** (as applying to *exposing building face*) means a doorway, window or opening other than one equipped with a closure having the required *fire-protection rating*, or any part of a wall forming part of the exposing building face that has a *fire-resistance rating* less than that required for the exposing building face.

**Unsafe condition** means any condition that could cause undue hazard to the life, limb or health of any person authorized, expected or anticipated to be on or about the premises, *building or construction*.
Unstable liquid means a liquid, including flammable liquids and combustible liquids, that is chemically reactive to the extent that it will vigorously react or decompose at or near normal temperature and pressure conditions or that is chemically unstable when subjected to impact.

Vapour barrier means the elements installed to control the diffusion of water vapour.

Vent connector (as applying to heating or cooling systems) means the part of a venting system that conducts the flue gases or vent gases from the flue collar of a gas appliance to the chimney or gas vent, and may include a draft control device.

Venting system means an assembly of pipes and fittings that connects a drainage system with outside air for circulation of air and the protection of trap seals in the drainage system. (See Book II, Division A, Figures A-1.4.1.2.(1)-F and A-1.4.1.2.(1)-G in Note A-1.4.1.2.(1).)

Vertical service space means a shaft oriented essentially vertically that is provided in a building to facilitate the installation of building services including mechanical, electrical and plumbing installations and facilities such as elevators, refuse chutes and linen chutes.

Walkway means a covered or roofed pedestrian thoroughfare used to connect 2 or more buildings.

Water craft means any boat, hull, barge, or houseboat which is afloat, whether self-propelled or not, and includes pleasure and commercial craft.

Water distribution system means an assembly of pipes, fittings, valves and appurtenances that conveys water from the water service pipe or private water supply system to water supply outlets, fixtures, appliances and devices.

Water service pipe means a pipe that conveys water from a public water main or private water source to the inside of the building.

Water system means a private water supply system, a water service pipe, a water distribution system or parts thereof.

1.4.2. Symbols and Other Abbreviations

1.4.2.1. Symbols and Other Abbreviations

1) The symbols and other abbreviations in this By-law shall have the meanings assigned to them in this Article and Article 1.3.2.1. of Division B.

Section 1.5. Referenced Documents and Organizations

1.5.1. Referenced Documents

1.5.1.1. Application of Referenced Documents

1) Except as provided in Sentence (2), the provisions of documents referenced in this By-law, and of any documents referenced within those documents, apply only to the extent that they relate to
   a) buildings, and
   b) the objectives and functional statements attributed to the applicable acceptable solutions in Division B where the documents are referenced.

(See Note A-1.5.1.1.(1).)

2) Where a provision of this By-law references the Fire By-law, the NECB, or Book II (Plumbing Systems) of this By-law, the applicable objectives and functional statements shall include those found in that referenced document. (See Note A-2.1.1.2.(6).)
1.5.1.2. Conflicting Requirements
   1) In case of conflict between the provisions of this By-law and those of a referenced document, the provisions of this By-law shall govern.

1.5.1.3. Applicable Editions
   1) Where documents are referenced in this By-law, they shall be the editions designated in Subsection 1.3.1. of Division B.

1.5.2. Organizations

1.5.2.1. Abbreviations of Proper Names
   1) The abbreviations of proper names in this By-law shall have the meanings assigned to them in Article 1.3.2.1. of Division B.
Notes to Part 1

Compliance

A-1.1.1.1.(3) Factory-Constructed Buildings. The Building By-law applies the same requirements to site-built and factory-constructed buildings. However, it can often be difficult to determine whether a factory-constructed building complies with the By-law once it has been delivered to the construction site because many of the wall, roof and floor assemblies are closed in and so their components cannot be inspected. CSA A277, “Procedure for Factory Certification of Buildings,” was developed to address this problem with regard to residential, commercial and industrial buildings. This standard describes a procedure whereby an independent certification agency can review the quality control procedures of a factory and make periodic unannounced inspections of its products. The standard is not a building code, only a procedure for certifying compliance of factory-constructed components with a building code or other standard. If a factory-constructed building bears the label of an accredited certification agency indicating that compliance with the National Building Code has been certified using the CSA A277 procedure, the accepting authority will have some assurance that the concealed components do not require re-inspection on site. On the other hand, standards in the CSA Z240 MH Series, “Manufactured Homes,” do resemble a building code. These portions contain requirements in many of the areas where the Building By-law also has requirements and frequently the requirements are different. Other portions of these requirements are different. Other portions of the Z240 standards deal with special requirements for manufactured homes related to the fact that these houses must be moved over roads, which is an issue the Building By-law does not address. The Building By-law considers mobile homes certified to the Z240 standard as acceptable housing and they are permitted under Clause 1.1.1.1.(2)(g). The Building By-law does reference CSA Z240.10.1, “Site Preparation, Foundation, and Anchorage of Manufactured Homes,” which is not actually part of the CSA Z240 MH Series. This standard contains requirements for surface foundations where buildings – not just houses – comply with the deformation resistance test provided in CSA Z240.2.1, “Structural Requirements for Manufactured Homes.”

A-1.1.1.1.(5) Heritage Buildings. The City has identified conservation of selected heritage properties, or protection of the heritage character of certain areas, as being community planning objectives. The City’s planning objectives and growth strategy encourage and support the retention of these properties and ways to make restoration and rehabilitation of heritage buildings economically viable for the properties’ owners. It is generally recognized that the present Building By-law was primarily written for new construction and provides for a performance level that is significantly higher than what exists with many older buildings. To apply present By-law provisions to existing buildings is, in many cases, impractical and with heritage buildings may compromise historic appearances or authenticity. Therefore, Section 11.5 was developed to provide alternate methods for complying with the performance level intended by the By-law. The use of sprinklers is advocated as one of the primary methods in assuring this performance level for heritage buildings. Sprinkler systems not only control the fire, which aids evacuation, but also provides the added benefit of protecting the building from possible destruction by fire. Section 11.5 represents some of the ways that restoration and rehabilitation of heritage buildings can be facilitated without compromising the objectives of the By-law.

Only buildings which have been identified by the provincial or a local government are included in the definition of “heritage building.” However, subject to the discretion of the Chief Building Official, buildings with character merit may also qualify under Section 3 of the Heritage By-law. For these buildings, conservation is also a public objective. Heritage buildings often offer unique problems and opportunities, and each situation must be assessed individually. The use of the Alternate Compliance Methods in Table A-1.1.1.5. is not mandatory, and an owner may choose
• to apply acceptable solutions in Division B,
• to apply alternate solutions under Clause 1.2.1.1.(1)(b),
• to apply alternate compliance methods in Table A-1.1.1.5., or
• to combine these options.
A-1.1.2.(1) **Application to Existing Buildings.** This **By-law** is most often applied to existing or relocated buildings when an owner wishes to rehabilitate a building, change its use, or build an addition, or when an enforcement authority decrees that a building or class of buildings be altered for reasons of public safety. It is not intended that the Building By-law be used to enforce the retrospective application of new requirements to existing buildings or existing portions of relocated buildings, unless specifically required by local regulations or bylaws. For example, although the Fire By-law could be interpreted to require the installation of fire alarm, standpipe and hose, and automatic sprinkler systems in an existing building for which there were no requirements at the time of construction, it is not intended that the Fire By-law be applied in this manner to these buildings unless the authority having jurisdiction has determined that there is an inherent threat to occupant safety and has issued an order to eliminate the unsafe condition, or where substantial changes or additions are being made to an existing building or the occupancy has been changed. (See also Note A-1.1.1.(1) of Division A of the Fire By-law.)

Relocated buildings that have been in use in another location for a number of years can be considered as existing buildings, in part, and the same analytical process can be applied as for existing buildings. It should be noted, however, that a change in occupancy may affect some requirements (e.g. loads and fire separations) and relocation to an area with different wind, snow or earthquake loads will require the application of current By-law requirements. Depending on the construction of the building and the changes in load, structural modifications may be required. Similarly, parts of a relocated or existing building that are reconstructed, such as foundations and basements, or parts being modified are required to be built to current codes.

Whatever the reason, By-law application to existing or relocated buildings requires careful consideration of the level of safety needed for that building. This consideration involves an analytical process similar to that required to assess alternative design proposals for new construction. See Clause 1.2.1.1.(1)(b) for information on achieving compliance with the By-law using alternative solutions.

In developing By-law requirements for new buildings, consideration has been given to the cost they impose on a design in relation to the perceived benefits in terms of safety. The former is definable; the latter difficult to establish on a quantitative basis. In applying the By-law requirements to an existing building, the benefits derived are the same as in new buildings. On the other hand, the increased cost of implementing in an existing building a design solution that would normally be intended for a new building may be prohibitive.

The successful application of By-law requirements to existing construction becomes a matter of balancing the cost of implementing a requirement with the relative importance of that requirement to the overall By-law objectives. The degree to which any particular requirement can be relaxed without affecting the intended level of safety of the By-law requires considerable judgment on the part of both the designer and the authority having jurisdiction.

Further information on the application of By-law requirements to existing or relocated buildings can be found in the following publications:
- “Guidelines for Application of Part 3 of the National Building Code of Canada to Existing Buildings”
- CBD 230, “Applying Building Codes to Existing Buildings”

These publications can be ordered through NRC’s Web site.

A-1.2.1.1.(1a) **By-law Compliance via Acceptable Solutions.** If a building design (e.g. material, component, assembly or system) can be shown to meet all provisions of the applicable acceptable solutions in Division B (e.g. it complies with the applicable provisions of a referenced standard), it is deemed to have satisfied the objectives and functional statements linked to those provisions and thus to have complied with that part of the By-law. In fact, if it can be determined that a design meets all the applicable acceptable solutions in Division B, there is no need to consult the objectives and functional statements in Division A to determine its compliance.
A-1.2.1.1.(1)(b)  **By-law Compliance via Alternative Solutions.** Where a design differs from the acceptable solutions in Division B, then it should be treated as an “alternative solution.” A proponent of an alternative solution must demonstrate that the alternative solution addresses the same issues as the applicable acceptable solutions in Division B and their attributed objectives and functional statements. However, because the objectives and functional statements are entirely qualitative, demonstrating compliance with them in isolation is not possible. Therefore, Clause 1.2.1.1.(1)(b) identifies the principle that Division B establishes the quantitative performance targets that alternative solutions must meet. In many cases, these targets are not defined very precisely by the acceptable solutions – certainly far less precisely than would be the case with a true performance code, which would have quantitative performance targets and prescribed methods of performance measurement for all aspects of building performance. Nevertheless, Clause 1.2.1.1.(1)(b) makes it clear that an effort must be made to demonstrate that an alternative solution will perform as well as a design that would satisfy the applicable acceptable solutions in Division B – not “well enough” but “as well as.”

In this sense, it is Division B that defines the boundaries between acceptable risks and the “unacceptable” risks referred to in the statements of the By-law’s objectives, i.e. the risk remaining once the applicable acceptable solutions in Division B have been implemented represents the residual level of risk deemed to be acceptable by the broad base of Canadians who have taken part in the consensus process used to develop the By-law.

**Level of Performance**
Where Division B offers a choice between several possible designs, it is likely that these designs may not all provide exactly the same level of performance. Among a number of possible designs satisfying acceptable solutions in Division B, the design providing the lowest level of performance should generally be considered to establish the minimum acceptable level of performance to be used in evaluating alternative solutions for compliance with the By-law.

Sometimes a single design will be used as an alternative solution to several sets of acceptable solutions in Division B. In this case, the level of performance required of the alternative solution should be at least equivalent to the overall level of performance established by all the applicable sets of acceptable solutions taken as a whole.

Each provision in Division B has been analyzed to determine what it is intended to achieve. The resultant intent statements clarify what undesirable results each provision seeks to preclude. These statements are not a legal component of the By-law, but are advisory in nature, and can help By-law users establish performance targets for alternative solutions. They are published as part of the online By-law subscriptions and as a separate electronic document entitled “Supplement to the NBC 2015: Intent Statements,” which is available on NRC’s Web site. These intent statements should be cross referenced with the associated requirements of the Building By-law.

**Areas of Performance**
A subset of the acceptable solutions in Division B may establish criteria for particular types of designs (e.g. certain types of materials, components, assemblies, or systems). Often such subsets of acceptable solutions are all attributed to the same objective: Fire Safety for example. In some cases, the designs that are normally used to satisfy this subset of acceptable solutions might also provide some benefits that could be related to some other objective: Fire Protection of the Building for example. However, if none of the applicable acceptable solutions are linked to Objective OP1, Fire Protection of the Building, it is not necessary that alternative solutions proposed to replace these acceptable solutions provide a similar benefit related to Fire Protection of the Building. In other words, the acceptable solutions in Division B establish acceptable levels of performance for compliance with the By-law only in those areas defined by the objectives and functional statements attributed to the acceptable solutions.

**Applicable Acceptable Solutions**
In demonstrating that an alternative solution will perform as well as a design that would satisfy the applicable acceptable solutions in Division B, its evaluation should not be limited to comparison with the acceptable
solutions to which an alternative is proposed. It is possible that acceptable solutions elsewhere in the By-law also apply. The proposed alternative solution may be shown to perform as well as the most apparent acceptable solution which it is replacing but may not perform as well as other relevant acceptable solutions. For example, an innovative sheathing material may perform adequately as sheathing in a wall system that is braced by other means but may not perform adequately as sheathing in a wall system where the sheathing must provide the structural bracing. All applicable acceptable solutions should be taken into consideration in demonstrating the compliance of an alternative solution.

A-1.2.1.2.(1) Responsibility of Owner. Sentence 1.1.1.1.(1) is not intended to imply that a person who becomes the owner of a building must bring the entire building into compliance with the By-law. The By-law applies only in the cases and to the extent specified by Article 1.1.1.1., and the owner of a building is therefore made responsible for ensuring the building complies with the By-law by Sentence 1.2.1.2.(1) only in the cases and to the extent specified by Article 1.1.1.1. and Part 11. If none of the provisions in Sentence 1.1.1.1.(1) and Part 11 apply to the building, the owner is not required to make any changes to the building.

A-1.3.3.4.(1) Buildings Divided by Firewalls. This concept relates to the provisions directly regulated by this By-law and does not apply to electrical service entrance requirements, which are regulated by other documents.

A-1.3.3.4.(2) & (3) Buildings on Sloping Sites. Application of the definition of grade to stepped buildings on sloping sites often results in such buildings being designated as being greater than 4 storeys in building height even though there may be only 2, 3 or 4 storeys at any one location. Figure A-1.3.3.4.(2)-A illustrates this application compared to a similar building on a flat site.

Under Sentence 1.3.3.4.(2), Building A can be considered as being 4 storeys in building height instead of 7 storeys in building height. Both Building A and B are comparable with regard to fire safety and egress.

This relaxation applies to the determination of building height only. All other requirements continue to apply as appropriate.

Figure A-1.3.3.4.(2)-A
Application of the definition of grade
Larger buildings also have significant challenges due to sloping sites.

Figure A-1.3.3.4.(2)-B illustrates this application of Sentence (3). Under Sentence 1.3.3.4.(2), Building A and B can be considered separately as these would have a level of fire safety and egress comparable with buildings constructed as separate entities.

As with the 4 storey case, this relaxation applies to the determination of building height only. All other requirements continue to apply as appropriate.

---

**A-1.3.3.6.(2)(k) Portable Classroom Exemption**

This exemption is based on the following considerations:

- the building area is less than 100 m² in building area and each unit is provided with exiting directly to the exterior,
- the building is constructed with smoke detection in all major rooms and with adequate portable fire extinguishers,
- the building is properly supervised with a practised and drilled fire safety plan and with supervisory staff fully trained in securing the rapid evacuation of the facilities upon initiation of any alarm device, and
- the building, its construction type and any required fire ratings are otherwise in full conformance with the requirements of the By-law.

---

**A-1.4.1.2.(1) Defined Terms.**

**Access or Accessible and Persons with Disabilities**

The terms “access” or “accessible” and the term “persons with disabilities” are revised in this edition of the By-law for greater alignment with the United Nations (UN) Convention on the Rights of Persons with Disabilities. This does not alter the objectives and functional statements attributed to the provisions of this By-law regarding access for persons with disabilities. The revised definitions are to provide greater clarity as to why the By-law applies requirements the way it does.

**ASTC and STC**

The higher the ASTC or STC rating, the more the assembly or the system of assemblies protects occupants from noise in adjacent spaces. These ratings, which are determined in accordance with ASTM E 413, “Classification for Rating Sound Insulation,” roughly describe the noise reduction in decibels (dB) provided by the separating floor or wall, or in the case of the ASTC rating, by the system of separating and adjoining walls and floors. For example, where an 80 dB sound on one side of a wall/floor/ceiling is reduced to 30 dB on the other side, that partition is said to have an STC of 50.

The dB scale is a logarithmic one and the human ear perceives a 10 dB reduction in sound as roughly halving the volume: for example, a 40 dB noise, subjectively, seems half as loud as a 50 dB one.
Care Occupancy
Support services rendered by or through care facility management refer to services provided by the organization that is responsible for the care for a period exceeding 24 consecutive hours. They do not refer to services provided by residents of dwelling units or suites, or to services arranged directly by residents of dwelling units or suites with outside agencies.

In the context of care occupancies, these services may include a daily assessment of the resident’s functioning, awareness of their whereabouts, the making of appointments for residents and reminding them of those appointments, the ability and readiness to intervene if a crisis arises for a resident, supervision in areas of nutrition or medication, and provision of transient medical services. Services may also include activities of daily living such as bathing, dressing, feeding, and assistance in the use of washroom facilities, etc. No actual treatment is provided by or through care facility management.

Dangerous Goods
In previous editions of the Building By-law, the terminology used to identify dangerous goods came from TC SOR/2008-34, “Transportation of Dangerous Goods Regulations (TDGR).” The TDGR apply solely to the adequate identification of hazards related to dangerous goods in the contexts of transportation and emergency response.

Dangerous goods in the workplace are identified in accordance with the “Workplace Hazardous Materials Information System (WHMIS),” established in accordance with the “Hazardous Products Act.” The WHMIS identification system is specifically designed with the users of the product in mind.

This edition of the Building By-law identifies dangerous goods as products regulated by the TDGR or classified under the WHMIS. In order to harmonize these two nomenclatures for dangerous goods, class descriptors were developed taking into consideration both the TDGR and WHMIS classification systems. The proposed nomenclature introduces a descriptive approach to classifying dangerous goods, which is similar to the one proposed by the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) developed by the United Nations (UN). Canada has actively participated in the development of the GHS and has committed to its implementation through the TDGR and WHMIS regulations.

The Building By-law 2019 nomenclature takes a common sense approach that corresponds more closely to how people refer to dangerous goods on a daily basis, blending TDGR and WHMIS terminology without using nondescript numbers and letters as previously found in the Building By-law, TDGR and WHMIS.

### Notes to Table A-1.4.1.2.(1):

1. The WHMIS has various descriptors for this Class of products based on their toxicity.
2. The WHMIS has various descriptors for this Class of products based on the nature of the danger presented by the product.

### Designated Flood Plain

The Burrard Inlet, English Bay, False Creek and Fraser River flood plains are illustrated on Diagram A1 and the wave effect zones are illustrated on Diagram A2. See Figure A-1.4.1.2.(1)-C and Figure A-1.4.1.2.(1)-D.

The Still Creek flood plain is illustrated on Figure A-1.4.1.2.(1)-E.

### Exit

Exits include doors or doorways leading directly into an exit stair or directly to the outside. In the case of an exit leading to a separate building, exits also include vestibules, walkways, bridges or balconies.

### Farm Building

Farm buildings as defined in Article 1.4.1.2. include, but are not limited to, produce storage and packing facilities, livestock and poultry housing, milking centres, manure storage facilities, grain bins, silos, feed preparation centres, farm workshops, greenhouses, farm retail centres, and horse riding, exercise and training facilities. Farm buildings may be classed as low or high human occupancy, depending on the occupant load. Examples of farm buildings likely to be classed as low human occupancy as defined in Article 1.2.1.2. of the National Farm Building Code of Canada are livestock and poultry housing, manure and machinery storage facilities and horse exercise and training facilities where no bleachers or viewing area are provided. Examples of farm buildings that would be classed as other than low human occupancy include farm retail centres for feeds, horticultural and livestock produce, auction barns and show areas where bleachers or other
public facilities are provided. Farm work centres where the number of workers frequently exceeds the limit for low human occupancy will also be in this category.

It is possible to have areas of both high and low human occupancy in the same building provided that the structural safety and fire separation requirements for high human occupancy are met in the part thus designated.

**Fire Separation**

It is generally understood that the term “fire” refers to all products of combustion, including heat and smoke. Although a fire separation is not always required to have a fire-resistance rating, it should act as a barrier to the spread of smoke and fire until some type of response is initiated. If the fire-resistance rating of a fire separation is permitted to be waived on the basis of the presence of an automatic sprinkler system, it is nonetheless the intent of the By-law that the fire separation be constructed so that it will remain in place and act as a barrier against the spread of smoke until the sprinklers have actuated.

**Flight**

![Flight Diagram](image)

**Flood Construction Level Requirements**

The Burrard Inlet, English Bay, False Creek and Fraser River flood plains are illustrated on Diagram A1 and the wave effect zones are illustrated on Diagram A2. See Figure A-1.4.1.2.(1)-C and Figure A-1.4.1.2.(1)-D.

The Still Creek flood construction levels are illustrated on Figure A-1.4.1.2.(1)-E.

**Grade**

Localized depressions that need not be considered in the determination of the elevation of grade include such features as vehicle and pedestrian entrances and other minor depressions that do not affect accessibility for firefighting or evacuation.

**Heritage Building**

Heritage buildings are buildings that are legally recognized by the Province or the City as having historic, architectural or cultural value the community. To qualify as a heritage building under the Vancouver Building By-law, a building must be:

- protected as heritage property by the Province under the Heritage Conservation Act or the Park Act;
• subject to a heritage designation bylaw pursuant to the Municipal Act or Vancouver Charter;
• listed in the Provincial heritage register or in an inventory of heritage buildings maintained for this purpose under section 20(1)(h) of the Heritage Conservation Act.

Despite this definition of Heritage Buildings, the Chief Building Official may accept a lesser standard.

Mechanically Vented
The definition of this term is intended to include all types of appliances and venting systems that rely entirely on fans to evacuate the products of combustion. Systems variously referred to as “forced draft,” “power vented” and “induced draft” in standards and industry terminology may be covered by this definition. The key characteristic of such systems is that they are more resistant to depressurization-induced spillage of combustion products into the building in which they are housed because the combustion venting system downstream of the fan is “sealed,” i.e. includes no draft hood or draft control device.

Post-disaster Building
There may be circumstances where the Chief Building Official would choose to exempt certain types of buildings or parts thereof from being designated as post-disaster buildings in order to permit them to be governed by Part 9 rather than by the rest of the By-law. Such is the case in the following examples: an ambulance that is stored at a volunteer’s residence or a police station that is housed in a small shopping mall. The circumstances where such exemptions are permitted are intentionally limited by the definition of post-disaster building.

Public Corridor
A covered mall is considered to be a public corridor and, as such, is subject to the same requirements as a public corridor.

Rim Joist
In the field, rim joists may also be referred to as rim boards, headers or header joists.

Service Room
Typical examples of service rooms include boiler rooms, furnace rooms, incinerator rooms, garbage handling rooms and rooms to accommodate air-conditioning or heating appliances, pumps, compressors and electrical equipment. Rooms such as elevator machine rooms and common laundry rooms are not considered to be service rooms.

Solid Masonry Units
The net solid area of a masonry unit is calculated by determining the gross area of the bed face of the unit (L × T) and subtracting the cumulative areas of the hollow portions. As long as the total area of the hollow portions is 25% or less of the gross area, the unit is considered to be a solid masonry unit.
Storage Garage
Entrances at which vehicles stop for a short time beneath an unenclosed canopy to pick up and drop off passengers are not considered as storage garages. As a subsidiary use, storage garages may also contain space for parking or storing other vehicles (bicycles, boat, etc.).

Suite
Tenancy in the context of the term “suite” applies to both rental and ownership tenure. In a condominium arrangement, for example, dwelling units are considered separate suites even though they are individually owned. In order to be of complementary use, a series of rooms that constitute a suite must be in reasonably close proximity to each other and have access to each other either directly by means of a common doorway or indirectly by a corridor, vestibule or other similar arrangement.

The term “suite” does not apply to rooms such as service rooms, common laundry rooms and common recreational rooms that are not leased or under a separate tenure in the context of the By-law. Similarly, the term “suite” is not normally applied in the context of buildings such as schools and hospitals, since the entire building is under a single tenure. However, a room that is individually rented is considered a suite. A warehousing unit in a mini-warehouse is a suite. A rented room in a nursing home could be considered as a suite if the room was under a separate tenure. A hospital bedroom on the other hand is not considered to be under a separate tenure, since the patient has little control of that space, even though he pays the hospital a per diem rate for the privilege of using the hospital facilities, which include the sleeping areas.

For certain requirements in the By-law, the expression “room or suite” is used (e.g., travel distance). This means that the requirement applies within the rooms of suites as well as to the suite itself and to rooms that may be located outside the suite. In other places the expression “suite, and rooms not located within a suite” is used (e.g., for the installation of smoke and heat detectors). This means that the requirement applies to individual suites as defined, but not to each room within the suite. The rooms “not within a suite” would include common

Figure A-1.4.1.2.(1)-B
Net solid area of masonry unit

gross area = length \times thickness
net solid area = shaded area
laundry rooms, common recreational rooms and service rooms, which are not considered as tenant-occupied space.

**Tapered Tread**
The definition of tapered tread includes treads in curved stairs and treads in winder stairs. However, requirements for winders differ from those for other tapered treads. Requirements for tapered treads are found in Articles 3.3.1.16., 3.4.6.9., and 9.8.4.3. of Division B. Requirements for winders are found in Article 9.8.4.6. of Division B.

**Treatment**
The ability to evacuate unassisted implies that a person is capable of recognizing and responding to an emergency given their physical, cognitive and behavioural abilities, and able to move to a safe location without the assistance of another person. For example, such persons must be able to arise and walk, or transfer from a bed or chair to a means of mobility, and leave the building or move to a safe location on their own.

**Treatment Occupancy**
“Treatments” may include such things as surgery, intensive care, and emergency medical intervention. Treatment services differ from the services provided by care occupancies like personal care assistance or the administration of medication, and from those provided by business and personal services occupancies like dentistry or day procedures.

**Illustrations for Defined Terms**

*Designated Flood Plains*

Flood plains are based on flood risk assessed to the year 2100, including sea level rise, as assessed in January, 2014.

Diagram B: Still Creek Flood Plain and Flood Construction Levels
A-1.5.1.1.(1) **Application of Referenced Documents.** Documents referenced in the Building By-law may contain provisions covering a wide range of issues, including issues that are unrelated to the objectives and functional statements stated in Parts 2 and 3 of Division A respectively; e.g. aesthetic issues such as colour-fastness or uniformity. Sentence 1.5.1.1.(1) is intended to make it clear that, whereas referencing a document in the By-law generally has the effect of making the provisions of that document part of the By-law, provisions that are unrelated to buildings or to the objectives and functional statements attributed to the provisions in Division B where the document is referenced are excluded.

Furthermore, many documents referenced in the By-law contain references to other documents, which may also, in turn, refer to other documents. These secondary and tertiary referenced documents may contain provisions that are unrelated to buildings or to the objectives and functional statements of the By-law; such provisions – no matter how far down the chain of references they occur – are not included in the intent of Sentence 1.5.1.1.(1).
Part 2
Objectives

Section 2.1. Application

2.1. Application

2.1.1. Application

1) This Part applies to all buildings covered in this By-law. (See Article 1.1.1.1.)

2.1.1.2. Application of Objectives

(See Note A-2.2.1.1.(1).)

1) Except as provided in Sentences (2) to (6), the objectives described in this Part apply
   a) to all buildings covered in this By-law (See Article 1.1.1.1.), and
   b) only to the extent that they relate to compliance with this By-law as required in Article 1.2.1.1.

2) Objective OS4, Resistance to Unwanted Entry, applies only to dwelling units or commonly accessible
   facilities serving multifamily dwelling units. (See Article 1.3.3.3.)

3) Objective OH3, Noise Protection, applies only to dwelling units.

4) Objective OH5, Hazardous Substances Containment, applies only to the extent defined in
   a) Book II, (Plumbing Systems) of this By-law, and
   b) the Fire By-law.

5) Objective OA, Accessibility (including Objectives OA1, Accessible Path of Travel, and OA2, Accessible
   Facilities), does not apply to
   a) dwelling units, row houses, boarding houses, lodging houses and construction camps, except as
      required by
      i) Article 3.8.2.12. of Division B, or
      ii) Subsection 3.8.5. of Division B,
   b) apartment and condominium buildings except to the extent described in Subsection 3.8.2. of
      Division B, high-hazard industrial occupancies
   c) buildings that are not intended to be occupied on a daily or full-time basis, including automatic
      telephone exchanges, pump houses and substations,
   e) public toilet buildings described in Clause 3.8.2.1.(1)(e) of Division B, and
   f) the storeys described in Clauses 3.8.2.1.(1)(f) and (g) of Division B.

6) Objective OE, Environment, applies only to
   a) buildings of residential occupancy to which Part 9 of Division B applies,
   b) buildings containing business and personal services, mercantile or low-hazard industrial
      occupancies to which Part 9 of Division B applies whose combined total floor area does not exceed
      300 m², and
   c) buildings containing a mix of the residential and non-residential occupancies described in
      Clauses (a) and (b).

(See also Article 1.3.3.3.)
Section 2.2. Objectives

2.2.1. Objectives

2.2.1.1. Objectives

1) The objectives of this By-law are as follows (See Note A-2.2.1.1.(1).):

   OS Safety
   An objective of this By-law is to limit the probability that, as a result of the design, construction or demolition of the building, a person in or adjacent to the building will be exposed to an unacceptable risk of injury.

   OS1 Fire Safety
   An objective of this By-law is to limit the probability that, as a result of the design or construction of the building, a person in or adjacent to the building will be exposed to an unacceptable risk of injury due to fire. The risks of injury due to fire addressed in this By-law are those caused by –
   OS1.1 fire or explosion occurring
   OS1.2 fire or explosion impacting areas beyond its point of origin
   OS1.3 collapse of physical elements due to a fire or explosion
   OS1.4 fire safety systems failing to function as expected
   OS1.5 persons being delayed in or impeded from moving to a safe place during a fire emergency

   OS2 Structural Safety
   An objective of this By-law is to limit the probability that, as a result of the design or construction of the building, a person in or adjacent to the building will be exposed to an unacceptable risk of injury due to structural failure. The risks of injury due to structural failure addressed in this By-law are those caused by –
   OS2.1 loads bearing on the building elements that exceed their loadbearing capacity
   OS2.2 loads bearing on the building that exceed the loadbearing properties of the supporting medium
   OS2.3 damage to or deterioration of building elements
   OS2.4 vibration or deflection of building elements
   OS2.5 instability of the building or part thereof
   OS2.6 collapse of the excavation

   OS3 Safety in Use
   An objective of this By-law is to limit the probability that, as a result of the design or construction of the building, a person in or adjacent to the building will be exposed to an unacceptable risk of injury due to hazards. The risks of injury due to hazards addressed in this By-law are those caused by –
   OS3.1 tripping, slipping, falling, contact, drowning or collision
   OS3.2 contact with hot surfaces or substances
   OS3.3 contact with energized equipment
   OS3.4 exposure to hazardous substances
   OS3.5 exposure to high levels of sound from fire alarm systems
   OS3.6 persons becoming trapped in confined spaces
   OS3.7 persons being delayed in or impeded from moving to a safe place during an emergency (See Note A-2.2.1.1.(1).)
OS4  Resistance to Unwanted Entry
An objective of this Cod By-law is to limit the probability that, as a result of the
design or construction of the building, a person in the building will be exposed to an
unacceptable risk of injury due to the building’s low level of resistance to unwanted
entry (See Sentence 2.1.1.2.(2) for application limitation). The risks of injury due to
unwanted entry addressed in this By-law are those caused by –
   OS4.1  – intruders being able to force their way through locked doors or
           windows
   OS4.2  – occupants being unable to identify potential intruders as such
   OS4.3  – intruders being able to force their way through physical security features

OS5  Safety at Construction and Demolition Sites
An objective of this By-law is to limit the probability that, as a result of the construction
or demolition of the building, the public adjacent to a construction or demolition site
will be exposed to an unacceptable risk of injury due to hazards. The risks of injury
due to construction and demolition hazards addressed in this By-law are those caused by –
   OS5.1  – objects projected onto public ways
   OS5.2  – vehicular accidents on public ways
   OS5.3  – damage to or obstruction of public ways
   OS5.4  – water accumulated in excavations
   OS5.5  – entry into the site
   OS5.6  – exposure to hazardous substances and activities
   OS5.7  – loads bearing on a covered way that exceed its loadbearing capacity
   OS5.8  – collapse of the excavation
   OS5.9  – persons being delayed in or impeded from moving to a safe place
during an emergency (See Note A-2.2.1.1.(1).)

OH  Health
An objective of this By-law is to limit the probability that, as a result of the design or
construction of the building, a person will be exposed to an unacceptable risk of illness.

OH1  Indoor Conditions
An objective of this By-law is to limit the probability that, as a result of the design or
construction of the building, a person in the building will be exposed to an
unacceptable risk of illness due to indoor conditions. The risks of illness due to indoor
conditions addressed in this By-law are those caused by –
   OH1.1  – inadequate indoor air quality
   OH1.2  – inadequate thermal comfort
   OH1.3  – contact with moisture

OH2  Sanitation
An objective of this By-law is to limit the probability that, as a result of the design or
construction of the building, a person in the building will be exposed to an
unacceptable risk of illness due to unsanitary conditions. The risks of illness due to
unsanitary conditions addressed in this By-law are those caused by –
   OH2.1  – exposure to human or domestic waste
   OH2.2  – consumption of contaminated water
   OH2.3  – inadequate facilities for personal hygiene
   OH2.4  – contact with contaminated surfaces
   OH2.5  – contact with vermin and insects

OH3  Noise Protection
An objective of this By-law is to limit the probability that, as a result of the design or
construction of the building, a person in the building will be exposed to an
unacceptable risk of illness due to high levels of sound originating in adjacent spaces.
Division A: Compliance, Objectives and Functional Statements

Part 2 – Objectives

in the building (See Sentence 2.1.1.2.(3) for application limitation). The risks of illness due to high levels of sound addressed in this By-law are those caused by –

OH3.1 exposure to airborne sound transmitted through assemblies separating dwelling units from adjacent spaces in the building

OH4 Vibration and Deflection Limitation
An objective of this By-law is to limit the probability that, as a result of the design or construction of the building, a person in the building will be exposed to an unacceptable risk of illness due to high levels of vibration or deflection of building elements.

OH5 Hazardous Substances Containment
An objective of this By-law is to limit the probability that, as a result of the design or construction of the building, the public will be exposed to an unacceptable risk of illness due to the release of hazardous substances from the building (See Sentence 2.1.1.2.(4) for application limitation).

OA Accessibility
An objective of this By-law is to limit the probability that, as a result of the design or construction of the building, persons with disabilities will be unacceptably impeded from accessing or using the building or its facilities (See Sentence 2.1.1.2.(5) for application limitations).

OA1 Accessible Path of Travel
An objective of this By-law is to limit the probability that, as a result of the design or construction of the building, persons with disabilities will be unacceptably impeded from accessing the building or circulating within it (See Sentence 2.1.1.2.(5) for application limitations).

OA2 Accessible Facilities
An objective of this By-law is to limit the probability that, as a result of the design or construction of the building, persons with disabilities will be unacceptably impeded from using the building's facilities (See Sentence 2.1.1.2.(5) for application limitations).

OP Fire and Structural Protection of Buildings
An objective of this By-law is to limit the probability that, as a result of the design, construction or demolition of the building, the building or adjacent buildings will be exposed to an unacceptable risk of damage due to fire or structural insufficiency, or the building or part thereof will be exposed to an unacceptable risk of loss of use also due to structural insufficiency.

OP1 Fire Protection of the Building
An objective of this By-law is to limit the probability that, as a result of its design or construction, the building will be exposed to an unacceptable risk of damage due to fire. The risks of damage due to fire addressed in this By-law are those caused by –

OP1.1 fire or explosion occurring
OP1.2 fire or explosion impacting areas beyond its point of origin
OP1.3 collapse of physical elements due to a fire or explosion
OP1.4 fire safety systems failing to function as expected

OP2 Structural Sufficiency of the Building
An objective of this By-law is to limit the probability that, as a result of its design or construction, the building or part thereof will be exposed to an unacceptable risk of damage or loss of use due to structural failure or lack of structural serviceability. The risks of damage and of loss of use due to structural failure or lack of structural serviceability addressed in this By-law are those caused by –

OP2.1 loads bearing on the building elements that exceed their loadbearing capacity
OP2.2 loads bearing on the building that exceed the loadbearing properties
of the supporting medium
OP2.3 – damage to or deterioration of building elements
OP2.4 – vibration or deflection of building elements
OP2.5 – instability of the building or part thereof
OP2.6 – instability or movement of the supporting medium

OP3 Protection of Adjacent Buildings from Fire
An objective of this By-law is to limit the probability that, as a result of the design or construction of the building, adjacent buildings will be exposed to an unacceptable risk of damage due to fire. The risks of damage to adjacent buildings due to fire addressed in this By-law are those caused by –
OP3.1 – fire or explosion impacting areas beyond the building of origin

OP4 Protection of Adjacent Buildings from Structural Damage
An objective of this By-law is to limit the probability that, as a result of the design, construction or demolition of the building, adjacent buildings will be exposed to an unacceptable risk of structural damage. The risks of structural damage to adjacent buildings addressed in this By-law are those caused by –
OP4.1 – settlement of the medium supporting adjacent buildings
OP4.2 – collapse of the building or portion thereof onto adjacent buildings
OP4.3 – impact of the building on adjacent buildings
OP4.4 – collapse of the excavation

OE Environment
An objective of this By-law is to limit the probability that, as a result of the design, construction or renovation of the building or of the plumbing system, the environment will be affected in an unacceptable manner.

OE1 Energy Efficiency and Water Use
An objective of this By-law is to limit the probability that, as a result of the design, construction or renovation of the building, the use of energy will be inefficient or the use of water will be excessive. The risks of inefficient energy use or excessive water use addressed in this By-law are those caused by –
OE1.1 – inefficient energy performance of buildings or building components
Notes to Part 2
Objectives

A-2.1.1.2.(6) Deleted.

A-2.2.1.1.(1) Objectives.
Listing of objectives
Any gaps in the numbering sequence of the objectives are due to the fact that there is a master list of objectives covering the principal By-law Documents – the Building By-law Book I: General, Building By-law Book II: Plumbing Systems, and the Fire By-law – but not all objectives are pertinent to all By-laws.

The building
Where the term “the building” is used in the wording of the objectives, it refers to the building for which compliance with the Building By-law is being assessed.

Emergency
The term “emergency” – in the context of safety in buildings – is often equated to the term “fire emergency;” however, the wording of objectives OS3.7 and OS5.9 makes it clear that the By-law addresses any type of emergency that would require the rapid evacuation of the building, such as a bomb threat or the presence of intruders.
Part 3

Functional Statements

Section 3.1. Application

3.1.1. Application

3.1.1.1. Application

1) This Part applies to all buildings covered in this By-law. (See Article 1.1.1.1.)

3.1.1.2. Application of Functional Statements

1) Except as provided in Sentences (2) to (4), the functional statements described in this Part apply
   a) to all buildings covered in this By-law (See Article 1.1.1.1.), and
   b) only to the extent that they relate to compliance with this By-law as required in Article 1.2.1.1.

2) Deleted.

3) Functional Statements F73 and F74 do not apply to
   a) dwelling units, row houses, boarding houses, lodging houses and construction camps, except as required by
      i) Article 3.8.2.12. of Division B, or
      ii) Subsection 3.8.5. of Division B,
   b) apartment and condominium buildings except to the extent described in Subsection 3.8.2. of Division B,
   c) high-hazard industrial occupancies,
   d) buildings that are not intended to be occupied on a daily or full-time basis, including automatic telephone exchanges, pump houses and substations,
   e) public toilet buildings described in Clause 3.8.2.1.(1)(e) of Division B, and
   f) the storeys described in Clauses 3.8.2.1.(1)(f) and (g) of Division B.

4) Deleted.

Section 3.2. Functional Statements

3.2.1. Functional Statements

3.2.1.1. Functional Statements

1) The objectives of this By-law are achieved by measures, such as those described in the acceptable solutions in Division B, that are intended to allow the building or its elements to perform the following functions (See Note A-3.2.1.1.1.):

   F01 To minimize the risk of accidental ignition.
   F02 To limit the severity and effects of fire or explosions.
   F03 To retard the effects of fire on areas beyond its point of origin.
   F04 To retard failure or collapse due to the effects of fire.
   F05 To retard the effects of fire on emergency egress facilities.
   F06 To retard the effects of fire on facilities for notification, suppression and emergency response.
   F10 To facilitate the timely movement of persons to a safe place in an emergency.
   F11 To notify persons, in a timely manner, of the need to take action in an emergency.
   F12 To facilitate emergency response.
   F13 To notify emergency responders, in a timely manner, of the need to take action in an emergency.
Division A: Compliance, Objectives and Functional Statements

Part 3 – Functional Statements

F20 To support and withstand expected loads and forces.
F21 To limit or accommodate dimensional change.
F22 To limit movement under expected loads and forces.
F23 To maintain equipment in place during structural movement.
F30 To minimize the risk of injury to persons as a result of tripping, slipping, falling, contact, drowning or collision.
F31 To minimize the risk of injury to persons as a result of contact with hot surfaces or substances.
F32 To minimize the risk of injury to persons as a result of contact with energized equipment.
F33 To limit the level of sound of a fire alarm system.
F34 To resist or discourage unwanted access or entry.
F35 To facilitate the identification of potential intruders.
F36 To minimize the risk that persons will be trapped in confined spaces.
F40 To limit the level of contaminants.
F41 To minimize the risk of generation of contaminants.
F42 To resist the entry of vermin and insects.
F43 To minimize the risk of release of hazardous substances.
F44 To limit the spread of hazardous substances beyond their point of release.
F46 To minimize the risk of contamination of potable water.
F50 To provide air suitable for breathing.
F51 To maintain appropriate air and surface temperatures.
F52 To maintain appropriate relative humidity.
F53 To maintain appropriate indoor/outdoor air pressure differences.
F54 To limit drafts.
F55 To resist the transfer of air through environmental separators.
F56 To limit the transmission of airborne sound into a dwelling unit from spaces elsewhere in the building (See Sentence 3.1.1.2.(2) for application limitation).
F60 To control the accumulation and pressure of water on and in the ground.
F61 To resist the ingress of precipitation, water or moisture from the exterior or from the ground.
F62 To facilitate the dissipation of water and moisture from the building.
F63 To limit moisture condensation.
F70 To provide potable water.
F71 To provide facilities for personal hygiene.
F72 To provide facilities for the sanitary disposal of human and domestic wastes.
F73 To facilitate access to and in the building and its facilities by persons with disabilities (See Sentence 3.1.1.2.(3) for application limitation).
F74 To facilitate the use of the building’s facilities by persons with disabilities (See Sentence 3.1.1.2.(3) for application limitation).
F75 To minimize obstacles for future modification to provide access (See Sentence 3.1.1.2.(4) for application limitation).
F80 To resist deterioration resulting from expected service conditions.
F81 To minimize the risk of malfunction, interference, damage, tampering, lack of use or misuse.
F82 To minimize the risk of inadequate performance due to improper maintenance or lack of maintenance.
F83 To control the amount of water a plumbing fixture will use.
F84 To control the flow of water to a plumbing fixture or outlet.
F85 To minimize thermal loss or gain.
F86 To minimize the use of energy for building systems.
F90 To limit the amount of uncontrolled air leakage through the building envelope.
F91 To limit the amount of uncontrolled air leakage through system components.
F92 To limit the amount of uncontrolled thermal transfer through the building envelope.
F93 To limit the amount of uncontrolled thermal transfer through system components.
F95  To limit the unnecessary demand and/or consumption of energy for heating and cooling.
F96  To limit the unnecessary demand and/or consumption of energy for service water heating.
F98  To limit the inefficiency of equipment.
F99  To limit the inefficiency of systems.
F100 To limit the unnecessary rejection of reusable waste energy.
Notes to Part 3

Functional Statements

A-3.2.1.1.(1) Listing of Functional Statements. The numbered functional statements are grouped according to functions that deal with closely related subjects. For example, the first group deals with fire risks, the second group deals with emergency egress and response, etc. There may be gaps in the numbering sequence for the following reasons:

- Each group has unused numbers which allows for the possible future creation of additional functional statements within any one group.
- There is a master list of functional statements covering the principal By-law Documents – the Building By-law Book I: General, Building By-law Book II: Plumbing Systems, and the Fire By-law – but not all functional statements are pertinent to all By-laws.
Part 1
General

Section 1.1. General

1.1. Application

1.1.1. Application
1) This Part applies to all buildings covered in this By-law. (See Article 1.1.1.1. of Division A.)
2) When an existing building is altered and the alteration triggers upgrading as determined by this By-law, alternative provisions in Part 11 of Division B may be used instead of the requirements of this Part. (See Article 1.1.1.2. of Division A.)

1.1.2. Objectives and Functional Statements

1.1.2.1. Attributions to Acceptable Solutions
1) For the purpose of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in Division B shall be the objectives and functional statements identified in Sections 3.10., 4.5., 5.10., 6.4., 7.2., 8.3., 9.38. and 10.5. (See Note A-1.1.2.1.(1).)

1.1.3. Design Data

1.1.3.1. Climatic and Seismic Values
1) Except as required by Sentence 9.7.4.3.(2), the climatic and seismic values required for the design of buildings under this By-law shall be in conformance with the values established by the Chief Building Official or, in the absence of such data, with Sentence (2) and the climatic and seismic values in Appendix C. (See Note A-1.1.3.1.(1).)
2) The outside winter design temperatures determined from Appendix C shall be those listed for the January 2.5% values. (See Note A-1.1.3.1.(2).)

1.1.3.2. Depth of Frost Penetration
1) Depth of frost penetration shall be no less than 450 mm.

1.1.3.3. Soil Gas
1) Except as provided in Sentence (2), the geographical locations requiring rough-ins for a subfloor depressurization system conforming to Article 9.13.4.3 shall be those areas identified in Table C-4 in Appendix C.
2) In addition to those areas identified in Sentence (1), the Chief Building Official may identify additional geographical locations requiring rough-ins for a subfloor depressurization system conforming to Article 9.13.4.3. if data obtained by the Chief Building Official indicates the location is at an elevated risk of the presence of indoor radon levels exceeding Health Canada guidelines.

1.1.4. Fire Safety Plan

1.1.4.1. Fire Safety Plan
1) Fire safety plans shall conform to the Fire By-law.
Section 1.2. Terms and Abbreviations

1.2.1. Definitions of Words and Phrases

1.2.1.1. Non-defined Terms

1) Words and phrases used in Division B that are not included in the list of definitions in Article 1.4.1.2. of Division A shall have the meanings that are commonly assigned to them in the context in which they are used, taking into account the specialized use of terms by the various trades and professions to which the terminology applies.

2) Where objectives and functional statements are referred to in Division B, they shall be the objectives and functional statements described in Parts 2 and 3 of Division A.

3) Where acceptable solutions are referred to in Division B, they shall be the provisions stated in Parts 3 to 10.

1.2.1.2. Defined Terms

1) The words and terms in italics in Division B shall have the meanings assigned to them in Article 1.4.1.2. of Division A.

1.2.2. Symbols and Other Abbreviations

1.2.2.1. Symbols and Other Abbreviations

1) The symbols and other abbreviations in Division B shall have the meanings assigned to them in Article 1.4.2.1. of Division A and Article 1.3.2.1.

Section 1.3. Referenced Documents and Organizations

1.3.1. Referenced Documents

1.3.1.1. Effective Date

1) Unless otherwise specified herein, the documents referenced in this By-law shall include all amendments, revisions, reaffirmations, reapprovals, addenda and supplements effective to 30 June 2014.

1.3.1.2. Applicable Editions

1) Where documents are referenced in this By-law, they shall be the editions designated in Table 1.3.1.2.

Table 1.3.1.2.

Notes to Table 1.3.1.2.:
(1) See Table D-1.1.2. in Appendix D for the list of standards referenced therein.
(2) Some documents may have been reaffirmed or reapproved. Check with the applicable issuing agency for up-to-date information.
(3) Some titles have been abridged to omit superfluous wording.
(4) By-law reference is in Division A.
(5) By-law reference is in Division C.
(6) Notwithstanding the effective date stated in Sentence 1.3.1.1.(1), the August 2014 edition of CSA S304 is referenced as it better meets the intent of the By-law.

1.3.2. Organizations

1.3.2.1. Abbreviations of Proper Names
1) The abbreviations of proper names in this By-law shall have the meanings assigned to them in this Article.

AAMA American Architectural Manufacturers Association (www.aamanet.org)
ACGIH American Conference of Governmental Industrial Hygienists (www.acgih.org)
AHAM Association of Home Appliance Manufacturers (www.aham.org)

Notes to Part 1

General

A-1.1.2.1.(1) Objectives and Functional Statements Attributed to Acceptable Solutions. The objectives and functional statements attributed to each By-law provision are listed in a table following the provisions in each Part.

Many provisions in Division B serve as modifiers of or pointers to other provisions, or serve other clarification or explanatory purposes. In most cases, no objectives and functional statements have been attributed to such provisions, which therefore do not appear in the above-mentioned tables.

For provisions that serve as modifiers of or pointers to other referenced provisions and that do not have any objectives and functional statements attributed to them, the objectives and functional statements that should be used are those attributed to the provisions they reference.

A-1.1.3.1.(1) Climatic and Seismic Values. Climatic values for municipalities not listed in Appendix C may be obtained by contacting the Meteorological Service of Canada, Environment Canada, 4905 Dufferin Street, Toronto, Ontario M3H 5T4; www.climate.weather.gc.ca.

Seismic values for municipalities not listed in Appendix C can be obtained at www.earthquakescanada.nrcan.gc.ca or by writing to the Geological Survey of Canada at 7 Observatory Crescent, Ottawa, Ontario K1A 0Y3, or at P.O. Box 6000, Sidney, B.C. V8L 4B2.

A-1.1.3.1.(2) Winter Design Temperatures. The 2.5% values referred to in Sentence 1.1.3.1.(2) are the least restrictive temperatures that can be used. A designer may choose to use the 1% values given in Appendix C, which are in excess of the By-law minimums but are considered acceptable.
Part 3
Fire Protection, Occupant Safety and Accessibility

Section 3.1. General

3.1.1. Scope and Definitions

3.1.1.1. Scope
1) The scope of this Part shall be as described in Subsection 1.3.3. of Division A.

3.1.1.2. Defined Words
1) Words that appear in italics are defined in Article 1.4.1.2. of Division A.

3.1.1.3. Use of Term Storage Tank
1) For the purposes of this Part, the term “storage tank” shall mean a vessel for flammable liquids or combustible liquids having a capacity of more than 230 L and designed to be installed in a fixed location.

3.1.1.4. Fire Protection Information
1) Information to be submitted regarding major components of fire protection shall conform to the requirements of Subsection 2.2.3. of Division C.

3.1.2. Classification of Buildings or Parts of Buildings by Major Occupancy
(See Note A-3.1.2.)

3.1.2.1. Classification of Buildings
1) Except as permitted by Articles 3.1.2.3. to 3.1.2.6., every building or part thereof shall be classified according to its major occupancy as belonging to one of the Groups or Divisions described in Table 3.1.2.1. (See Note A-3.1.2.1.(1).)  
2) A building intended for use by more than one major occupancy shall be classified according to all major occupancies for which it is used or intended to be used.

#### 3.1.2.2. Occupancies of Same Classification

1) Any building is deemed to be occupied by a single major occupancy, notwithstanding its use for more than one major occupancy, provided that all occupancies are classified as belonging to the same Group classification or, where the Group is divided into Divisions, as belonging to the same Division classification described in Table 3.1.2.1.

#### 3.1.2.3. Arena-Type Buildings

1) An arena-type building intended for occasional use for trade shows and similar exhibition purposes shall be classified as a Group A, Division 3 occupancy. (See Note A-3.1.2.3.(1).)

#### 3.1.2.4. Police Stations

1) A police station with detention quarters is permitted to be classified as a Group B, Division 2 major occupancy provided the station is not more than 1 storey in building height and 600 m² in building area.

#### 3.1.2.5. Convalescent, Children’s Custodial, and Residential Care Homes

1) Convalescent homes and children’s custodial homes are permitted to be classified as residential occupancies within the application of Part 3, provided that occupants are ambulatory and live as a single housekeeping unit in a suite with sleeping accommodation for not more than 10 persons.

2) A care facility accepted for residential use pursuant to provincial legislation, a community care facility or a group residence, is permitted to be classified as a residential occupancy, provided
   a) occupants live as a single housekeeping unit in a dwelling unit with sleeping accommodation for not more than 10 persons,
   b) smoke alarms are installed in conformance with Article 3.2.4.20.,
   c) emergency lighting is provided in conformance with Subsection 3.2.7., and
   d) the building is sprinklered throughout.

#### 3.1.2.6. Group A, Division 2, Low Occupant Load

1) A suite of Group A, Division 2 assembly occupancy, except a child care facility, is permitted to be classified as a Group D, business and personal services occupancy provided
   a) the number of persons in the suite does not exceed 30, and
   b) except as permitted by Sentence (2), the suite is separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 1 hr.

2) The fire separation required by Sentence (1) need not have a fire-resistance rating where the suite is located in a building that is sprinklered throughout.

3) A permanent sign, with lettering not less than 50 mm high with a 12 mm stroke, indicating the lesser of the occupant load for the suite or 30 persons, shall be posted in a conspicuous location near the suite’s principal entrance.
3.1.2.7. Storage of Combustible Fibres
1) Buildings or parts thereof used for the storage of baled combustible fibres shall be classified as medium-hazard industrial occupancies.

3.1.2.8. Child Care Facilities
(See Note A-3.1.2.8.)
1) A child care facility shall be classified as either a Group C or Group A Division 2 major occupancy as determined by this Article provided:
   a) except as permitted by Clause (d), the fire safety requirements for the major occupancy determined from Table 3.1.2.8. have been met,
   b) all additional requirements in this By-law for new construction and the determined major occupancy have been met,
   c) for existing buildings, the upgrade requirements in Clause 11.4.2.1.(1)(g) have been met, and
   d) temporary child care facilities need not be sprinklered in accordance with Table 3.1.2.8. when provided with at least two means of egress:
      i) directly to the exterior,
      ii) where it is not required to travel up or down more than 1 storey, and
      iii) located so that one doorway could provide egress from the child care facility if the other doorway becomes inaccessible to the occupants due to a fire.
(See also Article 3.3.2.17.)

Notes to Table 3.1.2.8.:
(1) Applies to residential buildings with no more than 2 principal dwelling units or row houses
(2) Smoke detection shall include smoke detectors where the building is provided with a fire alarm system, and smoke alarms where required by Article 3.2.4.20.

3.1.2.9. Retail Food Facility
1) A retail food facility is permitted to be classified as a Group E major occupancy provided it is designed to accommodate not more than 16 persons consuming food or drink.

3.1.3. Multiple Occupancy Requirements
3.1.3.1. Separation of Major Occupancies

1) Except as permitted by Sentences (2) and (3), major occupancies shall be separated from adjoining major occupancies by fire separations having fire-resistance ratings conforming to Table 3.1.3.1.

2) In a building not more than 3 storeys in building height, if not more than 2 dwelling units are contained together with a Group E major occupancy, the fire-resistance rating of the fire separation between the 2 major occupancies need not be more than 1 h.

3) In a building conforming to the requirements of Articles 3.2.8.2. to 3.2.8.8., the requirements of Sentence (1) for fire separations between major occupancies do not apply at the vertical plane around the perimeter of an opening through the horizontal fire separation.

Notes to Table 3.1.3.1.:

(1) (1) Section 3.3. contains requirements for the separation of occupancies and tenancies that are in addition to the requirements for the separation of major occupancies.

(2) (2) See Sentence 3.1.3.2.(1).

(3) Where the building is constructed in accordance with Article 3.2.2.50., a fire separation with a 2 h fire-resistance rating is required between the Group C and Group A, Division 2 major occupancies.

(4) Where the building is constructed in accordance with Article 3.2.2.58., a fire separation with a 2 h fire-resistance rating is required between the
Group D and Group A, Division 2 major occupancies.

(5) See Sentence 3.1.3.1.(2).
(6) See Sentence 3.1.3.2.(2).
(7) See Article 3.2.1.7.

3.1.3.2. Prohibition of Occupancy Combinations

1) No major occupancy of Group F, Division 1 shall be contained within a building with any occupancy classified as Group A, B or C.

2) Except as provided in Article 3.1.3.4. and Subsection 11.4.5., not more than one suite of residential occupancy shall be contained within a building classified as a Group F, Division 2 major occupancy.

3) Reserved.

4) Reserved.

5) Reserved.

3.1.3.3. Artist Live/Work - Class A Artist Studio

1) A building containing artist studio — class A and residential quarters integrated with the studio for the use of artists occupying the studio may be designed as a Group C major occupancy provided

   a) the building is sprinklered in conformance with NFPA 13, and

   b) structural floor loads are based on a light industrial occupancy, with a minimum live load of 3.6 kPa and, where the floor areas are designated for residential use only, such as sleeping lofts, dinettes and bathrooms, with a minimum live load of 1.9 kPa.

3.1.3.4. Artist Live/Work - Class B Artist Studio

1) A building containing artist studio — class B and residential quarters integrated with the studio for the use of artists occupying the studio may be permitted provided

   a) the construction requirements of Subsection 3.2.2. are based on the most restrictive requirements arising from the evaluation of the building as both a Group F Division 2 occupancy and a Group C occupancy,

   b) the spatial separation requirements of the building are based on Table 3.2.3.1.D for a Group F, Division 2 occupancy,

   c) the fire alarm is based on Group C occupancy requirements and where a fire alarm is required, smoke detectors are installed in corridors and stair shafts as required in Article 3.2.4.11.,

   d) smoke alarms are provided in individual suites as required in Article 3.2.4.20.,

   e) the building is sprinklered in conformance with NFPA 13 to a minimum Ordinary Hazard Group 1 classification,

   f) standpipes are based on residential Group C occupancy requirements,

   g) accessible design is based on Group C occupancy requirements, and

   h) structural floor loads are based on a light industrial occupancy, with a minimum live load of 3.6 kPa and, i) where floor areas are designated for residential use only, such as sleeping lofts, dinettes and bathrooms, with a minimum live load of 1.9 kPa.

2) Light and ventilation requirements can be borrowed from the working studio area.

3) Where a portion of the studio such as a dinette or sleeping loft is used solely as living space, exit travel distances from these spaces may be based on a Group C residential occupancy.

3.1.3.5. Training School

1) A building or portion of a building containing a training school is permitted to be considered as a Group D major occupancy provided

   a) the suite area is not more than 46 m², and

   b) the total occupant load of the suite is not more than 10.

3.1.3.6. Industrial Flex Space
1) An industrial flex space use is permitted in a new building containing a Group C major occupancy provided:
   a) the total floor area of each industrial flex space unit or a single tenant industrial flex space is not more than 500 m²,
   b) the industrial flex space shall be located on the first storey and completely independent of the Group C portion of the building, including the exit system,
   c) the ventilation systems for individual industrial flex spaces shall be completely separate and independent from each other and from the residential portion of the building,
   d) a horizontal fire separation of concrete construction having a fire-resistance rating of no less than 2 hours shall be provided between the industrial flex space and the Group C occupancy,
   e) vertical fire separations between industrial flex space units and any Group C portion of the building shall be of concrete or masonry construction having a fire-resistance rating of not less than 2 hours,
   f) the Group C portion of the building shall be separated from the industrial flex space portion of the building by construction having a STC rating of not less than 55,
   g) the penetrations between the horizontal fire separation in Clause (c) shall be FT rated,
   h) the industrial flex space units shall be sprinklered in conformance with NFPA 13 to a minimum Ordinary Hazard Group 2 classification using only quick response heads and no reduction in design area,
   i) the automatic sprinkler system noted in Clause (h) shall be a single system supplying the entire building, and shall be designed so that the industrial flex spaces as a whole and the Group C occupancy floors as a whole are supplied by separate water supply lines,
   j) each individual industrial flex space unit shall have a minimum of two egress doors regardless of the unit size,
   k) the principal egress door serving each industrial flex space unit shall exit directly to the street,
   l) except for the principal exit door in Clause (k), all other exit or egress doors shall lead to a lane or to an independent corridor leading to a public thoroughfare serving only the industrial flex space portion of the building and shall be separated from the remainder of the building by a concrete or masonry fire separation having a fire-resistance rating of not less than 2 hours,
   m) the industrial flex spaces shall be provided with two unisex water closets, notwithstanding the requirement of Section 3.7 of Division B, and
   n) one of the washrooms serving the industrial flex space shall comply with the requirements of Section 3.8 of Division B.

2) An industrial flex space use is not permitted in an existing building.

3.1.4. Combustible Construction

3.1.4.1. Combustible Materials Permitted
   1) A building permitted to be of combustible construction is permitted to be constructed of combustible materials, with or without noncombustible components. (See Note A-3.1.4.1.(1).)
   2) The flame-spread rating on any exposed surface of foamed plastic insulation, and on any surface that would be exposed by cutting through the insulation in any direction, shall be not more than 500.

3.1.4.2. Protection of Foamed Plastics
   (See Note A-3.1.4.2.)
   1) Except as permitted in Sentence (2), foamed plastics that form part of a wall or ceiling assembly in combustible construction shall be protected from adjacent spaces in the building, other than adjacent concealed spaces within attic or roof spaces, crawl spaces, and wall and ceiling assemblies,
      a) by one of the interior finishes described in Subsections 9.29.4. to 9.29.9.,
      b) provided the building does not contain a Group A, Group B or Group C major occupancy, by sheet metal.
i) mechanically fastened to the supporting assembly independent of the insulation,
ii) not less than 0.38 mm thick, and
iii) with a melting point not below 650°C, or
c) by any thermal barrier that meets the requirements of Sentence 3.1.5.15.(2). (See Note A-3.1.4.2.(1)(c).)
(See Note A-3.1.4.2.(1).)

2) A walk-in cooler or freezer consisting of factory-assembled wall, floor or ceiling panels containing foamed plastics is permitted in a building permitted to be of combustible construction, provided the panels
   a) are protected on both sides by sheet metal not less than 0.38 mm thick having a melting point not less than 650°C,
   b) do not contain an air space, and
c) when a sample panel with an assembled joint typical of field installation is subjected to the applicable test described in Subsection 3.1.12., have a flame-spread rating not more than that permitted for the space in which they are located or the space that they bound, as applicable.
(See Note A-3.1.4.2.(2) and 3.1.5.7.(3).)

3) The flame-spread rating of doors containing foamed plastics shall comply with Sentences 3.1.13.2.(1) to (3).

3.1.4.3. Wires and Cables
1) Except as required by Article 3.6.4.3., optical fibre cables and electrical wires and cables with combustible insulation, jackets or sheathes that are installed in a building permitted to be of combustible construction shall
   a) not convey flame or continue to burn for more than 1 min when tested in conformance with the Vertical Flame Test (FT1 rating) in CSA C22.2 No. 0.3, “Test Methods for Electrical Wires and Cables”, or
   b) be located in
      i) totally enclosed noncombustible raceways, (See Note A-3.1.4.3.(1)(b)(i).)
      ii) masonry walls,
      iii) concrete slabs, or
      iv) totally enclosed non-metallic raceways conforming to Clause 3.1.5.23.(1)(b).
(See Note A-3.1.4.3.(1).)
2) Except as permitted in Article 3.6.4.3., optical fibre cables and electrical wires and cables with combustible insulation, jackets or sheathes that are used for the transmission of voice, sound or data and are installed in a plenum in a building permitted to be of combustible construction shall exhibit the following characteristics when tested in conformance with CAN/ULC-S102.4, “Standard Method of Test for Fire and Smoke Characteristics of Electrical Wiring, Cables and Non-Metallic Raceways,” (FT6 rating):
   a) a horizontal flame distance of not more than 1.5 m,
   b) an average optical smoke density of not more than 0.15, and
   c) a peak optical smoke density of not more than 0.5.
(See Note A-3.1.4.3.(2).)
3) Deleted.
4) Deleted.

3.1.4.4. Non-metallic Raceways
1) Totally enclosed non-metallic raceways used in a plenum in a building permitted to be of combustible construction shall meet the requirements of Clause 3.1.5.23.(1)(a).

3.1.4.5. Fire-Retardant-Treated Wood
1) If fire-retardant-treated wood is specified in this Part, the wood shall
   a) be pressure impregnated with fire-retardant chemicals in conformance with CAN/CSA-O80 Series, “Wood Preservation,” and
b) have a flame-spread rating not more than 25.

3.1.4.6. Heavy Timber Construction Alternative

1) If combustible construction is permitted and is not required to have a fire-resistance rating more than 45 min, heavy timber construction is permitted to be used.

2) If heavy timber construction is permitted, it shall conform to Article 3.1.4.7.

3.1.4.7. Heavy Timber Construction

1) Wood elements in heavy timber construction shall be arranged in heavy solid masses and with essentially smooth flat surfaces to avoid thin sections and sharp projections.

2) Except as permitted by Sentences (3) to (6) and (12), the minimum dimensions of wood elements in heavy timber construction shall conform to Table 3.1.4.7.

3) Where splice plates are used at splices of roof arches supported on the tops of walls or abutments, roof trusses, roof beams and roof girders in heavy timber construction, they shall be not less than 64 mm thick.

4) Floors in heavy timber construction shall be of glued-laminated or solid sawn plank not less than
   a) 64 mm thick, splined or tongued and grooved, or
   b) 38 mm wide and 89 mm deep set on edge and well spiked together.

5) Floors in heavy timber construction shall be laid
   a) so that no continuous line of end joints will occur except at points of support, and covered with
      i) tongued and grooved flooring not less than 19 mm thick laid crosswise or diagonally, or
      ii) tongued and grooved phenolic-bonded plywood, strandboard or waferboard not less than 12.5 mm thick, and
   b) not closer than 15 mm to the walls to provide for expansion, with the gap covered at the top or bottom.

6) Roofs in heavy timber construction shall be of tongued and grooved phenolic-bonded plywood, strandboard or waferboard not less than 28 mm thick, or glued-laminated or solid sawn plank that is
   a) not less than 38 mm thick, splined or tongued and grooved, or
b) not less than 38 mm wide and 64 mm deep set on edge and laid so that no continuous line of end joints will occur except at the points of support.

7) Wood columns in heavy timber construction shall be continuous or superimposed throughout all storeys.

8) Superimposed wood columns in heavy timber construction shall be connected by
   a) reinforced concrete or metal caps with brackets,
   b) steel or iron caps with pintles and base plates, or
   c) timber splice plates fastened to the columns by metal connectors housed within the contact faces.

9) Where beams and girders in heavy timber construction enter masonry, wall plates, boxes of the self-releasing type or hangers shall be used.

10) Wood girders and beams in heavy timber construction shall be closely fitted to columns, and adjoining ends shall be connected by ties or caps to transfer horizontal loads across the joints.

11) In heavy timber construction, intermediate wood beams used to support a floor shall be supported on top of the girders or on metal hangers into which the ends of the beams are closely fitted.

12) Roof arches supported on the top of walls or abutments, roof trusses, roof beams and roof girders in heavy timber construction are permitted to be not less than 64 mm wide provided
   a) where two or more spaced members are used, the intervening spaces are
      i) blocked solidly throughout, or
      ii) tightly closed by a continuous wood cover plate not less than 38 mm thick secured to the underside of the members, or
   b) the underneath of the roof deck or sheathing is sprinklered.

3.1.4.8. Exterior Cladding
1) The exterior cladding on each exterior wall of buildings conforming to Article 3.2.2.50. or 3.2.2.58. shall consist of
   a) noncombustible cladding, or
   b) a wall assembly that satisfies the criteria of Clause 3.1.5.5.(1)(b).
(See Note A-3.1.4.8.(1).) (See also Notes A-3.1.5.5.(1)(b)(i) and A-3.1.5.5.(1)(b)(ii).)
2) A wall assembly conforming to Clause (1)(b) that includes combustible cladding made of fire-retardant-treated wood shall be tested for fire exposure after the cladding has been subjected to the accelerated weathering test specified in ASTM D 2898, “Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing.”
3) The solution described in Clause (1)(b) is not permitted where an exposing building face is required by Article 3.2.3.7. to have noncombustible cladding.

3.1.5. Noncombustible Construction

3.1.5.1. Noncombustible Materials
(See Note A-3.1.4.1.(1).)
1) Except as permitted by Sentences (2) to (4) and Articles 3.1.5.2. to 3.1.5.24., 3.1.13.4. and 3.2.2.16., a building or part of a building required to be of noncombustible construction shall be constructed with noncombustible materials. (See also Subsection 3.1.13. for the requirements regarding the flame-spread rating of interior finishes.)
2) Notwithstanding the definition of noncombustible materials stated in Article 1.4.1.2. of Division A, a material is permitted to be used in noncombustible construction provided that, when tested in accordance with ULC-S135, “Test Method for the Determination of Combustibility Parameters of Building Materials Using an Oxygen Consumption Calorimeter (Cone Calorimeter),” at a heat flux of 50 kW/m²,
   a) its average total heat release is not more than 3 MJ/m²,
   b) its average total smoke extinction area is not more than 1.0 m², and
   c) the test duration is extended beyond the time stipulated in the referenced standard until it is clear that there is no further release of heat or smoke.
3) If a material referred to in Sentence (2) consists of a number of discrete layers and testing reveals that the surface layer or layers protect the underlying layers such that complete combustion of the underlying layers does not occur, the test shall be repeated by removing the outer layers sequentially until all layers have been exposed during testing, or until complete combustion has occurred.
4) The acceptance criteria for a material tested in accordance with Sentence (3) shall be based on the cumulative emissions from all layers, which must not exceed the criteria stated in Clauses (2)(a) and (b).

3.1.5.2. Minor Combustible Components
1) The following minor combustible components are permitted in a building required to be of noncombustible construction:
   a) paint (See also Clause 3.1.13.1.(2)(b)),
   b) self-adhesive tapes, mastics and caulking materials, including foamed plastic air sealants, applied to provide a seal between the major components of exterior wall construction, (See also Article 3.6.4.3. for limits on the use of combustible materials in plenum spaces),
   c) fire stops and fire blocks conforming to Sentence 3.1.9.1.(1) and Article 3.1.11.7.,
   d) tubing for pneumatic controls provided it has an outside diameter of not more than 10 mm,
   e) adhesives, vapour barriers and sheathing papers,
   f) electrical outlet and junction boxes,
   g) wood blocking within wall assemblies intended for the attachment of handrails, fixtures, and similar items mounted on the surface of the wall, and
   h) similar minor components.

3.1.5.3. Combustible Roofing Materials
1) Combustible roof covering that has an A, B, or C classification determined in conformance with Subsection 3.1.15. is permitted on a building required to be of noncombustible construction.
2) Combustible roof sheathing and roof sheathing supports installed above a concrete deck are permitted on a building required to be of noncombustible construction provided
   a) the concrete deck is not less than 50 mm thick,
   b) the height of the roof space above the deck is not more than 1 m,
   c) the roof space is divided into compartments by fire blocks in conformance with Article 3.1.11.5.,
   d) openings through the concrete deck other than for noncombustible roof drains and plumbing piping are protected by masonry or concrete shafts
      i) constructed as fire separations having a fire-resistance rating not less than 1 h, and
      ii) extending from the concrete deck to not less than 150 mm above the adjacent roof sheathing,
   e) the perimeter of the roof is protected by a noncombustible parapet extending from the concrete deck to not less than 150 mm above the adjacent sheathing, and
   f) except as permitted by Clause (d), the roof space does not contain any building services.
3) Combustible cant strips, roof curbs, nailing strips and similar components used in the installation of roofing are permitted on a building required to be of noncombustible construction.
4) Wood nailer facings to parapets, not more than 600 mm high, are permitted on a building required to be of noncombustible construction, if the facings and any roof membranes covering the facings are protected by sheet metal.

3.1.5.4. Combustible Glazing and Skylights
1) Combustible skylight assemblies are permitted in a building required to be of noncombustible construction if the assemblies have a flame-spread rating not more than
   a) 150 provided the assemblies
      i) have an individual area not more than 9 m²,
ii) have an aggregate horizontal projected area of the openings through the ceiling not more than 25% of the area of the ceiling of the room or space in which they are located, and
iii) are spaced not less than 2.5 m from adjacent assemblies and from required fire separations, or
b) 75 provided the assemblies
   i) have an individual area not more than 27 m²,
   ii) have an aggregate horizontal projected area of the openings through the ceiling not more than 33% of the area of the ceiling of the room or space in which they are located, and
   iii) are spaced not less than 1.2 m from adjacent assemblies and from required fire separations.

(See Note A-3.1.5.4.(1).)

2) Combustible vertical glazing installed no higher than the second storey is permitted in a building required to be of noncombustible construction.

3) Except as permitted by Sentence (4), the combustible vertical glazing permitted by Sentence (2) shall have a flame-spread rating not more than 75.

4) The flame-spread rating of combustible glazing is permitted to be not more than 150 if the aggregate area of glazing is not more than 25% of the wall area of the storey in which it is located, and
   a) the glazing is installed in a building not more than 1 storey in building height,
   b) the glazing in the first storey is separated from the glazing in the second storey in accordance with the requirements of Article 3.2.3.17. for opening protection, or
   c) the building is sprinklered throughout.

5) Combustible window sashes and frames are permitted in a building required to be of noncombustible construction provided
   a) each window in an exterior wall face is an individual unit separated by noncombustible wall construction from every other opening in the wall,
   b) windows in exterior walls in contiguous storeys are separated by not less than 1 m of noncombustible construction, and
   c) the aggregate area of openings in an exterior wall face of a fire compartment is not more than 40% of the area of the wall face.

3.1.5.5. Combustible Cladding on Exterior Walls

(See Note A-3.1.5.5.)

1) Except as provided in Sentences (2) and (3), combustible cladding is permitted to be used on an exterior wall assembly in a building required to be of noncombustible construction, provided
   a) the building is
      i) not more than 3 storeys in building height, or
      ii) sprinklered throughout, and
   b) when tested in accordance with CAN/ULC-S134, “Fire Test of Exterior Wall Assemblies,” the wall assembly satisfies the following criteria for testing and conditions of acceptance (See Note A-3.1.5.5.(1)(b).):
      i) flaming on or in the wall assembly does not spread more than 5 m above the opening (See Note A-3.1.5.5.(1)(b)(i).), and
      ii) the heat flux during the flame exposure on the wall assembly is not more than 35 kW/m² measured at 3.5 m above the opening (See Note A-3.1.5.5.(1)(b)(ii).).

2) Except as permitted by Articles 3.2.3.10. and 3.2.3.11., where the limiting distance in Tables 3.2.3.1.-B to 3.2.3.1.-E permits an area of unprotected openings of not more than 10% of the exposing building face, the construction requirements of Table 3.2.3.7. shall be met.

3) A wall assembly permitted by Sentence (1) that includes combustible cladding of fire-retardant-treated wood shall be tested for fire exposure after the cladding has been subjected to an accelerated weathering

3.1.5.6. Combustible Components in Exterior Walls
(See Note A-3.1.5.6.)

1) Combustible components, other than those permitted by Article 3.1.5.5., are permitted to be used in an exterior wall assembly of a building required to be of noncombustible construction, provided
   a) the building is
      i) not more than 3 storeys in building height, or
      ii) sprinklered throughout, and
   b) the wall assembly
      i) meets the requirements of Clause 3.1.5.5.(1)(b), or
      ii) is protected by masonry or concrete cladding not less than 25 mm thick (See Note A-3.1.5.5.(1)(b)).

3.1.5.7. Factory-Assembled Panels

1) Except as provided in Sentence (2), factory-assembled wall and ceiling panels containing foamed plastic insulation with a flame-spread rating not more than 500 are permitted to be used in a building required to be of noncombustible construction, provided
   a) the building
      i) is sprinklered,
      ii) is not more than 18 m high, measured from grade to the underside of the roof, and
      iii) does not contain a Group A, Group B, or Group C major occupancy, and
   b) the panels
      i) do not contain an air space,
      ii) when tested in accordance with CAN/ULC-S138, “Test for Fire Growth of Insulated Building Panels in a Full-Scale Room Configuration,” meet the criteria defined therein, and
      iii) when a sample panel with an assembled joint typical of field installation is subjected to the applicable test described in Subsection 3.1.12., have a flame-spread rating not more than that permitted for the room or space that they bound.

2) Factory-assembled exterior wall panels containing thermosetting foamed plastic insulation are permitted to be used in a building required to be of noncombustible construction, provided
   a) the building
      i) is not more than 18 m high, measured from grade to the underside of the roof, and
      ii) does not contain a Group B or Group C major occupancy, and
   b) the wall panels
      i) do not contain an air space,
      ii) are protected on both sides by sheet steel not less than 0.38 mm thick,
      iii) remain in place for not less than 10 min when tested in conformance with CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials,” where the exposed surface includes typical vertical and horizontal joints, and
      iv) when a sample panel with an assembled joint typical of field installation is subjected to the applicable test described in Subsection 3.1.12., have a flame-spread rating not more than that permitted for the room or space that they bound.

3) A walk-in cooler or freezer consisting of factory-assembled wall, floor or ceiling panels containing foamed plastic insulation with a flame-spread rating not more than 500 is permitted to be used in a building required to be of noncombustible construction, provided
   a) the building is sprinklered, and
   b) the panels
      i) are protected on both sides by sheet metal not less than 0.38 mm thick with a melting point not less than 650°C,
ii) do not contain an air space,
iii) when tested in accordance with CAN/ULC-S138, “Test for Fire Growth of Insulated Building Panels in a Full-Scale Room Configuration,” meet the criteria defined therein, and
iv) when a sample panel with an assembled joint typical of field installation is subjected to the applicable test described in Subsection 3.1.12., have a flame-spread rating not more than that permitted for the space in which they are located or the space that they bound, as applicable.

(See Note A-3.1.4.2.(2) and 3.1.5.7.(3).)

3.1.5.8. Nailing Elements
1) Wood nailing elements attached directly to or set into a continuous noncombustible backing for the attachment of interior finishes are permitted in a building required to be of noncombustible construction provided the concealed space created by the wood elements is not more than 50 mm thick.

3.1.5.9. Combustible Millwork
1) Combustible millwork, including interior trim, doors and door frames, show windows together with their frames, aprons and backing, handrails, shelves, cabinets and counters, is permitted in a building required to be of noncombustible construction.

3.1.5.10. Combustible Flooring Elements
1) Combustible stage flooring supported on noncombustible structural members is permitted in a building required to be of noncombustible construction.
2) Wood members more than 50 mm but not more than 300 mm high applied directly to or set into a noncombustible floor slab are permitted for the construction of a raised platform in a building required to be of noncombustible construction provided the concealed created are divided into compartments by fire blocks in conformance with Sentence 3.1.11.3.(2).
3) The floor system for the raised platform referred to in Sentence (2) is permitted to include a combustible subfloor and combustible finished flooring.
4) Combustible finished flooring is permitted in a building required to be of noncombustible construction.

3.1.5.11. Combustible Stairs in Dwelling Units
1) Combustible stairs are permitted in a dwelling unit in a building required to be of noncombustible construction.

3.1.5.12. Combustible Interior Finishes
1) Except as permitted in Sentences (2) and (3), combustible interior wall and ceiling finishes referred to in Clause 3.1.13.1.(2)(b) that are not more than 1 mm thick are permitted in a building required to be of noncombustible construction.
2) Combustible interior wall finishes, other than foamed plastics, that are not more than 25 mm thick are permitted in a building required to be of noncombustible construction, provided they have a flame-spread rating not more than 150 on any exposed surface, or any surface that would be exposed by cutting through the material in any direction.
3) Except as provided in Sentence (4), combustible interior ceiling finishes, other than foamed plastics, that are not more than 25 mm thick are permitted in a building required to be of noncombustible construction, provided they have a flame-spread rating not more than 25 on any exposed surface or on any surface that would be exposed by cutting through the material in any direction, except that not more than 10% of the ceiling area within each fire compartment is permitted to have a flame-spread rating not more than 150.
4) Combustible interior ceiling finishes made of fire-retardant-treated wood are permitted in a building required to be of noncombustible construction, provided they are not more than 25 mm thick or are exposed fire-retardant-treated wood battens.
3.1.5.13. Gypsum Board

1) Gypsum board with a tightly adhering paper covering not more than 1 mm thick is permitted in a building required to be of noncombustible construction provided the flame-spread rating on the surface is not more than 25.

3.1.5.14. Combustible Insulation

(See Notes A-3.1.4.2. and A-3.1.4.2.(1.).)

1) Foamed plastic insulation shall conform to Article 3.1.5.15.

2) Combustible insulation with a flame-spread rating not more than 25 on any exposed surface, or any surface that would be exposed by cutting through the material in any direction, is permitted in a building required to be of noncombustible construction.

3) Combustible insulation is permitted to be installed above roof decks, outside of foundation walls below ground level, and beneath concrete slabs-on-ground of buildings required to be of noncombustible construction.

4) Except as provided in Sentences (5) and (6), combustible insulation with a flame-spread rating more than 25 but not more than 500 on any exposed surface, or any surface that would be exposed by cutting through the material in any direction, is permitted in a building required to be of noncombustible construction, provided the insulation is protected from adjacent space in the building, other than adjacent concealed spaces within wall assemblies, by a thermal barrier consisting of

   a) not less than 12.7 mm thick gypsum board mechanically fastened to a supporting assembly independent of the insulation,
   b) lath and plaster, mechanically fastened to a supporting assembly independent of the insulation,
   c) masonry, or
   d) concrete.

5) Combustible insulation with a flame-spread rating more than 25 but not more than 500 on any exposed surface, or any surface that would be exposed by cutting through the material in any direction, is permitted in the exterior walls of a building required to be of noncombustible construction that is not sprinklered and is more than 18 m high, measured from grade to the underside of the roof, provided the insulation is protected from adjacent space in the building, other than adjacent concealed spaces within wall assemblies, by a thermal barrier consisting of

   a) gypsum board not less than 12.7 mm thick, mechanically fastened to a supporting assembly independent of the insulation and with all joints either backed or taped and filled,
   b) lath and plaster, mechanically fastened to a supporting assembly independent of the insulation,
   c) masonry or concrete not less than 25 mm thick, or
   d) any thermal barrier that, when tested in conformance with CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials,” will not develop an average temperature rise more than 140°C or a maximum temperature rise more than 180°C at any point on its unexposed face within 10 min (See Note A-3.1.5.14.(5)(d).) (See also Article 3.2.3.7.).

6) Combustible insulation with a flame-spread rating more than 25 but not more than 500 on any exposed surface, or any surface that would be exposed by cutting through the material in any direction, is permitted in the interior walls, within ceilings and within roof assemblies of a building required to be of noncombustible construction that is not sprinklered and is more than 18 m high, measured from grade to the underside of the roof, provided the insulation is protected from adjacent space in the building, other than adjacent concealed spaces within wall assemblies, by a thermal barrier consisting of

   a) Type X gypsum board not less than 15.9 mm thick, mechanically fastened to a supporting assembly independent of the insulation and with all joints either backed or taped and filled, conforming to

      i) ASTM C 1177/C 1177M, “Glass Mat Gypsum Substrate for Use as Sheathing,”
      ii) ASTM C 1178/C 1178M, “Coated Glass Mat Water-Resistant Gypsum Backing Panel,”
      iii) ASTM C 1396/C 1396M, “Gypsum Board,”
      iv) ASTM C 1658/C 1658M, “Glass Mat Gypsum Panels,” or
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

v) CAN/CSA-A82.27-M, “Gypsum Board,”
b) non-loadbearing masonry or concrete not less than 50 mm thick,
c) loadbearing masonry or concrete not less than 75 mm thick, or
d) any thermal barrier that, when tested in conformance with CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials,”
   i) does not develop an average temperature rise more than 140°C or a maximum temperature rise more than 180°C at any point on its unexposed face within 20 min, and
   ii) remains in place for not less than 40 min.

3.1.5.15. Foamed Plastic Insulation
   (See Notes A-3.1.4.2. and A-3.1.4.2.(1).)
   1) Foamed plastic insulation is permitted to be installed above roof decks, outside of foundation walls below ground level, and beneath concrete slabs-on-ground of a building required to be of noncombustible construction.
   2) Except as provided in Sentences (3) and (4), foamed plastic insulation with a flame-spread rating not more than 500 on any exposed surface, or any surface that would be exposed by cutting through the material in any direction, is permitted in a building required to be of noncombustible construction, provided the insulation is protected from adjacent space in the building, other than adjacent concealed spaces within wall assemblies, by a thermal barrier consisting of
      a) not less than 12.7 mm thick gypsum board mechanically fastened to a supporting assembly independent of the insulation,
      b) lath and plaster, mechanically fastened to a supporting assembly independent of the insulation,
      c) masonry,
      d) concrete, or
      e) any thermal barrier that meets the requirements of classification B when tested in conformance with CAN/ULC-S124, “Test for the Evaluation of Protective Coverings for Foamed Plastic.”
   3) Foamed plastic insulation with a flame-spread rating more than 25 but not more than 500 on any exposed surface, or any surface that would be exposed by cutting through the material in any direction, is permitted in the exterior walls of a building required to be of noncombustible construction that is not sprinklered and is more than 18 m high, measured from grade to the underside of the roof, provided the insulation is protected from adjacent space in the building, other than adjacent concealed spaces within wall assemblies, by a thermal barrier consisting of
      a) gypsum board not less than 12.7 mm thick, mechanically fastened to a supporting assembly independent of the insulation and with all joints either backed or taped and filled,
      b) lath and plaster, mechanically fastened to a supporting assembly independent of the insulation,
      c) masonry or concrete not less than 25 mm thick, or
      d) any thermal barrier that, when tested in conformance with CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials,” does not develop an average temperature rise more than 140°C or a maximum temperature rise more than 180°C at any point on its unexposed face within 10 min (See Note A-3.1.5.14.(5)(d)). (See also Article 3.2.3.7.).
   4) Foamed plastic insulation with a flame-spread rating more than 25 but not more than 500 on any exposed surface, or any surface that would be exposed by cutting through the material in any direction, is permitted in the interior walls, within ceilings and within roof assemblies of a building required to be of noncombustible construction that is not sprinklered and is more than 18 m high, measured from grade to the underside of the roof, provided the insulation is protected from adjacent space in the building, other than adjacent concealed spaces within wall assemblies, by a thermal barrier consisting of
      a) Type X gypsum board not less than 15.9 mm thick, mechanically fastened to a supporting assembly independent of the insulation and with all joints either backed or taped and filled, conforming to
         i) ASTM C 1177/C 1177M, “Glass Mat Gypsum Substrate for Use as Sheathing,”
         ii) ASTM C 1178/C 1178M, “Coated Glass Mat Water-Resistant Gypsum Backing Panel,”
iii) ASTM C 1396/C 1396M, “Gypsum Board,” or
iv) CAN/CSA-A82.27-M, “Gypsum Board,”
b) non-loadbearing masonry or concrete not less than 50 mm thick,
c) loadbearing masonry or concrete not less than 75 mm thick, or
d) any thermal barrier that, when tested in conformance with CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials,”
   i) does not develop an average temperature rise more than 140°C or a maximum temperature rise more than 180°C at any point on its unexposed face within 20 min, and
   ii) remains in place for not less than 40 min.

3.1.5.16. Combustible Elements in Partitions
1) Except as permitted by Sentence (2), solid lumber partitions not less than 38 mm thick and wood framing in partitions located in a fire compartment not more than 600 m² in area are permitted to be used in a building required to be of noncombustible construction in a floor area that is not sprinklered throughout provided the partitions
   a) are not required fire separations, and
   b) are not located in a care, treatment or detention occupancy.
2) Partitions installed in a building of noncombustible construction are permitted to contain wood framing provided
   a) the building is not more than 3 storeys in building height,
   b) the partitions are not located in a care, treatment or detention occupancy, and
   c) the partitions are not installed as enclosures for exits or vertical service spaces.
3) Solid lumber partitions not less than 38 mm thick and partitions that contain wood framing are permitted to be used a) in a building required to be of noncombustible construction provided
   a) the building is sprinklered throughout, and
   b) the partitions are not
      i) located in a care, treatment or detention occupancy,
      ii) installed as enclosures for exits or vertical service spaces, or
      iii) used to satisfy the requirements of Clause 3.2.8.1.(1)(a).

3.1.5.17. Storage Lockers in Residential Buildings
1) Storage lockers in storage rooms are permitted to be constructed of wood in a building of residential occupancy required to be of noncombustible construction.

3.1.5.18. Combustible Ducts
1) Except as required by Sentence 3.6.4.3.(1), combustible ducts, including plenums and duct connectors, are permitted to be used in a building required to be of noncombustible construction provided these ducts and duct connectors are used only in horizontal runs.
2) Combustible duct linings, duct coverings, duct insulation, vibration isolation connectors, duct tape, pipe insulation and pipe coverings are permitted to be used in a building required to be of noncombustible construction provided they conform to the appropriate requirements of Subsection 3.6.5.
3) In a building required to be of noncombustible construction, combustible ducts need not comply with the requirements of Sentences 3.6.5.1.(1) and (2) provided the ducts are
   a) part of a duct system conveying only ventilation air, and
   b) contained entirely within a dwelling unit.

3.1.5.19. Combustible Piping Materials
1) Except as permitted by Clause 3.1.5.2.(1)(d) and Sentences (2) and (3), combustible piping and tubing and associated adhesives are permitted to be used in a building required to be of noncombustible construction provided that, except when concealed in a wall or concrete floor slab, they
   a) have a flame-spread rating not more than 25, and
b) if used in a building described in Subsection 3.2.6., have a smoke developed classification not more than 50.

2) Combustible sprinkler piping is permitted to be used within a sprinklered floor area in a building required to be of noncombustible construction. (See also Article 3.2.5.13.)

3) Polypropylene pipes and fittings are permitted to be used for drain, waste and vent piping for the conveyance of highly corrosive materials and for piping used to distribute distilled or dialyzed water in laboratory and hospital facilities in a building required to be of noncombustible construction, provided
   a) the building is sprinklered throughout,
   b) the piping is not located in a vertical shaft, and
   c) piping that penetrates a fire separation is sealed at the penetration by a fire stop that has an FT rating not less than the fire-resistance rating of the fire separation when subjected to the fire test method in CAN/ULC-S115, “Fire Tests of Firestop Systems,” with a pressure differential of 50 Pa between the exposed and unexposed sides, with the higher pressure on the exposed side.

3.1.5.20. Combustible Plumbing Fixtures

1) Combustible plumbing fixtures, including wall and ceiling enclosures that form part of the plumbing fixture, are permitted in a building required to be of noncombustible construction provided they are constructed of material having a flame-spread rating and smoke developed classification not more than that permitted for the wall surface of the room or space in which they are installed.

3.1.5.21. Wires and Cables

1) Except as required by Sentence (2) and Article 3.1.5.22., optical fibre cables and electrical wires and cables with combustible insulation, jackets or sheathes are permitted in a building required to be of noncombustible construction, provided
   a) the wires and cables exhibit a vertical char of not more than 1.5 m when tested in conformance with the Vertical Flame Test – Cables in Cable Trays (FT4 rating) in CSA C22.2 No. 0.3, “Test Methods for Electrical Wires and Cables,” except as otherwise required by Sentence 3.6.4.3.(1),
   b) the wires and cables are located in
      i) totally enclosed noncombustible raceways (See Note A-3.1.4.3.(1)(b)(i)),
      ii) masonry walls,
      iii) concrete slabs,
      iv) a service room separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h, or
      v) totally enclosed non-metallic raceways conforming to Clause 3.1.5.23.(1)(b), or
   c) the wires and cables are communication cables used at the service entry to a building and are not more than 3 m long.
   (See Note A-3.1.5.21.(1).)

2) Except as permitted in Article 3.6.4.3., optical fibre cables and electrical wires and cables with combustible insulation, jackets or sheathes that are used for the transmission of voice, sound or data and are not located in totally enclosed noncombustible raceways are permitted to be installed in a plenum in a building required to be of noncombustible construction, provided the wires and cables exhibit a horizontal flame distance of not more than 1.5 m, an average optical smoke density of not more than 0.15, and a peak optical smoke density of not more than 0.5 when tested in conformance with CAN/ULC-S102.4, “Standard Method of Test for Fire and Smoke Characteristics of Electrical Wiring, Cables and Non-Metallic Raceways,” (FT6 rating).

3) Deleted.

4) Deleted.

3.1.5.22. Combustible Travelling Cables for Elevators

1) Combustible travelling cables are permitted on elevating devices in a building required to be of noncombustible construction.
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

3.1.5.23. Non-metallic Raceways

1) Except as required in Sentence (2), subject to the limits on the size of elements that penetrate fire separations as stated in Sentence 3.1.9.3.(2), within a fire compartment of a building required to be of noncombustible construction, totally enclosed non-metallic raceways not more than 175 mm in outside diameter, or of an equivalent rectangular area, are permitted to be used to enclose optical fibre cables and electrical wires and cables, provided

a) where the wires and cables in the raceways meet or exceed the requirements of Clause 3.1.5.21.(1)(a), the non-metallic raceways meet the requirements for at least an FT4 rating in
   i) CAN/CSA-C22.2 No. 262, “Optical Fiber Cable and Communication Cable Raceway Systems,” or
   ii) CAN/ULC-S143, “Fire Tests for Non-Metallic Electrical and Optical Fibre Cable Raceway Systems,” and

b) where the wires and cables in the raceways do not meet or exceed the requirements of Clause 3.1.5.21.(1)(a), the non-metallic raceways exhibit a vertical char of not more than 1.5 m when tested in conformance with the Vertical Flame Test (FT4) – Conduit or Tubing on Cable Tray in Clause 6.16 of CSA C22.2 No. 211.0, “General Requirements and Methods of Testing for Nonmetallic Conduit.”

2) Totally enclosed non-metallic raceways used in a plenum in a building required to be of noncombustible construction shall exhibit a horizontal flame distance of not more than 1.5 m, an average optical smoke density of not more than 0.15, and a peak optical smoke density of not more than 0.5 when tested in conformance with CAN/ULC-S102.4, “Standard Method of Test for Fire and Smoke Characteristics of Electrical Wiring, Cables and Non-Metallic Raceways,” (FT6 rating).

3.1.5.24. Decorative Wood Cladding

1) On buildings required to be of noncombustible construction, decorative wood cladding is permitted to be used on the exterior fascias and soffits of marquees or canopies on the building face of a storey having direct access to a street or access route, provided the wood cladding is fire-retardant-treated wood that has been conditioned in conformance with ASTM D 2898, “Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing,” before being tested in accordance with CAN/ULC-S102, “Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies.”

3.1.6. Tents and Air-Supported Structures

(See Note A-3.1.6.)

3.1.6.1. Means of Egress

1) Tents and air-supported structures shall conform to Sections 3.3. and 3.4.

3.1.6.2. Restrictions

1) An air-supported structure shall not be located above the first storey on any building.

2) An air-supported structure shall not be used for Groups B, C, or Group F, Division 1 major occupancies or for classrooms.

3) An air-supported structure shall be designed as open floor space without interior walls, mezzanines, intermediate floors or similar construction.

3.1.6.3. Clearance to Other Structures

1) Except as permitted by Sentences (2), (3) and (4), every tent and air-supported structure shall conform to Subsection 3.2.3.

2) Tents and air-supported structures
   a) shall not be erected closer than 3 m to other structures on the same property except as permitted by Sentences (3) and (4), and
b) shall be sufficiently distant from one another to provide an area to be used as a means of emergency egress.

3) Tents and *air-supported structures* not occupied by the public
   a) need not be separated from one another, and
   b) are permitted to be erected less than 3 m from other structures on the same property provided this spacing does not create a hazard to the public.

4) Tents not more than 120 m² in ground area, located on fair grounds or similar open spaces, need not be separated from one another provided this does not create a hazard to the public.

3.1.6.4. Clearance to Flammable Material

1) The ground enclosed by a tent or *air-supported structure* and not less than 3 m of ground outside the structure shall be cleared of all flammable material or vegetation that will spread fire.

3.1.6.5. Flame Resistance

1) Every tent and *air-supported structure* and all tarpaulins and decorative materials used in connection with these structures shall conform to CAN/ULC-S109, "Flame Tests of Flame-Resistant Fabrics and Films."

3.1.6.6. Emergency Air Supply

1) An *air-supported structure* used as a place of assembly for more than 200 persons shall have either
   a) an automatic emergency engine-generator set capable of powering one blower continuously for 4 h, or
   b) a supplementary blower powered by an automatic internal combustion engine.

3.1.6.7. Electrical Systems

1) The electrical system and equipment in a tent or *air-supported structure*, including electrical fuses and switches, shall be inaccessible to the public.

2) Cables on the ground in areas used by the public in a tent or *air-supported structure* shall be placed in trenches or protected by covers to prevent damage from traffic.

3.1.7. Fire-Resistance Ratings

3.1.7.1. Determination of Ratings

1) Except as permitted by Sentence (2) and Articles 3.1.7.2. and 3.6.3.5., the rating of a material, assembly of materials or a structural member that is required to have a *fire-resistance rating*, shall be determined on the basis of the results of tests conducted in conformance with CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials."

2) A material, assembly of materials or a structural member is permitted to be assigned a *fire-resistance rating* on the basis of Appendix D.

3) A ceiling assembly is permitted to be assigned a *fire-resistance rating* on the basis of Assembly Number R1 in Table A-9.10.3.1.-B.

4) A ceiling membrane is permitted to be assigned a *fire-resistance rating* on the basis of Assembly Number M1 or M2 in Table A-9.10.3.1.-B.

3.1.7.2. Exception for Exterior Walls

1) The limit on the rise of temperature on the unexposed surface of an assembly as required by the tests referred to in Sentence 3.1.7.1.(1) shall not apply to an exterior wall that has a *limiting distance* of 1.2 m or more, provided correction is made for radiation from the unexposed surface in accordance with Sentence 3.2.3.1.(9).

3.1.7.3. Exposure Conditions for Rating

1) Floor, roof and ceiling assemblies shall be rated for exposure to fire on the underside.
2) Firewalls and interior vertical fire separations shall be rated for exposure to fire on each side.
3) Exterior walls shall be rated for exposure to fire from inside the building.

3.1.7.4. Minimum Fire-Resistance Rating
1) The use of materials or assemblies having a greater fire-resistance rating than required shall impose no obligation to exceed in whole or in part the minimum fire-resistance ratings required by this Part.

3.1.7.5. Rating of Supporting Construction
1) Except as permitted by Sentence (2) and by Articles 3.2.2.20. to 3.2.2.90. for mixed types of construction, all loadbearing walls, columns and arches in the storey immediately below a floor or roof assembly required to have a fire-resistance rating shall have a fire-service rating not less than that required for the supported floor or roof assembly.
2) Loadbearing walls, columns and arches supporting a service room or service space need not conform to Sentence (1).
3) Except for noncombustible roof assemblies required by Clauses 3.2.2.50.(2)(c) and 3.2.2.58.(2)(c), if an assembly is required to be of noncombustible construction and have a fire-resistance rating, it shall be supported by noncombustible construction.

3.1.8. Fire Separations and Closures

3.1.8.1. General Requirements
1) Any wall, partition or floor assembly required to be a fire separation shall
   a) except as permitted by Sentence (2), be constructed as a continuous element, and
   b) as required in this Part, have a fire-resistance rating as specified (See Note A-3.1.8.1.(1)(b)).
2) Openings in a fire separation shall be protected with closures, shafts or other means in conformance with Articles 3.1.8.4. to 3.1.8.19. and Subsections 3.1.9. and 3.2.8. (See Note A-3.1.8.1.(2).)

3.1.8.2. Combustible Construction Support
1) Combustible construction that abuts on or is supported by a noncombustible fire separation shall be constructed so that its collapse under fire conditions will not cause the collapse of the fire separation.

3.1.8.3. Continuity of Fire Separations
1) Except as permitted by Sentence 3.6.4.2.(2), a horizontal service space or other concealed space located above a required vertical fire separation, including the walls of a vertical shaft, shall be divided at the fire separation by an equivalent fire separation within the service space.
2) The fire separation required by Sentence (1) shall terminate so that smoke-tight joints are provided where it abuts on or intersects
   a) a floor,
   b) a roof slab, or
   c) a roof deck.
3) Except as required by Subsection 3.6.3. for a shaft penetrating a roof assembly, a shaft, including an exit enclosure, that penetrates a fire separation, shall
   a) extend through any horizontal service space or any other concealed space, and
   b) terminate so that smoke-tight joints are provided where the shaft abuts on or intersects
      i) a floor,
      ii) a roof slab, or
      iii) a roof deck.
4) The continuity of a fire separation shall be maintained where it abuts another fire separation, a floor, a ceiling, a roof, or an exterior wall assembly. (See Note A-3.1.8.3.(4).)

3.1.8.4. Determination of Ratings and Classifications
1) Except as permitted by Sentences (2) and 3.1.8.16.(1), the fire-protection rating of a closure shall be determined in accordance with
   a) CAN/ULC-S104, “Fire Tests of Door Assemblies,”
   b) CAN4-S106-M, “Fire Tests of Window and Glass Block Assemblies,” or
   c) CAN/ULC-S112, “Fire Test of Fire Damper Assemblies.”
   (See Articles 3.1.8.17. to 3.1.8.19. for additional requirements for closures.)
2) Except as permitted by Sentence 3.1.8.12.(1), the fire-protection rating of a closure shall conform to Table 3.1.8.4. for the required fire-resistance rating of the fire separation.
3) The leakage rate of smoke dampers and combination smoke/fire dampers shall
   a) be determined in accordance with the applicable provisions in CAN/ULC-S112.1, “Leakage Rated Dampers for Use in Smoke Control Systems,” and
   b) conform to Class I, II or III of that standard.
4) The leakage rate of a door assembly shall be determined in accordance with ANSI/UL-1784, “Air Leakage Tests of Door Assemblies and Other Opening Protectives.”

3.1.8.5. Installation of Closures
1) Except where fire dampers, window assemblies and glass block are used as closures, closures of the same fire-protection rating installed on opposite sides of the same opening are deemed to have a fire-protection rating equal to the sum of the fire-protection ratings of the closures. (See Note A-3.1.8.1.(2).)
2) Except as otherwise specified in this Part, every door, fire damper, window assembly or glass block used as a closure in a required fire separation shall be installed in conformance with NFPA 80, “Fire Doors and Other Opening Protectives.” (See Note A-3.1.8.1.(2).)
3) Except as otherwise specified in this Part, every smoke damper or combination smoke/fire damper used as a closure in a required fire separation shall be installed in conformance with NFPA 105, “Smoke Door Assemblies and Other Opening Protectives.”
4) If a door is installed such that it could damage the integrity of a fire separation if its swing is unrestricted, door stops shall be installed to prevent the damage.
5) Protective guarding devices shall be
   a) provided where necessary to prevent damage to the mechanical components of doors in fire separations, and
   b) installed so as not to interfere with the proper operation of the doors.
6) A leakage-rated door assembly complying with Sentence 3.1.8.4.(4) shall be installed in
   a) fire separations in protected floor areas referred to in Clause 11.3.7.1.1(b),
   b) fire separations in care or treatment occupancies referred to in Sentence 3.3.3.5.(4),
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

c) except as provided in Sentence (8), fire separations of public corridors serving dwelling units in storeys that are not sprinklered, and
d) firewalls that are a horizontal exit referred to in Sentence 3.3.3.5.(3).

7) Leakage-rated door assemblies required by Sentence (6) shall be installed in accordance with NFPA 105, “Smoke Door Assemblies and Other Opening Protectives.”

8) A leakage-rated door assembly need not be installed where a dwelling unit served by a public corridor has
   a) a second and separate means of egress, or
   b) an open-air balcony that is sized to accommodate the number of occupants for which the dwelling unit is intended.

9) A closure installed as part of a vertical fire separation within connecting construction described in Clause 1.3.3.4.(3)(b) of Division A, shall be protected by a dedicated water curtain that
   a) consists of quick response sprinklers with a nominal k-factor of 5.6 of the upright or pendant type on each side,
   b) is located such that
      i) the water curtain sprinklers are between 150 mm and 300 mm horizontally from the interior face of the opening,
      ii) the water curtain sprinklers are located and not more than 3.6 m vertically above the floor immediately below and within 300 mm of the ceiling per the manufacturers listing for the quick response sprinkler head and NFPA 13,
      iii) if the opening is 1.8 m or less in width, have one sprinkler head installed at the center of the opening with no more than 0.9 m horizontally from the edge of the opening,
      iv) if the opening is more than 1.8 m in width, have multiple sprinkler heads installed at 1.8 m on center with no more than 0.9 m horizontally from the edge of the opening, and
   c) have sprinkler heads protected from spray and from cold solder effects from adjacent sprinklers (floor area or water curtain sprinkler heads) by means of baffles in accordance with NFPA 13, and be hydraulically designed to
      i) discharge water at a minimum flow rate of 1.13 L/s (18 usgpm),
      ii) sprinklers will be supplied on a separate zone, and
      iii) be included in the most hydraulically demanding design area for the adjacent floor area sprinklers plus the inside and outside hose stream allowance per NFPA 13.

3.1.8.6. Maximum Openings

1) The size of an opening in an interior fire separation required to be protected with a closure shall be not more than 11 m², with no dimension more than 3.7 m, if a fire compartment on either side of the fire separation is not sprinklered.

2) The size of an opening in an interior fire separation required to be protected with a closure shall be not more than 22 m², with no dimension more than 6 m, provided the fire compartments on both sides of the fire separation are sprinklered.

3.1.8.7. Location of Fire Dampers and Smoke Dampers

1) Except as provided in Article 3.1.8.8., a fire damper having a fire-protection rating conforming to Sentence 3.1.8.4.(2) shall be installed in conformance with Article 3.1.8.10. in ducts or air-transfer openings that penetrate an assembly required to be a fire separation.

2) Except as provided in Article 3.1.8.9., a smoke damper or a combination smoke/fire damper shall be installed in conformance with Article 3.1.8.11. in ducts or air-transfer openings that penetrate an assembly required to be a fire separation, where the fire separation
   a) separates a public corridor,
   b) contains an egress door referred to in Sentence 3.4.2.4.(2),
   c) serves an assembly, care, treatment, detention or residential occupancy, or
   d) is installed to meet the requirements of Clause 11.3.7.1.(1)(b) or Sentence 3.3.3.5.(4).
3.1.8.8. Fire Dampers Waived

1) Except as provided in Sentence (2), the requirement for fire dampers stated in Sentence 3.1.8.7.(1) is permitted to be waived for:
   a) ducts that serve commercial cooking equipment (See also Article 6.3.1.7.),
   b) continuous noncombustible ducts having a melting point above 760°C that penetrate a vertical fire separation required by Sentence 3.3.1.1.(1) between suites of assembly, mercantile, low-hazard industrial, medium-hazard industrial or high-hazard industrial occupancy,
   c) ducts or air-transfer openings that penetrate a vertical fire separation not required to have a fire-resistance rating, or
   d) noncombustible ducts or air-transfer openings that penetrate a horizontal fire separation not required to have a fire-resistance rating.

2) The requirement for fire dampers stated in Sentence 3.1.8.7.(1) is permitted to be waived for noncombustible branch ducts having a melting point above 760°C that penetrate a fire separation,
   a) provided the ducts
      i) have a cross-sectional area not more than 0.013 m² and serve only air-conditioning units or combined air-conditioning and heating units discharging air not more than 1.2 m above the floor, or
      ii) extend not less than 500 mm inside exhaust duct risers that are under negative pressure and in which the airflow is upward as required by Article 3.6.3.4., or
   b) where the fire separation separates a vertical service space from the remainder of the building, provided each individual duct exhausts directly to the outdoors at the top of the vertical service space.

3.1.8.9. Smoke Dampers Waived

1) Except as provided in Sentence (2), the requirement for smoke dampers or combination smoke/fire dampers stated in Sentence 3.1.8.7.(2) is permitted to be waived for:
   a) that serve commercial cooking equipment (See also Article 6.3.1.7.),
   b) in which all inlet and outlet openings serve not more than one fire compartment, or
   c) that penetrate a vertical fire separation referred to in Clause 11.3.7.1.(1)(b) or in Sentence 3.3.3.5.(4), provided
      i) the movement of air is continuous, and
      ii) the configuration of the air-handling system prevents the recirculation of exhaust or return air under fire emergency conditions.

2) The requirement for smoke dampers or combination smoke/fire dampers stated in Sentence 3.1.8.7.(2) is permitted to be waived for noncombustible branch ducts having a melting point above 760°C that penetrate a fire separation,
   a) provided the ducts
      i) have a cross-sectional area not more than 0.013 m² and serve only air-conditioning units or combined air-conditioning and heating units discharging air not more than 1.2 m above the floor,
      ii) extend not less than 500 mm inside exhaust duct risers that are under negative pressure and in which the airflow is upward as required by Article 3.6.3.4., or
      iii) are required to function as part of a smoke control system, or
   b) where the fire separation separates a vertical service space from the remainder of the building, provided each individual duct exhausts directly to the outdoors at the top of the vertical service space.

3.1.8.10. Installation of Fire Dampers

1) A fire damper shall be installed in the plane of the fire separation so as to stay in place should the duct become dislodged during a fire. (See Note A-3.1.8.10.(1).)
2) A fire damper shall be arranged so as to close automatically upon the operation of a fusible link conforming to ULC-S505, “Fusible Links for Fire Protection Service,” or other heat-actuated or smoke-actuated device.

3) A heat-actuated device referred to in Sentence (2) shall
   a) be located where it is readily affected by an abnormal rise in temperature in the duct, and
   b) have a temperature rating approximately 30°C above the maximum temperature that would exist in the system, whether it is in operation or shut down.

4) A fire damper tested in the vertical or horizontal position shall be installed in the position in which it was tested.

5) A tightly fitted access door shall be installed for each fire damper to provide access for the inspection of the damper and the resetting of the release device. (See Note A-3.1.8.10.(5).)

3.1.8.11. Installation of Smoke Dampers
   1) Where smoke dampers are used as a closure in an air-transfer opening, they shall be installed in the plane of the fire separation.
   2) Where combination smoke/fire dampers are used as a closure in a duct, they shall be installed within 610 mm of the plane of the fire separation, provided there is no inlet or outlet opening between the fire separation and the damper.
   3) Except as required by a smoke control system, smoke dampers and combination smoke/fire dampers shall be configured so as to close automatically upon a signal from an adjacent smoke detector located as described in CAN/ULC-S524, “Installation of Fire Alarm Systems,” within 1.5 m horizontally of the duct or air-transfer opening in the fire separation
      a) on both sides of the air-transfer opening, or
      b) in the duct downstream of the smoke damper or combination smoke/fire damper.
   4) Smoke dampers or combination smoke/fire dampers shall be installed in the vertical or horizontal position in which they were tested.
   5) A tightly fitted access door shall be installed for each smoke damper and combination smoke/fire damper to provide access for their inspection and the resetting of the release device. (See Note A-3.1.8.10.(5).)

3.1.8.12. Twenty-Minute Closures
   1) A door assembly having a fire-protection rating not less than 20 min is permitted to be used as a closure in
      a) a fire separation not required to have a fire-resistance rating more than 1 h, located between
         i) a public corridor and a suite,
         ii) a corridor and adjacent sleeping rooms, or
         iii) a corridor and adjacent classrooms, offices and libraries in Group A, Division 2 major occupancies, or
      b) a fire separation not required to have a fire-resistance rating more than 45 min, located in a building not more than 3 storeys in building height.
   2) The requirements for noncombustible sills and combustible floor coverings in NFPA 80, “Fire Doors and Other Opening Protectives,” do not apply to a door described in Sentence (1).
   3) A door described in Sentence (1) shall have clearances of not more than 6 mm at the bottom and not more than 3 mm at the sides and top.

3.1.8.13. Self-closing Devices
   1) Except as permitted by Sentence (2), every door in a fire separation, other than doors to freight elevators and dumbwaiters, shall be equipped with a self-closing device designed to return the door to the closed position after each use.
   2) A self-closing device need not be provided on a door that is located between
      a) a classroom and a corridor providing access to exit from the classroom in a building that is not more than 3 storeys in building height,
b) a public corridor and an adjacent room of business and personal services occupancy in a building that is not more than 3 storeys in building height provided the door is not located in a dead-end portion of the corridor,
c) a patients’ sleeping room and a corridor serving the patients’ sleeping room, provided the room and corridor are within a fire compartment in a hospital or nursing home with treatment that complies with the requirements of Article 3.3.3.5., or
d) a patients’ sleeping room and an adjacent room that serves the patients’ sleeping room, provided these rooms are within a fire compartment in a hospital or nursing home with treatment that complies with the requirements of Article 3.3.3.5.

3.1.8.14. Hold-Open Devices

1) Except as provided in Sentences 3.1.8.10.(2) and 3.1.8.11.(3), a hold-open device is permitted to be used on a closure in a required fire separation, other than on an exit stair door in a building more than 3 storeys in building height and on a door for a vestibule required by Article 3.3.5.7., provided the device is designed to release the closure in conformance with this Article.

2) Except as provided in Sentences (5) and (6), where the building is provided with a fire alarm system, a hold-open device permitted by Sentence (1) shall release
   a) in a single-stage system, upon any signal from the fire alarm system, and
   b) in a 2-stage system,
      i) upon any alert signal from the fire alarm system, or
      ii) upon actuation of any adjacent smoke detectors.

3) Where the building is provided with a fire alarm system, a hold-open device permitted by Sentence (1) shall release upon a signal from a smoke detector connected to the fire alarm system and located as described in CAN/ULC-S524, “Installation of Fire Alarm Systems,” where the hold-open device is used on
   a) an exit door,
   b) a door opening into a public corridor,
   c) an egress door referred to in Sentence 3.4.2.4.(2),
   d) a closure serving an assembly, care, treatment, detention, or residential occupancy,
   e) a door in a fire separation referred to in Clause 11.3.7.1.(1)(b) or Sentence 3.3.3.5.(4), or
   f) a door required to function as part of a smoke control system.

4) Where the building is not provided with a fire alarm system, a hold-open device permitted by Sentence (1) shall release upon a signal from a smoke alarm located on each side of the fire separation at ceiling level within 1.5 m horizontally of the closure opening in the fire separation, where the hold-open device is used on closures described in Clauses (3)(a) to (e).

5) Where a hold-open device is used on closures other than those described in Sentences (3) and (4), it is permitted to be released upon actuation of a heat-actuated device.

6) A hold-open device used on a door located between a corridor used by the public and an adjacent sleeping room in a treatment occupancy need not release automatically as stated in Sentence (2).

3.1.8.15. Door Latches

1) Except as permitted by Article 3.3.3.5., a swing-type door in a fire separation shall be equipped with a positive latching mechanism designed to hold the door in the closed position after each use.

3.1.8.16. Wired Glass and Glass Block

1) Except as permitted by Articles 3.1.8.18. and 3.1.8.19. for the separation of exits, an opening in a fire separation having a fire-resistance rating not more than 1 h is permitted to be protected with fixed wired glass assemblies or glass blocks installed in conformance with NFPA 80, “Fire Doors and Other Opening Protectives.”

2) Wired glass assemblies permitted by Sentence (1) and described in Appendix D are permitted to be used as closures in vertical fire separations without being tested in accordance with Sentence 3.1.8.4.(1).
3) Glass blocks permitted by Sentence (1) shall be installed in accordance with Subsection 4.3.2. and reinforced with steel reinforcement in each horizontal joint.

3.1.8.17. Temperature Rise Limit for Doors

1) Except as permitted by Article 3.1.8.19., the maximum temperature rise on the opaque portion of the unexposed side of a door used as a closure in a fire separation in a location shown in Table 3.1.8.17. shall conform to the Table when tested in conformance with Sentence 3.1.8.4.(1).

3.1.8.18. Area Limits for Wired Glass and Glass Block

1) Except as permitted by Article 3.1.8.19., the maximum area of wired glass in a door used in the locations shown in Table 3.1.8.17. shall conform to the Table. (See Note A-3.1.8.18.(1).)

2) Except as permitted by Article 3.1.8.19., the maximum area of glass block and wired glass panels not in a door, used in the locations shown in Table 3.1.8.17., shall conform to the Table.

3.1.8.19. Temperature Rise and Area Limits Waived

1) The temperature rise limits and glass area limits required by Articles 3.1.8.17. and 3.1.8.18. are waived for a closure between an exit enclosure and an enclosed vestibule or corridor, provided

   a) the vestibule or corridor is separated from the remainder of the floor area by a fire separation having a fire-resistance rating not less than 45 min,
b) the fire separation required by Clause (a) contains no wired glass or glass block within 3 m of the closure into the exit enclosure, and

c) the vestibule or corridor contains no occupancy.

(See Note A-3.1.8.19.(1).)

3.1.9. Penetrations in Fire Separations and Fire-Rated Assemblies

(See Note A-3.1.9.)

3.1.9.1. Fire Stops

1) Except as provided in Sentences (2) to (5) and Article 3.1.9.4., penetrations of a fire separation or a membrane forming part of an assembly required to have a fire-resistance rating shall be

a) sealed by a fire stop that, when subjected to the fire test method in CAN/ULC-S115, “Fire Tests of Firestop Systems,” has an F rating not less than the fire-protection rating required for closures in the fire separation in conformance with Table 3.1.8.4.,

b) cast in place (See Note A-3.1.9.1.(1)(b).), or

c) tightly fitted (See Note A-3.1.9.1.(1)(c)).

(See also Article 3.1.9.5. for requirements regarding penetrations by combustible drain, waste and vent piping.)

2) Penetrations of a firewall or a horizontal fire separation that is required to have a fire-resistance rating in conformance with Article 3.2.1.2. shall be sealed at the penetration by a fire stop that, when subjected to the fire test method in CAN/ULC-S115, “Fire Tests of Firestop Systems,” has an FT rating not less than the fire-resistance rating for the fire separation.

3) Penetrations of a fire separation in conformance with Sentence 3.6.4.2.(2) shall be sealed by a fire stop that, when subjected to the fire test method in CAN/ULC-S115, “Fire Tests of Firestop Systems,” has an FT rating not less than the fire-resistance rating for the fire separation.

4) Sprinklers are permitted to penetrate a fire separation or a membrane forming part of an assembly required to have a fire-resistance rating without having to meet the fire stop requirements of Sentences (1) to (3), provided the annular space created by the penetration of a fire sprinkler is covered by a metal escutcheon plate in accordance with NFPA 13, “Installation of Sprinkler Systems.”

5) Unless specifically designed with a fire stop, fire dampers are permitted to penetrate a fire separation or a membrane forming part of an assembly required to have a fire-resistance rating without having to meet the fire stop requirements of Sentences (1) to (3), provided the fire damper is installed in conformance with NFPA 80, “Fire Doors and Other Opening Protectives.”

3.1.9.2. Combustibility of Service Penetrations

1) Except as permitted by Articles 3.1.9.3. and 3.1.9.5., pipes, ducts, electrical outlet boxes, totally enclosed raceways or other similar service equipment that penetrate an assembly required to have a fire-resistance rating shall be noncombustible, unless the assembly was tested incorporating that service equipment. (See Note A-3.1.9.2.(1).)

3.1.9.3. Penetration by Wires, Cables and Outlet Boxes

1) Optical fibre cables and electrical wires and cables in totally enclosed noncombustible raceways are permitted to penetrate an assembly required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required by Article 3.1.9.2.

2) Except as permitted by Sentence (3), totally enclosed non-metallic raceways conforming to Article 3.1.5.23., optical fibre cables, and electrical wires and cables, single or grouped, with combustible insulation, jackets or sheathes that conform to the requirements of Clause 3.1.5.21.(1)(a) and that are not installed in totally enclosed noncombustible raceways are permitted to penetrate an assembly required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required by Article 3.1.9.2., provided the overall diameter of the single or grouped wires or cables, or the raceways is not more than 25 mm.
3) Single conductor metal sheathed cables with combustible jacketing that are more than 25 mm in overall diameter are permitted to penetrate a fire separation required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required by Article 3.1.9.2., provided the cables are not grouped and are spaced a minimum of 300 mm apart.

4) Combustible totally enclosed raceways that are embedded in a concrete floor slab are permitted in an assembly required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required by Article 3.1.9.2., provided the concrete cover between the raceway and the bottom of the slab is not less than 50 mm.

5) Combustible outlet boxes are permitted in an assembly required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required by Article 3.1.9.2., provided the opening through the membrane into the box is not more than 0.016 m².

3.1.9.4. Penetration by Outlet Boxes
(See Note A-3.1.9.4.)

1) Except as provided in Sentence (2), outlet boxes are permitted to penetrate the membrane of an assembly required to have a fire-resistance rating, provided they are sealed at the penetration by a fire stop that has an FT rating not less than the fire-resistance rating of the fire separation when subjected to the fire test method in CAN/ULC-S115, “Fire Tests of Firestop Systems.”

2) Except as provided in Sentences 3.1.9.1.(2) and (3), noncombustible outlet boxes that penetrate a vertical fire separation or a membrane forming part of an assembly required to have a fire-resistance rating need not be sealed at the penetration with a fire stop, provided
   a) they do not exceed
      i) 0.016 m² in area, and
      ii) an aggregate area of 0.065 m² in any 9.3 m² of surface area, and
   b) the annular space between the membrane and the noncombustible electrical outlet boxes does not exceed 3 mm.

3) In addition to the requirements of Sentence (2), outlet boxes on opposite sides of a vertical fire separation having a fire-resistance rating shall be separated by
   a) a horizontal distance of not less than 600 mm, or
   b) a fire block conforming to Article 3.1.11.7.

3.1.9.5. Combustible Piping Penetrations

1) Combustible sprinkler piping is permitted to penetrate a fire separation provided the fire compartments on each side of the fire separation are sprinklered.

2) Combustible water distribution piping is permitted to penetrate a fire separation that is required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required by Article 3.1.9.2., provided the piping is protected at the penetration with a fire stop in conformance with Sentence (4).

3) Except as permitted by Sentences (4) to (5), combustible piping shall not be used in a drain, waste and vent piping system if any part of that system penetrates
   a) a fire separation required to have a fire-resistance rating, or
   b) a membrane that forms part of an assembly required to have a fire-resistance rating.

4) Combustible drain, waste and vent piping is permitted to penetrate a fire separation required to have a fire-resistance rating or a membrane that forms part of an assembly required to have a fire-resistance rating, provided
   a) the piping is sealed at the penetration by a fire stop that has an F rating not less than the fire-resistance rating required for the fire separation when subjected to the fire test method in CAN/ULC-S115, “Fire Tests of Firestop Systems,” with a pressure differential of 50 Pa between the exposed and unexposed sides, with the higher pressure on b) the exposed side, and
   b) the piping is not located in a vertical service space.
5) *Combustible* drain, waste and vent piping is permitted on one side of a vertical *fire separation* provided it is not located in a *vertical service space*.

6) *Combustible* piping for central vacuum systems is permitted to penetrate a *fire separation* provided the installation conforms to the requirements that apply to *combustible* drain, waste and vent piping specified in Sentence (4).

### 3.1.9.6. Openings for Ducts through a Membrane Ceiling

1) A membrane ceiling forming part of an assembly assigned a *fire-resistance rating* on the basis of Appendix D or Sentence 3.1.7.1.(4) is permitted to be penetrated by openings leading into ducts within the ceiling space, provided
   a) the ducts are sheet steel, and
   b) the number of openings and their protection conform to the requirements of Appendix D.

### 3.1.9.7. Plenums

1) A ceiling assembly used as a *plenum* shall conform to Article 3.6.4.3.

### 3.1.10. Firewalls

#### 3.1.10.1. Prevention of Firewall Collapse

1) Except as permitted by Sentence (2), the connections and supports for structural framing members that are connected to or supported on a *firewall* and have a *fire-resistance rating* less than that required for the *firewall*, shall be designed so that the failure of the framing systems during a fire will not affect the integrity of the *firewall* during the fire.

2) Sentence (1) does not apply to a *firewall* consisting of two separate wall assemblies each tied to its respective *building* frame but not to each other, provided each wall assembly is
   a) a *fire separation* having one half of the *fire-resistance rating* required for the *firewall* by Sentences 3.1.10.2.(1) and (2), and
   b) designed so that the collapse of one wall assembly will not cause collapse of the other.

3) A *firewall* is permitted to be supported on the structural frame of a *building of noncombustible construction* provided the supporting frame has a *fire-resistance rating* not less than that required for the *firewall*.

4) Piping, ducts and totally enclosed *noncombustible* raceways shall be installed so that their collapse will not cause collapse of the *firewall*.

#### 3.1.10.2. Rating of Firewalls

1) A *firewall* that separates a *building* or *buildings* with *floor areas* containing a Group E or a Group F, Division 1 or 2 *major occupancy* shall be constructed as a *fire separation of noncombustible construction* having a *fire-resistance rating* not less than 4 h, except that where the upper portion of a *firewall* separates *floor areas* containing other than Group E or Group F, Division 1 or 2 *major occupancies*, the *fire-resistance rating* of the upper portion of the *firewall* is permitted to be not less than 2 h.

2) A *firewall* that separates a *building* or *buildings* with *floor areas* containing *major occupancies* other than Group E or Group F, Division 1 or 2 shall be constructed as a *fire separation of noncombustible construction* having a *fire-resistance rating* not less than 2 h.

3) Except as permitted by Sentence (4), the required *fire-resistance rating* of a *firewall*, except for *closures*, shall be provided by masonry or concrete.

4) A *firewall* permitted to have a *fire-resistance rating* not more than 2 h need not be constructed of masonry or concrete, provided
   a) the assembly providing the *fire-resistance rating* is protected against damage that would compromise the integrity of the assembly, and
   b) the design conforms to Article 4.1.5.17.

(See Note A-3.1.10.2.(4).)
3.1.10.3. Continuity of Firewalls
   1) A firewall shall extend from the ground continuously through, or adjacent to, all storeys of a building or buildings so separated, except that a firewall located above a basement storage garage conforming to Article 3.2.1.2. is permitted to commence at the floor assembly immediately above the storage garage. (See also Sentence 3.1.10.1.(3).)
   2) A firewall is permitted to terminate on the underside of a reinforced concrete roof slab, provided
      a) the roof slab on both sides of the firewall has a fire-resistance rating not less than
         i) 1 h if the firewall is required to have a fire-resistance rating not less than 2 h, or
         ii) 2 h if the firewall is required to have a fire-resistance rating not less than 4 h, and
      b) there are no concealed spaces within the roof slab in that portion immediately above the firewall.

3.1.10.4. Parapets
   1) Except as permitted by Sentences (2) and 3.1.10.3.(2), a firewall shall extend above the roof surface to form a parapet not less than
      a) 150 mm high for a firewall required to have a fire-resistance rating not less than 2 h, and
      b) 900 mm high for a firewall required to have a fire-resistance rating not less than 4 h.
   2) A firewall that separates 2 buildings with roofs at different elevations need not extend above the upper roof surface to form a parapet, provided the difference in elevation between the roofs is more than 3 m.

3.1.10.5. Maximum Openings
   1) Openings in a firewall shall conform to the size limits described in Article 3.1.8.6. and the aggregate width of openings shall be not more than 25% of the entire length of the firewall.

3.1.10.6. Exposure Protection for Adjacent Walls
   1) The requirements of Article 3.2.3.14. shall apply to the external walls of 2 buildings that meet at a firewall at an angle less than 135°.

3.1.10.7. Combustible Projections
   1) Combustible material shall not extend across the end of a firewall but is permitted to extend across a roof above a firewall that is terminated in conformance with Sentence 3.1.10.3.(2).
   2) If buildings are separated by a firewall, combustible projections on the exterior of one building, including balconies, platforms, canopies, eave projections and stairs, that extend outward beyond the end of the firewall, shall not be permitted within 2.4 m of combustible projections and window or door openings of the adjacent building. (See also Article 3.2.3.6.)

3.1.11. Fire Blocks in Concealed Spaces

3.1.11.1. Separation of Concealed Spaces
   1) Concealed spaces in interior wall, ceiling and crawl spaces shall be separated from concealed spaces in exterior walls and attic or roof spaces by fire blocks conforming to Article 3.1.11.7.

3.1.11.2. Fire Blocks in Wall Assemblies and Vertical Concealed Spaces
   1) Except as permitted by Sentence (2), fire blocks conforming to Article 3.1.11.7. shall be provided to block off concealed spaces within a wall assembly and concealed vertical spaces forming part of wood-frame buildings
      a) at every floor level,
      b) at every ceiling level where the ceiling forms part of an assembly required to have a fire-resistance rating, and
c) so that the maximum horizontal dimension is not more than 20 m and the maximum vertical
dimension is not more than 3 m.

2) Fire blocks conforming to Sentence (1) are not required, provided
   a) the wall space or concealed vertical space is filled with insulation,
   b) the exposed construction materials and any insulation within the wall space or concealed vertical
      space are noncombustible,
   c) the exposed materials within the wall space or concealed vertical space, including insulation but
      not including wiring, piping or similar services, have a flame-spread rating not more than 25 on any
      exposed surface, or on any surface that would be exposed by cutting through the material in any
      direction, and fire blocks are installed so that the vertical distance between them is not more than
      10 m, or
   d) the insulated wall assembly contains not more than one concealed air space, and the horizontal
      thickness of that air space is not more than 25 mm.

3.1.11.3. Fire Blocks between Nailing and Supporting Elements
   1) In a building required to be of noncombustible construction, a concealed space in which there is an
      exposed ceiling finish with a flame-spread rating more than 25 shall be provided with fire blocks conformed
      to Article 3.1.11.7. between wood nailing elements so that the maximum area of the concealed space is not
      more than 2 m².
   2) In a building required to be of noncombustible construction, fire blocks conforming to Article 3.1.11.7.
      shall be provided in the concealed spaces created by the wood members permitted by Sentence
      3.1.5.10.(2) so that the maximum area of a concealed space is not more than 10 m².

3.1.11.4. Fire Blocks between Vertical and Horizontal Spaces
   1) Fire blocks conforming to Article 3.1.11.7. shall be provided
      a) at all interconnections between concealed vertical and horizontal spaces in interior coved
         ceilings, drop ceilings and soffits in which the exposed construction materials within the space have
         a flame-spread rating more than 25, and
      b) at the end of each run and at each floor level in concealed spaces between stair stringers in
         which the exposed construction materials within the space have a flame-spread rating more than
         25.

3.1.11.5. Fire Blocks in Horizontal Concealed Spaces
   1) Except for crawl spaces conforming to Sentence 3.1.11.6.(1) and as required in Sentence (3), horizontal
      concealed spaces within a floor assembly or roof assembly of combustible construction, in which sprinklers
      are not installed, shall be separated by construction conforming to Article 3.1.11.7. into compartments
      a) not more than 600 m² in area with no dimension more than 60 m if the exposed construction
         materials within the space have a flame-spread rating not more than 25, and
      b) not more than 300 m² in area with no dimension more than 20 m if the exposed construction
         materials within the space have a flame-spread rating more than 25.
      (See Note A-3.1.11.5.(1).)
   2) A concealed space in an exterior cornice, a mansard-style roof, a balcony or a canopy in which exposed
      construction materials within the space have a flame-spread rating more than 25, shall be separated by
      construction conforming to Article 3.1.11.7.
         a) at locations where the concealed space extends across the ends of required vertical fire
            separations, and
         b) so that the maximum dimension in the concealed space is not more than 20 m.
   3) Except as provided in Sentence (4), in buildings or parts thereof conforming to Article 3.2.2.50. or
      3.2.2.58., horizontal concealed spaces within a floor assembly or roof assembly of combustible construction
      shall be separated by construction conforming to Article 3.1.11.7. into compartments that are
3.1.11.5. Fire Blocks in Crawl Spaces

1) A crawl space that is not considered as a basement by Article 3.2.2.9. and in which sprinklers are not installed, shall be separated by construction conforming to Article 3.1.11.7. into compartments not more than 600 m² in area with no dimension more than 30 m.

3.1.11.6. Fire Blocks in Crawl Spaces

4) Fire blocks conforming to Sentence (3) are not required where the horizontal concealed space within the floor or roof assembly is entirely filled with noncombustible insulation such that any air gap between the top of the insulation and the floor or roof deck does not exceed 50 mm.

3.1.11.7. Fire Block Materials

1) Except as permitted by Sentences (2) to (4) and (7), fire blocks shall remain in place and prevent the passage of flames for not less than 15 min when subjected to the standard fire exposure in CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials.”

2) Gypsum board not less than 12.7 mm thick and sheet steel not less than 0.38 mm thick need not be tested in conformance with Sentence (1), provided all joints have continuous support.

3) In a building required to be of noncombustible construction, wood nailing elements described in Article 3.1.5.8. need not be tested in conformance with Sentence (1).

4) In a building permitted to be of combustible construction, in a combustible roof system permitted by Sentence 3.1.5.3.(2), and in a raised platform permitted by Sentence 3.1.5.10.(2), fire blocks are permitted to be

   a) solid lumber or a structural composite lumber product conforming to ASTM D 5456, “Evaluation of Structural Composite Lumber Products,” not less than 38 mm thick,

   b) phenolic bonded plywood, waferboard, or oriented strandboard not less than 12.5 mm thick with joints supported, or

   c) two thicknesses of lumber or a structural composite lumber product conforming to ASTM D 5456, “Evaluation of Structural Composite Lumber Products,” each not less than 19 mm thick with joints staggered, where the width or height of the concealed space requires more than one piece of lumber or structural composite lumber product not less than 38 mm thick to block off the space.

5) Openings through materials referred to in Sentences (1) to (4) shall be protected to maintain the integrity of the construction.

6) Where materials referred to in Sentences (1) to (4) are penetrated by construction elements or by service equipment, a fire stop shall be used to seal the penetration. (See Note A-3.1.11.7.(6).)

7) In buildings permitted to be of combustible construction, semi-rigid fibre insulation board produced from glass, rock or slag is permitted to be used to block the vertical space in a double stud wall assembly formed at the intersection of the floor assembly and the walls, provided the width of the vertical space does not exceed 25 mm and the insulation board

   a) has a density not less than 45 kg/m³,

   b) is securely fastened to one set of studs,

   c) extends from below the bottom of the top plates in the lower storey to above the top of the bottom plate in the upper storey, and

   d) completely fills the portion of the vertical space between the headers and between the wall plates.

(See Note A-3.1.11.7.(7).)

3.1.12. Flame-Spread Rating and Smoke Developed Classification
3.1.12. Determination of Ratings

1) Except as required by Sentence (2) and as permitted by Sentence (3), the flame-spread rating and smoke developed classification of a material, assembly, or structural member shall be determined on the basis of not less than three tests conducted in conformance with CAN/ULC-S102, “Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies.”

2) The flame-spread rating and smoke developed classification of a material or assembly shall be determined on the basis of not less than three tests conducted in conformance with CAN/ULC-S102.2, “Test for Surface Burning Characteristics of Flooring, Floor Coverings, and Miscellaneous Materials and Assemblies,” if the material or assembly
   a) is designed for use in a relatively horizontal position with only its top surface exposed to air,
   b) cannot be tested in conformance with Sentence (1) without the use of supporting material that is not representative of the intended installation, or
   c) is thermoplastic.

3) A material, assembly, or structural member is permitted to be assigned a flame-spread rating and smoke developed classification on the basis of Appendix D.

3.1.13. Interior Finish

3.1.13.1. Interior Finishes, Furnishings and Decorative Materials

1) Except as otherwise provided by this Subsection, interior finishes, furnishings and decorative materials shall conform to Section 2.3. of Division B of the Fire By-law.

2) Interior finish material shall include any material that forms part of the interior surface of a floor, wall, partition or ceiling, including
   a) interior cladding of plaster, wood or tile,
   b) surfacing of fabric, paint, plastic, veneer or wallpaper,
   c) doors, windows and trim,
   d) lighting elements such as light diffusers and lenses forming part of the finished surface of the ceiling, and
   e) carpet material that overlies a floor that is not intended as the finished floor.

3.1.13.2. Flame-Spread Rating

1) Except as otherwise required or permitted by this Subsection, the flame-spread rating of interior wall and ceiling finishes, including glazing and skylights, shall be not more than 150 and shall conform to Table 3.1.13.2.

<table>
<thead>
<tr>

Covered vehicular passageways, except for roof assemblies of heavy timber construction in the passageways | 25 | 25 |
Vertical service spaces | 25 | 25 |

Notes to Table 3.1.13.2.:
(1) See Articles 3.1.13.8. and 3.1.13.10.

2) Except as permitted by Sentence (3), doors, other than those in Group A, Division 1 occupancies, need not conform to Sentence (1) provided they have a flame-spread rating not more than 200. (See Note A-3.1.13.2.(2).)
3) Doors within a dwelling unit need not conform to Sentences (1) and (2).
4) Up to 10% of the total wall area and 10% of the total ceiling area of a wall or ceiling finish that is required by Sentence (1) to have a flame-spread rating less than 150 is permitted to have a flame-spread rating not more than 150, except that up to 25% of the total wall area of lobbies described in Sentence 3.4.4.2.(2) is permitted to have a flame-spread rating not more than 150.
5) Except in the case of Group A, Division 1 occupancies, combustible doors, skylights, glazing and light diffusers and lenses shall not be considered in the calculation of wall and ceiling areas described in Sentence (4).

3.1.13.3. Bathrooms in Residential Suites
1) The flame-spread rating of interior wall and ceiling finishes for a bathroom within a suite of residential occupancy shall be not more than 200.

3.1.13.4. Light Diffusers and Lenses
1) The flame-spread rating of combustible light diffusers and lenses in all occupancies other than Group A, Division 1 is permitted to be more than the flame-spread rating limits required elsewhere in this Subsection, provided the light diffusers and lenses
   a) have a flame-spread rating not more than 250 and a smoke developed classification not more than 600 when tested in conformance with CAN/ULC-S102.2, “Test for Surface Burning Characteristics of Flooring, Floor Coverings, and Miscellaneous Materials and Assemblies,”
   b) fall to the bottom of the test apparatus before igniting when tested in conformance with CAN/ULC-S102.3, “Fire Test of Light Diffusers and Lenses,”
   c) are not prevented from falling from the ceiling by construction located beneath the elements, and
d) are not used in a corridor that is required to be separated from the remainder of the building by a fire separation or in an exit shaft unless individual diffusers or lenses are not more than 1 m² in area and are not less than 1.2 m apart.

3.1.13.5. Skylights
1) Individual combustible skylights in a corridor that is required to be separated from the remainder of the building by a fire separation shall be not more than 1 m² in area and not less than 1.2 m apart.

3.1.13.6. Corridors
1) Except as permitted by Sentences (2) and (3), the flame-spread rating shall be not more than 75 for the interior wall finish of
   a) a public corridor,
   b) a corridor used by the public in an assembly occupancy, or
c) a corridor serving classrooms.

2) The flame-spread rating for corridors specified in Sentence (1) is permitted to be waived, provided the flame-spread rating is not more than
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

a) 25 on the upper half of the wall, and
b) 150 on the lower half of the wall.

3) Where the floor area is sprinklered throughout, the flame-spread ratings for corridors specified in Sentences (1) and (2) shall be not more than 150.

4) The flame-spread ratings specified in Sentences (1), (2) and (3) apply to occupancies in the corridor as well as to the corridor itself.

5) Except as provided in Sentence (6), the interior ceiling finish of corridors and occupancies referred to in Sentences (1) and (4) shall have a flame-spread rating not more than 25.

6) Where the floor area is sprinklered throughout, the flame-spread rating of the interior ceiling finish of corridors and occupancies referred to in Sentences (1) and (4) shall be not more than 150.

3.1.13.7. High Buildings

1) Except as permitted by Sentences (2) to (4), the interior wall, ceiling and floor finishes in a building regulated by the provisions of Subsection 3.2.6. shall conform to the flame-spread rating requirements in Articles 3.1.13.2. and 3.1.13.11. and to the flame-spread rating and smoke developed classification values in Table 3.1.13.7.

Notes to Table 3.1.13.7:
(1) See Article 3.1.13.4. for lighting elements.
(2) Other requirements of this Part apply.

2) Except for a building of Group B major occupancy and elevator cars, the flame-spread rating and smoke developed classification of interior wall, floor and ceiling finishes need not conform to the values in Table 3.1.13.7., provided the building is sprinklered.

3) Trim and millwork in an exit stairway, a vestibule to an exit stairway, a lobby described in Sentence 3.4.4.2.(2), or a corridor not within a suite need not conform to the flame-spread rating and smoke developed classification requirements of Sentence (1) provided they have
   a) a flame-spread rating not more than 150,
   b) a smoke developed classification not more than 300, and
   c) an aggregate area not more than 10% of the area of the wall or ceiling on which they occur.
4) A door serving an exit stairway, a vestibule to an exit stairway, a lobby described in Sentence 3.4.4.2.(2), or a corridor not within a suite need not conform to the flame-spread rating and smoke developed classification requirements of Sentence (1) provided
   a) it has a flame-spread rating not more than 200,
   b) it has a smoke developed classification not more than 300, and
   c) the aggregate area of all doors is not more than 10% of the area of the wall in which they are located.

3.1.13.8. Noncombustible Construction
   1) In a building required to be of noncombustible construction,
      a) the flame-spread ratings required by Subsection 3.1.5. shall apply in addition to the requirements in this Subsection, and
      b) the flame-spread ratings for exits in this Subsection shall also apply to any surface in the exit that would be exposed by cutting through the material in any direction, except that this requirement does not apply to doors, heavy timber construction in a sprinklered building and fire-retardant-treated wood.

3.1.13.9. Underground Walkways
   1) Except for paint, the interior wall and ceiling finishes of an underground walkway shall be of noncombustible materials.

3.1.13.10. Exterior Exit Passageway
   1) The wall and ceiling finishes of an exterior exit passageway that provides the only means of egress from the rooms or suites it serves, including the soffit beneath and the guard on the passageway, shall have a flame-spread rating not more than 25, except that a flame-spread rating not more than 150 is permitted for up to 10% of the total wall area and for up to 10% of the total ceiling area.

3.1.13.11. Elevator Cars
   1) The wall and ceiling surfaces of elevator cars shall have a flame-spread rating not more than 75.
   2) The wall, ceiling and floor surfaces of elevator cars shall have a smoke developed classification not more than 450.

3.1.14. Roof Assemblies

3.1.14.1. Fire-Retardant-Treated Wood Roof Systems
   1) If a fire-retardant-treated wood roof system is used to comply with the requirements of Subsection 3.2.2., the roof deck assembly shall meet the conditions of acceptance of CAN/ULC-S126, “Test for Fire Spread Under Roof-Deck Assemblies.”
   2) Supports for the roof deck assembly referred to in Sentence (1) shall consist of
      a) fire-retardant-treated wood,
      b) heavy timber construction,
      c) noncombustible construction, or
      d) a combination thereof.

3.1.14.2. Metal Roof Deck Assemblies
   1) Except as permitted by Sentence (2), a metal roof deck assembly shall meet the conditions of acceptance of CAN/ULC-S126, “Test for Fire Spread Under Roof-Deck Assemblies,” if
      a) it supports a combustible material above the deck that could propagate a fire beneath the roof deck assembly, and
      b) the deck is used to comply with the requirements of Sentences 3.2.2.25.(2), 3.2.2.32.(2), 3.2.2.60.(2), 3.2.2.66.(2), 3.2.2.76.(2) and 3.2.2.83.(2) for noncombustible construction.
2) The requirements of Sentence (1) are waived provided
   a) the combustible material above the roof deck is protected by not less than 12.7 mm thick
      gypsum board, mechanically fastened to a supporting assembly if located beneath the roof deck, or
      by a thermal barrier conforming to one of Clauses 3.1.5.15.(2)(c) to (e) that is located
         i) on the underside of the combustible material, or
         ii) beneath the roof deck,
   b) the building is sprinklered throughout, or
   c) the roof assembly has a fire-resistance rating not less than 45 min.

3.1.14.3. Overhead Skylight Glazing
1) All skylights shall be glazed with wired glass, laminated safety glass or combustible glazing, which is
   anchored to the skylight frame and to the building structure. (See Note A-3.1.14.3.)

3.1.14.4. Green Roof Assemblies
1) A green roof assembly is permitted in combustible and noncombustible construction if
   a) the green roof assembly is designed and constructed in conformance with ANSI/SPRI VF-1
      “External Fire Design Standard for Vegetative Roofs”,
   b) gravity loads on the building structure are determined by ASTM E2397-11 “Standard Practice for
      Determination of Dead Loads and Live Loads Associated with Vegetative (Green) Roof Systems”,
   c) the green roof assembly is designed and constructed with a root barrier,
   d) the green roof assembly is designed and constructed with water retention materials to support
      vegetative growth, and
   e) the drainage layer of the green roof assembly is designed to accommodate rainwater harvesting
      and conforms to f) ASTM E2398-11 “Standard Test Method for Water Capture and Media Retention
      of Geocomposite Drain Layers for Vegetative (Green) Roof Systems”.

2) In addition to the requirements in Sentence (1), the roof assembly which supports a green roof assembly
   shall conform with Subsection 3.1.15., except for Part 9 buildings.
3) In addition to the requirements in Sentence (1), the roof assembly which supports a green roof assembly
   shall conform with Part 5.

3.1.15. Roof Covering

3.1.15.1. Roof Covering Classification
1) A roof covering classification shall be determined in conformance with CAN/ULC-S107, “Fire Tests of
   Roof Coverings.”

3.1.15.2. Roof Coverings
1) Except as provided in Sentences (2) and (3), every roof covering shall have a Class A, B or C
   classification as determined in accordance with Article 3.1.15.1.
2) A roof covering is not required to have a Class A, B or C classification for
   a) a tent,
   b) an air-supported structure,
   c) a building of Group A, Division 2 occupancy not more than 2 storeys in building height and not
      more than 1 000 m² in building area provided the roof covering is underlaid with noncombustible
      material, or
   d) a steel building system referred to in Article 4.3.4.3., provided the roof covering consists of brick,
      masonry, concrete, metal sheets or metal shingles.

3) Except as provided in Sentence (4), roof coverings on buildings conforming to Article 3.2.2.50. or
   3.2.2.58. shall have a Class A classification where the roof height is greater than 25 m measured from the
   floor of the first storey to the highest point of the roof.
4) Where buildings conforming to Article 3.2.2.50. or 3.2.2.58. include non-contiguous roof assemblies at different elevations, the roof coverings referred to in Sentence (3) are permitted to be evaluated separately to determine the roof covering classification required.

3.1.16. Fabrics

3.1.16.1. Fabric Canopies and Marquees

1) Fabrics used as part of an awning, canopy or marquee that is located within or attached to a building of any type of construction shall conform to CAN/ULC-S109, "Flame Tests of Flame-Resistant Fabrics and Films."

3.1.17. Occupant Load

3.1.17.1. Occupant Load Determination

1) The occupant load of a floor area or part of a floor area shall be based on
   a) the number of seats in an assembly occupancy having fixed seats,
   b) 2 persons per sleeping room in a dwelling unit, or
   c) the number of persons for which the area is designed, but not less than that determined from Table 3.1.17.1. for occupancies other than those described in Clauses (a) and (b), unless it can be shown that the area will be occupied by fewer persons.

2) If a floor area or part thereof has been designed for an occupant load other than that determined from Table 3.1.17.1., a permanent sign indicating that occupant load shall be posted in a conspicuous location.

**Notes to Table 3.1.17.1.:**

1) See Clause 3.1.17.1.(1)(a).
2) See Clause 3.1.17.1.(1)(b) (apply values for dwelling units to suites of care occupancy).
3) See Note A-3.3.
4) See Note A-3.1.17.1.

---

3) For the purposes of this Article, mezzanines, tiers and balconies shall be regarded as part of the floor area.
4) If a room or group of rooms is intended for different occupancies at different times, the value to be used from Table 3.1.17.1. shall be the value which gives the greatest number of persons for the occupancies concerned.

### Section 3.2. Building Fire Safety

#### 3.2.1. General

**3.2.1.1. Exceptions in Determining Building Height**

1) A roof-top enclosure shall not be considered as a storey in calculating the building height if the roof-top enclosure is
   a) provided for elevator machinery, a stairway or a service room, and
   b) used for no purpose other than for service to the building.
   (See Note A-3.2.1.1.(1).)
2) Space under tiers of seats in a building of the arena type shall not be considered as adding to the building height provided the space is used only for dressing rooms, concession stands and similar purposes incidental to the major occupancy of the building.
3) Except as required by Sentence (5), the space above a mezzanine need not be considered as a storey in calculating the building height, provided
   a) not less than 60% of the horizontal plane separating the mezzanine from the room or floor space in which it is located is open, and
   b) except as permitted in Sentences (7) and 3.3.2.13.(3), the space above the mezzanine is used as an open area without partitions or subdividing walls higher than 1 070 mm above the mezzanine floor.
   (See Note A-3.2.1.1.(3).)
4) Except as required by Sentence (5), the space above a mezzanine need not be considered as a storey in calculating the building height, provided
   a) the aggregate area of mezzanines that are not superimposed and do not meet the conditions of Sentence (3) does not exceed 10% of the floor area in which they are located, and
   b) the area of a mezzanine in a suite does not exceed 10% of the area of that suite.
   (See Note A-3.2.1.1.(4).)
5) Except as permitted by Sentence (6), each level of mezzanine that is partly or wholly superimposed above the first level of mezzanine shall be considered as a storey in calculating the building height.
6) Platforms intended solely for periodic inspection and elevated maintenance catwalks need not be considered as floor assemblies or mezzanines for the purpose of calculating building height, provided
a) they are not used for storage, and
b) they are constructed with noncombustible materials, unless the building is permitted to be of combustible construction.

7) The space above a mezzanine conforming to Sentence (3) is permitted to include an enclosed space whose area does not exceed 10% of the horizontal plane separating the mezzanine from the room or floor space in which the mezzanine is located, provided the enclosed space does not obstruct visual communication between the open space above the mezzanine and the room in which it is located. (See Figure A-3.2.1.1.(3)-D.)

8) A service space in which facilities are included to permit a person to enter and to undertake maintenance and other operations pertaining to building services from within the service space need not be considered a storey if it conforms to Articles 3.2.5.14. and 3.3.1.24., and Sentences 3.2.4.18.(10), 3.2.7.3.(2), 3.3.1.3.(7), 3.4.2.4.(3) and 3.4.4.4.(9). (See Note A-3.2.1.1.(8).)

3.2.1.2. Storage Garage Considered as a Separate Building
1) A basement used primarily as a storage garage is permitted to be considered as a separate building for the purposes of Subsection 3.2.2. and Sentences 3.2.5.12.(2) and (3), provided the floor and roof assemblies above the basement and the exterior walls of the basement above the adjoining ground level are constructed as fire separations of noncombustible construction having a fire-resistance rating not less than 2 h and protected in conformance with Clause 3.1.10.2.(4)(a), except as permitted by Sentence (2). (See Notes A-3.1.10.2.(4) and A-3.2.5.12.(2).)

2) The exterior wall of a basement that is required to be a fire separation with a fire-resistance rating in accordance with Sentence (1) is permitted to be penetrated by openings that are not protected by closures provided
   a) the storage garage is sprinklered throughout,
   b) every opening in the exterior wall is separated from storeys above the opening by a projection of the floor or roof assembly above the basement, extending not less than
      i) 1 m beyond the exterior face of the storage garage if the upper storeys are required to be of noncombustible construction, or
      ii) 2 m beyond the exterior face of the storage garage if the upper storeys are permitted to be of combustible construction, or
   c) the exterior walls of any storeys located above the floor or roof assembly referred to in Sentence (1) are recessed behind the outer edge of the assembly by not less than
      i) 1 m if the upper storeys are required to be of noncombustible construction, or
      ii) 2 m if the upper storeys are permitted to be of combustible construction.

3) The floor or roof assembly projection referred to in Clause (2)(b) shall have a fire-resistance rating not less than 2 h and shall have no openings within the projection.

3.2.1.3. Roof Considered as a Wall
1) For the purposes of this Section any part of a roof that is pitched at an angle of 60° or more to the horizontal and is adjacent to a space intended for occupancy within a building shall be considered as part of an exterior wall of the building.

3.2.1.4. Floor Assembly over Basement
1) Except as permitted by Sentence 3.2.2.47.(3), 3.2.2.48.(3), 3.2.2.49.(3), 3.2.2.51.(3), 3.2.2.52.(3), 3.2.2.53.(3) or 3.2.2.54.(3), a floor assembly immediately above a basement shall be constructed as a fire separation having a fire-resistance rating conforming to the requirements of Articles 3.2.2.20. to 3.2.2.90. for a floor assembly, but not less than 45 min.

2) All loadbearing walls, columns and arches supporting a floor assembly immediately above a basement shall have a fire-resistance rating not less than that required by Sentence (1) for the floor assembly.
3.2.1.5. Fire Containment in Basements

1) In a building in which an automatic sprinkler system is not required to be installed by Article 3.2.2.18., every basement shall
   a) be sprinklered throughout, or
   b) be subdivided into fire compartments not more than 600 m² in area by a fire separation having a fire-resistance rating not less than that required for the floor assembly immediately above the basement.

2) Deleted.

3.2.1.6. Mezzanines

1) The floor assembly of a mezzanine that is required to be considered as a storey in calculating the building height shall be constructed in conformance with the fire separation requirements for floor assemblies stated in Articles 3.2.2.20. to 3.2.2.90.

3.2.1.7. Fire Containment in Combustible Buildings

1) All Group C major occupancies in a building of combustible construction greater than 2 storeys in building height shall be separated from all other major occupancies except as prohibited in Article 3.1.3.2. and except as permitted in Sentence (2) and (3), by a fire separation with at least a 2 h fire-resistance rating constructed of
   a) concrete,
   b) masonry, or
   c) in a sprinklered building, encapsulated mass timber construction in accordance with Sentence (4) or (5).

2) The fire-resistance rating required in Sentence (1) is permitted to be 1.5 h for a storage garage.

3) The fire separation of every exit, elevator and vertical service shaft that penetrates a concrete, masonry, or encapsulated mass timber floor assembly as required in Sentence (1) shall be separated from the remainder of the building by a fire separation having a fire-resistance rating determined by Sentences (1) or (2) for
   a) the floor assembly above the storey, or
   b) the floor assembly below the storey, if there is no floor assembly above.

4) Where a building of combustible construction greater than 2 storeys in building height contains an occupancy other than Group C or Group D on the second or third storey that is required to be constructed in accordance with Sentences 3.2.2.50.(5) or 3.2.2.58.(4), the building shall
   a) be sprinklered,
   b) be divided into at least two horizontal fire compartments on each storey containing a major occupancy other than Group C or Group D which are
      i) not more than 1000 m² in area, and
      ii) constructed as fire separations with at least a 2 h fire-resistance rating,
   c) exit stairs serving storeys above the third storey shall be constructed as fire separations with at least a 2 h fire-resistance rating, and
   d) each fire compartment required by Clause (b) shall be served by at least one exit stair.

(See Note A-3.2.1.7.(4) )

5) Encapsulated mass timber construction as identified in Sentence (1)(c) and in fire separations required by Sentence (4) shall consist of structural mass timber elements, including beams, columns, arches, and wall, floor and roof assemblies encapsulated in a continuous fire-resistive membrane and (See Note A-3.2.1.7.(5).)
   a) be arranged in heavy solid masses containing no concealed spaces,
   b) have essentially smooth flat surfaces with no thin sections or sharp projections,
   c) timber elements shall conform to the minimum dimensions stated in Table 3.2.1.7.(5),
d) adhesives used in structural mass timber elements provided in accordance with Clause (1)(c) that are constructed of cross-laminated timber shall conform to the elevated temperature performance requirements in ANSI/APA PRG 320 “Standard for Performance-Rated Cross-Laminated Timber.”,

e) the exposed surfaces of structural timber elements conforming to clause (d) shall be protected from adjacent spaces in the building, including adjacent concealed spaces within wall, floor and roof assemblies, by a fire-resistive membrane consisting of a minimum of two layers of 5/8” thickness type ‘X’ or two layers of 1/2” thickness type ‘C’ gypsum board, or gypsum-concrete topping and concrete not less than 38 mm thick when installed on the upper side of a mass timber floor or roof assembly, and

(See Note A-3.2.1.7.(5).)

f) gypsum board membranes shall be installed with staggered joints, and mechanically fastened directly to the mass timber elements with fasteners spaced not more than 300 mm o.c. and 20 mm to 38 mm from the boards’ edges.

Note to Table 3.2.1.7.(5):
(1) See Note A-Table 3.2.1.7.(5)

3.2.2. Building Size and Construction Relative to Occupancy

3.2.2.1. Application

1) Except as permitted by Article 3.2.2.3., a building shall be constructed in conformance with this Subsection to prevent fire spread and collapse caused by the effects of fire. (See Subsection 3.1.3. for fire separations between major occupancies.)

3.2.2.2. Special and Unusual Structures

1) A structure that cannot be identified with the characteristics of a building in Articles 3.2.2.20. to 3.2.2.90. shall be protected against fire spread and collapse in conformance with good fire protection engineering practice. (See Note A-3.2.2.2.(1).) (See also Notes A-3 and A-3.2.5.12.(1).)

3.2.2.3. Exceptions to Structural Fire Protection

1) Fire protection is not required for

a) steel lintels above openings not more than 2 m wide in loadbearing walls and not more than 3 m wide in non-loadbearing walls,
b) steel lintels above openings more than 2 m wide in loadbearing walls and more than 3 m wide in non-loadbearing walls provided the lintels are supported at intervals of not more than 2 m by structural members with the required fire-resistance rating,
c) the bottom flanges of shelf angles and plates that are not a part of the structural frame,
d) steel members for framework around elevator hoistway doorways, steel for the support of elevator and dumbwaiter
d) guides, counterweights and other similar equipment, that are entirely enclosed in a hoistway and are not a part of the structural frame of the building,
e) steel members of stairways and escalators that are not a part of the structural frame of a building,
f) steel members of porches, exterior balconies, exterior stairways, fire escapes, cornices, marquees and other similar appurtenances, provided they are outside an exterior wall of a building, and
g) loadbearing steel or concrete members wholly or partly outside a building face in a building not more than 4 storeys in building height and classified as Group A, B, C, D or F, Division 3 major occupancy provided the members are
i) not less than 1 m away from any unprotected opening in an exterior wall, or
ii) shielded from heat radiation in the event of a fire within the building by construction that will provide the same degree of protection that would be necessary if the member was located inside the building, with the protection extending on either side of the member a distance equal to the projection of the member from the face of the wall.

(See also Article 3.2.3.9.)

3.2.2.4. Buildings with Multiple Major Occupancies
1) The requirements restricting fire spread and collapse for a building of a single major occupancy classification are provided in this Subsection according to its building height and building area.
2) If a building contains more than one major occupancy, classified in more than one Group or Division, the requirements of this Subsection concerning building size and construction relative to major occupancy shall apply according to Articles 3.2.2.5. to 3.2.2.8.

3.2.2.5. Applicable Building Height and Area
1) In determining the fire safety requirements of a building in relation to each of the major occupancies contained therein, the building height and building area of the entire building shall be used.

3.2.2.6. Multiple Major Occupancies
1) Except as permitted by Articles 3.2.2.7. and 3.2.2.8., and Sentences 3.2.2.50.(5) and 3.2.2.58.(4) in a building containing more than one major occupancy, the requirements of this Subsection for each portion of the building containing a major occupancy contained shall apply to the whole building.

3.2.2.7. Superimposed Major Occupancies
1) Except as provided in Article 3.2.2.8., Sentence 3.2.2.18.(2), and Sentences 3.2.2.50.(5) and 3.2.2.58.(4), in a building in which one major occupancy is located entirely above another major occupancy, the requirements in this Subsection for each portion of the building containing a major occupancy shall apply to that portion as if the entire building were of that major occupancy.
2) If one major occupancy is located above another major occupancy, the fire-resistance rating of the floor assembly between the major occupancies shall be determined on the basis of the requirements of this Subsection for the lower major occupancy. (See also Article 3.1.3.1.) (See Note A-3.2.2.7.(2).)
3) Reserved.
4) Reserved.

3.2.2.8. Exceptions for Major Occupancies
1) In a building in which the aggregate area of all major occupancies in a particular Group or Division is not more than 10% of the floor area of the storey in which they are located, these major occupancies need not be considered as major occupancies for the purposes of this Subsection, provided they are not classified as Group F, Division 1 or 2 occupancies.

3.2.2.9. Crawl Spaces
1) For the purposes of Articles 3.1.11.6., 3.2.1.4. and 3.2.1.5., a crawl space shall be considered as a basement if it is
   a) more than 1.8 m high between the lowest part of the floor assembly and the ground or other surface below,
   b) used for any occupancy,
   c) used for the passage of flue pipes, or
   d) used as a plenum in combustible construction.
2) A floor assembly immediately above a crawl space is not required to be constructed as a fire separation and is not required to have a fire-resistance rating provided the crawl space is not required to be considered as a basement by Sentence (1).

3.2.2.10. Streets
1) Every building shall face a street located in conformance with the requirements of Articles 3.2.5.4. and 3.2.5.5. for access routes.
2) For the purposes of Subsections 3.2.2. and 3.2.5. an access route conforming to Subsection 3.2.5. is permitted to be considered as a street.
3) A building conforming to Article 3.2.2.50. or 3.2.2.58. is considered to face 1 street where not less than 10% of the building perimeter is located within 15 m of a street or streets.
4) A building is considered to face 2 streets provided not less than 50% of the building perimeter is located within 15 m of the street or streets.
5) A building is considered to face 3 streets provided not less than 75% of the building perimeter is located within 15 m of the street or streets.
6) Enclosed spaces, tunnels, bridges and similar structures, even though used for vehicular or pedestrian traffic, are not considered as streets for the purpose of this Part.

3.2.2.11. Exterior Balconies
1) An exterior balcony shall be constructed in accordance with the type of construction required by Articles 3.2.2.20. to 3.2.2.90., as applicable to the occupancy classification of the building.

3.2.2.12. Exterior Passageways
1) An elevated exterior passageway used as part of a means of egress shall conform to the requirements of Articles 3.2.2.20. to 3.2.2.90. for mezzanines.

3.2.2.13. Occupancy on Roof
1) A portion of a roof that supports an occupancy shall be constructed in conformance with the fire separation requirements of Articles 3.2.2.20. to 3.2.2.90. for floor assemblies, and not the fire-resistance rating for roof assemblies.

3.2.2.14. Roof-Top Enclosures
1) A roof-top enclosure for elevator machinery or for a service room shall be constructed in accordance with the type of construction required by Articles 3.2.2.20. to 3.2.2.90.
2) A roof-top enclosure for elevator machinery or for a service room, not more than one storey high, is not required to have a fire-resistance rating.
3) A roof-top enclosure for a stairway shall be constructed in accordance with the type of construction required by Articles 3.2.2.20. to 3.2.2.90.
4) A roof-top enclosure for a stairway need not have a fire-resistance rating nor be constructed as a fire separation.

3.2.2.15. Storeys below Ground

1) If a building is erected entirely below the adjoining finished ground level and does not extend more than one storey below that ground level, the minimum precautions against fire spread and collapse shall be the same as are required for basements under a building of 1 storey in building height having the same occupancy and building area.

2) If any portion of a building is erected entirely below the adjoining finished ground level and extends more than one storey below that ground level, the following minimum precautions against fire spread and collapse shall be taken (See Note A-3.2.2.15.(2).)
   a) the basements shall be sprinklered throughout,
   b) a floor assembly below the ground level shall be constructed as a fire separation with a fire-resistance rating not less than
      i) 3 h if the basements are used as Group E or Group F, Division 1 or 2 occupancies, or
      ii) 2 h if the basements are not used as Group E or Group F, Division 1 or 2 occupancies, and
   c) all loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the construction that they support.

3) Deleted.

3.2.2.16. Heavy Timber Roof Permitted

1) Unless otherwise permitted by Articles 3.2.2.20. to 3.2.2.90., a roof assembly in a building up to 2 storeys in building height is permitted to be of heavy timber construction regardless of building area or type of construction required, provided the building is sprinklered throughout.

2) If Sentence (1) permits a roof assembly to be of heavy timber construction, structural members in the storey immediately below the roof assembly are permitted to be of heavy timber construction.

3.2.2.17. Arena-Type Building Roof Assembly

1) The requirements for a roof assembly to have a fire-resistance rating are permitted to be waived for a gymnasium, a swimming pool, an arena, or a rink if no part of the roof assembly is less than 6 m above the main floor or balcony and the roof carries no loads other than normal roof loads, including permanent access walks, and ventilating, sound and lighting equipment, except that the restriction concerning minimum distance shall not apply to
   a) an inclined and stepped floor ascending from the main floor which is used for seating purposes only, or
   b) a balcony used for seating purposes only.

3.2.2.18. Automatic Sprinkler System Required

1) Except as required by Sentence (2) and (3), an automatic sprinkler system conforming to the requirements of Articles 3.2.4.7., 3.2.4.8., 3.2.4.9. and 3.2.5.12. shall be installed throughout a building regulated by one or more of Articles 3.2.2.20., 3.2.2.21., 3.2.2.22., 3.2.2.23., 3.2.2.24., 3.2.2.26., 3.2.2.27., 3.2.2.29., 3.2.2.31., 3.2.2.33., 3.2.2.36., 3.2.2.37., 3.2.2.38., 3.2.2.39., 3.2.2.40., 3.2.2.41., 3.2.2.42., 3.2.2.43., 3.2.2.44., 3.2.2.45., 3.2.2.46., 3.2.2.47., 3.2.2.48., 3.2.2.50., 3.2.2.51., 3.2.2.54., 3.2.2.55., 3.2.2.57., 3.2.2.58., 3.2.2.59., 3.2.2.61., 3.2.2.63., 3.2.2.64., 3.2.2.65., 3.2.2.67., 3.2.2.69., 3.2.2.70., 3.2.2.71., 3.2.2.72., 3.2.2.74., 3.2.2.75., 3.2.2.77., 3.2.2.79., 3.2.2.80., 3.2.2.82., 3.2.2.84., 3.2.2.86. and 3.2.2.88.

2) If a storey in a building or a floor area is required to have an automatic sprinkler system installed throughout in accordance with one or more of Articles 3.2.2.20. to 3.2.2.90. or Section 3.3., the automatic sprinkler system shall also be installed throughout all lower storeys in the building notwithstanding
permission in Articles 3.2.2.20. to 3.2.2.90. to construct one or more of those storeys without installing automatic sprinkler protection.
(See Note A-3.2.2.18.(2).)

3) Except for buildings described in Sentence 1.3.3.6.(2) of Division A, all newly constructed buildings shall be provided with an automatic sprinkler system designed and installed in accordance with Article 3.2.5.12.

4) Where an assembly occupancy is located in a basement, the basement shall be sprinklered throughout.

3.2.2.19. Buildings Containing Impeded Egress Zones

1) A building containing an impeded egress zone and conforming to the appropriate requirements of Articles 3.2.2.20. to 3.2.2.90. is not required to conform to the requirements of Articles 3.2.2.36. and 3.2.2.37. for a Group B, Division 1 major occupancy provided
   a) the building is sprinklered throughout,
   b) it is not more than 1 storey in building height,
   c) it does not include
      i) a contained use area,
      ii) sleeping accommodation,
      iii) a high-hazard industrial occupancy, or
      iv) a mercantile occupancy,
   d) the building area is not more than 6 400 m² if the building includes a medium-hazard industrial occupancy,
   e) the impeded egress zone does not extend beyond the boundaries of the fire compartment in which it is located, and
   f) the occupant load of the impeded egress zone is not more than 100.

3.2.2.20. Group A, Division 1, Any Height, Any Area, Sprinklered

1) Except as permitted by Articles 3.2.2.21. and 3.2.2.22., a building classified as Group A, Division 1 shall conform to Sentence (2).

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinklered throughout,
   b) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
   c) mezzanines shall have a fire-resistance rating not less than 1 h, and
   d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.21. Group A, Division 1, One Storey, Limited Area, Sprinklered

1) A building classified as Group A, Division 1 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 1 storey in building height,
   c) it has less than 40% of the area of the building as 2 storeys for the purpose of
      i) development of productions, including preparation of scenery and costumes and rehearsal of performers,
      ii) organization of performers, scenery and sound equipment,
      iii) preparation by performers for a performance,
      iv) managerial functions, or
      v) toilets, rest rooms and similar public facilities,
   d) it has no occupancy above or below the auditorium other than one which serves it or is dependent on it,
   e) it is not more than 600 m² in building area, and
f) the occupant load is not more than 600.

2) The building referred to in Sentence (1) is permitted to be of heavy timber construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations
      i) with a fire-resistance rating not less than 45 min, or
      ii) of heavy timber construction, and
   b) loadbearing walls, columns and arches shall
      i) have a fire-resistance rating not less than that required for the supported assembly, or
      ii) be of heavy timber construction.

3.2.2.22. Group A, Division 1, One Storey, Sprinklered
   1) A building classified as Group A, Division 1 is permitted to conform to Sentence (2) provided
      a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
      b) it is not more than 1 storey in building height,
      c) no part of an auditorium floor is more than 5 m above or below grade,
      d) no occupancy is above or below the auditorium other than one which serves it or is dependent on it, and
      e) the occupant load of the auditorium floor is not more than 300.
   2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly, or in combination, and
      a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
      b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
      c) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
         i) have a fire-resistance rating not less than 45 min, or
         ii) be of noncombustible construction, and
      d) loadbearing walls, columns and arches supporting a fire separation shall have a fire-resistance rating not less than that required for the fire separation.

3.2.2.23. Group A, Division 2, Any Height, Any Area, Sprinklered
   1) Except as permitted by Articles 3.2.2.24. to 3.2.2.28., a building classified as Group A, Division 2 shall conform to Sentence (2).
   2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
      a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinklered throughout,
      b) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
      c) mezzanines shall have a fire-resistance rating not less than 1 h, and
      d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.24. Group A, Division 2, up to 6 Storeys, Any Area, Sprinklered
   1) A building classified as Group A, Division 2, that is not limited by building area, is permitted to conform to Sentence (2), provided
      a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout, and
      b) it is not more than 6 storeys in building height.
   2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

3.2.2.25. Group A, Division 2, up to 2 Storeys

1) A building classified as Group A, Division 2 is permitted to conform to Sentence (2) provided
   a) it is not more than 2 storeys in building height, and
   b) it has a building area not more than the value in Table 3.2.2.25.

Table 3.2.2.25.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
   c) roof assemblies shall have, if of combustible construction, a fire-resistance rating not less than 45 min, except that in a building not more than 1 storey in building height, the fire-resistance rating is permitted to be waived provided the roof assembly is constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1., and the building area is not more than
      i) 800 m² if facing one street,
      ii) 1 000 m² if facing 2 streets, or
      iii) 1 200 m² if facing 3 streets, and
   d) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction.

3.2.2.26. Group A, Division 2, up to 2 Storeys, Increased Area, Sprinklered

1) A building classified as Group A, Division 2 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 2 storeys in building height, and
   c) it has a building area not more than
      i) 4 800 m² if 1 storey in building height, or
      ii) 2 400 m² if 2 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min,

b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
c) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
   i) have a fire-resistance rating not less than 45 min, or
   ii) be of noncombustible construction.

3.2.2.27. Group A, Division 2, up to 2 Storeys, Sprinklered

1) A building classified as Group A, Division 2 is permitted to be of combustible construction or noncombustible construction, used singly or in combination, provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 2 storeys in building height, and
   c) it has a building area not more than
      i) 2 400 m² if 1 storey in building height with no basement,
      ii) 1 200 m² if 1 storey in building height, or
      iii) 600 m² if 2 storeys in building height.

3.2.2.28. Group A, Division 2, One Storey

1) A building classified as Group A, Division 2 is permitted to be of combustible construction or noncombustible construction, used singly or in combination, provided
   a) it is not more than 1 storey in building height, and
   b) except as permitted by Sentence (2), it has a building area not more than
      i) 400 m² if facing one street,
      ii) 500 m² if facing 2 streets, or
      iii) 600 m² if facing 3 streets.

2) In a building referred to in Sentence (1) without a basement, the building area limits of Sentence (1) are permitted to be doubled provided a fire separation with a fire-resistance rating not less than 1 h is used to separate the building into fire compartments, each one of which does not exceed the limits of Clause (1)(b).

3.2.2.29. Group A, Division 3, Any Height, Any Area, Sprinklered

1) Except as permitted by Articles 3.2.2.30. to 3.2.2.34., a building classified as Group A, Division 3 shall conform to Sentence (2).

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinklered throughout,
   b) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
   c) mezzanines shall have a fire-resistance rating not less than 1 h, and
   d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.30. Group A, Division 3, up to 2 Storeys

1) A building classified as Group A, Division 3 is permitted to conform to Sentence (2) provided
   a) it is not more than 2 storeys in building height, and
   b) it has a building area not more than the value in Table 3.2.2.30.

Table 3.2.2.30.

2) Except as permitted by Clauses (c) and (d), the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h,
   c) roof assemblies shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of heavy timber construction, and
   d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly, except that arches and structural members within the storey immediately below a roof assembly are permitted to be of heavy timber construction.

3) If intended for occasional use for trade shows and similar exhibition purposes, a building referred to in Sentence (1) that is more than 1 500 m² in building area shall be sprinklered throughout.

3.2.2.31. Group A, Division 3, up to 2 Storeys, Sprinklered

1) A building classified as Group A, Division 3 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 2 storeys in building height, and
   c) it has a building area not more than
      i) 12 000 m² if 1 storey in building height, or
      ii) 6 000 m² if 2 storeys in building height.

2) Except as permitted by Clause (c) and Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly, except that arches are permitted to be of heavy timber construction.

3.2.2.32. Group A, Division 3, One Storey, Increased Area

1) A building classified as Group A, Division 3 is permitted to conform to Sentence (2) provided
   a) it is not more than 1 storey in building height, and
   b) it has a building area not more than
      i) 2 400 m² if facing one street,
      ii) 3 000 m² if facing 2 streets, or
      iii) 3 600 m² if facing 3 streets.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
b) roof assemblies shall have, if of combustible construction, a fire-resistance rating not less than 45 min, except that the fire-resistance rating is permitted to be waived provided the roof assembly is constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1., and the building area is not more than
i) 1 200 m² if facing one street,
ii) 1 500 m² if facing 2 streets, or
iii) 1 800 m² if facing 3 streets, and
c) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
i) have a fire-resistance rating not less than 45 min, or
ii) be of noncombustible construction.

3) If intended for occasional use for trade shows and similar exhibition purposes, a building referred to in Sentence (1) that is more than 1 500 m² in building area shall be sprinklered throughout.

3.2.2.33. Group A, Division 3, One Storey, Sprinklered
1) A building classified as Group A, Division 3 is permitted to be of combustible construction or noncombustible construction used singly or in combination provided
a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 1 storey in building height, and
c) it has a building area not more than 7 200 m².

3.2.2.34. Group A, Division 3, One Storey
1) A building classified as Group A, Division 3 is permitted to be of combustible construction or noncombustible construction used singly or in combination provided
a) it is not more than 1 storey in building height, and
b) it has a building area not more than
i) 1 000 m² if facing one street,
ii) 1 250 m² if facing 2 streets, or
iii) 1 500 m² if facing 3 streets.

3.2.2.35. Group A, Division 4
1) Except as permitted by Sentences (2) and (3), a building classified as Group A, Division 4 shall be of noncombustible construction.
2) Roof assemblies and supporting arches and columns are permitted to be of heavy timber construction.
3) A building classified as Group A, Division 4 is permitted to be of combustible construction provided
   a) the occupant load is less than 1 500, and
   b) the building has a limiting distance not less than 6 m.
4) Sprinklers shall be installed in all spaces below tiers of seats in a building classified as Group A, Division 4 if those spaces are used for occupancy. (See Note A-3.2.2.35.(4).)

3.2.2.36. Group B, Division 1, Any Height, Any Area, Sprinklered
1) Except as permitted by Article 3.2.2.37., a building classified as Group B, Division 1 shall conform to Sentence (2).
2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinklered throughout,
   b) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
   c) mezzanines shall have a fire-resistance rating not less than 1 h, and
d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.37. Group B, Division 1, up to 3 Storeys, Sprinklered

1) A building classified as Group B, Division 1 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 3 storeys in building height, and
   c) it has a building area
      i) that is not limited if the building is not more than 1 storey in building height,
      ii) not more than 12,000 m² if 2 storeys in building height, or
      iii) not more than 8,000 m² if 3 storeys in building height.

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.38. Group B, Division 2, Any Height, Any Area, Sprinklered

1) Except as permitted by Articles 3.2.2.39. to 3.2.2.41., a building classified as Group B, Division 2 shall conform to Sentence (2).

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinklered throughout,
   b) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
   c) mezzanines shall have a fire-resistance rating not less than 1 h, and
   d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.39. Group B, Division 2, up to 3 Storeys, Sprinklered

1) A building classified as Group B, Division 2 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 3 storeys in building height, and
   c) it has a building area
      i) that is not limited if the building is not more than 1 storey in building height,
      ii) not more than 12,000 m² if 2 storeys in building height, or
      iii) not more than 8,000 m² if 3 storeys in building height.

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.40. Group B, Division 2, up to 2 Storeys, Sprinklered

1) A building classified as Group B, Division 2 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

b) it is not more than 2 storeys in building height, and
c) it has a building area not more than
   i) 2 400 m² if 1 storey in building height, or
   ii) 1 600 m² if 2 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.41. Group B, Division 2, One Storey, Sprinklered
   1) A building classified as Group B, Division 2 is permitted to be of combustible construction or noncombustible construction, used singly or in combination, provided
      a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
      b) it is not more than 1 storey in building height, and
      c) it has a building area not more than 500 m².

3.2.2.42. Group B, Division 3, Any Height, Any Area, Sprinklered
   1) Except as permitted by Articles 3.2.2.43. to 3.2.2.46., a building classified as Group B, Division 3 shall conform to Sentence (2).
   2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
      a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinklered throughout,
      b) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
      c) mezzanines shall have a fire-resistance rating not less than 1 h, and
      d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.43. Group B, Division 3, up to 3 Storeys (Noncombustible), Sprinklered
   1) A building classified as Group B, Division 3 is permitted to conform to Sentence (2) provided
      a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
      b) it is not more than 3 storeys in building height, and
      c) it has a building area
         i) that is not limited if the building is not more than 1 storey in building height,
         ii) not more than 12 000 m² if 2 storeys in building height, or
         iii) not more than 8 000 m² if 3 storeys in building height.
   2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
      a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
      b) mezzanines shall have a fire-resistance rating not less than 1 h, and
      c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.44. Group B, Division 3, up to 3 Storeys, Sprinklered
   1) A building classified as Group B, Division 3 is permitted to conform to Sentence (2) provided
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 3 storeys in building height, and
c) it has a building area not more than
   i) 5 400 m² if 1 storey in building height,
   ii) 2 700 m² if 2 storeys in building height, or
   iii) 1 800 m² if 3 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction, used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.45. Group B, Division 3, up to 2 Storeys, Sprinklered

1) A building classified as Group B, Division 3 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 2 storeys in building height, and
   c) it has a building area not more than
      i) 2 400 m² if 1 storey in building height, or
      ii) 1 600 m² if 2 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction, used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.46. Group B, Division 3, One Storey, Sprinklered

1) A building classified as Group B, Division 3 is permitted to be of combustible construction or noncombustible construction, used singly or in combination, provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 1 storey in building height, and
   c) it has a building area not more than 600 m².

3.2.2.47. Group C, Any Height, Any Area, Sprinklered

1) Except as permitted by Articles 3.2.2.48. to 3.2.2.54., a building classified as Group C shall conform to Sentence (2).

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinklered throughout,
   b) except as permitted by Sentence (3), floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
   c) mezzanines shall have a fire-resistance rating not less than 1 h, and
   d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.
3) In a building that contains dwelling units that have more than one storey, subject to the requirements of Sentence 3.3.4.2.(3), the floor assemblies, including floors over basements, which are entirely contained within these dwelling units, shall have a fire-resistance rating not less than 1 h but need not be constructed as fire separations.

3.2.2.48. Group C, up to 6 Storeys, Sprinklered, Noncombustible Construction

1) A building classified as Group C is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 6 storeys in building height, and
   c) it has a building area
      i) that is not limited if the building is not more than 2 storeys in building height,
      ii) not more than 12 000 m² if 3 storeys in building height,
      iii) not more than 9 000 m² if 4 storeys in building height,
      iv) not more than 7 200 m² if 5 storeys in building height, or
      v) not more than 6 000 m² if 6 storeys in building height.

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) except as permitted by Sentence (3), floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3) In a building that contains dwelling units that have more than one storey, subject to the requirements of Sentence 3.3.4.2.(3), the floor assemblies, including floors over basements, which are entirely contained within these dwelling units, shall have a fire-resistance rating not less than 1 h but need not be constructed as fire separations.

3.2.2.49. Group C, up to 3 Storeys, Noncombustible Construction

1) A building classified as Group C is permitted to conform to Sentence (2) provided
   a) it is not more than 3 storeys in building height, and
   b) it has a building area not more than the value in Table 3.2.2.49.

   Table 3.2.2.49.

   Maximum Building Area, Group C, up to 3 Storeys

2) The building referred to in Sentence (1) shall be of noncombustible construction, and
   a) except as permitted by Sentence (3), floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h,
   c) roof assemblies shall have a fire-resistance rating not less than 1 h, and
3.2.2.50. Group C, up to 6 Storeys, Sprinklered

1) A building classified as Group C is permitted to conform to Sentence (2), provided
   a) it is sprinklered throughout,
   b) it is not more than 6 storeys in building height,
   c) it has a height not more than 18 m measured between the floor of the first storey and the uppermost floor level that does not serve a rooftop enclosure for elevator machinery, a stairway or a service room used only for service to the building, and
   d) it has a building area not more than
      i) 9 000 m² if 1 storey in building height,
      ii) 4 500 m² if 2 storeys in building height,
      iii) 3 000 m² if 3 storeys in building height,
      iv) 2 250 m² if 4 storeys in building height,
      v) 1 800 m² if 5 storeys in building height, or
      vi) 1 500 m² if 6 storeys in building height.

2) Buildings referred to in Sentence (1) are permitted to be of combustible construction or noncombustible construction, used singly or in combination, and
   a) except as provided in Sentence (3), floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) roof assemblies shall have a fire-resistance rating not less than 1 h,
   c) except as provided in Sentence (4), where the roof assembly has a height greater than 25 m measured from the floor of the first storey to the highest point of the roof assembly, the roof assembly shall be constructed of noncombustible construction or fire-retardant-treated wood conforming to Article 3.1.4.5.,
   d) mezzanines shall have a fire-resistance rating not less than 1 h, and
   e) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3) In a building that contains dwelling units that have more than one storey, subject to the requirements of Sentence 3.3.4.2.(3), the floor assemblies, including those over basements, that are entirely contained within these dwelling units shall have a fire-resistance rating not less than 1 h but need not be constructed as fire separations.

4) Where buildings conforming to Sentence (2) include non-contiguous roof assemblies at different elevations, the roof assemblies are permitted to be evaluated separately to determine which ones are required to be constructed in accordance with Clause (2)(c).

5) Group A, Division 2 major occupancies, Group E major occupancies and storage garages located in a building or part of a building within the scope of this Article are permitted to be constructed in accordance with this Article provided
   a) the Group A, Division 2 major occupancy, and Group E major occupancy is located below the third storey, and
   b) the storage garage is located below the fourth storey (See also Sentence 4.4.2.1.(1.).)
   (See Note A-3.2.2.50.(5) and 3.2.2.58.(4.).) (See also Article 3.2.1.7)

3.2.2.51. Group C, up to 4 Storeys, Sprinklered

1) A building classified as Group C is permitted to conform to Sentence (2) provided
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 4 storeys in building height, and
c) it has a building area not more than
   i) 7 200 m² if 1 storey in building height,
   ii) 3 600 m² if 2 storeys in building height,
   iii) 2 400 m² if 3 storeys in building height, or
   iv) 1 800 m² if 4 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) except as permitted by Sentences (3) and (4), floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3) In a building that contains dwelling units that have more than one storey, subject to the requirements of Sentence 3.3.4.2.(3), the floor assemblies, including floors over basements, which are entirely contained within these dwelling units, shall have a fire-resistance rating not less than 1 h but need not be constructed as fire separations.

4) In a building in which there is no dwelling unit above another dwelling unit, the fire-resistance rating for floor assemblies entirely within the dwelling unit is waived.

3.2.2.52. Group C, up to 3 Storeys, Increased Area

1) A building classified as Group C is permitted to conform to Sentence (2) provided
   a) it is not more than 3 storeys in building height, and
   b) it has a building area not more than the value in Table 3.2.2.52.

Table 3.2.2.52.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) except as permitted by Sentences (3) and (4), floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) roof assemblies shall have a fire-resistance rating not less than 1 h, and
   d) loadbearing walls, columns, and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3) In a building that contains dwelling units that have more than one storey, subject to the requirements of Sentence 3.3.4.2.(3), the floor assemblies, including floors over basements, which are entirely contained within these dwelling units, shall have a fire-resistance rating not less than 1 h but need not be constructed as fire separations.
4) In a building in which there is no dwelling unit above another dwelling unit, the fire-resistance rating for floor assemblies entirely within the dwelling unit is waived.

3.2.2.53. Group C, up to 3 Storeys
1) A building classified as Group C is permitted to conform to Sentence (2) provided
a) it is not more than 3 storeys in building height, and
b) it has a building area not more than the value in Table 3.2.2.53.

<table>
<thead>
<tr>

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
a) except as permitted by Sentences (3) and (4), floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3) In a building that contains dwelling units that have more than one storey, subject to the requirements of Sentence 3.3.4.2.(3), the floor assemblies, including floors over basements, which are entirely contained within these dwelling units, shall have a fire-resistance rating not less than 45 min but need not be constructed as fire separations.

4) In a building in which there is no dwelling unit above another dwelling unit, the fire-resistance rating for floor assemblies entirely within the dwelling unit is waived.

3.2.2.54. Group C, up to 3 Storeys, Sprinklered
1) A building classified as Group C is permitted to conform to Sentence (2) provided
a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 3 storeys in building height, and
c) it has a building area not more than
   i) 5 400 m² if 1 storey in building height,
   ii) 2 700 m² if 2 storeys in building height, or
   iii) 1 800 m² if 3 storeys in building height.
2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
a) except as permitted by Sentences (3) and (4), floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
c) *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

3) In a *building* that contains *dwelling units* that have more than one *storey*, subject to the requirements of Sentence 3.3.4.2.(3), the floor assemblies, including floors over *basements*, which are entirely contained within these *dwelling units*, shall have a *fire-resistance rating* not less than 45 min but need not be constructed as *fire separations*.

4) In a *building* in which there is no *dwelling unit* above another *dwelling unit*, the *fire-resistance rating* for floor assemblies entirely within the *dwelling unit* is waived.

### 3.2.2.55. Group D, Any Height, Any Area, Sprinklered

1) Except as permitted by Articles 3.2.2.56. to 3.2.2.63., a *building* classified as Group D shall conform to Sentence (2).

2) Except as permitted by Article 3.2.2.16., the *building* referred to in Sentence (1) shall be of *noncombustible construction*, and

   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the *building* shall be *sprinklered* throughout,
   
   b) floor assemblies shall be *fire separations* with a *fire-resistance rating* not less than 2 h,

   c) *mezzanines* shall have a *fire-resistance rating* not less than 1 h, and

   d) *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

### 3.2.2.56. Group D, up to 6 Storeys

1) A *building* classified as Group D is permitted to conform to Sentence (2) provided

   a) it is not more than 6 *storeys* in *building height*, and
   
   b) it has a *building area* not more than the value in Table 3.2.2.56.

2) The *building* referred to in Sentence (1) shall be of *noncombustible construction*, and

   a) floor assemblies shall be *fire separations* with a *fire-resistance rating* not less than 1 h,
   
   b) *mezzanines* shall have a *fire-resistance rating* not less than 1 h,

   c) roof assemblies shall have a *fire-resistance rating* not less than 1 h, except that in a *building* not more than 1 *storey* in *building height* this requirement is waived, and

   d) *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.
3.2.2.57. Group D, up to 6 Storeys, Sprinklered, Noncombustible Construction

1) A building classified as Group D is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 6 storeys in building height, and
   c) it has a building area
      i) that is not limited if the building is not more than 2 storeys in building height,
      ii) not more than 14 400 m² if 3 storeys in building height,
      iii) not more than 10 800 m² if 4 storeys in building height,
      iv) not more than 8 640 m² if 5 storeys in building height, or
      v) not more than 7 200 m² if 6 storeys in building height.

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.58. Group D, up to 6 Storeys, Sprinklered

1) A building classified as Group D is permitted to conform to Sentence (2), provided
   a) it is sprinklered throughout,
   b) it is not more than 6 storeys in building height,
   c) it has a height not more than 18 m measured between the floor of the first storey and the uppermost floor level that does not serve a rooftop enclosure for elevator machinery, a stairway or a service room used only for service to the building, and
   d) it has a building area not more than
      i) 18 000 m² if 1 storey in building height,
      ii) 9 000 m² if 2 storeys in building height,
      iii) 6 000 m² if 3 storeys in building height,
      iv) 4 500 m² if 4 storeys in building height,
      v) 3 600 m² if 5 storeys in building height, or
      vi) 3 000 m² if 6 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction, used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) roof assemblies shall have a fire-resistance rating not less than 1 h,
   c) except as provided in Sentence (3), where the roof assembly has a height greater than 25 m measured from the floor of the first storey to the highest point of the roof assembly, the roof assembly shall be constructed of noncombustible construction or fire-retardant-treated wood conforming to Article 3.1.4.5.,
   d) mezzanines shall have a fire-resistance rating not less than 1 h, and
   e) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3) Where buildings conforming to Sentence (2) include non-contiguous roof assemblies at different elevations, the roof assemblies are permitted to be evaluated separately to determine which ones are required to be constructed in accordance with Clause (2)(c).

4) Group A, Division 2 major occupancies, Group E major occupancies, Group F, Division 2 and 3 major occupancies and storage garages located in a building or part of a building within the scope of this Article are permitted to be constructed in accordance with this Article provided
   a) the Group A, Division 2 major occupancy, and Group E major occupancy, and Group F, Division 2 and 3 major occupancy is located below the third storey, and
b) the storage garage is located below the fourth storey (See also Sentence 4.4.2.1.(1.).) (See Note A-3.2.2.50.(5) and 3.2.2.58.(4.) (See also Article 3.2.1.7)

3.2.2.59. Group D, up to 4 Storeys, Sprinklered

1) A building classified as Group D is permitted to conform to Sentence (2) provided
a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 4 storeys in building height, and
c) it has a building area not more than 3 600 m².

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
b) mezzanines shall have a fire-resistance rating not less than 1 h, and
c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.60. Group D, up to 3 Storeys

1) A building classified as Group D is permitted to conform to Sentence (2) provided
a) it is not more than 3 storeys in building height, and
b) it has a building area not more than the value in Table 3.2.2.60.

Table 3.2.2.60.
Maximum Building Area, Group D, up to 3 Storeys
Forming Part of Sentence 3.2.2.60.(1)

<table>

</tbody>
</table>

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min,
b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
c) roof assemblies shall have, if of combustible construction, a fire-resistance rating not less than 45 min, except that in a building not more than 1 storey in building height, the fire-resistance rating is permitted to be waived provided the roof assembly is constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1. and the building area is not more than
   i) 2 400 m² if facing one street,
   ii) 3 000 m² if facing 2 streets, or
   iii) 3 600 m² if facing 3 streets, and
d) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
   i) have a fire-resistance rating not less than 45 min, or
3.2.2.61. Group D, up to 3 Storeys, Sprinklered

1) A building classified as Group D is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 3 storeys in building height, and
   c) it has a building area not more than
      i) 14 400 m² if 1 storey in building height,
      ii) 7 200 m² if 2 storeys in building height, or
      iii) 4 800 m² if 3 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
   c) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction.

3.2.2.62. Group D, up to 2 Storeys

1) A building classified as Group D is permitted to conform to Sentence (2) provided
   a) it is not more than 2 storeys in building height, and
   b) it has a building area not more than the value in Table 3.2.2.62.

<table>
<thead>
<tr>

</tbody>
</table>

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min,
   b) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction.

3.2.2.63. Group D, up to 2 Storeys, Sprinklered

1) A building classified as Group D is permitted to conform to Sentence (2) provided
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

3.2.2.64. Group E, Any Height, Any Area, Sprinklered

1) Except as permitted by Articles 3.2.2.65. to 3.2.2.69., a building classified as Group E shall conform to Sentence (2).

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and

a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 2 storeys in building height, and
c) it has a building area not more than
   i) 3 000 m² if 1 storey in building height, or
   ii) 2 400 m² if 2 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and

a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min, and
b) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
   i) have a fire-resistance rating not less than 45 min, or
   ii) be of noncombustible construction.

3.2.2.65. Group E, up to 4 Storeys, Sprinklered

1) A building classified as Group E is permitted to conform to Sentence (2) provided

a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 4 storeys in building height, and
c) it has a building area not more than 1 800 m².

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and

a) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
b) mezzanines shall have a fire-resistance rating not less than 1 h, and
c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.66. Group E, up to 3 Storeys

1) A building classified as Group E is permitted to conform to Sentence (2) provided

a) it is not more than 3 storeys in building height, and
b) it has a building area not more than the value in Table 3.2.2.66.

Table 3.2.2.66.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
 b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
c) roof assemblies shall have a fire-resistance rating not less than 45 min, except that in a building not more than 1 storey in building height, the fire-resistance rating is permitted to be waived provided the roof assembly is of noncombustible construction or is constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1.,
d) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
   i) have a fire-resistance rating not less than 45 min, or
   ii) be of noncombustible construction, and
e) loadbearing walls, columns and arches supporting a fire separation shall have a fire-resistance rating not less than that required for the fire separation.

3.2.2.67. Group E, up to 3 Storeys, Sprinklered
1) A building classified as Group E is permitted to conform to Sentence (2) provided
 a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 3 storeys in building height, and
c) it has a building area not more than
   i) 7 200 m² if 1 storey in building height,
   ii) 3 600 m² if 2 storeys in building height, or
   iii) 2 400 m² if 3 storeys in building height.
2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
c) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
   i) have a fire-resistance rating not less than 45 min, or
   ii) be of noncombustible construction, and
d) loadbearing walls, columns and arches supporting a fire separation shall have a fire-resistance rating not less than that required for the fire separation.

3.2.2.68. Group E, up to 2 Storeys
1) A building classified as Group E is permitted to conform to Sentence (2) provided
 a) it is not more than 2 storeys in building height, and
 b) it has a building area not more than the value in Table 3.2.2.68.
Table 3.2.2.68.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min, and
   b) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.69. Group E, up to 2 Storeys, Sprinklered
1) A building classified as Group E is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 2 storeys in building height, and
   c) it has a building area not more than
      i) 3 000 m² if 1 storey in building height, or
      ii) 1 800 m² if 2 storeys in building height.
2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min, and
   b) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.70. Group F, Division 1, up to 4 Storeys, Sprinklered
1) Except as permitted by Articles 3.2.2.71. to 3.2.2.73., a building classified as Group F, Division 1 shall conform to Sentence (2) provided
   a) it is not more than 4 storeys in building height, and
   b) it has a building area not more than
      i) 9 000 m² if 1 storey in building height,
      ii) 4 500 m² if 2 storeys in building height,
      iii) 3 000 m² if 3 storeys in building height, or
      iv) 2 250 m² if 4 storeys in building height.
2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinklered throughout,
   b) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
   c) mezzanines shall have a fire-resistance rating not less than 1 h, and
   d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.71. Group F, Division 1, up to 3 Storeys, Sprinklered
1) A building classified as Group F, Division 1 is permitted to conform to Sentence (2) provided except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinkled throughout,
   a) it is not more than 3 storeys in building height, and
   b) it has a building area not more than
      i) 3 600 m² if 1 storey in building height,
      ii) 1 800 m² if 2 storeys in building height, or
      iii) 1 200 m² if 3 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of heavy timber construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min, and
   b) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.72. Group F, Division 1, up to 2 Storeys, Sprinklered
1) A building classified as Group F, Division 1 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinkled throughout,
   b) it is not more than 2 storeys in building height, and
   c) it has a building area not more than
      i) 2 400 m² if 1 storey in building height, or
      ii) 1 200 m² if 2 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min, and
   b) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction.

3.2.2.73. Group F, Division 1, One Storey
1) A building classified as Group F, Division 1 is permitted to be of combustible construction or noncombustible construction used singly or in combination provided
   a) it is not more than 1 storey in building height, and
   b) it has a building area not more than 800 m².

3.2.2.74. Group F, Division 2, Any Height, Any Area, Sprinklered
1) Except as permitted by Articles 3.2.2.75. to 3.2.2.79., a building classified as Group F, Division 2 shall conform to Sentence (2).
2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinkled throughout,
   b) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h,
   c) mezzanines shall have a fire-resistance rating not less than 1 h, and
   d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.75. Group F, Division 2, up to 4 Storeys, Increased Area, Sprinklered
1) A building classified as Group F, Division 2 is permitted to conform to Sentence (2) provided
a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 4 storeys in building height, and
c) it has a building area not more than
   i) 18 000 m² if 1 storey in building height,
   ii) 9 000 m² if 2 storeys in building height,
   iii) 6 000 m² if 3 storeys in building height, or
   iv) 4 500 m² if 4 storeys in building height.

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.76. Group F, Division 2, up to 3 Storeys

1) A building classified as Group F, Division 2 is permitted to conform to Sentence (2) provided
   a) it is not more than 3 storeys in building height, and
   b) it has a building area not more than the value in Table 3.2.2.76.

<table>

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
   c) roof assemblies shall have, if of combustible construction, a fire-resistance rating not less than 45 min, except that in a building not more than 1 storey in building height, the fire-resistance rating is permitted to be waived provided that the roof assembly is constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1.,
   d) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction, and
   e) loadbearing walls, columns and arches supporting a fire separation shall have a fire-resistance rating not less than that required for the fire separation.

3.2.2.77. Group F, Division 2, up to 4 Storeys, Sprinklered

1) A building classified as Group F, Division 2 is permitted to conform to Sentence (2) provided
a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 4 storeys in building height, and
c) it has a building area not more than
   i) 9 600 m² if 1 storey in building height,
   ii) 4 800 m² if 2 storeys in building height,
   iii) 3 200 m² if 3 storeys in building height, or
   iv) 2 400 m² if 4 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
   c) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction, and
   d) loadbearing walls, columns and arches supporting a fire separation shall have a fire-resistance rating not less than that required for the fire separation.

3.2.2.78. Group F, Division 2, up to 2 Storeys
   1) A building classified as Group F, Division 2 is permitted to conform to Sentence (2) provided
      a) it is not more than 2 storeys in building height, and
      b) it has a building area not more than the value in Table 3.2.2.78.

   2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
      a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min, and
      b) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
         i) have a fire-resistance rating not less than 45 min, or
         ii) be of noncombustible construction.

3.2.2.79. Group F, Division 2, up to 2 Storeys, Sprinklered
   1) A building classified as Group F, Division 2 is permitted to conform to Sentence (2) provided
      a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
      b) it is not more than 2 storeys in building height, and
      c) it has a building area not more than
i) 4,500 m² if 1 storey in building height, or
ii) 1,800 m² if 2 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min, and
   b) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction.

3.2.2.80. Group F, Division 3, Any Height, Any Area, Sprinklered
   1) Except as permitted by Articles 3.2.2.81. to 3.2.2.90., a building classified as Group F, Division 3 shall conform to Sentence (2).
   2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
      a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building shall be sprinklered throughout,
      b) floor assemblies shall be fire separations with a fire-resistance rating not less than 2 h, except that floor assemblies are permitted to be fire separations with a fire-resistance rating not less than 1 h in a storage garage with all storeys constructed as open-air storeys,
      c) mezzanines shall have a fire-resistance rating not less than 1 h, and
      d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.81. Group F, Division 3, up to 6 Storeys
   1) A building classified as Group F, Division 3 is permitted to conform to Sentence (2) provided
      a) it is not more than 6 storeys in building height, and
      b) it has a building area not more than the value in Table 3.2.2.81.

<table>

2) The building referred to in Sentence (1) shall be of noncombustible construction, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
b) mezzanines shall have a fire-resistance rating not less than 1 h,
c) roof assemblies shall have a fire-resistance rating not less than 1 h, and
d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.82. Group F, Division 3, up to 6 Storeys, Sprinklered

1) A building classified as Group F, Division 3 is permitted to conform to Sentence (2) provided
a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
b) it is not more than 6 storeys in building height, and
c) it has a building area
   i) that is not limited if the building is not more than 1 storey in building height,
   ii) not more than 21 600 m² if 2 storeys in building height,
   iii) not more than 14 400 m² if 3 storeys in building height,
   iv) not more than 10 800 m² if 4 storeys in building height,
   v) not more than 8 640 m² if 5 storeys in building height, or
   vi) not more than 7 200 m² if 6 storeys in building height.

2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and
a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
b) mezzanines shall have a fire-resistance rating not less than 1 h, and
c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3.2.2.83. Group F, Division 3, up to 4 Storeys

1) A building classified as Group F, Division 3 is permitted to conform to Sentence (2) provided
a) it is not more than 4 storeys in building height, and
b) it has a building area not more than the value in Table 3.2.2.83.

<table>
<thead>
<tr>

<td>1 500</td>
</tr>
</tbody>
</table>

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min,
b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
c) roof assemblies shall have, if of combustible construction, a fire-resistance rating not less than 45 min, except that in a building not more than 1 storey in building height, the fire-resistance rating is permitted to be waived provided the roof assembly is constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1., and the building area is not more than
   i) 2 400 m² if facing one street,
   ii) 3 000 m² if facing 2 streets, or
   iii) 3 600 m² if facing 3 streets, and

d) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
   i) have a fire-resistance rating not less than 45 min, or
   ii) be of noncombustible construction.

3.2.2.84. Group F, Division 3, up to 4 Storeys, Sprinklered

1) A building classified as Group F, Division 3 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 4 storeys in building height, and
   c) it has a building area not more than
      i) 14 400 m² if 1 storey in building height,
      ii) 7 200 m² if 2 storeys in building height,
      iii) 4 800 m² if 3 storeys in building height, or
      iv) 3 600 m² if 4 storeys in building height.

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
   c) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction.

3.2.2.85. Group F, Division 3, up to 2 Storeys

1) A building classified as Group F, Division 3 is permitted to conform to Sentence (2) provided
   a) it is not more than 2 storeys in building height, and
   b) it has a building area not more than the value in Table 3.2.2.85.

Table 3.2.2.85.

</tbody>
</table>

2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min, and
b) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
   i) have a fire-resistance rating not less than 45 min, or
   ii) be of noncombustible construction.

3.2.2.86. Group F, Division 3, up to 2 Storeys, Sprinklered
1) A building classified as Group F, Division 3 is permitted to conform to Sentence (2) provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 2 storeys in building height, and
   c) it has a building area not more than
      i) 7 200 m² if 1 storey in building height, or
      ii) 2 400 m² if 2 storeys in building height.
2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min, and
   b) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction.

3.2.2.87. Group F, Division 3, One Storey
1) A building classified as Group F, Division 3 is permitted to be of heavy timber construction or noncombustible construction used singly or in combination provided
   a) it is not more than 1 storey in building height, and
   b) it has a building area not more than
      i) 5 600 m² if facing one street,
      ii) 7 000 m² if facing 2 streets, or
      iii) 8 400 m² if facing 3 streets.

3.2.2.88. Group F, Division 3, One Storey, Sprinklered
1) A building classified as Group F, Division 3 is permitted to be of heavy timber construction or noncombustible construction used singly or in combination provided
   a) except as permitted by Sentences 3.2.2.7.(1) and 3.2.2.18.(2), the building is sprinklered throughout,
   b) it is not more than 1 storey in building height, and
   c) it has a building area not more than 16 800 m².

3.2.2.89. Group F, Division 3, One Storey, Any Area, Low Fire Load Occupancy
1) A building classified as Group F, Division 3 is permitted to conform to Sentence (2) provided it is
   a) not more than 1 storey in building height,
   b) used solely for low fire load occupancies such as
      i) power generating plants, or
      ii) plants for the manufacture or storage of noncombustible materials, and
   c) not limited in building area.
2) The building referred to in Sentence (1) shall be of noncombustible construction.

3.2.2.90. Group F, Division 3, Storage Garages up to 22 m High
1) A building used as a storage garage with all storeys constructed as open-air storeys and having no other occupancy above it is permitted to have its floor, wall, ceiling and roof assemblies constructed without a fire-resistance rating provided it is
   a) of noncombustible construction,
   b) not more than 22 m high, measured between grade and the ceiling level of the top storey,
   c) not more than 10 000 m² in building area, and
   d) designed so that every portion of each floor area is within 60 m of an exterior wall opening.

3.2.3. Spatial Separation and Exposure Protection
(See Note A-3.2.3.)

3.2.3.1. Limiting Distance and Area of Unprotected Openings
1) Except as permitted by Articles 3.2.3.10. to 3.2.3.12., the area of unprotected openings in an exposing building face for the applicable limiting distance shall be not more than the value determined in accordance with
   a) Table 3.2.3.1.-B or 3.2.3.1.-C for an exposing building face conforming to Article 3.2.3.2. of a building or fire compartment which is not sprinklered, or
   b) Table 3.2.3.1.-D or 3.2.3.1.-E for an exposing building face conforming to Article 3.2.3.2. of a sprinklered fire compartment that is part of a building which is sprinklered in conformance with Section 3.2.
(See Note A-3.)
(See also Article 3.1.6.3.)
2) The area of the unprotected openings in an exposing building face shall be the aggregate area of unprotected openings expressed as a percentage of the area of the exposing building face in Table 3.2.3.1.-B, 3.2.3.1.-C, 3.2.3.1.-D or 3.2.3.1.-E. (See Sentence 3.2.3.2.(1).)
3) For the purpose of determining the type of construction and cladding and the fire-resistance rating of an exterior wall,
   a) the exposing building face shall be taken as the projection of the exterior wall onto a vertical plane located so that no portion of the exterior wall of the building or of a fire compartment, if the fire compartment complies with the requirements of Article 3.2.3.2., is between the vertical plane and the line to which the limiting distance is measured, and
   b) the area of unprotected openings shall be determined from Table 3.2.3.1.-B, 3.2.3.1.-C, 3.2.3.1.-D or 3.2.3.1.-E.
4) For the purpose of determining the actual percentage of unprotected openings permitted in an exterior wall, the location of the exposing building face is permitted to be taken at a vertical plane located so that there are no unprotected openings between the vertical plane and the line to which the limiting distance is measured. (See Note A-3.2.3.1.(4).)
5) Except for buildings that are sprinklered, where the limiting distance is 2 m or less, individual unprotected openings in an exposing building face shall be no greater than
   a) the area stated in Table 3.2.3.1.-A, or
   b) where the limiting distance is equal to or greater than 1.2 m, the area calculated by

   \[ \text{Area} = 0.24 \times (2 \times \text{LD} - 1.2)^2 \]

   where
   \[ \text{Area} = \text{area of the unprotected opening, and} \]
   \[ \text{LD} = \text{limiting distance}. \]
Table 3.2.3.1.-A
Maximum Concentrated Area of Unprotected Openings
Forming Part of Sentence 3.2.3.1.(5)

<table>
<thead>
<tr>
<th>Limiting Distance, m</th>
<th>Maximum Area of Individual Unprotected Openings, m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.2</td>
<td>0.35</td>
</tr>
<tr>
<td>1.5</td>
<td>0.78</td>
</tr>
<tr>
<td>2.0</td>
<td>1.88</td>
</tr>
</tbody>
</table>

6) The spacing between individual unprotected openings described in Sentence (5) that serve a single room or space described in Sentence (7) shall not be less than
   a) 2 m horizontally of another unprotected opening that is on the same exposing building face and serves the single room or space, or
   b) 2 m vertically of another unprotected opening that serves the single room or space, or another room or space on the same storey.

7) For the purpose of Sentence (6), “single room or space” shall mean
   a) two or more adjacent spaces having a full-height separating wall extending less than 1.5 m from the interior face of the exterior wall, or
   b) two or more stacked spaces that are on the same storey.

8) A limiting distance equal to half the actual limiting distance shall be used as input to Tables 3.2.3.1.-B and 3.2.3.1.-C, where
   a) the time from receipt of notification of a fire by the fire department until the arrival of the first fire department vehicle at the building exceeds 10 min in 10% or more of all fire department calls to the building, and
   b) any storey in the building is not sprinklered.

(See Notes A-3.2.3.1.(8) and A-3.2.3.)

9) If the surface temperature on the unexposed surface of a wall assembly exceeds the temperature limit of a standard fire test as permitted by Article 3.1.7.2., an allowance shall be made for the radiation from the hot unexposed wall surface by adding an equivalent area of unprotected opening to the area of actual openings as follows:

   \[ A_C = A + (A_F \times F_{EO}) \]

where

   \( A_C \) = corrected area of unprotected openings including actual and equivalent openings,
   \( A \) = actual area of unprotected openings,
   \( A_F \) = area of exterior surface of the exposing building face, exclusive of openings, on which the temperature limit of the standard test is exceeded, and
   \( F_{EO} \) = an equivalent opening factor derived from the following expression:

   \[ F_{EO} = \left(\frac{T_U + 273}{T_E + 273}\right)^\frac{4}{4} \]

   \( T_U \) = average temperature in degrees Celsius of the unexposed wall surface at the time the required fire-resistance rating is reached under test conditions,
   \( T_E = 692°C \) for a fire-resistance rating not less than 45 min, 927°C for a fire-resistance rating not less than 1 h, and 1 010°C for a fire-resistance rating not less than 2 h.
10) Unless a closure used to protect an opening in an exposing building face has a protective performance equivalent to that required for the wall assembly in which it is located, an equivalent area of unprotected opening, determined in accordance with the procedures of Sentence (9) shall be added to the greater of:
   a) the actual area of unprotected openings, or
   b) the corrected area of unprotected openings.

Notes to Table 3.2.3.1.-D:
- Apply whichever ratio is greater.
- L = Length of exposing building face
- H = Height of exposing building face
3.2.3.2. Area of Exposing Building Face

1) Except as permitted by Sentences (2) and (3), the area of an exposing building face shall be calculated as the total area of an exterior wall facing in one direction on any side of a building measured from the finished ground level to the uppermost ceiling.

2) If a building is divided by fire separations into fire compartments, the area of exposing building face is permitted to be calculated for each fire compartment provided the fire separations have a fire-resistance rating not less than 45 min.

3) In a building that is sprinklered throughout and contains an interconnected floor space, the area of the exposing building face for the interconnected floor space is permitted to be determined by considering each storey as a separate fire compartment notwithstanding openings through the floor assemblies.

3.2.3.3. Wall Enclosing Attic or Roof Space
1) An exterior wall enclosing an attic or roof space and located above an exposing building face, shall be constructed in conformance with the requirements for the exposing building face.

3.2.3.4. Party Wall
1) A party wall shall be constructed as a firewall. (See Note A-3.2.3.4.(1).)

3.2.3.5. Wall with Limiting Distance Less Than 1.2 m
1) Openings in a wall that has a limiting distance less than 1.2 m shall be protected by closures whose fire-protection rating is in conformance with the fire-resistance rating required for the wall.
2) Wired glass or glass block shall not be used for a closure referred to in Sentence (1).

3.2.3.6. Combustible Projections
1) Except for a building containing one or 2 dwelling units only, combustible projections on the exterior of a wall that could expose an adjacent building to fire spread and are more than 1 m above ground level, including balconies, platforms, canopies and stairs, shall not be permitted within
   a) 1.2 m of a property line or the centre line of a public way, or
   b) 2.4 m of a combustible projection on another building on the same property.
2) Except as provided in Sentence (4), where the exposing building face has a limiting distance of not more than 0.45 m, projecting roof soffits shall not be constructed above the exposing building face. (See Note A-3.2.3.6.(2).)
3) Except as provided in Sentence (4), where the exposing building face has a limiting distance of more than 0.45 m, the face of roof soffits shall not project to less than 0.45 m from the property line. (See Note A-3.2.3.6.(2).)
4) The face of a roof soffit is permitted to project to the property line, where it faces a street, lane or public thoroughfare. (See Note A-9.10.14.5.(11) and 9.10.15.5.(10).)
5) Where roof soffits project to less than 1.2 m from the centre line of a lane or public thoroughfare, or from an imaginary line between two buildings or fire compartments on the same property, they shall
   a) have no openings, and
   b) be protected by
      i) not less than 0.38 mm thick sheet steel,
      ii) unvented aluminum conforming to CAN/CGSB-93.2-M, “Prefinished Aluminum Siding, Soffits, and Fascia, for Residential Use,”
      iii) not less than 12.7 mm thick gypsum soffit board or gypsum ceiling board installed according to CSA A82.31-M, “Gypsum Board Application,”
      iv) not less than 11 mm thick plywood,
      v) not less than 12.5 mm thick OSB or waferboard, or
      vi) not less than 11 mm thick lumber.
6) For buildings of combustible construction, materials installed to provide the required protection of soffits may be covered with a combustible or noncombustible finish material.

3.2.3.7. Construction of Exposing Building Face
1) Except as provided in Sentences (3) and (4), and Articles 3.2.3.10. and 3.2.3.11., the fire-resistance rating, construction and cladding for exposing building faces of buildings or fire compartments of Group A, B, C, D or Group F, Division 3 occupancy classification shall comply with Table 3.2.3.7.
2) Except as provided in Sentences (3) and (4) and Article 3.2.3.10., the fire-resistance rating, construction and cladding for exposing building faces of buildings or fire compartments of Group E or Group F, Division 1 or 2 occupancy classification shall comply with Table 3.2.3.7.

**Notes to Table 3.2.3.7.:**

1) See also Article 3.1.4.8. for additional requirements for exterior cladding on buildings conforming to Article 3.2.2.50. and Article 3.2.2.58.

3) Except as provided in Article 3.1.4.8., the requirement in Table 3.2.3.7. for noncombustible cladding for buildings or fire compartments where the maximum permitted area of unprotected openings is more than 10% of the exposing building face is permitted to be waived for exterior wall assemblies that comply with Article 3.1.5.5.

4) Except as provided in Article 3.1.4.8., the requirement in Table 3.2.3.7. for noncombustible cladding for buildings or fire compartments where the maximum permitted area of unprotected openings is more than 25% but not more than 50% of the exposing building face is permitted to be waived where
   a) the limiting distance is greater than 5 m,
   b) the building or fire compartment and all combustible attic and roof spaces are sprinklered throughout,
   c) the cladding
      i) conforms to Subsections 9.27.6., 9.27.7., 9.27.8., 9.27.9. or 9.27.10.,
      ii) is installed without furring members, or on furring not more than 25 mm thick, over gypsum sheathing at least 12.7 mm thick or over masonry, and
      iii) after conditioning in conformance with ASTM D 2898, “Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing,” has a flame-spread rating not greater than 25 on the exterior face when tested in accordance with Sentence 3.1.12.1.(1),
d) the cladding
   i) conforms to Subsection 9.27.12.,
   ii) is installed with or without furring members over gypsum sheathing at least 12.7 mm
       thick or over masonry,
   iii) has a flame-spread rating not greater than 25 when tested in accordance with
       Sentence 3.1.12.1.(2), and
   iv) does not exceed 2 mm in thickness exclusive of fasteners, joints and local
       reinforcements, or
   the exterior wall assembly complies with Article 3.1.5.5.

5) The construction requirements for the exposing building face stated in Sentences (1) and (2) shall be
   satisfied before increasing the unprotected opening area as permitted by Sentence 3.2.3.12.(1).

3.2.3.8. Protection of Exterior Building Face

1) Except as permitted by Sentence (3) and in addition to the requirements of Sentences 3.2.3.7.(1) and (2)
   and where the maximum permitted area of unprotected openings is greater than 10% of the exposing
   building face, foamed plastic insulation used in an exterior wall of a building more than 3 storeys in building
   height shall be protected on its exterior surface by
   a) concrete or masonry not less than 25 mm thick, or
   b) noncombustible material that complies with the criteria for testing and the conditions of
      acceptance stated in Sentence (2) when tested in conformance with CAN/ULC-S101, “Fire
      Endurance Tests of Building Construction and Materials.”

2) The criteria for testing and the conditions of acceptance for a wall assembly to satisfy the requirements of
   Clause (1)(b) are that
   a) the fire exposed area of the wall assembly shall be not less than 9.3 m² and have no dimension
      less than 2.75 m,
   b) the exposed surface shall include typical vertical and horizontal joints,
   c) the test shall be continued for not less than 15 min and the standard time/temperature curve of
      the referenced standard shall be followed,
   d) the noncombustible protective material must remain in place and no through openings should
      develop that are visible when viewed normal to the face of the material, and
   e) the noncombustible protective material should not disintegrate in a manner that would permit fire
      to propagate along the surface of the test assembly.

3) The requirements of Sentence (1) are waived for wall assemblies that comply with the requirements of
   Article 3.1.5.5. (See Note A-3.1.4.1.(1).)

3.2.3.9. Protection of Structural Members

1) Structural members, including beams, columns and arches, that are placed wholly or partly outside the
   exterior face of a building and are less than 3 m from the property line or the centre line of a public
   thoroughfare shall be protected from exterior fire exposure by fire protection having a fire-resistance rating
   not less than that required for their protection from interior fire exposure, as stated in Articles 3.2.2.20. to
   3.2.2.90., but not less than 1 h.

2) Structural members of heavy timber construction, including beams, columns and arches, that are placed
   wholly or partly outside the exterior face of a building and are 3 m or more from the property line or the
   centre line of a public thoroughfare need not be covered with noncombustible cladding.

3.2.3.10. Unlimited Unprotected Openings

1) An exposing building face in a storage garage with all storeys constructed as open-air storeys is
   permitted to have unlimited unprotected openings provided it has a limiting distance not less than 3 m.

2) The exposing building face of a storey that faces a street and is at the same level as the street is
   permitted to have unlimited unprotected openings if the limiting distance is not less than 9 m.
3.2.3.11. Low Fire Load, One Storey Building

1) An exposing building face of a building of low-hazard industrial occupancy conforming to Article 3.2.2.89. is permitted to be of noncombustible construction without a fire-resistance rating provided
   a) it is not a loadbearing wall, and
   b) the limiting distance is not less than 3 m.

3.2.3.12. Area Increase for Unprotected Openings

1) Except as required by Sentence 3.2.3.7.(5), the maximum area of unprotected openings in any exposing building face of an unsprinklered building is permitted to be doubled if the openings are glazed with
   a) glass block conforming to the requirements of Article 3.1.8.16., or
   b) wired glass assemblies conforming to D-2.3.15. in Appendix D.

3.2.3.13. Protection of Exit Facilities

1) Except as required by Sentence (3) and as permitted by Sentence 3.4.4.3.(1), if the plane of an exterior wall of an exit enclosure forms an angle less than 135° with the plane of an exterior wall of the building it serves, and an opening in the exterior wall of the exit enclosure could be exposed to fire from an opening in the exterior wall of the building, the opening in either the exterior wall of the exit or the exterior wall of the building shall be protected in conformance with the requirements of Sentence (4) where the opening in the exterior wall of the building is within 3 m horizontally and
   a) less than 10 m below an opening in the exterior wall of the exit, or
   b) less than 2 m above an opening in the exterior wall of the exit.

   (See Note A-3.2.3.14.(1).)

2) If an unenclosed exterior exit stair, ramp, or confined path of travel could be exposed to fire from an opening in the exterior wall of the building it serves, the opening in the exterior wall of the building shall be protected in conformance with the requirements of Sentence (4) where the opening in the exterior wall of the building is within 3 m horizontally and
   a) less than 10 m below the exit stair, ramp, or confined path of travel, or
   b) less than 5 m above the exit stair, ramp, or confined path of travel.

3) Except as permitted by Sentence 3.4.4.3.(1), if an exterior exit door in one fire compartment is within 3 m horizontally of an opening in another fire compartment and the exterior walls of these fire compartments intersect at an exterior angle of less than 135°, the opening shall be protected in conformance with the requirements of Sentence (4).

4) The opening protection referred to in Sentences (1), (2) and (3) shall consist of
   a) glass block conforming to the requirements of Article 3.1.8.16.,
   b) a wired glass assembly conforming to D-2.3.15. in Appendix D,
   c) a closure conforming to the requirements of Subsection 3.1.8. and Articles 3.2.3.1. and 3.2.3.14.,
   d) a dedicated sprinkler water curtain in accordance with Sentence (5).

5) An opening provided with a dedicated sprinkler water curtain for opening protection as permitted in Clause (4)(d) shall
   a) be provided with tempered or laminated safety glass glazed openings where windows are provided.
   b) be provided with quick response sprinklers with a nominal k-factor of 5.6 of the upright or pendant type
   c) be located such that
      i) the water curtain sprinklers are between 150 mm and 300 mm horizontally from the interior face of the opening,
      ii) located and not more than 3.6 m vertically above the floor immediately below and within 300 mm of the ceiling per the manufacturers listing for the quick response sprinkler head and NFPA 13,
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

3.2.3.14. Wall Exposed to Another Wall

1) Except as required by Sentences (3) and 3.2.3.13.(1) or as permitted by Sentence 3.2.3.19.(4), if an unprotected opening in an exterior wall of a fire compartment is exposed to an unprotected opening in the exterior wall of another fire compartment, and the planes of the 2 walls are parallel or at an angle less than 135°, measured from the exterior of the building, the unprotected openings in the 2 fire compartments shall be separated by a distance not less than

\[ D_o = 2D - \left( \frac{\theta}{90} \times D \right) \]

but in no case less than 1 m, and

- \( D = \) the greater required limiting distance for the exposing building faces of the 2 fire compartments, and
- \( \theta = \) the angle made by the intersecting planes of the exposing building faces of the 2 fire compartments (in the case where the exterior walls are parallel and face each other, \( \theta = 0° \)).

(See Note A-3.2.3.14.(1).)

2) The exterior wall of each fire compartment referred to in Sentence (1) within the distance, \( D_o \), shall have a fire-resistance rating not less than that required for the interior vertical fire separation between the fire compartment and the remainder of the building.

3) Sentence (1) does not apply to unprotected openings of fire compartments within a building that is sprinklered throughout, but shall apply to

- a) unprotected openings of fire compartments on opposite sides of a firewall, and
- b) exposure from unprotected openings of a fire compartment that is not protected by an automatic sprinkler system.

3.2.3.15. Wall Exposed to Adjoining Roof

1) Except as permitted by Sentence 3.2.3.19.(4), if a wall in a building is exposed to a fire hazard from an adjoining roof of a separate fire compartment that is not sprinklered in the same building, and the exposed wall contains windows within 3 storeys vertically and 5 m horizontally of the roof, the roof shall contain no skylights within 5 m of the exposed wall.

3.2.3.16. Protection of Soffits

1) Except as permitted by Sentences (3) and (4), where there is a common attic or roof space above more than 2 suites of residential occupancy or above more than 2 patients' sleeping rooms, and the common attic or roof space projects beyond the exterior wall of the building, the soffit, and any opening in the soffit or other surface of the projection located within 2 500 mm of a window or door opening, shall be protected by

- a) noncombustible material
  - i) not less than 0.38 mm thick, and
  - ii) having a melting point not below 650°C,
- b) plywood not less than 11 mm thick,
- c) strandboard or waferboard not less than 12.5 mm thick, or
- d) lumber not less than 11 mm thick.
2) The soffit protection required by Sentence (1) shall extend the full width of the opening and to not less than 1 200 mm on either side of it, and shall apply to all openings through the soffit within this limit.

3) If an eave overhang is completely separated from the remainder of the attic or roof space by the use of fire blocks, the requirements of Sentence (1) do not apply.

4) The protection required by Sentence (1) for projections is permitted to be omitted if
   a) the fire compartments behind the window and door openings are sprinklered in accordance with Article 3.2.5.12., and
   b) all rooms, including closets and bathrooms, having openings in the wall beneath the soffit are sprinklered, notwithstanding exceptions permitted in the standards referenced in Article 3.2.5.12. for the installation of automatic sprinkler systems.

3.2.3.17. Canopy Protection for Vertically Separated Openings
   1) Except as permitted by Sentences (2) and (3), if a storey classified as a Group E or Group F, Division 1 or 2 major occupancy is required to be separated from the storey above by a fire separation,
      a) every opening in the exterior wall of the lower storey that is located vertically below an opening in the storey above shall be separated from the storey above by a canopy projecting not less than 1 m from the face of the building at the intervening floor level, and
      b) the canopy required by Clause (a) shall have a fire-resistance rating not less than that required for the floor assembly but need not be more than 1 h, except as required elsewhere in this Subsection.

   2) Except as permitted by Sentence (3), the canopy required by Sentence (1) is permitted to be omitted if the exterior wall of the upper storey is recessed not less than 1 m behind the exterior wall containing the opening in the lower storey.

   3) The requirements of Sentences (1) and (2) are permitted to be waived if the building is sprinklered throughout.

3.2.3.18. Covered Vehicular Passageway
   1) A covered vehicular passageway designed as a receiving or shipping area shall be separated from every building or part of a building adjoining it by a fire separation having a fire-resistance rating not less than 1.5 h.

   2) A covered vehicular passageway constructed below grade shall be of noncombustible construction.

3.2.3.19. Walkway Between Buildings
   1) Except as required by Sentence 3.2.3.20.(2), if buildings are connected by a walkway, each building shall be separated from the walkway by a fire separation with a fire-resistance rating not less than 45 min.

   2) Except as permitted by Sentence (3), a walkway connected to a building required to be of noncombustible construction shall also be of noncombustible construction.

   3) A walkway connected to a building required to be of noncombustible construction is permitted to be of heavy timber construction provided
      a) not less than 50% of the area of any enclosing perimeter walls is open to the outdoors, and
      b) the walkway is at ground level.

   4) A walkway of noncombustible construction used only as a pedestrian thoroughfare need not conform to the requirements of Articles 3.2.3.14. and 3.2.3.15.

   5) A walkway between buildings shall be not more than 9 m wide.

3.2.3.20. Underground Walkway
   1) An underground walkway shall not be designed or used for any purpose other than pedestrian travel unless
      a) the purpose is acceptable to the authority having jurisdiction, and
      b) sprinklers are installed in any space in the walkway containing an occupancy.
2) Buildings connected by an underground walkway shall be separated from the walkway by a fire separation with a fire-resistance rating not less than 1 h.

3) An underground walkway shall be of noncombustible construction suitable for an underground location.

4) In an underground walkway
   a) smoke barrier doors shall be installed at intervals of not more than 100 m, or
   b) the travel distance from the door of an adjacent room or space to the nearest exit shall be not more than one and a half times the least allowable travel distance to an exit for any of the adjacent occupancies as permitted by Sentence 3.4.2.5.(1).

5) An underground walkway between buildings shall be not more than 9 m wide.

3.2.3.21. Storage and Process Equipment Located Outdoors
1) Location of outdoor storage and outdoor process equipment in relation to buildings shall conform to Parts 3 and 4 of Division B of the Fire By-law.

3.2.3.22. Installation of Service Lines Under Buildings
1) When a building is erected over existing buried flammable gas mains, such service lines shall be encased in gas-tight conduits in conformance with CSA Z662 Package, “Oil and Gas Pipeline Systems/CSA Z662-11, Commentary on Oil and Gas Pipeline Systems.”

3.2.4. Fire Alarm and Detection Systems
(See Note A-3.2.4.)

3.2.4.1. Determination of Requirement for a Fire Alarm System
1) Except as permitted in Sentences (2), (3), (5), (6) and (7), a fire alarm system shall be installed in buildings in which an automatic sprinkler system is required by this Part.

2) Buildings in which a sprinkler system is installed in accordance with NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes,” need not comply with Sentence (1).

3) Buildings that contain fewer than 9 sprinklers conforming to Sentence 3.2.5.12.(4) need not comply with Sentence (1).

4) Except as permitted by Sentences (5) to (7) and Sentence 3.2.4.2.(4), a fire alarm system shall be installed in a building that is not sprinklered throughout and that contains
   a) a contained use area,
   b) an impeded egress zone,
   c) more than 3 storeys, including the storeys below the first storey,
   d) a total occupant load more than 300, other than in open air seating areas,
   e) an occupant load more than 150 above or below the first storey, other than in open air seating areas,
   f) a school, college, or child care facility, including a daycare facility for children, with an occupant load more than 40,
   g) a licensed beverage establishment or a licensed restaurant, with an occupant load more than 150,
   h) a low-hazard industrial occupancy with an occupant load more than 75 above or below the first storey,
   i) a medium-hazard industrial occupancy with an occupant load more than 75 above or below the first storey,
   j) a residential occupancy with sleeping accommodation for more than 10 persons,
   k) a high-hazard industrial occupancy with an occupant load more than 25, or
   l) an occupant load more than 300 below an open air seating area.

5) Where each dwelling unit in an apartment building has direct access to an exterior exit facility leading to ground level, a fire alarm system is not required if
   a) not more than 4 dwelling units share a common means of egress, or
b) the building is not more than 3 storeys in building height.

6) A fire alarm system is not required in a hotel or motel 3 storeys or less in building height provided each suite has direct access to an exterior exit facility leading to ground level.

7) A fire alarm system is not required in a storage garage conforming to Article 3.2.2.90, that is contained in a building that is not sprinklered provided there are no other occupancies in the building.

3.2.4.2. Continuity of Fire Alarm System

1) Except as permitted by Sentence (6), if there are openings through a firewall, other than those for piping, tubing, wiring and totally enclosed noncombustible raceways, the requirements in this Subsection shall apply to the floor areas on both sides of the firewall as if they were in the same building.
2) Except as permitted by Sentence (4), if a building contains more than one major occupancy and a fire alarm system is required, a single system shall serve all occupancies.
3) Except as permitted by Sentence (4), if a fire alarm system is required in any portion of a building, it shall be installed throughout the building.
4) Except as required by Sentence (5), the requirements in this Subsection are permitted to be applied to each portion of a building not more than 3 storeys in building height, in which a vertical fire separation having a fire-resistance rating not less than 1 h separates the portion from the remainder of the building as if it were a separate building, provided there are no openings through the fire separation, other than those for piping, tubing, wiring and totally enclosed noncombustible raceways.
5) The permission in Sentence (4) to consider separated portions of a building as separate buildings does not apply to service rooms and storage rooms.
6) Buildings interconnected by walkways permitted in Articles 3.2.3.19 and 3.2.3.20, or by vestibules provided in conformance with Article 3.2.6.3, shall be treated as separate buildings for the purpose of fire alarm installation required by this Subsection.

3.2.4.3. Types of Fire Alarm Systems

1) A fire alarm system shall be
   a) a single-stage system in a Group F, Division 1 occupancy,
   b) except as permitted in Clause (c), a 2-stage system in a Group B occupancy,
   c) a single- or 2-stage system in a Group B, Division 3 occupancy where the building is 3 storeys or less in building height, and
   d) a single- or 2-stage system in all other cases.

3.2.4.4. Description of Fire Alarm Systems

1) A single stage fire alarm system shall, upon the operation of any manual station, waterflow detecting device, or fire detector, cause an alarm signal to sound on all audible signal devices in the system. (See Note A-3.2.4.4.(1).)
2) A 2-stage fire alarm system shall
   a) cause an alert signal to sound upon the operation of any manual station, waterflow detecting device, or fire detector,
   b) automatically cause an alarm signal to sound if the alert signal is not acknowledged within 5 min of its initiation, and
   c) have manual stations, each of which is equipped so that the use of a key or other similar device causes an alarm signal to sound that continues to sound upon removal of the key or similar device from the manual station (See Note A-3.2.4.4.(2)(c)).
(See Note A-3.2.4.4.(2).)
3) A 2-stage fire alarm system is permitted to be zone so that, upon the operation of any manual station, waterflow detecting device, or fire detector,
   a) a coded alert signal is sounded indicating the zone of alarm initiation,
   b) the coded alert signal is repeated in its entirety not less than 4 times, and
c) a continuous alert signal is sounded upon completion of the coded signals referred to in Clause (b) and Sentence (4).

4) If a second manual station, waterflow detecting device, or fire detector is operated in a fire alarm system with zone coding as permitted by Sentence (3), in a zone other than that for which the first alert signal was sounded, the coded alert signal for the first zone shall be completed before the coded alert signal for the second zone is repeated not less than 4 times.

3.2.4.5. Installation and Verification of Fire Alarm Systems
1) Fire alarm systems, including the voice communication capability where provided, shall be installed in conformance with CAN/ULC-S524, “Installation of Fire Alarm Systems.”
2) Fire alarm systems shall be verified in conformance with CAN/ULC-S537, “Verification of Fire Alarm Systems,” to ensure they are operating satisfactorily.

3.2.4.6. Silencing of Alarm Signals
1) A fire alarm system shall be designed so that when an alarm signal is actuated, it cannot be silenced automatically before a period of time has elapsed that is not less than
   a) 5 min for a building not required to be equipped with an annunciator, and
   b) 20 min for any other building.
2) Except as permitted by Sentence 3.2.4.18.(7) and Sentences 3.2.4.22.(2) and (3), a fire alarm system shall not incorporate manual silencing switches other than those installed inside the fire alarm control unit. (See Note A-3.2.4.6.(2).)
3) A manual silencing switch, accessible only to authorized personnel, shall be installed inside of the annunciator described in Sentence 3.2.4.8.(1). (See Note A-3.2.4.6.(3).)

3.2.4.7. Signals to Fire Department
1) A single stage fire alarm system installed in a building of assembly occupancy that has an occupant load more than 300 shall be designed to notify the fire department, in conformance with Sentence (4), that an alarm signal has been initiated.
2) A fire alarm system that includes waterflow-indicating devices shall be designed to notify the fire department in conformance with Sentence (4) when an alarm is initiated.
3) A 2-stage fire alarm system shall be designed to notify the fire department, in conformance with Sentence (4), that an alert signal has been initiated.
4) Notification of the fire department, as required by Sentences (1), (2) and (3), shall be provided in conformance with CAN/ULC-S561, “Installation and Services for Fire Signal Receiving Centres and Systems.” (See Note A-3.2.4.7.(4).)
5) Where a single stage fire alarm system is installed in a building that is not sprinklered throughout and Sentence (1) does not apply, a legible notice that is not easily removed shall be affixed to the wall near each manual station stating
   a) that the fire department is to be notified in the event of a fire emergency, and
   b) the emergency telephone number for the municipality or for the fire department (See Note A-3.2.4.7.(5)(b)).
6) Helicopter landing areas on roofs shall be provided with telephone extensions or means to notify the fire department.

3.2.4.8. Annunciator and Zone Indication
1) Except as permitted by Sentences (3) to (5), an annunciator shall be installed in close proximity to a building entrance that faces a street or an access route for fire department vehicles that complies with Sentence 3.2.5.5.(1).
2) Except as permitted by Sentences (6), (8), (9) and (10), the annunciator required by Sentence (1) shall have separate zone indication of the actuation of the alarm initiating devices, smoke detectors, heat detectors, manual stations and waterflow detecting devices, in each
   a) floor area so that the area of coverage for each zone in a building that is not sprinklered is not more than 2,000 m²,
   b) floor area so that the area of coverage for each zone is neither
      i) more than one storey, nor
      ii) more than the system area limits specified in NFPA 13, “Installation of Sprinkler Systems,”
   c) shaft required to be equipped with smoke detectors,
   d) air-handling system required to be equipped with smoke detectors,
   e) fire extinguishing system required by NFPA 96, “Ventilation Control and Fire Protection of Commercial Cooking Operations,”
   f) contained use area,
   g) impeded egress zone,
   h) fire compartment required by Sentence 3.3.3.5.(2), and
   i) floor area required to be equipped with smoke detector or detectors as required by Clause 3.2.4.11.(1)(h) to
      i) initiate an alert signal in a 2 stage system or an alarm signal in a single stage system, and
      ii) indicate the actuation of each device separately on the fire alarm system annunciator.

(See Note A-3.2.4.8.(2).)

3) An annunciator need not be provided for a fire alarm system if not more than one zone indicator is required by Sentence (2).

4) If an annunciator is not installed as part of a fire alarm system in conformance with Sentence (1), a visual and audible trouble signal device shall be provided inside the main entrance of the building.

5) The requirements of Sentence (1) are waived in a building
   a) in which an automatic sprinkler system is not installed,
   b) that has an aggregate area for all storeys of not more than 2,000 m², and
   c) that is not more than 3 storeys in building height.

6) The area limits of Clause (2)(a) are waived for an interior undivided open space used as an arena, a rink, or a swimming pool provided that other spaces in the building that are separated from the open space are individually zoned in accordance with the requirements of Sentence (2).

7) A fire alarm control unit installed in close proximity to a building entrance that faces a street or an access route for fire department vehicles that complies with Sentence 3.2.5.5.(1) is deemed to satisfy the requirement for an annunciator, provided all indicators required for an annunciator or trouble signal device are included on the control unit.

8) If a fire alarm system is required in row housing or in residential buildings where the egress of the dwelling units conforms to Sentence 3.3.4.4.(3) and the building is no more than 4 storeys in building height, the building shall be provided with
   a) a single electrically supervised fire alarm system for the entire building,
   b) at least one sprinkler zone for each block of row housing or each residential block,
   c) a sprinkler system which is monitored by the fire alarm system and an off-site monitoring service,
   d) a strobe light located outside the principal entrance of each dwelling unit and connected to an internal smoke alarm within the dwelling unit, and
   e) an exterior audible signal activated by the fire alarm system.

9) In a multi-level residential suite, where a single egress door is provided and the egress door opens directly into a public corridor or an exterior exit passageway or onto a street, a separate zone for sprinkler water flow detecting devices on each storey is not required provided
   a) the actuation of a sprinkler waterflow detecting device in the suite shall be zoned at the public corridor or exterior exit passageway floor level, and
b) a strobe light is installed and maintained outside the suite entrance of the dwelling unit, and connected to an internal smoke alarm within the dwelling unit.

10) A separate zone for waterflow detecting devices is not required for a shaft described in Clause 3.2.4.9.(2)(c).

11) The annunciator required by Sentence (1) shall have indicator lamps for the separate zone indications required by Sentence (2). (See Note A-3.2.4.8.(11).)

3.2.4.9. Electrical Supervision

1) Electrical supervision shall be provided for a fire alarm system.

2) If a fire alarm system in a building is required to have an annunciator by Sentence 3.2.4.8.(1), except for hose valves, all valves controlling water supplies in a standpipe system shall be equipped with an electrically supervised switch for transmitting a trouble signal to the annunciator in the event of movement of the valve handle.

3) An automatic sprinkler system shall be electrically supervised to indicate a trouble supervisory signal on the building fire alarm system annunciator for each of the following:
   a) movement of a valve handle that controls the supply of water to sprinklers,
   b) loss of excess water pressure required to prevent false alarms in a wet pipe system,
   c) loss of air pressure in a dry pipe system,
   d) loss of air pressure in a pressure tank,
   e) a significant change in water level in any water storage container used for firefighting purposes,
   f) loss of power to any automatically starting fire pump (See Note A-3.2.4.9.(3)(f).), and
   g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for firefighting purposes.

4) A fire pump shall be electrically supervised as stipulated in NFPA 20, “Installation of Stationary Pumps for Fire Protection.”

5) Except as permitted by Sentence (6), a radio antenna system shall perform a self-test at least twice daily and shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator for:
   a) loss of power to any head-end equipment, and
   b) fundamental failure of a self-test.

6) Electrical supervision of a radio antenna system in a building in which a fire alarm system is not installed shall be provided by an acceptable method.

7) A trouble signal indicating the nature of the trouble in accordance with Sentence (3) and (5) shall be transmitted to a Fire Signal Receiving Centre conforming to CAN/ULC-S561, “Installation and Services for Fire Signal Receiving Centres and Systems” as provided for in Sentence 3.2.4.7.(4).

3.2.4.10. Fire Detectors

1) Fire detectors required by this By-law shall be connected to the fire alarm system.

2) Except as permitted by Sentence (3), if a fire alarm system is required in a building that is not sprinklered, fire detectors shall be installed in the following spaces:
   a) storage rooms not within dwelling units,
   b) service rooms not within dwelling units,
   c) janitors’ rooms,
   d) rooms in which hazardous substances are to be used or stored (See Note A-3.3.1.2.(1).),
   e) elevator hoistways and dumbwaiter shafts, and
   f) laundry rooms in buildings of residential occupancy, but not those within dwelling units.

3) Fire detectors required by Sentence (2) need not be provided within floor areas that are sprinklered.

4) Fire detectors required by Sentence (2) shall be installed in elevator hoistways and dumbwaiter shafts where a sprinkler system is not installed within the hoistway or shaft.
3.2.4.11. Smoke Detectors

1) If a fire alarm system is installed, smoke detectors shall be installed in
   a) except as permitted in Sentence (2), each sleeping room and each corridor serving as part of a
   means of egress from sleeping rooms in portions of a building classified as a Group B major
   occupancy,
   b) each room in a contained use area and corridors serving those rooms,
   c) each corridor in portions of a building classified as a Group A, Division 1 major occupancy,
   d) each public corridor in portions of a building classified as a Group C major occupancy,
   e) each exit stair shaft other than those serving only a Group A, Division 4 major occupancy or an
   open storage garage,
   f) the vicinity of draft stops required by Article 3.2.8.6.,
   g) elevator machine rooms, and
   h) each floor area in front of the elevator or elevators as required by Sentence 3.2.6.4.(5).

(See Note A-3.2.4.11.(1).)

2) Smoke detectors need not be installed in sleeping rooms and in corridors serving the sleeping rooms
   within a suite of care occupancy where smoke alarms are installed in accordance with Article 3.2.4.20.

3) Smoke detectors required in the sleeping rooms of a care, treatment or detention occupancy shall, upon
   actuation, provide an audible and visible signal to staff serving those rooms so that the room or location
   containing the actuated smoke detector can be easily identified. (See Note A-3.2.4.11.(3).)

4) Smoke detectors required in Clause (1)(g) shall, upon actuation, recall the elevators served by the
   elevator machine room in which the smoke detector is installed.

5) Except as permitted in Sentences (6) and (7), smoke detectors installed in buildings required to be
   equipped with a fire alarm system shall be located near the entrance to walkways described in Articles
   3.2.3.19. and 3.2.3.20. or vestibules provided in conformance with Article 3.2.6.3.

6) Smoke detectors installed at the entrance to the walkways in conformance with Article 3.1.8.14. shall be
   deemed to meet the requirements of Sentence (5).

7) Smoke detectors required by Sentence (5) may be replaced with fire detectors in Group F occupancies
   where the smoke detectors may be subjected to false alarms due to the activities within the building.

3.2.4.12. Prevention of Smoke Circulation

1) If a fire alarm system is installed, an air-handling system shall be designed to prevent the circulation of
   smoke upon a signal from a duct-type smoke detector if the air-handling system
   a) serves more than one storey,
   b) serves more than one suite in a storey, or
   c) serves more than one fire compartment required by Sentence 3.3.3.5.(2).

3.2.4.13. Vacuum Cleaning System Shutdown

1) A central vacuum cleaning system in a building equipped with a fire alarm system shall be designed to
   shut down upon actuation of the fire alarm system.

3.2.4.14. Elevator Emergency Return

1) Deleted. [See Article 3.2.6.4. for high buildings.]

2) Deleted.

3) Deleted.

3.2.4.15. System Monitoring

1) An automatic sprinkler system shall be equipped with waterflow detecting devices and, if an annunciator
   is required by Article 3.2.4.8., shall be installed so that each device serves
   a) not more than one storey, and
   b) except as required by Sentence 3.2.4.8.(2), an area on each storey that is not more than the
   system area limits as specified in NFPA 13, “Installation of Sprinkler Systems.”
2) Waterflow-detecting devices required by Sentence (1) shall be connected to the fire alarm system so that, upon its actuation, an alert signal or an alarm signal is initiated.

3) The actuation of each waterflow detecting device required by Sentence (1) shall be indicated separately on the fire alarm system annunciator.

3.2.4.16. Manual Stations

1) Except as permitted by Sentences (2) and (3), where a fire alarm system is installed, a manual station shall be installed in every floor area near
   a) every principal entrance to the building, and
   b) every required exit, and
   c) every other egress facility that has been designed and identified as an exit and has all the features of a required exit.
   (See Note A-3.2.4.16.(1).)

2) In a building that is sprinklered throughout, a manual station is not required at an exterior egress doorway from a suite that does not lead to an interior shared means of egress in a hotel or motel not more than 3 storeys in building height, provided each suite is served by an exterior exit facility leading directly to ground level.

3) In a building that is sprinklered throughout, a manual station is not required at an exterior egress doorway from a dwelling unit that does not lead to an interior shared means of egress in a building not more than 3 storeys in building height containing only dwelling units, provided each dwelling unit is served by an exterior exit facility leading directly to ground level.

4) In a building referred to in Sentences (2) or (3), manual stations shall be installed near doorways leading from shared interior corridors to the exterior.

5) Where a fire alarm system is installed, a manually operated fire alarm station shall be installed on the roof at each exit from a helicopter landing area.

3.2.4.17. Alert and Alarm Signals

1) In a 2-stage fire alarm system described in Sentence 3.2.4.4.(2), the same audible signal devices are permitted to be used to sound the alert signals and the alarm signals.

2) If audible signal devices with voice reproduction capabilities are intended for paging and similar voice message use, other than during a fire emergency, they shall be installed so that alert signals and alarm signals take priority over all other signals.

3) Audible signal devices forming part of a fire alarm or voice communication system shall not be used for playing music or background noise.

3.2.4.18. Audibility of Alarm Systems

(See Note A-3.2.4.18.)

1) Audible signal devices forming part of a fire alarm system shall be installed in a building so that
   a) alarm signals are clearly audible throughout the floor area, and
   b) alert signals are clearly audible in continuously staffed locations, and where there are no continuously staffed locations, throughout the floor area.
   (See Note A-3.2.4.18.(1).)

2) The sound pattern of an alarm signal shall conform to the temporal pattern defined in Clause 4.2 of ISO 8201, “Acoustics – Audible emergency evacuation signal.” (See Note A-3.2.4.18.(2).)

3) The sound patterns of alert signals shall be significantly different from the temporal patterns of alarm signals. (See Note A-3.2.4.18.(3).)

4) The fire alarm signal sound pressure level shall be not more than 110 dBA in any normally occupied area. (See Note A-3.2.4.18.(4).)

5) The sound pressure level in a sleeping room from a fire alarm audible signal device shall be not less than 75 dBA in a building of residential or care occupancy when any intervening doors between the device and the sleeping room are closed. (See Note A-3.2.4.18.(5).)
6) Except as required by Sentence (5), the sound pressure level from a fire alarm system’s audible signal device within a floor area shall be not less than 10 dBA above the ambient noise level without being less than 65 dBA.

7) Except as permitted by Sentence (11), audible signal devices located within a dwelling unit shall include a means for them to be manually silenced for a period of not more than 10 min, after which time the devices shall restore themselves to normal operation. (See Note A-3.2.4.18.(7).)

8) Audible signal devices within a dwelling unit or a suite of residential or care occupancy shall be connected to the fire alarm system

   a) in a manner such that a single open circuit or short circuit at one device will not impair the operation of other audible signal devices on that same circuit that serve the other dwelling units or suites of residential or care occupancy, or
   b) on separate signal circuits that are not connected to the devices in any other dwelling unit, public corridor or suite of residential or care occupancy.

(See Note A-3.2.4.18.(8) and (9).)

9) Deleted.

10) Audible signal devices shall be installed in a service space referred to in Sentence 3.2.1.1.(8) and shall be connected to the fire alarm system.

11) Audible signal devices within dwelling units that are wired on separate signal circuits need not include a means for silencing as required by Sentence (7) provided the fire alarm system includes a provision for an automatic signal silence within dwelling units, where

   a) the automatic signal silence cannot occur within the first 60 s of operation or within the zone of initiation,
   b) a subsequent alarm elsewhere in the building will reactuate the silenced audible signal devices within dwelling units,
   c) after a period of not more than 10 min, the silenced audible signal devices will be restored to continuous audible signal if the alarm is not acknowledged, and
   d) the voice communication system referred to in Article 3.2.4.22. has a provision to override the automatic signal silence to allow the transmission of voice messages through silenced audible signal device circuits that serve the dwelling units.

(See Note A-3.2.4.18.(7).)

12) If a 2-stage fire alarm system has been installed with an automatic signal silence as described in Sentence (11), the system shall be designed so that any silenced audible signal devices serving dwelling units are reactuated whenever an alarm signal is required to be transmitted as part of the second stage.

(See Note A-3.2.4.18.(7).)

13) A signal device forming part of a fire alarm system shall be provided that will sound alert or alarm signals that are clearly discernable to persons on the roof deck or balcony that are located

   a) in the vicinity of an exterior door providing access to a private residential roof deck or balcony, or
   b) on exterior public roof decks or balconies.

3.2.4.19. Visible Signal Devices and Visible Warning Systems

1) Visible signal devices shall be installed in addition to alarm signals

   a) in buildings or portions thereof intended for use primarily by persons are deaf or hard of hearing,
   b) in assembly occupancies in which music and other sounds associated with performances could exceed 100 dBA,
   c) in any floor area in which the ambient noise level is more than 87 dBA, and
   d) in any floor area in which the occupants

      i) use ear protection devices,
      ii) are located in an audiometric booth, or
      iii) are located in sound-insulating enclosures.
2) Visible signal devices required by Sentence (1) shall be installed so that the signal from at least one device is visible throughout the floor area or portion thereof in which they are installed. (See Note A-3.2.4.19.2.)

3) A visible warning system shall be installed in the rooms and spaces required by Section 3.8. and shall conform to
   a) Sentence (4) where a fire alarm system is provided, and
   b) Sentence (5) where a fire alarm system is not provided.

4) The visible warning system required by Sentences (2) and (3) shall consist of strobe lights conforming to CAN/ULC-S526, “Visible Signal Devices for Fire Alarm Systems, Including Accessories” that are designed to operate as part of the fire alarm system, and
   a) have a luminous intensity of not less than
      i) 75 candela, if the strobe light is located in a sleeping room or bed space, and
      ii) 15 candela, if the strobe light is not located in a sleeping room or bed space,
   b) produce between 1 and 3 flashes per second, with the flashes synchronized when more than one strobe light is visible from a single location,
   c) have a clear or white translucent lens with the word “FIRE” clearly visible on the
      i) lens, or
      ii) attached nameplate,
   d) be installed in each
      i) sleeping room or bed space,
      ii) room closed off from the living area by a door including bathrooms, and
      iii) living area or hallway serving the living area,
   e) be located in conformance with the installation requirements for visible signal devices in CAN/ULC-S524, “Installation of Fire Alarm Systems.”

5) Where a fire alarm system is not provided, the visible warning system required by Sentences (2) and (3) shall consist of strobe lights conforming to CAN/ULC-S526, “Visible Signal Devices for Fire Alarm Systems, Including Accessories” that shall
   a) be connected to, and activated by,
      i) the smoke alarms required by Article 3.2.4.20. and Article 9.10.19.1., or
      ii) the smoke detectors permitted by Article 3.2.4.20., 3.2.4.21. or 9.10.19.8.,
   b) have a luminous intensity of not less than
      i) 75 candela, if the strobe light is located in a sleeping room or bed space, or
      ii) 15 candela, if the strobe light is not located in a sleeping room or bed space,
   c) produce between 1 and 3 flashes per second, with the flashes synchronized when more than one strobe light is visible from a single location,
   d) have a clear or white translucent lens with the word “SMOKE” clearly visible on the
      i) lens, or
      ii) attached nameplate,
   e) be installed in each
      i) sleeping room or bed space,
      ii) room closed off from the living area by a door including bathrooms, and
      iii) living area or hallway serving the living area,
   f) be located not less than 2 100 mm above the floor on a wall or ceiling in a location that will maximize effectiveness.

6) The special outlet boxes and cover plates required by Sentences 3.8.2.12.(5) and 3.8.5.3.(4) shall be
   a) designed, located and wired specifically to allow strobe lights to operate in conformance with
      i) Sentence (4) where a fire alarm system is provided, or
      ii) Sentence (5) where a fire alarm system is not provided,
   b) permanently identified as “FIRE – Strobe Light Connection Only,”
   c) installed in each
      i) sleeping room or bed space,
ii) room closed off from the living area by a door including bathrooms, and
iii) living area or hallway serving the living area, and
d) be located not less than 2 100 mm above the floor on a wall or ceiling in a location that will maximize effectiveness.

7) For the purposes of providing power to the strobe lights that may be connected to the outlets described in Sentence (6), it shall be assumed that the total special outlets for at least 20 percent of the dwelling units in the building are in use.

3.2.4.20. Smoke Alarms

1) Except as provided in Article 3.2.4.21., smoke alarms shall be installed in accordance with this Article.

2) Except as required by Sentence (5) and permitted by Sentence (8), smoke alarms conforming to CAN/ULC-S531, “Standard for Smoke Alarms,” shall be installed in each dwelling unit and, except for care, treatment or detention occupancies required to have a fire alarm system, in each sleeping room not within a dwelling unit or suite of care occupancy.

3) At least one smoke alarm shall be installed on each storey of a dwelling unit or suite of care occupancy.

4) On any storey of a dwelling unit containing sleeping rooms, a smoke alarm shall be installed
   a) in each sleeping room, and
   b) in a location between the sleeping rooms and the remainder of the storey, and if the sleeping rooms are served by a hallway, the smoke alarm shall be located in the hallway.

5) Where a care occupancy has individual suites for residents, a smoke alarm shall be installed
   a) in each sleeping room, and
   b) in a location between the sleeping rooms and the remainder of the suite, and if the sleeping rooms are served by a corridor within the suite, the smoke alarm shall be located in the corridor.

6) A smoke alarm shall be installed on or near the ceiling.

7) Except as permitted in Sentence (8), smoke alarms referred in Sentence (2) shall
   a) be installed with permanent connections to an electrical circuit (See Note A-3.2.4.20.(7)(a).),
   b) have no disconnect switch between the overcurrent device and the smoke alarm, and
   c) in case the regular power supply to the smoke alarm is interrupted, be provided with a battery as an alternative power source that can continue to provide power to the smoke alarm for a period of no less than 7 days in the normal condition, followed by 4 minutes of alarm.

8) Suites of residential occupancy are permitted to be equipped with smoke detectors in lieu of smoke alarms, provided the smoke detectors
   a) sound audible signals only within the suite they serve,
   b) are installed in conformance with CAN/ULC-S524, “Installation of Fire Alarm Systems,” and
   c) form part of the fire alarm system.
   (See Note A-3.2.4.20.(8).)

9) If more than one smoke alarm is required in a dwelling unit, the smoke alarms shall be wired so that the actuation of one smoke alarm will cause all smoke alarms within the dwelling unit to sound.

10) A smoke alarm required by Sentence (2) shall be installed in conformance with CAN/ULC-S553, “Installation of Smoke Alarms.”

11) Except as permitted in Sentence (13), a manually operated silencing device shall be incorporated within the circuitry of a smoke alarm installed in a dwelling unit so that it will silence the signal emitted by the smoke alarm for a period of not more than 10 min, after which the smoke alarm will reset and again sound the alarm if the level of smoke in the vicinity is sufficient to reactivate the smoke alarm.

12) Suites of residential occupancy equipped with smoke detectors installed to CAN/ULC-S524, “Installation of Fire Alarm Systems,” as part of the fire alarm system in lieu of smoke alarms as permitted by Sentence (8), need not incorporate the manually operated device required in Sentence (12). (See Note A-3.2.4.20.(8).)

13) The sound patterns of smoke alarms shall
   a) meet the temporal patterns of alarm signals (See Note A-3.2.4.18.(2).), or
   b) be a combination temporal pattern and voice relay.
3.2.4.21. Residential Fire Warning Systems

1) Except where a fire alarm system is installed or required in a building, smoke detectors forming part of a residential fire warning system installed in conformance with CAN/ULC-S540, “Residential Fire and Life Safety Warning Systems: Installation, Inspection, Testing and Maintenance,” are permitted to be installed in lieu of all smoke alarms required by Article 3.2.4.20., provided the system
   a) is capable of sounding audible signals in accordance with Articles 9.10.19.2. and 9.10.19.5.,
   b) is powered in accordance with Article 9.10.19.4., and
   c) is provided with a silencing device in accordance with Article 9.10.19.6.

3.2.4.22. Voice Communication Systems
(See also Article 3.2.5.20)

1) A voice communication system required by Subsection 3.2.6. and Sentences (7) to (10) shall
   a) consist of a two-way means of communication with the central alarm and control facility and to
   the mechanical control centre from each floor area, and
   b) be capable of broadcasting prerecorded, synthesized, or live messages from the central alarm and
   control facility that are audible and intelligible in all parts of the building, except that this
   requirement does not apply to elevator cars (See Note A-3.2.4.22.(1)(b)).

2) The voice communication system referred to in Sentence (1) shall include a means to silence the alarm signal in a single stage fire alarm system while voice instructions are being transmitted, but only after the alarm signal has initially sounded for not less than 30 s.

3) The voice communication system referred to in Sentence (1) shall include a means to silence the alert signal and the alarm signal in a 2-stage fire alarm system while voice instructions are being transmitted, but only after the alert signal has initially sounded for not less than
   a) 10 s in hospitals that have supervisory personnel on duty for twenty-four hours each day, or
   b) 30 s for all other occupancies.

4) The voice communication system referred to in Clause (1)(b) shall be designed so that the alert signal or alarm signal in a 2-stage fire alarm system can be selectively transmitted to any zone or zones while maintaining an alert signal or selectively transmitting voice instructions to any other zone or zones in the building.

5) The 2-way communication system referred to in Clause (1)(a) shall be installed so that emergency telephones are located in each floor area near exit stair shafts.

6) Visible signal devices required by Sentence 3.2.4.19.(1) and visible warning systems required by Sentence 3.2.4.19.(3) shall continue to emit a visible signal while voice instructions are being transmitted.

7) Except for Group B, Division 1 and Group F, Division 1 major occupancies, where a fire alarm system is required under Subsection 3.2.4., a voice communication system shall be installed in buildings where a 2-stage fire alarm system is installed and whose occupant load exceeds 1 000.

8) A voice communication system required by Sentence (7) shall consist of loudspeakers that are
   a) operated from the central alarm and control facility or, in the absence of such a facility, from a
   designated area, and
   b) except in elevator cars, designed and located so that transmitted messages are audible and
   intelligible in all parts of the building.

(See Note A-3.2.4.22.(1)(b).)

9) Where the facility is not equipped with staff trained to provide instructions over the loudspeakers, a pre-recorded message shall be provided.

10) The voice communication system required by Sentence (7) shall meet the silencing and transmission requirements of Sentences (2) to (4).

11) Except where a radio antenna system conforming to Sentence 3.2.5.20.(1) is installed, emergency telephones shall be installed and located in each floor area near exit stair shafts for the 2-way communication system referred to in Clause (1)(a).

3.2.5. Provisions for Firefighting
3.2.5.1. Access to Above-Grade Storeys

1) Except for storeys below the first storey, direct access for firefighting shall be provided from the outdoors to every storey that is not sprinklered throughout and whose floor level is less than 25 m above grade, by at least one unobstructed window or access panel for each 15 m of wall in each wall required to face a street by Subsection 3.2.2.

2) An opening for access required by Sentence (1) shall
   a) have a sill no higher than 900 mm above the inside floor, and
   b) be not less than 1 100 mm high by not less than
      i) 550 mm wide for a building not designed for the storage or use of dangerous goods, or
      ii) 750 mm wide for a building designed for the storage or use of dangerous goods.

3) Access panels above the first storey shall be readily openable from both inside and outside, or the opening shall be glazed with plain glass.

4) Where locking devices to prevent access to floor areas are installed on exit doors
   a) a master key shall be provided in an acceptable location accessible to firefighters, or
   b) the exit doors shall be provided with a wired glass panel measuring no less than 0.0645 m² in area and located not more than 300 mm from the door opening hardware.

3.2.5.2. Access to Basements

1) Direct access from at least one street shall be provided from the outdoors in a building that is not sprinklered to each basement having a horizontal dimension more than 25 m.

2) The access required by Sentence (1) is permitted to be provided by
   a) doors, windows or other means that provide an opening not less than 1 100 mm high and 550 mm wide, with a sill no higher than 900 mm above the inside floor, or
   b) an interior stairway immediately accessible from the outdoors.

3.2.5.3. Roof Access

1) On a building more than 3 storeys in building height where the slope of the roof is less than 1 in 4, all main roof areas shall be provided with direct access from the floor areas immediately below, either by
   a) a stairway, or
   b) a hatch not less than 550 mm by 900 mm with a fixed ladder.

3.2.5.4. Access Routes

1) Every building shall be provided with fire department access route(s)
   a) to the building face having a principal entrance, and
   b) to each building face having access openings for firefighting as required by Articles 3.2.5.1. and 3.2.5.2.

3.2.5.5. Location of Access Routes and Paths of Travel

1) Except as provided by Sentences (2) and (3), access routes required by Article 3.2.5.4. shall be located so that every access opening required by Articles 3.2.5.1. and 3.2.5.2. are located not less than 3 m and not more than 15 m from the closest portion of the access route, measured horizontally to the face of the building.

2) Access routes required by Article 3.2.5.4. shall be located so that the principal entrance is no less than 3 m and no more than 15 m from the closest portion of the access route, measured horizontally along the path of travel from the access route to the principal entrance.

3) Paths of travel for firefighters shall not be more than
a) 45 m from the access route to the entrance door of each dwelling unit for sprinklered buildings of residential occupancy with exiting directly to adjacent grade.

b) 55 m from the access route to the entrance door of each dwelling unit with exiting directly to adjacent grade, where the dwelling unit is separated from adjacent floor areas by a fire separation with at least 1 h fire-resistance, if
   i) the building is sprinklered to NFPA 13R from NFPA 13D, or to NFPA 13 from NFPA 13R,
   ii) a strobe light is installed outside the principal entrance of the dwelling unit, and is connected to an internal smoke alarm within the dwelling unit,
   iii) sprinkler systems are monitored by the fire alarm system and by an off-site monitoring service,
   iv) the fire alarm system has a graphic annunciator,

c) 65 m from the access route to the entrance door of each dwelling unit provided each dwelling unit has direct access to an exterior exit facility leading to adjacent ground level, where the dwelling unit may contain an ancillary residential unit or the dwelling unit has not more than one dwelling unit on top, if
   i) the requirements of Subclauses (b)(i) to (b)(vii) are met,
   ii) a 64 mm diameter fire department hose connection is located adjacent to the path of travel for firefighters located not more than 45 m measured from the hose connection to the principal entrance of each of the dwelling units,
   iii) the location of the fire department hose connections required by Subclause (c)(ii) is indicated on the fire alarm system graphic annunciator, and
   iv) the building is sprinklered to NFPA 13, and

d) 45 m from the access route to the entrance door, for non-residential portions of a building, which are cut off from and have no internal access to the remainder of the building. (See Note A-3.2.5.5.(3)(d).)

4) The access route from the hydrant location to the building location or from the hydrant location to the principal entrance of the building as described in Sentences (5) and (6), shall be no more than 90 m. (See Note A-3.2.5.5.(4).)

5) Where the access route runs continuously across the face of a building, the length of the access route shall be measured by measuring the shortest distance between a line drawn perpendicular to the access route and through the hydrant and a line drawn perpendicular to the access route and through the principal entrance of the building. (See Note A-3.2.5.5.(5).)

6) Where the access route terminates before the principal entrance of a building, the length of the access route shall be measured by measuring from a line drawn perpendicular to the access route and through the hydrant straight along the access route to its terminus and thereafter along the actual path of travel to the principal entrance. (See Note A-3.2.5.5.(6).)

3.2.5.6. Design of Access Routes and Paths of Travel

1) A portion of a roadway or yard provided as a required access route for fire department use shall
   a) have a clear width not less than 6 m, unless it can be shown that lesser widths are satisfactory,
   b) have a centre-line radius not less than 12 m,
   c) have an overhead clearance not less than 5 m,
   d) have a change of gradient not more than 1 in 12.5 over a minimum distance of 15 m,
   e) be designed to support the expected loads imposed by firefighting equipment and be surfaced with concrete, asphalt or other material designed to permit accessibility under all climatic conditions,
f) have turnaround facilities for any dead-end portion of the access route more than 90 m long, and
g) be connected with a public thoroughfare.
(See Note A-3.2.5.6.(1).)

2) For buildings conforming to Article 3.2.2.50. or 3.2.2.58., no portion of the access route described in
Sentence 3.2.2.10.(3) shall be more than 20 m below the uppermost floor level.

3) The unobstructed path of travel for firefighters from the curb to the main entrance or suite entrance door
as required in Sentences 3.2.5.5.(1) to (3) and every access opening as required in Articles 3.2.5.1. and
3.2.5.2. shall be
   a) no less than
      i) 1.2 m in width, or
      ii) 900 mm in width where serving not more than one dwelling unit or ancillary residential
         unit, and
   b) surfaced with concrete, asphalt or similar material.
(See Note A-3.2.5.6.(3).)

3.2.5.7. Water Supply
1) Every building shall be provided with an adequate water supply for firefighting. (See Note A-3.2.5.7.(1).)
2) Buildings that are sprinklered throughout with a sprinkler system conforming to Article 3.2.5.12. or have a
   standpipe system conforming to Article 3.2.5.8. to 3.2.5.10. are deemed to comply with Sentence (1).

3.2.5.8. Standpipe Systems
1) Except as permitted by Sentence 3.2.5.9.(4), a standpipe system shall be installed in a building that is
   a) more than 3 storeys in building height,
   b) more than 14 m high measured between grade and the ceiling of the top storey, or
   c) not more than 14 m high measured between grade and the ceiling of the top storey but has a
      building area exceeding the area shown in Table 3.2.5.8. for the applicable building height unless
      the building is sprinklered throughout.

3.2.5.9. Standpipe System Design
1) Except as provided in Sentences (2) to (8), Articles 3.2.5.10. and 3.2.5.11., and Sentence 3.2.4.9.(2), the
design, construction, installation and testing of a standpipe system shall conform to NFPA 14, “Installation of
Standpipe and Hose Systems.”
2) A dry standpipe that is not connected to a water supply shall not be considered as fulfilling the
requirements of this Article.
3) If more than one standpipe is provided, the total water supply need not be more than 30 L/s.
4) A standpipe need not be installed in a storage garage conforming to Article 3.2.2.90., provided the building is not more than 15 m high.
5) The residual water pressure at the design flow rate at the topmost hose connection of a standpipe system that is required to be installed in a building is permitted to be less than 690 kPa provided
   a) the building is sprinklered throughout,
   b) the water supply at the base of the sprinkler riser is capable of meeting, without a fire pump, the design flow rate and pressure demand of the sprinkler system, including the inside and outside hose allowance, and
   c) fire protection equipment is available to deliver, by means of the fire department connection, the full demand flow rate at a residual water pressure of 690 kPa at the topmost hose connection of the standpipe system. (See Note A-3.2.5.9.(5)(c).)
6) A fire department connection shall be provided for every standpipe system.
7) If a standpipe system is required by Sentence 3.2.5.8.(1) and an exit stair shaft is not provided in the building, a standpipe system may be omitted if
   a) a 64 mm diameter fire department hose connection is located adjacent to the path of travel for firefighters and is connected to a fire department connection in conformance with 3.2.5.15., and
   b) the hose connection shall be available to reach all portions of the area with 30 m of hose plus 9 m of hose stream distance.
8) A standpipe system may be omitted from dwelling units where
   a) the building is of residential occupancy throughout,
   b) the path of travel may not exceed 15 m from the principal entrance of suite to the fire department access route,
   c) egress from each suite complies with Sentence 3.3.4.4.(3), and
   d) the travel distance from any point on the floor area to the primary entrance of each suite does not exceed 30 m.

3.2.5.10. Hose Connections
1) Hose connections shall be located in exits, in accordance with NFPA 14, “Installation of Standpipe and Hose Systems.”
2) Hose connections are not required within a floor area.
3) Hose connections shall be provided with sufficient clearance to permit the use of a standard fire department hose key.
4) Except as permitted by Sentence (5), 64 mm diam hose connections shall be installed in a standpipe system.
5) Hose connections for 64 mm diam hose are not required in a building that is not more than 25 m high, measured between grade and the ceiling level of the top storey and in which an automatic sprinkler system is not installed.

3.2.5.11. Hose Stations
1) Hose stations for 38 mm diam hose shall be installed for a standpipe system in a building that is not sprinklered throughout.
2) Hose stations for a 38 mm diam hose shall be installed for a standpipe system within every floor area that is not sprinklered throughout. (See Note A-3.2.5.11.(2).)
3) Hose stations shall be located in the floor area within 5 m of exits and at other locations to provide coverage of the entire floor area.
4) A hose station located on one side of a horizontal exit shall be considered to serve only the floor area on that side of the horizontal exit.
5) A hose cabinet shall be located so that its door, when fully opened, will not obstruct the required width of a means of egress.
6) Where a building or part thereof is used as a distillery and the building is sprinklered in conformance with Article 3.2.5.12., small hose (38 mm) stations are permitted to be supplied from interior sprinkler piping.

7) Where a hose station is provided in grain handling and storage facilities in which combustible dusts are produced in quantities or concentrations that create an explosion or fire hazard, fog and fine spray nozzles shall be used instead of nozzles that discharge a solid stream of water to prevent combustible dusts from being raised into suspension.

3.2.5.12. Automatic Sprinkler Systems

1) Except as permitted by Sentences (2), (3) and (4), an automatic sprinkler system shall be designed, constructed, installed and tested in conformance with NFPA 13, “Installation of Sprinkler Systems.” (See Note A-3.2.5.12.(1).)

2) Instead of the requirements of Sentence (1), NFPA 13R, “Installation of Sprinkler Systems in Low-Rise Residential Occupancies,” is permitted to be used for the design, construction and installation of an automatic sprinkler system installed
   a) in a building of Group C major occupancy containing no other major occupancies that
      i) is not more than 4 storeys in building height and conforms to Articles 3.2.2.47., 3.2.2.48., 3.2.2.50., 3.2.2.51. or 3.2.2.54., or
      ii) is not more than 3 storeys in building height and conforms to Article 9.10.1.3., or
   b) in a building of care occupancy with not more than 10 occupants that is not more than 3 storeys in building height and conforms to one of Articles 3.2.2.42. to 3.2.2.46.

(See Note A-3.2.5.12.(2).)

3) Instead of the requirements of Sentence (1), NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes,” is permitted to be used for the design, construction, installation and testing of an automatic sprinkler system installed
   a) in a residential building with not more than two principal dwelling units, where
      i) each dwelling unit has its own sprinkler water supply, and
      ii) a one tank-type water closet is supplied with water from the sprinkler head which is located farthest from the main water supply,
   b) in a building of care occupancy, provided
      i) it contains not more than 2 suites of care occupancy,
      ii) it has not more than 5 residents throughout, and
      iii) a 30-minute water supply demand can be met,
   c) in a building of residential occupancy throughout that contains only row housing where
      i) all vertical suite separations are constructed as a fire separation having no less than a 1 h fire-resistance rating,
      ii) the fire separation described in Subclause (c)(ii) provides continuous protection from the top of the footing to the underside of the roof deck and any space between the top of the wall and the roof deck is tightly fitted with mineral wool or noncombustible material,
      iii) each dwelling unit has its own sprinkler water supply, and
      iv) one tank-type water closet is supplied with water from the sprinkler head which is located farthest from the main water supply, or
   d) in an ancillary residential building where
      i) each bathroom, clothes closet, linen closet, and pantry must have sprinkler coverage, notwithstanding the exemptions set out in NFPA 13D,
      ii) sprinklers are provided in each attached garage or carport, notwithstanding the exemptions set out in NFPA 13D,
      iii) a one tank-type water closet is supplied with water from the sprinkler head which is located farthest from the main water supply,
      iv) the path of travel for firefighters complies with Clause 3.2.5.5.(3)(a), and
      v) each dwelling unit has direct access to an exterior exit facility complying with Sentence 3.3.4.4.(3);
4) If a building contains fewer than 9 sprinklers, the water supply for these sprinklers is permitted to be supplied from the domestic water system for the building provided the required flow for the sprinklers can be met by the domestic system.

5) If a water supply serves both an automatic sprinkler system and a system serving other equipment, control valves shall be provided so that either system can be shut off independently.

6) Notwithstanding the requirements of the standards referenced in Sentences (1) and (2) regarding the installation of automatic sprinkler systems, sprinklers shall not be omitted in any room or closet in the storey immediately below a roof assembly. (See Note A-3.2.5.12.(6).)

7) Fast response sprinklers shall be installed in residential occupancies, care occupancies, treatment occupancies and detention occupancies. (See Note A-3.2.5.12.(7).)

8) Notwithstanding the requirements of the standards referenced in Sentences (1) and (2) regarding the installation of automatic sprinkler systems, in buildings conforming to Article 3.2.2.50. or 3.2.2.58., sprinklers shall be provided for balconies and decks exceeding 610 mm in depth measured perpendicular to the exterior wall. (See Note A-3.2.5.12.(8).)

9) Sprinklers in elevator machine rooms shall have a temperature rating not less than that required for an intermediate temperature classification and shall be protected against physical damage. (See Note A-3.2.5.12.(9).)

10) Except as provided in Subsection 3.2.8., closely spaced sprinklers and associated draft stops need not be installed around floor openings in conformance with NFPA 13, “Installation of Sprinkler Systems”,

11) Notwithstanding Sentences (1) and (2) and except as permitted by Sentence (12), automatic sprinkler protection shall be provided for all unenclosed balconies, exterior decks, porches and patios of buildings sprinklered to NFPA 13R or NFPA 13 if
   a) the framing or cladding is of combustible construction,
   b) the depth of balcony, deck, porch, or patio is more than 1200 mm, and
   c) the balcony, roof overhang or structure above is more than 300 mm overlapping the balcony, deck or patio below and is located less than 3 m above the finished floor of the balcony, deck or patio below.

12) Automatic sprinkler protection for an unenclosed exterior balcony of a residential building may be omitted if
   a) the building is of noncombustible construction, and
   b) the exterior wall assembly adjoining the balcony and the exterior ceiling assembly covering the balcony are constructed with noncombustible materials.

13) Notwithstanding the requirements of the standards referenced by Sentence (3) regarding the installation of automatic sprinkler systems, sprinklers shall be provided in any storage garage attached to a building of residential occupancy where a fire separation is not provided between the storage garage and adjacent floor areas.

3.2.5.13. Combustible Sprinkler Piping

1) Combustible sprinkler piping shall be used only for sprinkler systems in residential occupancies and other light-hazard occupancies. (See Note A-3.2.5.13.(1).)

2) Combustible sprinkler piping shall meet the requirements of ULC/ORD-C199P, “Combustible Piping for Sprinkler Systems.”

3) Except as permitted by Sentence (5), combustible sprinkler piping shall be separated from the area served by the sprinkler system, and from any other fire compartment, by ceilings, walls, or soffits consisting of, as a minimum,
   a) lath and plaster,
   b) gypsum board not less than 9.5 mm thick,
   c) plywood not less than 13 mm thick, or
   d) a suspended membrane ceiling with
      i) steel suspension grids, and
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

ii) lay-in panels or tiles having a mass not less than 1.7 kg/m².

4) Except as permitted by Sentence (5), combustible sprinkler piping may be located above a ceiling provided that the distance between the edge of any ceiling opening that is not protected in conformance with Sentence (3) and the nearest sprinkler is not more than 300 mm.

5) Where combustible sprinkler piping has been tested in conformance with ULC/ORD-C199P, “Combustible Piping for Sprinkler Systems,” and has been shown to meet the requirements therein without additional protection, conformance to Sentences (3) and (4) is not required.

3.2.5.14. Sprinklered Service Space

1) An automatic sprinkler system shall be installed in a service space referred to in Sentence 3.2.1.1.(8) if flooring for access within the service space is other than catwalks.

2) The sprinkler system required by Sentence (1) shall be equipped with waterflow detecting devices, with each device serving not more than one storey.

3) The waterflow detecting devices required by Sentence (2) shall be connected to the fire alarm system, to
   a) initiate an alert signal in a 2-stage system or an alarm signal in a single stage system, and
   b) indicate separately on the fire alarm system annunciator the actuation of each device.

3.2.5.15. Fire Department Connections

(Also See A-3.2.5.5.)

1) The fire department connection for a standpipe system shall be located horizontally within 5 m of the principal entrance of a building, have unobstructed access for a distance of not less than 1 m and be visible from the street.

2) The fire department connection for an automatic sprinkler system shall be located horizontally within 5 m of the principal entrance of a building, have unobstructed access for a distance of not less than 1 m and be visible from the street.

3.2.5.16. Portable Fire Extinguishers

1) Portable extinguishers shall be provided and installed in accordance with the Fire By-law.

2) In a Group B, Division 1 major occupancy, portable fire extinguishers are permitted to be located in secure areas, or in lockable cabinets provided
   a) identical keys for all cabinets are located at all supervisory or security stations, or
   b) electrical remote release devices are provided and are connected to an emergency power supply.

3.2.5.17. Protection from Freezing

1) Equipment forming part of a fire protection system shall be protected from freezing if
   a) it could be adversely affected by freezing temperatures, and
   b) it is located in an unheated area.

3.2.5.18. Fire Pumps

1) If a fire pump is installed, it shall be installed in accordance with the requirements of NFPA 20, “Installation of Stationary Pumps for Fire Protection.” (See Note A-3.2.5.18.(1).)

3.2.5.19. Location of Building Safety Facilities for Firefighters

1) Fire fighting installations and building safety facilities including central control facility, firefighters’ elevator and stairwells equipped with standpipes shall be centrally located in close proximity to the firefighters’ entrance.

3.2.5.20. Radio Antenna Systems

(See Note A-3.2.5.20.).
1) Except as permitted by Sentence (2), an acceptable radio antenna system shall be installed in every building that
   a) is more than 6 storeys in building height,
   b) contains more than 1 storey in the basement, or
   c) contains more than 1200 m² of floor area in the basement.

2) A radio antenna system shall not be required for
   a) government buildings requiring security against transfer of signals inside and outside of buildings, and
   b) where, in the opinion of the Chief Building Official, in consultation with the Fire Chief, radio signals compromise the intended use of the building.

3) A radio antenna system shall provide not less than 98% coverage at in each of the following critical locations in the building
   a) exit stair shafts,
   b) exit corridors,
   c) public corridors,
   d) corridors used by the public,
   e) corridors serving classrooms or patients' sleeping rooms,
   f) within 5 m of the fire alarm control unit,
   g) within 5 m of the central alarm and control facility,
   h) within-5 m of the fire alarm annunciator,
   i) fire pump room,
   j) emergency generator room,
   k) electrical service and transformer room,
   l) elevator machine room,
   m) elevator lobbies,
   n) elevator hoistways,
   o) corridors in the basement and not within a suite, and
   p) storage garages and associated vehicle ramps.

3.2.6. Additional Requirements for High Buildings
(See Note A-3.2.6.)

3.2.6.1. Application
1) Except as permitted by Sentence (2), this Subsection applies to a building
   a) more than 18 m in height, measured between grade and the uppermost floor level of the top storey, or
   b) with a floor area or part of a floor area located above the third storey designed or intended as a Group B, Division 2 or Group B, Division 3 major occupancy.

2) A building or that portion of a building separated in accordance with Division A, Article 1.3.3.4., need not comply with the requirements of this Subsection, provided
   a) the building or that portion of a building does not exceed 6 storeys in building height,
   b) the building or that portion of a building does not contain a floor area or part of a floor area located above the third storey designed or intended as a Group B, Division 2 or Group B, Division 3 major occupancy,
   c) the principal entrance for fire fighters is located on the storey which requires vertical travel to the topmost floor level to be not more than 18 m,
   d) except where vestibules designed to limit movement of smoke from a fire in a floor area below the lowest exit storey into upper storeys are provided, stairs and elevators shall not directly connect more than 6 consecutive storeys (See Note A-3.2.6.2.(4).), and
   e) exit stair enclosures are provided with not less than a 2 h fire separation.
   f) the building sprinklers are designed in accordance with NFPA 13 "Installation of Sprinkler Systems", except that the design area of the floor areas above the basement shall be twice the
3.2.6.2. Limits to Smoke Movement
1) A building to which this Subsection applies shall be designed in accordance with Sentences (2) to (6) and Article 3.2.6.3. to limit the danger to occupants and firefighters from exposure to smoke in a building fire.

2) A building referred to in Sentence (1) shall be designed so that, during a period of 2 h after the start of a fire, each exit stair serving storeys below the lowest exit level will not contain more than 1% by volume of contaminated air from the fire floor, assuming an outdoor temperature equal to the January design temperature on a 2.5% basis determined in accordance with Subsection 1.1.3. (See Note A-3.2.6.2.(2).)

3) Each stairway that serves storeys above the lowest exit level shall have a vent to the outdoors, at or near the bottom of the stair shaft, that
   a) has an openable area of 0.05 m² for every door between the stair shaft and a floor area, but not less than 1.8 m²,
   b) opens directly to the outdoors or into a vestibule that has a similar opening to the outdoors, and
   c) has a door or closure that
      i) is openable manually, and
      ii) can remain in the open position during a fire emergency.
(See Note A-3.2.6.2.(3).)

4) Measures shall be taken to limit movement of smoke from a fire in a floor area below the lowest exit storey into upper storeys. (See Note A-3.2.6.2.(4).)

5) Except for exhaust fans in kitchens, washrooms and bathrooms in dwelling units, and except for fans used for smoke venting as required by Article 3.2.6.6., air moving fans in a system that serves more than 2 storeys shall be designed and installed so that in the event of a fire these fans can be stopped by means of a manually operated switch at the central alarm and control facility.

6) Except as provided in Article 3.2.4.12. or where there is a conflict with other smoke control measures in the building, air-handling systems used to provide make-up air to public corridors serving suites in a Group C major occupancy shall not shut down automatically upon activation of the fire alarm so as to maintain corridor pressurization.

3.2.6.3. Connected Buildings
1) If a building described in Article 3.2.6.1. is connected to any other building, measures shall be taken to limit movement of contaminated air from one building into another during a fire. (See Note A-3.2.6.3.(1).)

3.2.6.4. Emergency Operation of Elevators
1) Automatic and manual emergency recall shall be provided for all elevators serving storeys above the first storey.

2) Key-operated switches for emergency recall required by Sentence (1) shall be provided in a conspicuous location at
   a) each elevator lobby on the recall level, and
   b) the central alarm and control facility required by Article 3.2.6.7.

3) In-car emergency service switches shall be provided in all elevator cars.

4) Keys to operate the switches required by Sentences (2) and (3) shall be
   a) provided in a suitably identified box conspicuously located on the outside of an elevator hoistway near the central alarm and control facility required by Article 3.2.6.7., and
   b) kept at the central alarm and control facility.

5) The automatic emergency recall provided in accordance with Sentence (1) shall be activated by
   a) smoke detectors installed in each floor area in front of the elevator(s), or
   b) the building fire alarm system.
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

3.2.6.5. Elevator for Use by Firefighters

1) At least one elevator shall be provided for use by firefighters in conformance with Sentences (2) to (6).
2) The elevator referred to in Sentence (1) shall have a useable platform area not less than 2.2 m² and shall be capable of carrying a load of 900 kg to the top floor that it serves from a landing on the storey containing the entrance for firefighter access referred to in Articles 3.2.5.4. and 3.2.5.5. within 1 min.
3) Each elevator for use by firefighters shall
   a) be provided with a closure at each shaft opening so that the interlock mechanism remains mechanically engaged and electrical continuity is maintained in the interlock circuits and associated wiring for a period of not less than 1 h when the assembly is subjected to the standard fire exposure described in CAN/ULC-S104, “Fire Tests of Door Assemblies,”
   b) be protected with a vestibule containing no occupancy and separated from the remainder of the floor area by a fire separation having a fire-resistance rating not less than 45 min, or
   c) be protected with a corridor containing no occupancy and separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h.
4) Except as permitted by Sentence (5), an elevator referred to in Sentence (1) shall be capable of providing transportation from the storey containing the entrance for firefighter access referred to in Articles 3.2.5.4. and 3.2.5.5. to every floor that is above grade in the building and that is normally served by the elevator system.
5) If it is necessary to change elevators to reach any floor referred to in Sentence (4), the system shall be designed so that not more than one change of elevator is required when travelling to any floor in the building from the storey containing the entrance for firefighter access referred to in Articles 3.2.5.4. and 3.2.5.5.

6) Deleted.

3.2.6.6. Venting to Aid Firefighting

1) Means of venting each floor area to the outdoors shall be provided by windows, wall panels, smoke shafts, or the building exhaust system. (See Note A-3.2.6.6.(1).)
2) Fixed glass windows shall not be used for the venting required by Sentence (1) if the breaking of the windows could endanger pedestrians below.
3) Openable windows used for the venting required by Sentence (1) shall be permanently marked so that they are easily identifiable.
4) Elevator hoistways shall not be designed for the venting required by Sentence (1).

3.2.6.7. Central Alarm and Control Facility

1) A central alarm and control facility shall be provided on the storey containing the entrance for firefighter access referred to in Articles 3.2.5.4. and 3.2.5.5. in a location that
   a) is readily accessible to firefighters entering the building, and
   b) takes into account the effect of background noise likely to occur under fire emergency conditions, so that the facility can properly perform its required function under these conditions.
   (See Note A-3.2.6.7.(1).)
2) The central alarm and control facility required by Sentence (1) shall include
   a) means to control the voice communication system required by Article 3.2.6.8., so that messages can be sent to
      i) all loudspeakers simultaneously,
      ii) individual floor areas, and
      iii) exit stairwells,
   b) means to indicate audibly and visually alert signals and alarm signals and a switch to
i) silence the audible portion of these signals, and
ii) indicate visually that the audible portion has been silenced,
c) means to indicate visually that elevators are on emergency recall,
d) an annunciator conforming to Article 3.2.4.8.,
e) means to transmit alert signals and alarm signals to the fire department in conformance with Article 3.2.4.7.,
f) means to release hold-open devices on doors to vestibules,
g) means to manually actuate alarm signals in the building selectively to any zone or zones,
h) means to silence the alarm signals referred to in Clause (g) in conformance with Sentences 3.2.4.22.(2) and 3.2.4.22.(3),
i) means, as appropriate to the measure for fire safety provided in the building, to
   i) actuate auxiliary equipment identified in Articles 3.2.6.2., 3.2.6.3. and 3.2.6.6., or
   ii) communicate with a continually staffed auxiliary equipment control centre,
j) means to communicate with telephones in elevator cars, separate from connections to firefighters’ telephones, if elevator cars are required by ASME A17.1/CSA B44, “Safety Code for Elevators and Escalators,” to be equipped with a telephone,
k) means to indicate visually, individual sprinkler system waterflow signals,
l) means to indicate audibly and visually, sprinkler and standpipe system supervisory signals and trouble signals,
m) a switch to silence the audible portion of a supervisory signal or a trouble signal, and
n) visual indication that the audible portion of a supervisory signal or a trouble signal has been silenced.
(See Note A-3.2.6.7.(2).)

3.2.6.8. Voice Communication System

1) A voice communication system or systems conforming to Article 3.2.4.22. shall be provided in all buildings conforming to Article 3.2.6.1.
   a) deleted,
   b) deleted.

3.2.6.9. Testing

1) The systems for control of smoke movement and mechanical venting required by Articles 3.2.6.2. and 3.2.6.6. shall be tested to ensure satisfactory operation. (See Note A-3.2.6.9.(1).)

3.2.7. Lighting and Emergency Power Systems

3.2.7.1. Minimum Lighting Requirements

1) An exit, a public corridor, or a corridor providing access to exit for the public or serving patients’ sleeping rooms or classrooms shall be equipped to provide illumination to an average level not less than 50 lx at floor or tread level and at angles and intersections at changes of level where there are stairs or ramps.
2) The minimum value of the illumination required by Sentence (1) shall be not less than 10 lx.
3) Rooms and spaces used by the public shall be illuminated as described in Article 9.34.2.7.
4) Lighting outlets in a building of residential occupancy shall be provided in conformance with Subsection 9.34.2.

3.2.7.2. Recessed Lighting Fixtures

1) A recessed lighting fixture shall not be located in an insulated ceiling unless the fixture is designed for this type of installation.

3.2.7.3. Emergency Lighting
1) Emergency lighting shall be provided to an average level of illumination not less than 10 lx at floor or tread level in
   a) exits,
   b) principal routes providing access to exit in open floor areas and in service rooms,
   c) corridors used by the public,
   d) corridors serving sleeping rooms in a treatment occupancy,
   e) corridors serving sleeping rooms in a care occupancy, except corridors serving sleeping rooms
      within individual suites of care occupancy,
   f) corridors serving classrooms,
   g) underground walkways,
   h) public corridors,
   i) floor areas or parts thereof where the public may congregate
      i) in Group A, Division 1 occupancies, or
      ii) in Group A, Division 2 and 3 occupancies having an occupant load of 60 or more,
   j) floor areas or parts thereof where persons are cared for that are within daycare facilities,
      including child care facilities,
   k) food preparation areas in commercial kitchens, and
   l) public washrooms.

2) Emergency lighting to provide an average level of illumination of not less than 10 lx at floor or catwalk
   level shall be included in a service space referred to in Sentence 3.2.1.1.(8).

3) The minimum value of the illumination required by Sentences (1) and (2) shall be not less than 1 lx.

4) In addition to the requirements of Sentences (1) to (3), the installation of battery-operated emergency
   lighting in buildings or part thereof where treatment is provided shall conform to the appropriate

3.2.7.4. Emergency Power for Lighting

1) An emergency power supply shall be
   a) provided to maintain the emergency lighting required by this Subsection from a power source
      such as batteries or generators that will continue to supply power in the event that the regular
      power supply to the building is interrupted, and
   b) so designed and installed that upon failure of the regular power it will assume the electrical load
      automatically for a period of
      i) 2 h for a building within the scope of Subsection 3.2.6.,
      ii) 1 h for a building of Group B major occupancy classification that is not within the scope
          of Subsection 3.2.6.,
      iii) 1 h for a building constructed in accordance with Article 3.2.2.50. or 3.2.2.58., and
      iv) 30 min for a building of any other occupancy.

(See Note A-3.2.7.4.(1).)

2) If self-contained emergency lighting units are used, they shall conform to CSA C22.2 No. 141,
   “Emergency Lighting Equipment.”

3.2.7.5. Emergency Power Supply Installation

1) Except as required by Articles 3.2.7.6. and 3.2.7.7., an emergency electrical power supply system shall
   be installed in conformance with CSA C282, “Emergency Electrical Power Supply for Buildings.” (See
   Sentence 3.2.7.8.(1) for emergency electrical power supply for voice communication systems.)

3.2.7.6. Emergency Power for Treatment Occupancies

1) Except as required by Article 3.2.7.7., an emergency electrical power supply system for emergency
   equipment required by this Part for treatment occupancies shall be installed in conformance with CSA Z32,
   “Electrical Safety and Essential Electrical Systems in Health Care Facilities.” (See Note A-3.2.7.6.(1).)
3.2.7.7. Fuel Supply Shut-off Valves
1) If a liquid or gas fuel-fired engine or turbine for an emergency electric power supply is dependent on a fuel supply from outside the building, the fuel supply shall be provided with a suitably-identified separate shut-off valve outside the building.

3.2.7.8. Emergency Power for Fire Alarm Systems
1) Fire alarm systems, including those incorporating a voice communication system, shall be provided with an emergency power supply conforming to Sentences (2), (3) and (4).
2) The emergency power supply required by Sentence (1) shall be supplied from
   a) a generator,
   b) batteries, or
   c) a combination thereof.
3) The emergency power supply required by Sentence (1) shall be capable of providing
   a) supervisory power for not less than 24 h, and
   b) immediately following that period, emergency power under full load for not less than
      i) 2 h for a building within the scope of Subsection 3.2.6.,
      ii) 1 h for a building classified as a Group B major occupancy that is not within the scope of Subsection 3.2.6.,
      iii) 1 h for a building constructed in accordance with Article 3.2.2.50. or 3.2.2.58.,
      iv) 5 min for a building not required to be equipped with an annunciator, and
      v) 30 min for any other building.
   (See Note A-3.2.7.8.(3).)
4) The emergency power supply required by Sentence (1) shall be designed so that, in the event of a failure of the normal power source, there is an immediate automatic transfer to emergency power with no loss of information.

3.2.7.9. Emergency Power for Building Services
1) An emergency power supply capable of operating under a full load for not less than 2 h shall be provided by an emergency generator for
   a) every elevator serving storeys above the first storey in a building that is more than 18 m high measured between grade and the floor level of the top storey and every elevator for firefighters in conformance with Sentence (2),
   b) water supply for firefighting in conformance with Article 3.2.5.7., if the supply is dependent on electrical power supplied to the building,
   c) fans and other electrical equipment that are installed to maintain the air quality specified in Articles 3.2.6.2. and 3.3.3.6.,
   d) fans required for venting by Article 3.2.6.6., and
   e) fans required by Clause 3.2.8.4.(1)(c) and Article 3.2.8.7. in buildings within the scope of Subsection 3.2.6.
   (See Note A-3.2.7.9.(1).)
2) Except as permitted by Sentence (3), the emergency power supply for elevators required by Clause (1)(a) shall be capable of operating all elevators for firefighters plus one additional elevator simultaneously.
3) Sentence (2) does not apply if the time to recall all elevators under emergency power supply is not more than 5 min, each from its most remote storey to
   a) the storey containing the entrance for firefighter access referred to in Articles 3.2.5.4. and 3.2.5.5., or
   b) to a transfer lobby.

3.2.7.10. Protection of Electrical Conductors
1) Electrical and emergency conductors referred to in Clauses (a) to (c) shall be protected against exposure to fire, for a period of no less than 1 h, from the source of the emergency power supply to the branch circuits serving equipment, if
   a) electrical conductors located within buildings identified in Article 3.2.6.1. are serving
      i) fire alarms,
      ii) emergency lighting, or
      iii) emergency equipment within the scope of Articles 3.2.6.2. to 3.2.6.8.,
   b) emergency conductors are serving fire pumps, and
   c) electrical conductors are serving mechanical systems and auxiliary equipment
      i) that serve areas of refuge identified in Clause 3.3.3.6.(1)(b),
      ii) that serve contained use areas identified in Clauses 3.3.3.7.(4)(a) and (b), or
      iii) intended for fire and life safety purposes.
(See Note A-3.2.7.10.(1).)
2) Except as otherwise required by Sentence (3) and permitted by this Article, electrical conductors that are used in conjunction with systems identified in Sentence (1) shall
   a) conform to CAN/ULC-S139, “Fire Test for Evaluation of Integrity of Electrical Power, Data and Optical Fibre Cables,” including the hose stream application, to provide a circuit integrity rating of not less than 1 h (See Note A-3.2.7.10.(2)(a) and (3)(a).), or
   b) be located in a service space that is separated from the remainder of the building by a fire separation that has a fire-resistance rating not less than 1 h.
3) Electrical conductors identified in Clause (1)(c) shall
   a) conform to CAN/ULC-S139, “Fire Test for Evaluation of Integrity of Electrical Power, Data and Optical Fibre Cables,” including the hose stream application, to provide a circuit integrity rating of not less than 2 h (See Note A-3.2.7.10.(2)(a) and (3)(a).), or
   b) be located in a service space that is separated from the remainder of the building by a fire separation that has a fire-resistance rating not less than 2 h.
4) The service spaces referred to in Clauses (2)(b) and (3)(b) shall not contain any combustible materials other than the conductors being protected.
5) Except as stated in Sentences (7) and (9), the electrical conductors referred to in Sentence (1) are those that extend from the source of emergency power to
   a) the equipment served, or
   b) the distribution equipment supplying power to the equipment served, if both are in the same room. (See Note A-3.2.7.10.(5)(b).)
6) If a fire alarm transponder or annunciator in one fire compartment is connected to a central processing unit or another transponder or annunciator located in a different fire compartment, the electrical conductors connecting them shall be protected in accordance with Sentence (2).
7) Fire alarm system branch circuits within a storey that connect transponders and individual devices need not conform to Sentence (2). (See Note A-3.2.7.10.(7).)
8) Except as permitted in Sentence (9), if a distribution panel supplies power to emergency lighting, the power supply conductors leading up to the distribution panel shall be protected in accordance with Sentence (2).
9) Conductors leading from a distribution panel referred to in Sentence (8) to emergency lighting units in the same storey need not conform to Sentence (2).
10) Distribution panels serving emergency lighting units located on other storeys shall be installed in a service room separated from the floor area by a fire separation having a fire-resistance rating of at least 1 h.
11) Conductors leading from a distribution panel to emergency lighting units located on other storeys shall be protected in accordance with Sentence (2) between the distribution panel and the floor area where the emergency lighting units are located.

3.2.8. Mezzanines and Openings through Floor Assemblies
3.2.8.1. Application
1) Except as permitted by Article 3.2.8.2. and Sentence 3.3.4.2.(3), the portions of a floor area or a mezzanine that do not terminate at an exterior wall, a firewall or a vertical shaft shall
   a) terminate at a vertical fire separation having a fire-resistance rating not less than that required for the floor assembly and extending from the floor assembly to the underside of the floor or roof assembly above, or
   b) be protected in conformance with the requirements of Articles 3.2.8.3. to 3.2.8.8.
2) The penetration of a floor assembly by an exit or a vertical service space shall conform to the requirements of Sections 3.4., 3.5. and 3.6.
3) A floor area containing sleeping rooms in a building of Group B, Division 2 major occupancy shall not be constructed as part of an interconnected floor space.

3.2.8.2. Exceptions to Special Protection
1) A mezzanine need not terminate at a vertical fire separation nor be protected in conformance with the requirements of Articles 3.2.8.3. to 3.2.8.8. provided the mezzanine
   a) serves a Group A, Division 1 major occupancy,
   b) serves a Group A, Division 3 major occupancy in a building not more than 2 storeys in building height, or
   c) serves a Group A, C, D, E or F major occupancy and
      i) is 500 m² or less in area, and
      ii) conforms to Sentence 3.2.1.1.(3) or (4).
2) Except for floors referred to in Sentence 3.1.10.3.(1) and Article 3.2.1.2., openings through a horizontal fire separation for vehicular ramps in a storage garage are not required to be protected with closures and need not conform to this Subsection.
3) If a closure in an opening in a fire separation would disrupt the nature of a manufacturing process, such as a continuous flow of material from storey to storey, the closure for the opening is permitted to be omitted provided precautions are taken to offset the resulting hazard. (See Note A-3.2.8.2.(3).)
4) An interconnected floor space in a Group B, Division 1 occupancy need not conform to the requirements of Articles 3.2.8.3. to 3.2.8.8. provided the interconnected floor space does not interconnect more than 2 adjacent storeys.
5) Except as permitted by Sentence (6), openings for escalators and inclined moving walks need not conform to the requirements in Articles 3.2.8.3. to 3.2.8.8. provided
   a) the opening for each escalator or walk does not exceed 10 m²,
   b) the building is sprinklered throughout,
   c) the interconnected floor space contains only Group A, Division 1, 2 or 3, Group D or Group E major occupancies (See Note A-3.2.8.2.(6)(c).), and
   d) closely spaced sprinklers and associated draft stops shall be installed around the openings in conformance with NFPA 13, “Installation of Sprinkler Systems”.
6) An interconnected floor space need not conform to the requirements of Articles 3.2.8.3. to 3.2.8.8., provided
   a) it consists of the first storey and the storey next above or below it, but not both,
   b) it is sprinklered throughout or, where the building area is not more than one half of the area permitted by Subsection 3.2.2., the openings through the floor are used only for stairways, escalators or moving walks (See Note A-3.2.8.2.(6)(b).), and
   c) it contains only Group A, Division 1, 2 or 3, Group D, Group E, or Group F, Division 2 or 3 major occupancies. (See Note A-3.2.8.2.(6)(c).)

3.2.8.3. Sprinklers
1) A building containing an interconnected floor space shall be sprinklered throughout.
2) Except for large floor openings as defined in NFPA 13, “Installation of Sprinkler Systems”, closely spaced sprinklers and associated draft stops shall be installed around floor openings in conformance with NFPA 13.
3.2.8.4. Vestibules

1) An exit opening into an interconnected floor space shall be protected at each opening into the interconnected floor space by a vestibule:
   a) with doorways that are not less than 1.8 m apart,
   b) that is separated from the remainder of the floor area by a fire separation that is not required to have a fire-resistance rating (See Note A-3.1.8.1.(1)(b).), and
   c) that is designed to limit the passage of smoke so that the exit stair shaft does not contain more than 1% by volume of contaminated air from the fire floor, assuming an outdoor temperature equal to the January design temperature on a 2.5% basis determined in accordance with Subsection 1.1.3. (See Note A-3.2.8.4.(1)(c).)

2) An exit opening into an interconnected floor space shall conform to Sentence 3.4.3.2.(6).

3) If an elevator hoistway opens into an interconnected floor space and into storeys above the interconnected floor space, either the elevator doors opening into the interconnected floor space or the elevator doors opening into the storeys above the interconnected floor space shall be protected by vestibules conforming to Sentence (1).

3.2.8.5. Protected Floor Space

1) A protected floor space used to satisfy the requirements of Clause 3.4.3.2.(6)(b) shall
   a) be separated from the interconnected floor space by a fire separation having a fire-resistance rating not less than that required for the floor assembly of the storey in which it is located,
   b) have all openings in the vertical fire separation between a protected floor space and the adjacent interconnected floor space protected by vestibules conforming to Sentence 3.2.8.4.(1), and
   c) be designed so that it is not necessary to enter the interconnected floor space to reach an exit.

3.2.8.6. Draft Stops

1) A draft stop shall be provided at each floor level within an interconnected floor space, immediately adjacent to and surrounding the opening, and shall be not less than 500 mm deep measured from ceiling level down to the underside of the draft stop.

3.2.8.7. Mechanical Exhaust System

1) A mechanical exhaust system shall be provided to remove air from an interconnected floor space at a rate of 4 air changes per hour. (See Note A-3.2.8.7.(1).)

2) The mechanical exhaust system required by Sentence (1) shall be actuated by a switch located on the storey containing the entrance for firefighter access referred to in Articles 3.2.5.4. and 3.2.5.5. near the annunciator for the fire alarm system.

3.2.8.8. Combustible Content Limits

1) An interconnected floor space shall be designed so that the combustible contents, excluding interior finishes, in those parts of a floor area in which the ceiling is more than 8 m above the floor, are limited to not more than 16 g of combustible material for each cubic metre of volume of the interconnected floor space.

3.2.9. Integrated Fire Protection and Life Safety Systems

3.2.9.1. Testing

1) Where fire protection and life safety systems and systems with fire protection and life safety functions are integrated with each other, they shall be tested as a whole in accordance with CAN/ULC-S1001, “Integrated Systems Testing of Fire Protection and Life Safety Systems,” to verify that they have been properly integrated. (See Note A-3.2.9.1.(1).)
Section 3.3. Safety within Floor Areas
(See Note A-3.3.)

3.3.1. All Floor Areas

3.3.1.1. Separation of Suites
1) Except as permitted by Sentences (2) to (4), a suite shall be separated from adjoining suites by a fire separation having a fire-resistance rating not less than 1 h.
   (See also Subsection 3.3.3. for care, treatment or detention occupancies, Article 3.3.4.2. for residential occupancies, and Article 3.1.8.7. for fire dampers.)
2) The fire-resistance rating of the fire separation required by Sentence (1) is permitted to be less than 1 h but not less than 45 min provided the fire-resistance rating required by Subsection 3.2.2. is permitted to be less than 1 h for
   a) the floor assembly above the floor area, or
   b) the floor assembly below the floor area, if there is no floor assembly above.
3) Occupancies that are served by public corridors conforming to Clause 3.3.1.4.(4)(b) in a building that is sprinklered throughout, are not required to be separated from one another by fire separations provided the occupancies are
   a) suites of business and personal services occupancy,
   b) fast food vending operations that do not provide seating for customers,
   c) suites of mercantile occupancy, or
   d) any combination of these occupancies.
4) No fire separation is required between suites of business and personal services occupancy.
5) Except as permitted by Sentence (6), each suite other than a residential suite, located at ground level and having direct access to the street shall be separated from horizontally and vertically adjoining suites by a fire separation having a fire-resistance rating not less than 2 h.
6) The fire separation required by Sentence (5) need not be provided to a storage garage (See Article 3.3.5.6.).

3.3.1.2. Hazardous Substances, Equipment and Processes
1) Except as provided in Subsections 3.3.5. and 3.3.6., the storage, handling and use of hazardous substances shall be in conformance with the applicable requirements of
   a) the Fire By-law, and
   b) provincial regulations or other regulatory enactments.
   (See Note A-3.3.1.2.(1).)
2) Systems for the ventilation of cooking equipment that is not within a dwelling unit and is used in processes producing grease-laden vapours shall be designed and installed in conformance with Articles 3.6.3.5., 6.3.1.7. and 6.9.1.3. (See Note A-3.3.1.2.(2).)
3) A fuel-fired appliance shall not be installed in a corridor serving as an access to exit.

3.3.1.3. Means of Egress
1) Access to exit within floor areas shall conform to Subsections 3.3.2. to 3.3.5., in addition to the requirements of this Subsection.
2) If a podium, terrace, platform or contained open space is provided, egress requirements shall conform to the appropriate requirements of Sentence 3.3.1.5.(1) for rooms and suites.
3) Means of egress shall be provided from every roof which is intended for occupancy, and from every podium, terrace, platform or contained open space.
4) At least two separate means of egress shall be provided from a roof, used or intended for an occupant load more than 60, to stairs designed in conformance with the requirements regarding exit stairs stated in Section 3.4.
5) A roof-top enclosure shall be provided with an access to exit that leads to an exit
   a) at the roof level, or
   b) on the storey immediately below the roof.
6) A roof-top enclosure which is more than 200 m² in area shall be provided with at least 2 means of egress.
7) Two points of egress shall be provided for a service space referred to in Sentence 3.2.1.1.(8) if
   a) the area is more than 200 m², or
   b) the travel distance measured from any point in the service space to a point of egress is more
      than 25 m.
8) Except as permitted by Sentences 3.3.4.4.(5) and (6), each suite in a floor area that contains more than
    one suite shall have
   a) an exterior exit doorway, or
   b) a doorway
      i) into a public corridor, or
      ii) to an exterior passageway.
9) Except as permitted by this Section and by Sentence 3.4.2.1.(2), at the point where a doorway referred to
    in Sentence (8) opens onto a public corridor or exterior passageway, it shall be possible to go in opposite
    directions to each of 2 separate exits.

3.3.1.4. Public Corridor Separations
1) Except as otherwise required by this Part or as permitted by Sentence (4), a public corridor shall be
   separated from the remainder of the storey by a fire separation.
2) Except as permitted by Sentence (3) and Clauses (4)(a) and (b), the fire separation between a public
   corridor and the remainder of the storey shall have a fire-resistance rating not less than 45 min.
3) If a storey is sprinklered throughout, no fire-resistance rating is required for a fire separation between a
   public corridor and the remainder of the storey, provided the corridor does not serve a care, treatment or
   detention occupancy or a residential occupancy. (See Note A-3.1.8.1.(1)(b).)
4) No fire separation is required in a sprinklered floor area between a public corridor and
   a) except as required by Sentences 3.3.3.5.(8) and 3.3.4.2.(1), and notwithstanding Sentence
      3.4.2.4.(2), the remainder of a storey, provided the travel distance from any part of the floor area to
      an exit is not more than 45 m,
   b) a room or a suite, provided the public corridor complies with Sentence 3.3.1.9.(6) and Clause
      3.4.2.5.(1)(d), or
   c) a space containing plumbing fixtures required by Subsection 3.7.2., provided the space and the
      public corridor are separated from the remainder of the storey by a fire separation having a fire-
      resistance rating not less than that required between the public corridor and the remainder of the
      storey.

3.3.1.5. Egress Doorways
1) Except for dwelling units, a minimum of 2 egress doorways located so that one doorway could provide
   egress from the room or suite as required by Article 3.3.1.3. if the other doorway becomes inaccessible to
   the occupants due to a fire which originates in the room or suite, shall be provided for every room and every
   suite
   a) that is used for a high-hazard industrial occupancy and whose area is more than 15 m²,
   b) intended for an occupant load more than 60,
   c) in a floor area that is not sprinklered throughout, and
      i) the area of a room or suite is more than the value in Table 3.3.1.5.-A, or
      ii) the travel distance within the room or suite to the nearest egress doorway is more than
         the value in Table 3.3.1.5.-A, or
   d) in a floor area that is sprinklered throughout and does not contain a high-hazard industrial
      occupancy and
      i) the travel distance to an egress doorway is more than 25 m, or
ii) the area of the room or suite is more than the value in Table 3.3.1.5.-B.

2) Where 2 egress doorways are required by Sentence (1), they shall be placed at a distance from one another equal to or greater than one third of the maximum overall diagonal dimension of the area to be served, measured as the shortest distance that smoke would have to travel between the nearest required egress doors.

Notes to Table 3.3.1.5-B:
See Article 3.3.4.4. for dwelling units.

3.3.1.6. Travel Distance
1) If more than one egress doorway is required from a room or suite referred to in Article 3.3.1.5., the travel
distance within the room or suite to the nearest egress doorway shall not exceed the maximum travel
distances specified in Clauses 3.4.2.5.(1)(a), (b), (c) and (f) for exits.

3.3.1.7. Deleted.

3.3.1.8. Headroom Clearance
1) Except within the floor area of a storage garage, the minimum headroom clearance in every access to exit shall conform to the requirements of Article 3.4.3.4. for exits. (See also Sentence 3.3.5.4.(5).)

3.3.1.9. Corridors
1) The minimum width of a public corridor shall be 1 100 mm.
2) Except as required by Sentence 3.3.3.3.(3), the minimum unobstructed width of a corridor used by the public or a corridor serving classrooms or patients' sleeping rooms shall be 1 100 mm.
3) Except as permitted by Sentence (4), obstructions located within 1 980 mm of the floor shall not project more than 100 mm horizontally into an exit passageway, a public corridor, a corridor used by the public or a corridor serving classrooms or patients' sleeping rooms in a manner that would create a hazard for a person with a visual disability traveling adjacent to the walls.
4) The horizontal projection of an obstruction referred to in Sentence (3) is permitted to be more than 100 mm provided the clearance between the obstruction and the floor is less than 680 mm. (See Note A-3.3.1.9.(4).)
5) If a corridor contains an occupancy, the occupancy shall not reduce the unobstructed width of the corridor to less than its required width.
6) If a public corridor conforming to Clause 3.4.2.5.(1)(d) contains an occupancy,
   a) the occupancy shall be located so that for pedestrian travel there is an unobstructed width not less than 3 m at all times adjacent and parallel to all rooms and suites that front onto the public corridor, and
   b) the combined area of all occupancies in the public corridor shall be not more than 15% of the area of the public corridor.
7) Except for a dead-end corridor that is entirely within a suite or as permitted by Sentences 3.3.3.3.(1) and 3.3.4.4.(6), a dead-end corridor is permitted provided it is not more than 6 m long.

3.3.1.10. Aisles
1) Except as otherwise stated in this Section, aisles shall be provided in conformance with the Fire By-law.

3.3.1.11. Door Swing
1) Except as permitted by Sentence (5) and Article 3.3.1.12., a door that opens into a corridor or other facility providing access to exit from a suite or room not located within a suite shall swing on a vertical axis.
2) Except as permitted by Article 3.3.1.12., a door that opens into a corridor or other facility providing access to exit from a room or suite that is used or intended for an occupant load more than 60 or for a high-hazard industrial occupancy shall swing in the direction of travel to the exit.
3) Every door that divides a corridor that is not wholly contained within a suite shall swing on a vertical axis in the direction of travel to the exit.
4) If a pair of doors is installed in a corridor that provides access to exit in both directions, the doors shall swing in opposite directions, with the door on the right hand side swinging in the direction of travel to the exit.

5) Doors that serve storage suites not more than 28 m² in area in warehousing buildings need not conform to Sentence (1).

3.3.1.12. Sliding Doors
1) Except as permitted by Sentences (2) and 3.3.1.11.(5), a sliding door provided in the locations described in Article 3.3.1.11. shall
   a) be designed and installed to swing on the vertical axis in the direction of travel to the exit when pressure is applied, and
   b) be identified as a swinging door by means of a label or decal affixed to it.

2) In a Group B, Division 1 occupancy, or in an impeded egress zone in other occupancies, sliding doors used in an access to exit need not conform to Sentence (1) and Article 3.3.1.11.

3) Movable partitions used to separate a public corridor from an adjacent business and personal services occupancy or a mercantile occupancy need not conform to Sentence (1) and Sentences 3.3.1.11.(1) and (2), provided the partitions are not located in the only means of egress. (See Note A-3.3.1.12.(3).)

3.3.1.13. Doors and Door Hardware
1) Except as required by Article 3.3.3.4., a door that opens into or is located within a public corridor or other facility that provides access to exit from a suite shall
   a) provide a clear opening of not less than 800 mm if there is only one door leaf,
   b) in a doorway with multiple leaves, have the active leaf providing a clear opening of not less than 800 mm,
   c) not open onto a step, and
   d) have a threshold conforming to Sentence (11), except where it
      i) is used to confine the spillage of flammable liquids within a service room or within a room in an industrial occupancy, or
      ii) provides access to an exterior balcony, unless the balcony is required by Clause 11.3.7.1.(1)(c).

2) Except as provided in Sentences (6) and (7), a door in an access to exit shall be readily openable in travelling to an exit without requiring keys, special devices or specialized knowledge of the door-opening mechanism.

3) Except as permitted by Sentence (4), door release hardware shall comply with Clause 3.8.3.8.(1)(c) and the door shall be openable with not more than one releasing operation. (See also Sentence 3.8.3.6.(4).)

4) An egress door from an individual dwelling unit or from a suite of residential occupancy is permitted to be provided with additional devices that require a releasing operation additional to the main door release hardware, provided the devices are readily operable from the inside without the use of keys, special devices or specialized knowledge. (See Note A-3.3.1.13.(4).)

5) Except as provided in Sentence 3.4.6.17.(9), door release hardware shall be installed between 900 mm and 1100 mm above the finished floor.

6) An egress door in an access to exit serving a contained use area or an impeded egress zone is permitted to be equipped with locking devices, provided they can be released either locally or remotely in conformance with Sentence (8) or (9). (See Note A-3.3.1.13.(6).)

7) A door in an access to exit is permitted to be equipped with an electromagnetic lock conforming to Sentence 3.4.6.16.(4) or (5). (See Note A-3.3.1.13.(7).)

8) Local locking devices permitted by Sentence (6) shall be operable by a key from both sides of the door.

9) Controls for the remote release of door locking devices permitted by Sentence (6) shall be located in an area readily available to security personnel.

10) Locking devices permitted by Sentence (6) that are electrically operated shall be
   a) designed to operate on emergency power, and
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

b) capable of manual release by security personnel.

11) Except in locations described in Subclauses (1)(d)(i) and (ii), in doorways, where the threshold is not flush with the floor, the threshold shall be not more than 13 mm higher than the finished floor surface, and where it is higher than 6 mm, shall be beveled to a slope no steeper than 1 in 2.

12) Door assemblies providing access shall be designed in accordance with Subsection 3.8.3.

3.3.1.14. Ramps and Stairways

1) Except as permitted by Sentence (2), Article 3.3.1.16., Article 3.3.4.7. and Subsection 3.3.2., ramps and stairways that do not serve as exits shall conform to the requirements for exit ramps and stairways stated in Sentence 3.4.3.2.(8) and Articles 3.4.3.4., and 3.4.6.1. to 3.4.6.9.

2) Ramps and stairways that serve service rooms, service spaces or industrial occupancies need not comply with Sentence (1), provided
   a) they are intended only for occasional use for servicing equipment and machinery, and
   b) they do not serve as exits.

3.3.1.15. Exterior Passageways

1) An exterior passageway leading to a required exit shall conform to the requirements of Section 3.4. for exterior exit passageways.

3.3.1.16. Tapered Treads in a Curved Flight

1) Flights of stairs shall consist solely of
   a) straight flights, or
   b) curved flights complying with Sentence (2).
   (See also Articles 3.3.1.14. and 3.4.6.9.)

2) Tapered treads in a curved flight that is not required as an exit shall have
   a) a minimum run of 150 mm,
   b) a run not less than 280 mm when measured at a point 300 mm from the centre line of the handrail at the narrow end of the tread, and
   c) a riser conforming to Sentence 3.4.6.8.(2).

3) Tapered treads shall have a consistent angle and uniform run and rise dimensions in accordance with the construction tolerances stipulated in Article 3.4.6.8. when measured at a point 300 mm from the centre line of the handrail at the narrow end of the tread.

4) All tapered treads within a flight shall turn in the same direction.

3.3.1.17. Capacity of Access to Exits

(See Article 3.3.1.9. for minimum widths of corridors.)

1) The capacity of an access to exit shall be based on the occupant load of the portion of the floor area served.

2) In an access to exit the required width of ramps with a slope not more than 1 in 8, doorways, and corridors shall be based on not less than 6.1 mm per person.

3) In an access to exit the required width of a ramp with a slope more than 1 in 8 shall be based on not less than 9.2 mm per person.

4) In an access to exit from a floor area used or intended to be used for patients in a Group B, Division 2 occupancy or residents in a Group B, Division 3 occupancy, the required width of corridors, doorways, and ramps shall be based on not less than 18.4 mm per person.

5) The capacity of stairs in an access to exit shall conform to the requirements for stairs in Sentences 3.4.3.2.(1) to (3).

6) In a building that is not sprinklered throughout in accordance with Sentence 3.2.5.12.(1), an access to exit that is part of the principal entrance serving a dance hall or a licensed beverage establishment with an occupant load more than 250 shall provide at least one half of the required exit width.
3.3.1.18. Guards

1) Except as provided in Sentence (5) and Article 3.3.2.9., a guard not less than 1 070 mm high shall be provided
   a) around any roof to which access is provided for purposes other than maintenance,
   b) at openings into smoke shafts referred to in Subsection 3.2.6. that are less than 1 070 mm above the
      floor, and
   c) at each raised floor, mezzanine, balcony, gallery, interior or exterior vehicular ramp, and at other
      locations where (See Note A-9.8.8.1.)
      i) the difference in elevation is more than 600 mm between the walking surface and the
         adjacent surface, or
      ii) the adjacent surface within 1.2 m of the walking surface has a slope of more than 1 in
         2.

2) Except as provided in Sentence 3.3.2.9.(4) and Articles 3.3.4.7. and 3.3.5.10., openings through guards
   shall be of a size that prevents the passage of a spherical object whose diameter is more than 100 mm.

3) Deleted.

4) Except for guards conforming to Article 3.3.5.10., guards shall be designed so that no member,
   attachment or opening located between 140 mm and 900 mm above the level protected by the guard
   facilitates climbing. (See Note A-9.8.8.6.(1).)

5) Sentence (1) does not apply
   a) to the front edges of stages,
   b) to loading docks, or
   c) where access is provided for maintenance purposes only.

6) Swimming pools greater than 450 mm deep shall be protected in conformance with Article 9.8.8.1.

3.3.1.19. Transparent Doors and Panels

1) Except as permitted by Sentence (5), a glass or transparent door shall be designed and constructed so
   that the existence and position of the door is readily apparent, by attaching visually contrasting hardware,
   bars or other permanent fixtures to it.

2) The visibility of fully glazed transparent doors, sidelights and panels shall be enhanced through the
   inclusion of mullions, markings or other elements that
   a) are visually contrasting,
   b) are at least 50 mm high,
   c) extend the full width of the door, sidelight or panel, and
   d) are located between 1 350 mm and 1 500 mm above the floor.

3) A glass door shall be constructed of
   a) laminated or tempered safety glass conforming to CAN/CGSB-12.1-M, “Tempered or Laminated
      Safety Glass,” or
   b) wired glass conforming to CAN/CGSB-12.11-M, “Wired Safety Glass.”

4) Except as permitted by Sentence (5), transparent panels used in an access to exit that, because of their
   physical configuration or design, could be mistaken as a means of egress shall be made inaccessible by
   barriers or railings.

5) Sliding glass partitions that separate a public corridor from an adjacent occupancy and that are open
   during normal working hours need not conform to Sentences (1) and (4), provided the partitions are suitably
   marked in conformance with Sentence (2) to indicate their existence and position.

6) Where vision glass is provided in doors or transparent sidelights, the lowest edge of the glass shall be no
   higher than 900 mm above floor level.

7) Glass in doors and in sidelights that could be mistaken for doors, within or at the entrances to dwelling
   units and in public areas, shall conform to the requirements of Article 9.6.1.4.

8) A window in a public area that extends to less than 1 000 mm above the floor and is located above the
   second storey in a building of residential occupancy, shall be protected by a barrier or railing to not less than
1) An openable window which has a width of 380 mm or less, is located less than 1,070 mm above interior floor level, and which opens to a space more than 600 mm below the level of the interior floor, shall be protected by a guard in accordance with Article 3.3.1.18.

9) An openable window which has a width of 380 mm or less, is located less than 1,070 mm above interior floor level, and which opens to a space more than 600 mm below the level of the interior floor, shall be protected by:
   a) an opening mechanism that limits the unobstructed opening to no more than 100 mm measured either vertically or horizontally, or
   b) a guard in accordance with Article 3.3.1.18.

3.3.1.20. Exhaust Ventilation and Explosion Venting

1) Except as provided in Sentence (2), an exhaust ventilation system designed in accordance with the appropriate requirements of Part 6 shall be provided in a building or part of a building in which dust, fumes, gases, vapour or other impurities or contaminants have the potential to create a fire or explosion hazard. (See also Article 4.2.4.13.)

2) Where a fire separation required to have a fire-resistance rating is penetrated by a ventilation system required by Sentence (1) for power-ventilated enclosures in laboratories, the ducts shall be:
   a) continuously enclosed from the first penetrated fire separation to any subsequent fire separations or concealed spaces and all the way through to the outdoors so that the highest fire-resistance rating of all the penetrated fire separations is maintained, and
   b) exempted from the requirement to be equipped with a fire damper, smoke damper and fire/smoke damper as stated in Article 3.1.8.7.

3) Explosion relief devices, vents or other protective measures conforming to Subsection 6.3.1. and Article 6.9.1.2. shall be provided for a space in which substances or conditions that have the potential to create an explosion hazard are present as a result of the principal use of a building.

3.3.1.21. Janitors’ Rooms

1) Except as permitted by Sentences (2) and (3), a room or space within a floor area for the storage of janitorial supplies shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h.

2) The fire-resistance rating of the fire separation required by Sentence (1) is permitted to be less than 1 h but not less than 45 min provided the fire-resistance rating required by Subsection 3.2.2. is permitted to be less than 1 h for:
   a) the floor assembly above the floor area, or
   b) the floor assembly below the floor area, if there is no floor assembly above.

3) The fire separation required by Sentence (1) is not required to have a fire-resistance rating if the floor area in which the room or space is located is sprinklered throughout.

3.3.1.22. Common Laundry Rooms

1) Except as permitted by Sentences (2) and (3), in a building of residential occupancy, a laundry room in a floor area that is not within a dwelling unit shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h.

2) The fire-resistance rating of the fire separation required by Sentence (1) is permitted to be less than 1 h but not less than 45 min provided the fire-resistance rating required by Subsection 3.2.2. is permitted to be less than 1 h for:
   a) the floor assembly above the floor area, or
   b) the floor assembly below the floor area, if there is no floor assembly above.

3) The fire separation required by Sentence (1) is not required to have a fire-resistance rating if the floor area in which the laundry room is located is sprinklered throughout.
3.3.1.23. Obstructions
1) No obstruction shall be permitted in any occupancy that would restrict the width of a normal means of egress from any part of a floor area to less than 750 mm unless an alternative means of egress is provided adjacent to, accessible from, and plainly visible from the obstructed means of egress. (See Note A-3.3.1.23.(1).)

3.3.1.24. Signs in Service Spaces
1) Illuminated signs conforming to Sentences 3.4.5.1.(2) and (6) shall be provided to indicate the direction to egress points in a service space referred to in Sentence 3.2.1.1.(8).

3.3.1.25. Welding and Cutting
1) Except as provided in Sentence (2), welding and cutting operations shall be carried out in a room a) separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h, or b) protected by an automatic fire extinguishing system.
2) Sentence (1) shall not apply to industrial occupancies where the welding and cutting operations do not present a fire or explosion hazard to adjacent areas.

3.3.2. Assembly Occupancy

3.3.2.1. Scope
1) This Subsection applies to assembly occupancies and to outdoor places of assembly.
2) Except as required in Sentence (3), provisions 12.2.3.2, 12.2.3.3, 12.2.5.4, 12.2.5.5, 12.2.5.6, 12.2.11.1, 12.4.1 and 12.4.2 of Chapter 12 of NFPA 101, “Life Safety Code,” are permitted to be used in lieu of Articles 3.3.2.4., 3.3.2.5., 3.3.2.9., 3.3.2.11. and 3.3.2.12. (See Note A-3.3.2.1.(2).)
3) The minimum clear width of aisle accessways between rows of seats shall be calculated according to provisions 12.2.5.5.2, 12.2.5.5.4.1 and 12.2.5.5.5.1 of Chapter 12 of NFPA 101, “Life Safety Code,” except that in no case shall the width be less than 400 mm.

3.3.2.2. Fire Separations
1) Except as permitted by Sentence (2), the seating area of a Group A, Division 1 occupancy shall be separated from adjacent occupancies in the floor area by a fire separation having a fire-resistance rating not less than 1 h if the occupant load in the seating area exceeds 200.
2) The fire-resistance rating of the fire separation required by Sentence (1) is permitted to be less than 1 h but not less than 45 min provided the fire-resistance rating required by Subsection 3.2.2. is permitted to be less than 1 h for a) the floor assembly above the floor area, or b) the floor assembly below the floor area, if there is no floor assembly above.
3) If usable space exists under tiers of seats in arena-type buildings, a fire separation with a fire-resistance rating not less than 45 min shall be provided between the space and the seats or the space shall be sprinklered.

3.3.2.3. Non-fixed Seating
1) Non-fixed seating shall conform to the Fire By-law.

3.3.2.4. Fixed Seats
1) Except for the requirements of Article 3.3.2.8. for bench-type seats and except as required or permitted by Sentence (2) and Articles 3.3.2.11. and 3.3.2.12., fixed seats in places of assembly shall be a) attached or secured to the floor, platform or platform riser, b) provided with arms and back, and
c) arranged in rows having an unobstructed passage not less than 400 mm wide measured horizontally between plumb lines from the backs of the seats in one row and the edges of the furthest forward projection of the seats in the next row in the unoccupied position.

2) For fixed seats with backs and with folding tablet arms, the value of 400 mm required by Clause (1)(c) shall be measured when the tablet arms are in the use position, but is permitted to be measured in the stored position provided
   a) there are not more than 7 seats between any seat and the nearest aisle,
   b) the seats are located in a lecture hall or an auditorium used for instructional purposes, and
   c) the tablet arm, when raised manually to a vertical position, falls by the force of gravity to the stored position.
   (See Note A-3.3.2.4.(2).)

3) Except as permitted by Sentence (4), aisles shall be located so that there are not more than 7 seats with backs or 20 seats without backs between any seat and the nearest aisle.

4) The requirements of Sentence (3) do not apply if
   a) egress doorways are provided to serve both ends of rows of seats,
   b) each doorway referred to in Clause (a) serves not more than 3 rows of seats, and
   c) each row contains not more than 100 seats.

3.3.2.5. Aisles

1) Except as required by Articles 3.3.2.11. and 3.3.2.12., aisles leading to exits shall be provided in conformance with Sentences (2) to (17) in places of assembly which contain fixed seats.

2) The minimum clear width of aisles shall be not less than 1 100 mm, except that the width is permitted to be reduced to not less than
   a) 750 mm if serving not more than 60 seats, and
   b) 900 mm if serving seats on one side only.

3) Except in the case of bleacher seats, the minimum clear width of aisles referred to in Sentence (2) shall be measured at the point farthest from an exit, cross aisle or foyer and shall be increased by 25 mm for each metre of distance toward the exit, cross aisle or foyer.

4) Aisles shall terminate in a cross aisle, foyer or exit, and the width of the cross aisle, foyer or exit shall be not less than the required width of the widest aisle plus 50% of the total required width of the remaining aisles that it serves.

5) Dead-end aisles shall be not more than 6 m long.

6) The length of travel to an exit door by any aisle shall be not more than 45 m.

7) Side aisles shall be not less than 1 100 mm wide if seating is provided in conformance with Sentence 3.3.2.4.(4).

8) An aisle that has a slope not more than 1 in 8 shall not be stepped.

9) An aisle that slopes more than 1 in 8 shall be stepped.

10) The passageway between rows of seats served by a stepped aisle shall be level at right angles to the line of travel.

11) The riser of a step in an aisle shall be
   a) not less than 110 mm high, and
   b) not more than 200 mm high.

12) Variations are permitted in riser height provided
   a) the height of adjacent risers does not vary by more than 6 mm, and
   b) the width of a tread or a platform in the direction of travel is not less than 430 mm.

13) Steps in an aisle shall
   a) have a run not less than 230 mm exclusive of nosings,
   b) have a tread width not less than 250 mm,
   c) extend to the adjacent rows of seats in a manner that will not create a hazard from tripping, and
   d) have a finish on the treads conforming to Sentence 3.4.6.1.(1).
14) The location of every riser in an aisle shall be made apparent from both directions of travel by strategically placed lighting or contrasting marking stripes.
15) A platform in an aisle shall be level, except that a slope not more than 1 in 50 is permitted for a platform that is not less than 430 mm wide in the direction of exit travel.
16) If a step is used at the entry to a row of seats from a stepped aisle, an unobstructed platform not less than 800 mm square shall be provided adjacent to the aisle.
17) The finish of the surface of a platform in or adjacent to a stepped aisle shall conform to Sentence 3.4.6.1.(1).

3.3.2.6. Corridors
1) Except as permitted by Sentences (2) to (4), a corridor used by the public in an assembly occupancy as an access to exit shall be separated from the remainder of the floor area by a fire separation having a fire-resistance rating not less than 1 h.
2) The fire-resistance rating of the fire separation required by Sentence (1) is permitted to be less than 1 h but not less than 45 min provided the fire-resistance rating required by Subsection 3.2.2. is permitted to be less than 1 h for
   a) the floor assembly above the floor area, or
   b) the floor assembly below the floor area, if there is no floor assembly above.
3) The fire-resistance rating required by Sentence (1) is permitted to be waived if the floor area in which the corridor is located is sprinklered throughout.
4) The requirement for a fire separation stated in Sentence (1) is permitted to be waived if the distance from any point in the floor area to an exit measured along the path of travel to the exit does not exceed the travel distance permitted by Article 3.4.2.5.

3.3.2.7. Doors
1) A door equipped with a latching mechanism in an access to exit from a room or suite of assembly occupancy containing an occupant load more than 100 shall be equipped with a device that will release the latch and allow the door to swing wide open when a force not more than that specified in Sentence 3.8.3.6.(8) is applied to the device in the direction of travel to the exit.

3.3.2.8. Fixed Bench-Type Seats without Arms
1) If fixed bench-type seats without arms are provided, the seat width per person shall be assumed to be 450 mm.
2) The centre-to-centre spacing between rows of bench-type seats shall be not less than 760 mm if back rests are provided, and not less than 550 mm if back rests are not provided.
3) A clear space of not less than 300 mm shall be provided between the back of each seat and the front of the seat immediately behind it.

3.3.2.9. Guards
1) Except as required by Sentences (2) to (4) for bleacher seats, guards shall be installed in outdoor and indoor places of assembly with fixed seats so that
   a) at the fascia of every box, balcony or gallery where the seats extend to the edge, the height of guards is not less than
      i) 760 mm in front of the seats, and
      ii) 920 mm if located at the end of aisles or at the foot of steps,
   b) the height of guards along every cross aisle other than those adjacent to the fascia of every box, balcony or gallery is not less than 660 mm, except that guards need not be provided if the backs of the seats along the front side of the aisle are not less than 600 mm above the floor of the aisle, and
   c) where the seating is arranged in successive tiers and the height of rise between platforms is more than 450 mm, the height of guards is not less than 660 mm along the entire row of seats at the edge of the platform.
2) The backs and ends of bleacher seats more than 1 200 mm above the ground or floor that are not adjacent to a wall shall be protected with a guard
   a) not less than 1 070 mm high above an adjacent aisle surface or foot rest, and
   b) not less than 920 mm high above the centre of an adjacent seat board.
3) If the front of a bleacher is more than 600 mm above the ground or floor, it shall be protected with a guard not less than 840 mm high above the front foot rest.
4) The size of any opening in a guard required by Sentences (2) and (3) shall not allow the passage of a sphere whose diameter is more than 300 mm.

3.3.2.10. Handrails in Aisles with Steps
(See Note A-3.3.2.10.)
1) Handrails shall be provided in aisles with steps in conformance with Table 3.3.2.10.

Table 3.3.2.10.
Types and Location of Handrails in Aisles with Steps
Forming Part of Sentence 3.3.2.10.(1)

<table>
<thead>
<tr>
<th>Aisle Width</th>
<th>Aisle Serving Seating on One Side</th>
<th>Aisle Serving Seating on Both Sides</th>

<tr>
<td>1 100 mm or more</td>
<td>a centre-line handrail that conforms to Sentence (2) or a continuous handrail located on the side of the aisle opposite the seats that conforms to Sentences 3.4.6.5.(5) to (8), (11), (13) and (14), plus a handrail located at the end of each row of seats that conforms to Sentences 3.4.6.5.(5) to (8), (11), (13) and (14)</td>
<td>a centre line handrail that conforms to Sentence (2)</td>
</tr>
</tbody>
</table>

2) Handrails installed along aisle centre lines as required by Table 3.3.2.10. shall
   a) comply with Sentences 3.4.6.5.(5) to (7) and (14),
   b) have gaps not less than 560 mm and not more than 915 mm wide, measured horizontally, at intervals not exceeding five rows,
   c) comply with Sentence 3.4.6.5.(11) at terminations and required gaps, and
   d) have an intermediate rail located 305 mm below the principal handrail.

3.3.2.11. Outdoor Places of Assembly
1) A Group A, Division 4 occupancy and each tier or balcony that has a capacity of more than
   a) 1 000 persons shall have not less than 3 separate exits, or
   b) 4 000 persons shall have not less than 4 separate exits.
2) In a Group A, Division 4 occupancy, every seat shall be located so that the travel distance is not more than 45 m measured along the path of travel from the seat to
   a) the ground,
   b) an exit,
   c) an opening to a passageway leading from the seating area, or
   d) a portal, a vomitory or any other opening through the seating deck structure.
3) Exits from outdoor stadia or grandstands shall be located not more than 25 m apart.

4) The capacity of a means of egress for a Group A, Division 4 occupancy shall conform to the requirements of Sentence 3.4.3.2.(3).

5) Aisles in a Group A, Division 4 occupancy shall
   a) be located so that there are not more than 20 seats between any seat and the nearest aisle, and
   b) be not less than 1 200 mm wide, except that an aisle serving less than 60 persons is permitted to be 750 mm wide.

3.3.2.12. Bleachers

1) Steps provided in aisles of bleachers of the telescopic type shall
   a) have risers not more than 250 mm high, and
   b) have treads with a run not less than 280 mm.

2) If the vertical distance between seating platforms in bleachers is more than 280 mm, an intermediate step shall be provided the full width of the aisle and proportioned to provide 2 equal risers between platforms.

3) If the vertical distance between seating platforms in bleachers is more than 450 mm, 2 intermediate steps shall be provided the full width of the aisle so that there are 3 equal risers between platforms.

4) If the passageway between rows of seats is not a closed deck, footboards shall be provided so that
   a) the total width of the footboards shall be not less than three quarters of the centre-to-centre spacing between rows of seats, and
   b) the spacing between footboard members shall be not more than 25 mm.

5) Openings above footboards and below the seats in rows of bleacher seats shall be provided with intermediate construction so that there is no opening that would permit the passage of a sphere of more than 100 mm in diameter.

3.3.2.13. Libraries

1) Except as permitted by Sentence (2), a library book storage room that is not normally accessible to the public shall be separated from the remainder of the building by a fire separation with a fire-resistance rating not less than 2 h if it
   a) is more than 250 m² in area, or
   b) contains book stacks that
      i) are more than 10 m high, or
      ii) penetrate more than one floor assembly.

2) The fire separation required by Sentence (1) is not required if the book storage room is sprinklered.

3) Open book shelves are permitted above and below a mezzanine floor in a library building provided the height of the shelves is not more than 2.1 m but not more than 75% of the floor-to-ceiling height of the space above or below the mezzanine floor assembly.

3.3.2.14. Stages for Theatrical Performances

1) A stage for theatrical performances and ancillary spaces, including workshops, dressing rooms and storage areas, shall be sprinklered.

2) A fire separation with a fire-resistance rating not less than 1 h shall be provided between a stage for theatrical performances and ancillary spaces, including workshops, dressing rooms and storage areas.

3) Except as permitted by Sentence (6), a stage for theatrical performances and ancillary spaces, including workshops, dressing rooms and storage areas, shall be separated from the seating area by a fire separation having a fire-resistance rating not less than 1 h, except for a proscenium opening protected with
   a) a sprinkler deluge system conforming to the requirements of NFPA 13, “Installation of Sprinkler Systems,”
   b) an unframed fire curtain if the opening is not more than 20 m wide, or
   c) a semi-rigid fire curtain if the opening is more than 20 m wide.

4) A fire curtain required by Sentence (3) shall be of a type acceptable to the authority having jurisdiction and designed to close
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

a) automatically upon the actuation of the sprinkler system,
b) automatically upon actuation of the fire alarm system, and
c) manually by remote control devices located at the curtain control panel and at each side of the stage.

5) At least 2 vents for the purpose of venting fire and smoke to the outside of a building shall be provided above a stage designed for theatrical performances and shall
   a) have an aggregate area not less than one eighth of the area of the stage behind the proscenium opening, and
   b) be arranged to open automatically upon actuation of the sprinkler system.

6) The fire separation referred to in Sentence (3) is not required between a stage and a seating area in a building that is sprinklered throughout, provided a sprinkler deluge system is installed at the boundary between the stage and the seating area.

3.3.2.15. Risers for Stairs
   1) In a Group A, Division 2 occupancy used for the serving of food and beverages, an interior flight of stairs with fewer than 3 risers is permitted provided it
      a) is not less than 900 mm wide,
      b) is illuminated at all times that occupants are on the premises, and
      c) has a handrail on each side.

3.3.2.16. Storage Rooms
   1) Where storage rooms are required by Part 4 of Division B of the Fire By-law for the storage of flammable liquids or combustible liquids in assembly occupancies, such rooms shall not be located above or below the first storey.

3.3.2.17. Deleted
   (See Article 3.2.1.8.)

3.3.3. Care, Treatment or Detention Occupancies

3.3.3.1. Application
   1) This Subsection applies to care, treatment and detention occupancies. (See Note A-3.3.3.1.(1).)

3.3.3.2. Separations between Care, Treatment or Detention Occupancies and Repair Garages
   1) The fire separation required by Sentence 3.3.5.5.(1) between a care, treatment or detention occupancy and a repair garage shall have no openings.

3.3.3.3. Corridors
   1) Except as provided in Sentence (2), a corridor used by the public or serving patients’ or residents’ sleeping rooms shall have no dead-end portion.
   2) Corridors are permitted to have dead-portions, where
      a) the area served by the dead-end portion has a second and separate means of egress, or
      b) the corridor serves a suite of care occupancy and the dead-end portion does not exceed 6 m.
   3) Corridors shall be not less than
      a) 2 400 mm wide in buildings of treatment occupancy where the corridors may be used to move patients or residents in beds,
      b) 1 650 mm wide
         i) in buildings of care or treatment occupancy where the corridors will not be used to move patients or residents in beds, and
         ii) in buildings of care occupancy with more than 10 residents and where the corridors serve the residents, or
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

3.3.3.4. Doorway Width

1) Except as provided in Sentence (2) and within individual suites of care occupancy, the minimum clear width of a doorway shall be 850 mm where it opens into or is located within a public corridor or other facility that provides access to exit for patients or residents in floor areas containing care or treatment occupancies.

2) The minimum clear width of doorways through which it is necessary to move patients in bed shall be 1 050 mm. (See Note A-3.3.3.4.(2).)

3.3.3.5. Compartments and Fire Separations

1) Floor areas containing patients’ or residents’ sleeping rooms in a care or treatment occupancy where overnight sleeping accommodation is provided for more than a total of 10 patients or residents shall conform to Sentences (2) to (13).

2) Except as permitted by Sentence (3), a floor area described in Sentence (1) shall be divided into not less than 2 fire compartments, each not more than 1 000 m² in area.

3) The floor area on either side of a horizontal exit conforming to Article 3.4.6.10. is permitted to be considered as a fire compartment in applying the requirements of this Article.

4) Except as permitted by Sentence (5), fire separations separating fire compartments required by Sentence (2) shall have a fire-resistance rating not less than 1 h.

5) The fire-resistance rating of a fire separation referred to in Sentence (4) is permitted to be less than 1 h but not less than 45 min provided the fire-resistance rating required by Subsection 3.2.2. is permitted to be less than 1 h for

   a) the floor assembly above the floor area, or

   b) the floor assembly below the floor area, if there is no floor assembly above.

6) The travel distance from any point within each fire compartment referred to in Sentence (2) to a door to an adjoining fire compartment shall be not more than 45 m.

7) Each fire compartment referred to in Sentence (2) shall be capable of accommodating, in addition to its own occupants, the occupants of the largest adjacent fire compartment based on a clear floor space of 2.5 m² per patient in the adjacent fire compartment.

8) Except as provided in Sentences (9) to (13), walls between patients’ or residents’ sleeping rooms and the remainder of the floor area shall be constructed as fire separations but are not required to have a fire-resistance rating unless one is required by other provisions in this Part. (See Note A-3.1.8.1.(1)(b).)

9) The fire separation requirements of Sentence (8) do not apply to walls within a group of intercommunicating patients’ or residents’ sleeping rooms, provided the group of rooms does not

   a) contain more than 5 patients or residents, or

   b) include storage, bathing or toilet facilities serving persons not occupying the group of rooms.

(See Note A-3.3.3.5.(9).)

10) The fire separation requirements of Sentence (8) do not apply to walls within individual suites of care occupancy.

11) A door in a fire separation required by Sentence (8) is permitted to be equipped with a roller latch.

12) Except as permitted by Sentence (13), a fire separation required by Sentence (8) shall not have any grilles, louvres or other openings.

13) A door or wall separating a patient’s or resident’s sleeping room from an ensuite toilet room, shower room or similar ancillary space is permitted to incorporate grilles and louvres, provided

   a) the adjacent rooms are not used to store flammable or combustible materials, and

   b) the openings are located so that smoke cannot pass through these rooms to other parts of the building.

(See Note A-3.3.3.5.(13).)
14) Walls between individual suites of care occupancy and the remainder of the floor area in buildings of care occupancy shall be constructed as fire separations with a fire-resistance rating not less than that specified for residential occupancies in Sentences 3.3.4.2.(1) and (2).

15) Floor assemblies within individual suites of care occupancy need not be constructed as fire separations, provided the suites meet the conditions described in Clauses 3.3.4.2.(3)(a) and (b).

16) The fire-resistance rating of the fire separation required by Sentence 3.3.5.6.(1) is permitted to be waived if the fire separation is located between individual suites of care occupancy and an attached storage garage containing not more than 5 vehicles, provided the conditions described in Sentence 3.3.4.2.(4) are met.

17) Fire dampers in fire separations between fire compartments described in Sentence (2) shall be designed to close upon a signal from a smoke detector in either fire compartment. (See Note A-3.3.3.5.(1).)

3.3.3.6. Areas of Refuge
1) Compartments containing rooms such as operating rooms, recovery rooms, delivery rooms and intensive care units, from which it is impracticable to move patients in an emergency, shall be
   a) separated from adjacent spaces by fire separations having a fire-resistance rating not less than 1 h, and
   b) provided with a mechanical air supply so that during a period of 2 h after the start of a fire in another space, the compartments will not contain more than 1% by volume of contaminated air from the fire area.

3.3.3.7. Contained Use Areas
1) A contained use area shall conform to Sentences (2) to (5).
2) A contained use area shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h.
3) Except as permitted by Sentence (4), a building that includes a contained use area shall be sprinklered throughout.
4) A contained use area, in a building for which Articles 3.2.2.20. to 3.2.2.90. do not require the installation of an automatic sprinkler system, is not required to be sprinklered as required by Sentence (3) provided
   a) the building is designed so that during a period of 2 h after the start of a fire in the contained use area other fire compartments will not contain more than 1% by volume of contaminated air from the contained use area,
   b) the building is designed so that during a period of 2 h after the start of a fire in another part of the building the contained use area will not contain more than 1% by volume of contaminated air from the other part of the building,
   c) all doors are designed to be remotely released in conformance with Sentence 3.3.1.13.(6), and
   d) the contained use area does not contain any rooms lined with combustible padding.
5) A corridor serving a contained use area shall have no dead-end portion unless the area served by the dead-end portion has a second and separate means of egress.

3.3.4. Residential Occupancy
3.3.4.1. Scope
1) This Subsection applies to residential occupancies.

3.3.4.2. Fire Separations
1) Except as permitted by Sentences (2), 3.2.2.9.(2), and ancillary residential units complying with Section 9.37, suites of residential occupancy, shall be separated from each other and the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h.
2) The fire-resistance rating of the fire separation required by Sentence (1) is permitted to be less than 1 h but not less than 45 min provided the fire-resistance rating required by Subsection 3.2.2. is permitted to be less than 1 h for
   a) the floor assembly above the floor area, or
   b) the floor assembly below the floor area, if there is no floor assembly above.

3) Floor assemblies within a dwelling unit need not be constructed as fire separations provided
   a) the distance between the lowest floor level and the uppermost floor level within the dwelling unit
      is not more than 6 m, and
   b) the dwelling unit is separated from the remainder of the building by a fire separation having a
      fire-resistance rating not less than
      i) 1 h if the building is not sprinklered throughout,
      ii) 45 min if the building is sprinklered throughout and it is not more than 3 storeys in
          building height, or
      iii) 1 h if the building is sprinklered throughout and it is more than 3 storeys in building
          height.

4) The fire-resistance rating of the fire separation required by Sentence 3.3.5.6.(1) is permitted to be waived
   if the fire separation is located between a dwelling unit and an attached storage garage containing not more
   than 5 vehicles, provided
   a) the dwelling unit and the attached storage garage are sprinklered,
   b) the dwelling unit and the attached storage garage are separated from the remainder of the
      building in conformance with Sentences (1), (2) and (3),
   c) there are no air duct systems connecting the storage garage and the dwelling unit,
   d) the construction between the storage garage and the dwelling unit provides an effective barrier
      to gas and exhaust fumes, and
   e) every door between the storage garage and the dwelling unit is
      i) tight fitting and weather-stripped to provide an effective barrier against the passage of
          gas and exhaust fumes,
      ii) fitted with a self-closing device, and
      iii) not located in a room intended for sleeping.

5) The fire separation required by Sentence 3.3.5.6.(1) is not required between a dwelling unit and an
    attached storage garage, serving that dwelling unit only, provided
    a) the dwelling unit and its attached storage garage are sprinklered,
    b) the dwelling unit and its attached storage garage are separated from the remainder of the
       building in conformance with Sentences (1), (2) and (3),
    c) there are no air duct systems connecting the storage garage and the dwelling unit,
    d) the construction between the storage garage and the dwelling unit provides an effective barrier
       to gas and exhaust fumes, and
    e) every door between the storage garage and the dwelling unit is
       i) tight fitting and weather-stripped to provide an effective barrier against the passage of
          gas and exhaust fumes,
       ii) fitted with a self-closing device, and
       iii) not located in a room intended for sleeping.

3.3.4.3. Storage Rooms

1) Sprinklers shall be installed in a storage room provided for the use of tenants in a residential occupancy
   within a floor area but not contained within a suite.

2) Except as permitted by Sentence (3), a storage room referred to in Sentence (1) shall be separated from
   the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h.

3) The fire-resistance rating of the fire separation required by Sentence (2) is permitted to be less than 1 h
   but not less than 45 min provided the fire-resistance rating required by Subsection 3.2.2. is permitted to be
   less than 1 h for
   a) the floor assembly above the floor area, or
b) the floor assembly below the floor area, if there is no floor assembly above.

4) Except for the storage of flammable liquids and combustible liquids inside a building containing not more than one principal dwelling unit and garages or sheds attached to these dwelling units, where storage rooms are required by Part 4 of Division B of the Fire By-law for the storage of flammable liquids or combustible liquids in residential occupancies, such rooms shall not be located above or below the first storey.

3.3.4.4. Egress from Dwelling Units

1) Single storey dwelling units in an apartment building need not lead to a public corridor or exterior passageway on the same storey provided the dwelling units are served by private stairways leading directly to a public access to exit on the storey
   a) immediately above, and
   b) immediately below.
   (See Note A-3.3.4.4.(1).)

2) Except as permitted by Sentences (3), (4), and (7), a dwelling unit containing more than one storey shall have an exit door or an egress door opening directly into a public access to exit from the uppermost storey and from the lowest storey of the dwelling unit so that each of these storeys is served by an exit or egress door located not more than 1.5 m above or below its floor level.

3) A single exit is permitted from a dwelling unit provided the exit is an exterior doorway not more than 1.5m above adjacent ground level and
   a) it is not necessary to travel up or down more than one storey to reach the exit door,
   b) in a sprinklered building, it is not necessary to travel up or down more than two storeys to reach the exit door, provided the travel distance to a single exit door does not exceed 25 m, or
   c) the uppermost floor level opens to a balcony not more than 6 m above adjacent ground level.

4) An egress door from either the uppermost storey or the lowest storey of a dwelling unit, as required by Sentence (2), need not be provided if that storey is served by a stairway that
   a) leads to a public access to exit,
   b) has no direct access to any other storey in the dwelling unit, and
   c) is separated from the other storeys in the dwelling unit by a fire separation having a fire-resistance rating not less than 45 min.

5) In a building of residential occupancy not more than 3 storeys in building height, a doorway from a dwelling unit is permitted to open directly into an exit stairway provided the dwelling unit has a second and separate means of egress.

6) If a dwelling unit has a second and separate means of egress, one means of egress from a dwelling unit is permitted to pass through
   a) an interior corridor served by a single exit,
   b) an exterior balcony served by a single exit stairway, or
   c) an exterior passageway served by a single exit stairway.

7) A single means of egress is permitted from a dwelling unit in a sprinklered building if it is not necessary to travel more than 18 m from the most remote point within the dwelling unit, and (See Note A-3.3.4.4.(7).)
   a) 1 storey up or down, or
   b) two storeys above the first storey of the building.

3.3.4.5. Automatic Locking Prohibition

1) Except for hotels and motels, a door opening onto a public corridor which provides access to exit from a suite shall be designed not to lock automatically. (See Note A-3.3.4.5.(1).)

3.3.4.6. Sound Transmission

1) Occupants of dwelling units shall be protected from airborne noise in conformance with Section 5.8.

3.3.4.7. Stairs, Ramps, Landings, Handrails and Guards for Dwelling Units
1) Except as required in Article 3.3.4.8., stairs, ramps, landings, handrails and guards within a dwelling unit shall conform to the appropriate requirements in Section 9.8.
2) Exterior stairs, ramps, landings, handrails and guards serving a single dwelling unit, and loads on guards serving not more than two dwelling units, shall conform to the appropriate requirements in Section 9.8.

3.3.4.8. Protection of Openable Windows
1) Except as provided in Sentence (2), openable windows in suites of residential occupancy shall be protected by
   a) a guard with a minimum height of 1,070 mm constructed in accordance with Article 3.3.1.18., or
   b) a mechanism capable of controlling the free swinging or sliding of the openable part of the window so as to limit any clear unobstructed opening to not more than 100 mm measured either vertically or horizontally where the other dimension is greater than 380 mm.
2) Windows need not be protected in accordance with Sentence (1) where
   a) the only opening having greater dimensions than those allowed by Clause (1)(b) is located higher than 1,070 mm above the finished floor, or
   b) the bottom edge of the openable portion of the window is located less than 1,800 mm above the floor or ground on the other side of the window.

3.3.4.9. Resistance to Forced Entry
1) Dwelling units shall conform to Article 9.7.2.1. and Subsection 9.7.5.

3.3.5. Industrial Occupancy

3.3.5.1. Scope
1) This Subsection applies to industrial occupancies.

3.3.5.2. Fire Extinguishing Systems
1) In addition to other requirements in this By-law for the installation of automatic fire extinguishing systems, an appropriate fire extinguishing system shall be installed in every industrial occupancy floor area to provide protection if required by
   a) provincial or territorial regulations or other regulatory enactments, or
   b) the Fire By-law, in the absence of the regulations or bylaws referred to in Clause (a).

3.3.5.3. Basements
1) A basement shall not be used for the storage, manufacture or handling of volatile solids, liquids or gases that generate explosive air-vapour mixtures or for processes that involve explosive dusts.
2) Entrances and exits to a basement and to rooms containing building services shall be separate from the remainder of the building in a building in which
   a) the storage, manufacture or handling of volatile materials can generate explosive air-vapour mixtures, or
   b) processes occur that produce explosive dusts.
3) Basements and rooms referred to in Sentence (2) shall be separated from the remainder of the building with a vapour-tight separation.

3.3.5.4. Repair and Storage Garages
1) If access is provided from a storage garage to a stair tower or elevator serving occupancies above the level of the storage garage, the access shall be through a vestibule conforming to Sentence 3.3.5.7.(4).
2) Treads and landings in interior stairs that extend to the roof of a storage garage shall be designed to be free of accumulations of ice and snow.
3) A mechanical storage garage not more than 4 storeys in building height, in which no persons other than parking attendants are permitted above the street floor level, need not have a fire separation between the exits and the remainder of the building.

4) A garage shall be provided with natural or mechanical ventilation in conformance with the requirements of Subsection 6.3.1. and Article 6.9.1.2. to prevent excessive accumulation of carbon monoxide, exhaust fumes or flammable and toxic vapours.

5) The clear height in a storage garage shall be not less than 2 m.

6) Where garage floors or ramps are 600 mm or more above the adjacent ground or floor level, every opening through such floors and the perimeter of floors and ramps shall be provided with
   a) a continuous curb not less than 140 mm high, a guard not less than 1 070 mm high, and a vehicle guardrail not less than 500 mm high conforming to Sentence (7), or
   b) a full-height wall conforming to Sentence (7).

7) Vehicle guardrails and full-height walls required in Sentence (6) shall be designed and constructed to withstand the loading values stipulated in Sentence 4.1.5.15.(1).

8) Deleted.

3.3.5.5. Repair Garage Separation
   1) A repair garage and any ancillary spaces serving it, including waiting rooms, reception rooms, tool and parts storage areas and supervisory office space, shall be separated from other occupancies by a fire separation having a fire-resistance rating not less than 2 h.

3.3.5.6. Storage Garage Separation
   1) Except as permitted by Sentences 3.3.4.2.(4) and (5), a storage garage shall be separated from other occupancies by a fire separation with a fire-resistance rating not less than 1.5 h.

3.3.5.7. Vestibules
   1) Except as provided in Sentence (2), if access is provided through a fire separation between a storage garage and a Group A, Division 1 or Group B occupancy, the access shall be through a vestibule conforming to Sentence (4).
   2) If access is provided through a fire separation between a storage garage and a Group B, Division 3 occupancy with not more than 10 occupants, access need not be through a vestibule, provided the fire separation complies with Clauses 3.3.4.2.(5)(b) to (d).
   3) In a building more than 3 storeys in building height, access through a fire separation between a storage garage and a Group A, Division 2, 3 or 4, or a Group C occupancy, shall be through a vestibule conforming to Sentence (4).
   4) If access is provided through a vestibule, as required by Sentences (1), (3) and 3.3.5.4.(1), the vestibule shall
      a) be not less than 1.8 m long,
      b) be ventilated
         i) naturally to outside air by a vent that has an unobstructed area of not less than 0.1 m² for each door that opens into the vestibule but not less than 0.4 m², or
         ii) mechanically at a rate of 14 m³/h for each square metre of vestibule floor surface area, and
      c) have openings between the vestibule and an adjoining occupancy provided with self-closing doors with no hold-open devices.

3.3.5.8. Dispensing of Fuel
   1) Facilities for the dispensing of fuel having a flash point below 37.8°C shall not be installed above any space intended for occupancy.
   2) Facilities for the dispensing of fuel having a flash point below 37.8°C shall not be installed in any building, except that this requirement does not apply to a canopy which is open on not less than 75% of its perimeter.
3.3.5.9. Multiple-Tenant Self-Storage Warehouses
1) Except where a building is sprinklered throughout, each individual tenancy in a multiple tenant self storage warehouse classified as an industrial occupancy shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 45 min.

3.3.5.10. Guards
1) Except where they serve storage garages, guards in industrial occupancies are permitted to consist of
   a) a top railing, and
   b) one or more intermediate rails spaced such that openings through the guard are of a size that prevents the passage of a spherical object whose diameter is 535 mm.

3.3.6. Design of Hazardous Areas

3.3.6.1. Application
1) This Subsection applies to design and fire protection requirements for buildings or parts thereof used for the storage, handling, use and processing of dangerous goods, including flammable liquids and combustible liquids, in quantities in excess of those identified in Table 3.2.7.1. of Division B of the Fire By-law (See Note A-3.3.6.1.(1.).)

3.3.6.2. Storage of Dangerous Goods
1) Solid and liquid dangerous goods classified as oxidizers or organic peroxides shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 2 h.
2) Reactive materials shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 2 h. (See Note A-3.3.6.2.(2.).)
3) The design of buildings or parts thereof used for the storage of dangerous goods classified as explosives shall conform to the “Explosives Act” and its Regulations, published by Natural Resources Canada.
4) Where wiring or electrical equipment is located in areas in which flammable gases or vapours, combustible dusts or combustible fibres are present in quantities sufficient to create a hazard, such wiring and electrical equipment shall conform to the requirements for hazardous locations as required by the Electrical Safety Regulation.

3.3.6.3. Indoor Storage of Anhydrous Ammonia and Flammable, Toxic and Oxidizing Gases
1) Where required by the Fire By-law, cylinders of dangerous goods classified as flammable gases stored indoors shall be located in a room
   a) that is separated from the remainder of the building by a gas-tight fire separation having a fire-resistance rating of at least 2 h,
   b) that is located on an exterior wall of the building,
   c) that can be entered from the exterior, and
   d) whose closures leading to the interior of the building are
      i) equipped with self-closing devices that keep the closures closed when not in use, and
      ii) constructed so as to prevent the migration of gases from the room into other parts of the building.
2) Where required by the Fire By-law cylinders of anhydrous ammonia or dangerous goods classified as toxic or oxidizing gases stored indoors shall be located in a room
   a) that is separated from the remainder of the building by a gas-tight fire separation having a fire-resistance rating of at least 1 h,
   b) that is located on an exterior wall of the building,
   c) that can be entered from the exterior, and
   d) whose closures leading to the interior of the building are
      i) equipped with self-closing devices that keep the closures closed when not in use, and
ii) constructed so as to prevent the migration of gases from the room into other parts of the building.

3.3.6.4. Storage and Dispensing Rooms for Flammable Liquids and Combustible Liquids

1) Fire separations for rooms where flammable liquids and combustible liquids are stored are required to be constructed with a fire-resistance rating in conformance with Subsection 4.2.9. of Division B of the Fire By-law.

2) Where Class IA or IB liquids specified in Subsection 4.1.2. of Division B of the Fire By-law are dispensed within a storage room, the room shall be designed to prevent critical structural and mechanical damage from an internal explosion in conformance with good engineering practice such as that described in NFPA 68, “Explosion Protection by Deflagration Venting.” (See Note A-3.3.6.4.(2).)

3.3.6.5. Tire Storage

1) A tire storage area designed to contain more than 375 m³ of rubber tires shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 2 h. (See Note A-3.3.6.5.(1).)

3.3.6.6. Ammonium Nitrate Storage

1) Where Article 3.2.9.1. of Division B of the Fire By-law applies due to the quantity and nature of the stored product, and as stipulated in Sentences (2) to (6), buildings used for the storage of ammonium nitrate shall be classified as medium-hazard industrial occupancies (Group F, Division 2).

2) Buildings intended for the storage of ammonium nitrate shall be not more than one storey in building height.

3) Buildings intended for the storage of ammonium nitrate shall not
   a) have basements or crawl spaces, or
   b) contain open floor drains, tunnels, elevator pits or other pockets that might trap molten ammonium nitrate.

4) Buildings intended for the storage of ammonium nitrate shall have not less than 0.007 m² of vent area for each square metre of storage area, unless mechanical ventilation is provided.

5) All flooring in storage areas described in Sentence (1) shall be constructed of noncombustible materials.

6) Buildings intended for the storage of ammonium nitrate shall be designed to prevent the ammonium nitrate from coming into contact with building materials that
   a) will cause the ammonium nitrate to become unstable,
   b) may corrode or deteriorate by reason of contact with the ammonium nitrate, or
   c) will become impregnated with the ammonium nitrate.

   (See Note A-3.3.6.6.(6).)

3.3.6.7. Flooring Materials

1) Floors in areas where dangerous goods are stored shall be constructed of impermeable materials to prevent the absorption of chemicals.

3.3.6.8. Fire Separations in Process Plants

1) In process plants, areas where unstable liquids are handled or where small-scale unit chemical processes occur shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 2 h.

3.3.6.9. Basements and Pits

1) Process plants where Class I and II flammable liquids and combustible liquids are handled shall not be constructed with basements or covered pits.

3.3.7. Building Security
3.3.7.1. Scope
1) This Subsection is intended to address issues of life safety through the security of buildings.

3.3.7.2. Skylights
1) All openable skylights shall be designed to prevent opening from the outside when in the closed and locked position.
2) All exterior skylight fasteners shall be tamperproof.

3.3.7.3. Doors
1) All entrance and exterior doors to dwelling units, doors between dwelling units and attached garages, and doors which provide direct or indirect access from storage garages to dwelling units shall conform to Subsections 9.6.1. and 9.7.3.

3.3.7.4. Sidelights to Doors
1) All sidelights to doors and all windows adjacent to doors located within 915 mm of the door locks shall conform to Sentence 9.6.1.4.(1).

3.3.7.5. Exterior Sliding Windows
1) In buildings of residential occupancy, all exterior windows with a sliding sash located within 5 m of finished grade, shall be provided with a positive, automatically locking mechanism and installed so that the sliding sash cannot be removed from its frame when in the locked position.

3.3.7.6. Security Gates for Storage Garages
1) Security gates installed at vehicle entrances or at secured areas in storage garages shall comply with the following provisions.
   a) Except as required in Clause (1)(b), a security gate shall be designed and installed with clearance between the moving parts and adjacent surfaces which is sufficient to prevent injury or entrapment and is no greater than 100 mm.
   b) If a horizontally sliding security gate opens by sliding into a pocket guard enclosure constructed against a wall,
      i) the clearance between the pocket guard enclosure and the wall surface shall be no greater than 25 mm; and
      ii) the clearance between the pocket guard enclosure and the gate frame shall be no greater than 25 mm on each side of the gate frame.
   c) A security gate shall be designed and installed with
      i) a load sensitive device designed to reverse the gate on contact with an obstruction,
      ii) a five second audible or visual warning device indicating the opening or closing of the gate, and
      iii) a maximum clearance between the gate frame and wall surface of no more than 25 mm.

3.3.7.7. Security for Storage Garage
1) The provisions of Sentences (2) to (7) shall apply to a storage garage with more than 19 parking spaces.
2) If access is provided from a storage garage to a stair tower or to an elevator through a vestibule, the vestibule shall be constructed
   a) with closures glazed with clear wired glass in steel frames, which provide the greatest possible unobstructed view from the storage garage into the stair tower or vestibule,
   b) as a fire separation with a fire-resistance rating of not less than 1 hr,
   c) with full or half glazed closures with a fire-protection rating of not less than 45 min between the storage garage and the vestibule and between the vestibule and the stair tower, and
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

d) with a row of sprinkler heads running the full width of the glazing, installed on the garage side of the vestibule at a spacing of 1800 mm on centre parallel to the glass, located between 150 mm to 300 mm perpendicular to the glazing and vertically installed on the garage ceiling in conformance with NFPA requirements.

(See Note A-3.3.7.7.(2).)

3) A stair shaft serving a storage garage and which is connected to a storey containing an occupancy other than a storage garage, shall terminate at that storey.

4) Except for open-air storage garages and buildings of residential occupancy, a storage garage shall be provided with exits which only serve the storage garage and which exit directly outside the building.

5) Except as provided in Sentence 3.3.7.7.(6), an exterior stair shaft or elevator vestibule which serves as access to a storage garage shall be unenclosed.

6) An enclosed exterior stair shaft or elevator vestibule which serves as access to a storage garage shall conform to Clauses (2)(a) and (c) but need not conform to the fire separation and fire-resistance rating requirements.

7) Where the stair shaft or vestibule in Sentence (5) or (6) is required to have a fire-resistance rating, due to spatial separation requirements, the provisions of Clauses (2)(a), (b) and (c) shall apply.

8) Despite the provisions of Sentence 3.2.7.1.(2) and Table 9.34.2.7., storage garages shall meet the following average lighting levels measured at floor level
   a) 550 lx in the first 15 m of entrance roadway,
   b) 110 lx in traffic aisles, and
   c) 220 lx in pedestrian access vestibules, stairwells and elevator lobbies.

3.3.7.8. Washrooms in Public Buildings

1) Public access to washrooms in a public building shall be located in areas which are open to the public and shall not be located in enclosed stairwells.

3.3.7.9. Mailbox Construction in Multi-Family Buildings

(See Note A-3.3.7.9.)

1) In a multi-family building or parts thereof, commonly accessible mailbox assembly serving at least 20 dwelling units shall
   a) be constructed of heavy gauge metal,
   b) designed to resist prying and tampering,
   c) be well secured to framing members, blocking, or other solid construction,
   d) have individual storage compartment access doors made of 16 gauge steel or 4.76 mm thick aluminum,
   e) be hinged so that the hinge or hinge pin cannot be removed from the outside when the doors are closed, and
   f) be provided with a 5 pin cylinder cam lock that when locked, the bolt will engage with the frame for each storage compartment.

3.3.8. Public Storage Facilities

3.3.8.1. Egress From Storage Lockers

1) Despite the provisions of this By-law, an egress door from a storage locker in a public storage facility is not required to swing on a vertical axis if
   a) the storage locker is equipped with its own sprinkler head,
   b) the building is fully sprinklered in conformance with NFPA 13,
   c) the building is equipped with a fire alarm system in conformance with Subsection 3.2.4.,
   d) each storage locker is separated from the remainder of the floor area by a solid wall assembly without openings,
   e) the storage locker door is equipped with a failsafe locking mechanism,
f) the size of the storage locker does not exceed 50 m² and the travel distance to the egress door does not exceed 10 m,
g) the overhead door only serves a single storage locker, and
h) a continuous steel mesh is installed across the entire storage area and located no higher than 460 mm below the sprinkler head.

Section 3.4. Exits

3.4.1. General

3.4.1.1. Scope
1) Exit facilities complying with this Section shall be provided from every floor area that is intended for occupancy. (See Note A-3.4.1.1.(1).)

3.4.1.2. Separation of Exits
1) Except as permitted by Sentence (2), if more than one exit is required from a floor area, each exit shall be separate from every other exit leading from that floor area.
2) If more than 2 exits are provided from a floor area, exits are permitted to converge in conformance with Sentence 3.4.3.1.(2), provided the cumulative capacity of the converging exits does not contribute more than 50% of the total required exit width for the floor area.
3) Contiguous exit stairs (scissors stairs) are not permitted in a 5 or 6 storey wood frame building.

3.4.1.3. Access to Exits
1) Access to exits shall conform to Section 3.3.

3.4.1.4. Types of Exit
1) Subject to the requirements of this Section, an exit from any floor area shall be one of the following, used singly or in combination:
   a) an exterior doorway,
   b) an exterior passageway,
   c) an exterior ramp,
   d) an exterior stairway,
   e) a fire escape (conforming to Subsection 3.4.7.),
   f) a horizontal exit,
   g) an interior passageway,
   h) an interior ramp, or
   i) an interior stairway.

3.4.1.5. Exterior Exit Passageways
1) Access to an exterior exit passageway from a floor area shall be through exit doors at the floor level.

3.4.1.6. Restricted Use of Horizontal Exits
1) Except as permitted by Sentence (2), horizontal exits shall not comprise more than one half of the required number of exits from any floor area.
2) In a hospital or nursing home with treatment, horizontal exits serving patients' sleeping rooms shall comprise not more than two thirds of the required number of exits from any floor area. (See Note A-3.4.1.6.(2).)

3.4.1.7. Slide Escapes
1) A slide escape shall not be erected on any building as a required exit, but is permitted to be provided as an additional egress facility if unusual hazards are foreseen.

3.4.1.8. Transparent Doors and Panels
1) Glass and transparent panels in an exit shall conform to the appropriate requirements of Article 3.3.1.19, for glass and transparent panels in an access to exit.

3.4.1.9. Mirrors near Exits
1) No mirror shall be placed in or adjacent to any exit in a manner that would confuse the direction of exit.

3.4.1.10. Combustible Glazing in Exits
1) Combustible glazing is not permitted in wall or ceiling assemblies or in closures used to construct an exit enclosure.

3.4.2. Number and Location of Exits from Floor Areas

3.4.2.1. Minimum Number of Exits
1) Except as permitted by Sentences (2) to (4), every floor area intended for occupancy shall be served by at least 2 exits.
2) A floor area in a building not more than 2 storeys in building height, is permitted to be served by one exit provided the total occupant load served by the exit is not more than 60, and
   a) in a floor area that is not sprinklered throughout, the floor area and the travel distance are not more than the values in Table 3.4.2.1.-A, or
   b) in a floor area that is sprinklered throughout
      i) the travel distance is not more than 25 m, and
      ii) the floor area is not more than the value in Table 3.4.2.1.-B.

3) Except as permitted by Sentence (4), if Sentence (2) permits a single exit from a floor area classified as Group B or Group C occupancy, the exit shall be an exterior doorway not more than 1.5 m above adjacent ground level.

4) The requirements of Sentences (1) and (2) are permitted to be waived for dwelling units that have an access to exit conforming to Sentences 3.3.4.4.(1) to (4) and 3.3.4.4.(7).

5) Exits are not required directly from roof-top enclosures that are provided with access to exits in conformance with Sentences 3.3.1.3.(5) and (6).

#### 3.4.2.2. Means of Egress from Mezzanines

1) Except as permitted by Sentences (2) and (3), the space above a mezzanine shall be served by means of egress leading to exits accessible at the mezzanine level on the same basis as floor areas.

2) The means of egress from a mezzanine need not conform to Sentence (1), provided
   a) the mezzanine is not required to terminate at a vertical fire separation, as permitted in Sentence 3.2.8.2.(1),
   b) the occupant load of the mezzanine is not more than 60,
   c) the area of the mezzanine does not exceed the area limits stated in Table 3.4.2.2., and
   d) the distance limits stated in Table 3.4.2.2. measured along the path of travel are not exceeded from any point on the mezzanine to
      i) an egress door serving the space that the mezzanine overlooks, if the space is served by a single egress door, or
      ii) the egress stairway leading to an access to exit in the space below if that space is required to be served by 2 or more egress doorways in conformance with Sentence 3.3.1.5.(1).

3) At least half of the required means of egress from a mezzanine shall comply with Sentence (1) if the mezzanine is not required to terminate at a fire separation as permitted by Sentence 3.2.8.2.(1).

#### 3.4.2.3. Distance between Exits
1) Except as provided in Sentence (2), the least distance between 2 exits from a floor area shall be
   a) one half the maximum diagonal dimension of the floor area, but need not be more than 9 m for a floor area having a public corridor, or
   b) one half the maximum diagonal dimension of the floor area, but not less than 9 m for all other floor areas.
   (See Note A-3.4.2.3.(1).)
2) Exits need not comply with Sentence (1) where
   a) the floor area is divided so that not less than one third of the floor area is on each side of a fire separation, and
   b) it is necessary to pass through the fire separation to travel from one exit to another exit.
3) The minimum distance between exits referred to in Sentence (1) shall be the shortest distance that smoke would have to travel between the exits, assuming that the smoke will not penetrate an intervening fire separation.
4) The distance between 2 exterior discharges of exit stairs serving the same floor area shall be
   a) not less than 9 m, or
   b) not less than 6 m, where
      i) the building is sprinklered throughout, and
      ii) the 2 exterior discharges are located within 15 m of a street.

#### 3.4.2.4. Travel Distance
1) Except as permitted by Sentence (2), for the purposes of this Subsection, travel distance means the distance from any point in the floor area to an exit measured along the path of travel to the exit.
2) The travel distance from a suite or a room not within a suite is permitted to be measured from an egress door of the suite or room to the nearest exit, provided
   a) the suite or room is separated from the remainder of the floor area by a fire separation
      i) having a fire-resistance rating not less than 45 min in a floor area that is not sprinklered throughout, or
      ii) which is not required to have a fire-resistance rating, in a floor area that is sprinklered throughout, and
   b) the egress door opens onto
      i) an exterior passageway,
      ii) a corridor used by the public that is separated from the remainder of the floor area in conformance with the requirements in Article 3.3.1.4. for the separation of public corridors, or
      iii) a public corridor that is separated from the remainder of the floor area in conformance with Article 3.3.1.4. (See Note A-3.1.8.1.(1)(b).)
3) Travel distance to an exit shall be not more than 50 m from any point in a service space referred to in Sentence 3.2.1.1.(8).

3.4.2.5. Location of Exits
1) Except as permitted by Sentences (2) and 3.3.2.5.(6), if more than one exit is required from a floor area, the exits shall be located so that the travel distance to at least one exit shall be not more than
a) 25 m in a high-hazard industrial occupancy,
   b) 40 m in a business and personal services occupancy,
   c) 45 m in a floor area that contains an occupancy other than a high-hazard industrial occupancy, provided it is sprinklered throughout,
   d) 105 m in any floor area, served by a public corridor, in which rooms and suites are not separated from the remainder of the floor area by a fire separation, provided
      i) the public corridor is not less than 9 m wide,
      ii) the ceiling height in the public corridor is not less than 4 m above all floor surfaces,
      iii) the building is sprinklered throughout, and
   iv) not more than one half of the required egress doorways from a room or suite open into the public corridor if the room or suite is required to have more than one egress doorway,
   e) 60 m in any storage garage that conforms to the requirements of Article 3.2.2.90., and
   f) 30 m in any floor area other than those referred to in Clauses (a) to (e).
2) Except for a high-hazard industrial occupancy, Sentence (1) need not apply if exits are placed along the perimeter of the floor area and are not more than 60 m apart, measured along the perimeter, provided each main aisle in the floor area leads directly to an exit.
3) Exits shall be located and arranged so that they are clearly visible or their locations are clearly indicated and they are accessible at all times.

3.4.2.6. Principal Entrances
1) For the purposes of this Section, at least one door at every principal entrance to a building providing access from the exterior at ground level shall be designed in accordance with the requirements for exits.
2) In a building that is not sprinklered throughout in accordance with Sentence 3.2.5.12.(1), the principal entrance serving a dance hall or a licensed beverage establishment with an occupant load more than 250 shall provide at least one half of the required exit width.

3.4.3. Width and Height of Exits

3.4.3.1. Exit Width Based on Occupant Load
1) For the purpose of determining the aggregate width of exits, the occupant load of every room or floor area shall be determined in conformance with Subsection 3.1.17.
2) Except as permitted by Sentence 3.4.3.2.(4), the required exit width shall be cumulative if 2 or more exits converge.

3.4.3.2. Exit Width
1) Except as permitted by Sentence (3), the minimum aggregate required width of exits serving floor areas intended for assembly occupancies, residential occupancies, business and personal services occupancies, mercantile occupancies, and industrial occupancies shall be determined by multiplying the occupant load of the area served by
   a) 6.1 mm per person for ramps with a slope of not more than 1 in 8, doorways, corridors and passageways,
   b) 8 mm per person for a stair consisting of steps whose rise is not more than 180 mm and whose run is not less than 280 mm, or
   c) 9.2 mm per person for
      i) ramps with a slope of more than 1 in 8, or
Division B: Acceptable Solutions
Part 3 – Fire Protection, Occupant Safety and Accessibility

ii) stairs, other than stairs conforming to Clause (b).

2) The minimum aggregate width of exits serving floor areas intended for a care, treatment or detention occupancy shall be determined by multiplying the occupant load of the area served by 18.4 mm per person.

3) The minimum aggregate width of means of egress serving a Group A, Division 4 occupancy shall be determined by multiplying the occupant load of the area served by
   a) 1.8 mm per person for
      i) aisles,
      ii) stairs other than exit stairs, and
      iii) ramps and passageways in vomitories and exits, and
   b) 2.4 mm per person for exit stairs.

4) Except as required by Sentences 3.4.3.2.(5) and (6), the required exit width need not be cumulative in an exit serving 2 or more floor areas located one above the other.

5) The required exit width for an exit stair in an assembly hall or theatre serving more than one balcony level shall conform to Sentence (6).

6) The required exit width for exit stairs that serve interconnected floor space designed in accordance with Articles 3.2.8.3. to 3.2.8.8. shall be cumulative, unless
   a) the stairs provide not less than 0.3 m² of area of treads and landings for each occupant of the interconnected floor space (See Note A-3.4.3.2.(6).), or
   b) protected floor spaces conforming to Article 3.2.8.5. are provided at each floor level and the protected floor space on a floor level has not less than 0.5 m² of space for each occupant of that floor level of the interconnected floor space.

(See Note A-3.4.3.2.(6)(a).)

7) If more than one exit is required, every exit shall be considered as contributing not more than one half of the required exit width.

8) The minimum widths of exits shall conform to Tables 3.4.3.2.-A and 3.4.3.2.-B.

Table 3.4.3.2.-A
Minimum Widths of Exit Corridors, Passageways, Ramps, Stairs and Doorways in Group A, Group B, Division 1, and Groups C, D, E and F Occupancies

### 3.4.3. Exit Width Reduction

1) Except as permitted by Sentences (2) and (4), no fixture, turnstile or construction shall project into or be fixed within the required width of an exit.

2) Swinging doors in their swing shall not reduce the required width of exit stairs or landings to less than 750 mm or reduce the width of an exit passageway to less than the minimum required width.

3) Doors shall be installed so that, when open, they do not diminish nor obstruct the required width of the exit.

4) Handrails and construction below handrails, including handrail supports and stair stringers, shall not project more than 100 mm into the required width of a means of egress.

### 3.4.3.4. Headroom Clearance

(See Note A-3.4.3.4.)

1) Except as permitted by Sentences (4) and (5), every exit shall have a clear height over the clear width of the exit of not less than 2 050 mm.

2) The clear height of stairways shall be measured vertically over the clear width of the stairway, from the straight line tangent to the tread and landing nosings to the lowest element above. (See Note A-9.8.7.4.)

3) The clear height of landings shall be measured within the clear width of the landing vertically to the lowest element above.

4) Except as permitted by Sentence (5), the headroom clearance for doorways shall be not less than 2 030 mm.

5) No door closer or other device shall be installed so as to reduce the headroom clearance of a doorway to less than 1 980 mm.

### 3.4.4. Fire Separation of Exits

#### 3.4.4.1. Fire-Resistance Rating of Exit Separations

Notes to Table 3.4.3.2.-B:

(1) Minimum widths of ramps, stairs and doorways do not apply within individual suites of care occupancy.

(2) Serving not more than 2 storeys above the lowest exit level or not more than 1 storey below the lowest exit level.

(3) Serving more than 2 storeys above the lowest exit level or more than 1 storey below the lowest exit level.
1) Except as permitted by Sentences (2), 3.3.5.4.(3), 3.4.4.2.(2) and 3.4.4.3.(1), every exit shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than that required by Subsection 3.2.2., but not less than 45 min, for
   a) the floor assembly above the storey, or
   b) the floor assembly below the storey, if there is no floor assembly above.
2) The fire-resistance rating of the fire separation referred to in Sentence (1) need not be more than 2 h.
3) If an exit stair in an assembly hall or theatre serves more than one balcony level, the exit stair shall be separated from the remainder of the building in conformance with Sentence (1).

3.4.4.2. Exits through Lobbies
1) Except as permitted by Sentence (2), no exit from a floor area above or below the first storey shall lead through a lobby.
2) Not more than one exit from a floor area is permitted to lead through a lobby, provided
   a) the lobby floor is not more than 4.5 m above grade,
   b) the path of travel through the lobby to the outdoors is not more than 15 m,
   c) the adjacent rooms or premises having direct access to the lobby do not contain a care, residential or industrial occupancy,
   d) the lobby is not located within an interconnected floor space other than as described in Sentence 3.2.8.2.(6),
   e) the lobby conforms to the requirements for exits, except that
      i) rooms other than service rooms and storage rooms are permitted to open onto the lobby,
      ii) the fire separation between the lobby and a room used for the sole purpose of control and supervision of the building need not have a fire-resistance rating,
      iii) the fire separation between the lobby and adjacent occupancies that are permitted to open onto the lobby need not have a fire-resistance rating provided the lobby and adjacent occupancies are sprinklered, and
      iv) passenger elevators are permitted to open onto the lobby, provided the elevator doors are designed to remain closed except while loading and unloading passengers, and
   f) a fire separation, constructed in accordance with Sentence 3.4.4.1.(1), is maintained between the lobby and any exit permitted by this Sentence to lead through the lobby.

(See Note A-3.4.4.2.(2)(e).)

3.4.4.3. Exterior Passageway Exceptions
1) The requirements of Sentences 3.4.4.1.(1) and 3.2.3.13.(1) and (3) do not apply to an exterior exit passageway provided
   a) not less than 50% of the exterior side is open to the outdoors, and
   b) an exit stair is provided at each end of the passageway.

3.4.4.4. Integrity of Exits
1) A fire separation that separates an exit from the remainder of the building shall have no openings except for
   a) standpipe and sprinkler piping,
   b) electrical wires and cables, totally enclosed noncombustible raceways and noncombustible piping that serve only the exit,
   c) openings required by the provisions of Subsection 3.2.6.,
   d) exit doorways,
   e) wired glass and glass block permitted by Article 3.1.8.16., and
   f) wires, cables, totally enclosed noncombustible raceways, and distributed antenna for a radio antenna system conforming to Sentence 3.2.5.20.(1).
2) **Exits** within scissors stairs and other contiguous exit stairways shall be separated from each other by a smoke-tight **fire separation** having a **fire-resistance rating** not less than that required for the floor assembly through which they pass.

3) **Fire separations** separating contiguous stairs described in Sentence (2) shall not be pierced by doorways, ductwork, piping or any other openings that affect the continuity of the separation.

4) A fuel-fired **appliance** shall not be installed in an **exit**.

5) An **exit** shall not be used as a **plenum** for a heating, ventilating or air-conditioning system.

6) An **exit** shall be designed for no purpose other than for exiting, except that an **exit** is permitted also to be designed to serve as an access to a **floor area**.

7) A **service room** shall not open directly into an **exit**.

8) Storage rooms, washrooms, toilet rooms, laundry rooms and similar ancillary rooms shall not open directly into an **exit**.

9) **Service spaces** referred to in Sentence 3.2.1.1.(8) shall not open directly into an **exit**.

### 3.4.5. Exit Signs

#### 3.4.5.1. Exit Signs

1) Every **exit** door shall have an **exit** sign placed over or adjacent to it if the **exit** serves
   a) a **building** more than 2 storeys in **building height**,
   b) a **building** having an **occupant load** of more than 150, or
   c) a **room** or **floor area** that has a fire escape as part of a required **means of egress**.

2) Every **exit** sign shall
   a) be visible on approach to the **exit**,
   b) consist of a green and white or lightly tinted graphical symbol meeting the colour specifications referred to in ISO 3864-1, “Graphical symbols – Safety colours and safety signs – Part 1: Design principles for safety signs and safety markings,” and
   c) conform to ISO 7010, “Graphical symbols – Safety colours and safety signs – Registered safety signs,” for one or more of the following symbols (See Note A-3.4.5.1.(2)(c).):
      i) E001 emergency exit (left hand),
      ii) E002 emergency exit (right hand),
      iii) E005 Direction, arrow (90° increments), safe condition, and
      iv) E006 Direction, 45° arrow (90° increments), safe condition.

3) Internally illuminated **exit** signs shall be continuously illuminated and
   a) where illumination of the sign is powered by an electrical circuit, conform to CSA C22.2 No. 141, “Emergency Lighting Equipment,” or
   b) where illumination of the sign is not powered by an electrical circuit, conform to CAN/ULC-S572, “Photoluminescent and Self-Luminous Exit Signs and Path Marking Systems.”

4) Externally illuminated exit signs shall be continuously illuminated and conform to CAN/ULC-S572, “Photoluminescent and Self-Luminous Exit Signs and Path Marking Systems.” (See Note A-3.4.5.1.(4).)

5) The circuitry serving lighting for externally and internally illuminated **exit** signs shall
   a) serve no equipment other than emergency equipment, and
   b) be connected to an emergency power supply as described in Article 3.2.7.4.

6) Where no **exit** is visible from a **public corridor**, from a corridor used by the public in a Group A or B major **occupancy**, or from principal routes serving an open **floor area** having an **occupant load** of more than 150, an **exit** sign conforming to Clauses (2)(b) and (c) with an arrow or pointer indicating the direction of egress shall be provided.

7) Except for egress doorways described in Sentence 3.3.2.4.(4), an **exit** sign conforming to Sentences (2) to (5) shall be placed over or adjacent to every egress doorway from rooms with an **occupant load** of more than 60 in Group A, Division 1 **occupancies**, dance halls, licensed beverage establishments, and other similar **occupancies** that, when occupied, have lighting levels below that which would provide easy identification of the egress doorway.
3.4.5.2. Signs for Stairs and Ramps at Exit Level
1) In a building more than 2 storeys in building height, any part of an exit ramp or stairway that continues up or down past the lowest exit level shall have a posted sign clearly indicating that it does not lead to an exit.

3.4.6. Types of Exit Facilities
(See Note A-3.4.6.)

3.4.6.1. Slip Resistance of Ramps and Stairs
1) The surfaces of ramps, and landings and treads
   a) shall have a finish that is slip resistant, and
   b) if accessible to the public, shall have either a colour contrast or a distinctive pattern, readily visible from both directions of travel, to demarcate the leading edge of the tread and the leading edge of the landing, as well as the beginning and end of a ramp.
2) Treads and landings of exterior exit stairs more than 10 m high shall be designed to be free of ice and snow accumulations.

3.4.6.2. Minimum Number of Risers
1) Except as permitted by Sentence 3.3.2.15.(1), every flight of interior stairs shall have not less than 3 risers.

3.4.6.3. Maximum Vertical Rise of Stair Flights and Required Landings
1) No flight of stairs shall have a vertical rise of more than 3.7 m between floors or landings, except that a flight of stairs serving as an exit in a Group B, Division 2 occupancy shall have a vertical rise not more than 2.4 m between floors or landings.
2) Except as provided in Sentence (3), a landing shall be provided
   a) at the top and bottom of each flight of interior and exterior stairs,
   b) at the top and bottom of every section of ramp,
   c) where a doorway opens onto a stair or ramp,
   d) where a ramp opens onto a stair, and
   e) where a stair opens onto a ramp.
3) A landing may be omitted at the bottom of an exterior stair or ramp, provided there is no gate, door or fixed obstruction within the lesser of
   a) the width of the stair or ramp, or
   b) 1 100 mm.
4) Landings required at the top of a flight of stairs shall be provided with tactile walking surface indicators conforming to Subsection 3.8.3. unless the stairs are
   a) stairs within dwelling units or serving not more than two dwelling units,
   b) exit stairs not normally used for access purposes, or
   c) fire escape stairs.

3.4.6.4. Dimensions of Landings
(See Note A-3.4.6.4.)
1) Except as provided in Sentence (2), a landing shall be at least as wide and as long as the width of the stairway in which it occurs.
2) In a straight stairway and in a stairway that turns less than 90°, the length of the landing need not be more than the lesser of
   a) the required width of stair, or
   b) 1 100 mm.
3) The length of a landing shall be measured perpendicular to the nosing of adjacent steps, at a distance equal to half the length required in Sentence (2), from the narrow edge of the landing.
4) Where a doorway or stairway empties onto a ramp through a side wall, there shall be a level area extending across the full width of the ramp, and for a distance of 300 mm on either side of the wall opening, except one side if it abuts on an end wall.

5) Where a doorway or stairway empties onto a ramp through an end wall, there shall be a level area extending across the full width of the ramp and along its length for not less than 900 mm.

3.4.6.5. Handrails

1) One handrail shall be provided on stairs that are less than 1 100 mm in width.

2) One handrail shall be provided on each side of
   a) stairs that are 1 100 mm or more in width,
   b) curved flights of any width, and
   c) ramps.

3) In addition to Sentence (2), intermediate handrails shall be provided so that
   a) a handrail is reachable within 750 mm of all portions of the required exit width,
   b) at least one portion of the stair or ramp between two handrails is the minimum width required for stairways or ramps (See Sentences 3.4.3.2.(8) and 3.4.3.3.(4).), and
   c) all other portions of the stair or ramp between two handrails have a clear width of 510 mm or more.

4) Where a stair or ramp is wider than its required exit width, handrails shall be located along the most direct path of travel. (See Note A-3.4.6.5.(4).)

5) Handrails shall be continuously graspable along their entire length, be free of any sharp or abrasive elements, and have
   a) a circular cross-section with an outside diameter not less than 30 mm and not more than 43 mm, or
   b) a non-circular cross-section with a perimeter not less than 100 mm and not more than 125 mm and whose largest cross-sectional dimension is not more than 45 mm.

6) The height of handrails on stairs, on aisles with steps and on ramps shall be measured vertically from the top of the handrail to
   a) a straight line drawn tangent to the tread nosings of the stair or aisle step served by the handrail (See Note A-9.8.7.4.), or
   b) the surface of the ramp, floor or landing served by the handrail.

7) Except as provided in Sentence (8) and Clause 3.8.3.5.(1)(e), the height of handrails on stairs, on aisles with steps and on ramps shall be
   a) not less than 865 mm, and
   b) not more than 1 070 mm.

8) Handrails installed in addition to required handrails need not comply with Sentence (7).

9) Required handrails shall be continuously graspable throughout the length of
   a) a ramp, and
   b) a flight of stairs, from the bottom riser to the top riser.

(See Note A-9.8.7.2.)

10) Except where interrupted by doorways, at least one handrail shall be continuous throughout the length of a stairway or ramp, including at landings. (See Note A-3.4.6.5.(10).)

11) Handrails shall be terminated in a manner that will not obstruct pedestrian travel or create a hazard. (See Note A-3.4.6.5.(10).)

12) At least one handrail at the side of a stairway or ramp shall extend horizontally not less than 300 mm beyond the top and bottom of the stairway or ramp. (See Note A-3.4.6.5.(10).)

13) The clearance between a handrail and any surface behind it shall be not less than
   a) 50 mm, or
   b) 60 mm if the surface behind the handrail is rough or abrasive.

14) Handrails and their supports shall be designed and constructed to withstand the loading values specified in Sentence 4.1.5.14.(7).
15) A ramp shall have handrails on both sides.

3.4.6.6. Guards

1) Every exit shall have a wall or a well-secured guard on each side, where
   a) there is a difference in elevation of more than 600 mm between the walking surface and the adjacent surface, or
   b) the adjacent surface within 1.2 m of the walking surface has a slope of more than 1 in 2.
   (See Note A-9.8.8.1.)
2) Except as required by Sentence (4), the height of guards for exit stairs and exit ramps as well as their landings shall be not less than 1 070 mm.
3) The height of guards shall be measured vertically to the top of the guard from
   a) a line drawn through the outside edges of the stair nosings, or
   b) the surface of the ramp or landing.
4) The height of guards for exterior stairs and landings more than 10 m above adjacent ground level shall be not less than 1 500 mm measured vertically to the top of the guard from the surface of the landing or from a line drawn through the outside edges of the stair nosings.
5) Except as provided in Sentence 3.3.1.18.(3) and Articles 3.3.4.7. and 3.3.5.10., guards in exits shall not have any openings that permit the passage of a spherical object whose diameter is more than 100 mm.
6) In a stairway, a window for which the distance measured vertically between the bottom of the window and a line drawn through the outside edges of the stair nosings is less than 900 mm, or a window that extends to less than 1 070 mm above the landing, shall
   a) be protected by a guard that is
      i) located approximately 900 mm above a line drawn through the outside edges of the stair nosings, or
      ii) not less than 1 070 mm high measured to the top of the guard from the surface of the landing, or
   b) be fixed in position and designed to resist the lateral design loads specified for guards and walls in Articles 4.1.5.14. and 4.1.5.16.
7) Except for guards conforming to Article 3.3.5.10., guards that protect a level located more than one storey or 4.2 m above the adjacent level shall be designed so that no member, attachment or opening located between 140 mm and 900 mm above the level being protected by the guard facilitates climbing. (See Note A-9.8.8.6.(1.).)

3.4.6.7. Ramp Slope

(See also Article 3.8.3.5.)

1) Except as required for aisles by Article 3.3.2.5., the maximum slope of a ramp shall be
   a) 1 in 10 in any assembly, care, treatment, detention or residential occupancy,
   b) 1 in 6 in an industrial occupancy,
   c) 1 in 8 in all other occupancies, and
   d) 1 in 10 for an exterior ramp.

3.4.6.8. Treads and Risers

(See Note A-9.8.4.)

1) Except as permitted for dwelling units and by Sentence 3.4.7.5.(1) for fire escapes, steps for stairs shall have a run of not less than 280 mm between successive steps.
2) Steps for stairs referred to in Sentence (1) shall have a rise between successive treads not less than 125 mm and not more than 180 mm.
3) Except as provided in Article 3.3.4.7. and except for fire escape stairs, stairs that are principally used for maintenance and service, and stairs that serve industrial occupancies other than storage garages, steps for stairs shall have no open risers.
4) Except in fire escape stairs and where an exterior stair adjoins a walkway as permitted in Sentence 3.4.6.3.(3), risers, measured as the vertical nosing-to-nosing distance, shall be of uniform height in any one flight, with a maximum tolerance of
   a) 5 mm between adjacent treads or landings, and
   b) 10 mm between the tallest and shortest risers in a flight.
5) Except in fire escape stairs, treads shall have a uniform run with a maximum tolerance of
   a) 5 mm between adjacent treads, and
   b) 10 mm between the deepest and shallowest treads in a flight.
6) Treads and risers shall not differ significantly in run and rise in successive flights in any stair system.
7) The slope of treads or landings shall not exceed 1 in 50.
8) The top of the nosing of stair treads shall
   a) except as permitted in Sentence (10), have either a radius or a bevel between 6 mm and 10 mm in horizontal dimension,
   b) have no abrupt angles on the underside, and
   c) not project more than 38 mm.
9) The front edge of stair treads in exits and public access to exits shall be at right angles to the direction of exit travel.
10) If resilient material is used to cover the nosing of a stair tread, the minimum rounded or beveled edge required by Sentence (8) is permitted to be reduced to 3 mm.
11) Stairs shall be provided with tactile warning strips conforming to Article 3.8.3.9. unless the stairs are
    a) stairs within or serving dwelling units,
    b) exit stairs not normally used for access purposes, or
    c) fire escape stairs.

3.4.6.9. Curved Flights in Exits

1) Exit stair flights shall consist solely of
   a) straight flights, or
   b) curved flights complying with Sentence (2).
2) A curved flight used as an exit shall have
   a) a handrail on each side,
   b) a minimum run of 240 mm,
   c) a run that conforms to Article 3.4.6.8. when measured at a point 300 mm from the centre line of the handrail at the narrow end of the tread, and
   d) an inside radius that is not less than twice the stair width.
3) Tapered treads shall have a consistent angle and uniform run and rise dimensions in accordance with the construction tolerances stipulated in Article 3.4.6.8. when measured at a point 300 mm from the centre line of the handrail at the narrow end of the tread.
4) All tapered treads within a flight shall turn in the same direction.

3.4.6.10. Horizontal Exits

1) The floor area on each side of a horizontal exit shall be sufficient to accommodate the occupants of both floor areas, allowing not less than 0.5 m² of clear floor space per person, except that 1.5 m² shall be provided for each person in a wheelchair and 2.5 m² for each bedridden patient.
2) If vestibules, enclosed balconies or bridges are used as parts of a horizontal exit, their clear width shall be not less than that of the exit doorways opening into them, except that handrails are not permitted to project into this clear width more than 100 mm.
3) In a horizontal exit where there is a difference in level between the connected floor areas, slopes not more than those specified for ramps in Article 3.4.6.7. are permitted to be used.
4) No stairs or steps shall be used in a horizontal exit.
5) If 2 doors are provided in a horizontal exit that comprises a part of the required number of exits from the floor areas on both sides of the exit
a) the doors shall be mounted adjacent to each other with the door on the right side in the direction of travel through the horizontal exit swinging in the direction of travel through the horizontal exit, and 
b) signs shall be provided on each side of the horizontal exit to indicate the door that swings in the direction of travel from that side.  
(See Note A-3.4.6.10.(5).) 
6) If a horizontal exit utilizes bridges between buildings or outside balconies, the bridges or balconies shall conform to Article 3.2.3.19.

3.4.6.11. Doors
1) The distance between a stair riser and the leading edge of a door during its swing shall be not less than 300 mm. 
2) Except as provided in Sentence (3) and where doorways are used to confine the spillage of flammable liquids within a service room or within a room in an industrial occupancy, a threshold for a doorway in an exit shall be not more than 13 mm higher than the surrounding finished floor surface. 
3) Except for doors providing access to ground level as required by Clause 11.3.7.1.(d) and (e), an exit door is permitted to open onto not more than one step which shall be not more than 150 mm high where there is a risk of blockage by ice or snow. 
4) Exit doors shall be clearly identifiable. (See Note A-3.4.6.11.(4).) 
5) No door leaf in an exit doorway with more than one leaf shall be less than 610 mm wide. 
6) Where an exit door leading directly to the outside is subject to being obstructed by parked vehicles or storage because of its location, a visible sign or a physical barrier prohibiting such obstructions shall be installed on the exterior side of the door. 

3.4.6.12. Direction of Door Swing
1) Except for doors serving a single dwelling unit and except as permitted by Sentence (2), (3) and Article 3.4.6.14., every exit door shall 
a) open in the direction of exit travel, and 
b) swing on its vertical axis. 
2) Exit doors need not conform to Sentence (1), where 
a) they serve storage garages serving not more than one dwelling unit, 
b) they serve accessory buildings serving not more than one dwelling unit, 
c) reserved, or 
d) reserved. 
3) Despite the provisions of Sentence (1), principal entrance doors opening to an acceptable open space at ground level are not required to swing in the direction of exit travel if 
a) the suite is located at ground level, 
b) the suite does not serve a Group F, Division 1 occupancy, and 
c) the occupant load is not more than 60 persons. 

3.4.6.13. Self-closing Devices 
1) An exit door that is normally required to be kept closed 
a) shall be provided with a self-closing mechanism, and 
b) shall never be secured in an open position except as permitted by Sentence 3.1.8.14.(1). 

3.4.6.14. Sliding Doors 
1) Except as permitted by Sentences (2) and 3.4.6.12.(2), an exit door leading directly to outdoors at ground level is permitted to be a sliding door provided it conforms to Sentence 3.3.1.12.(1). 
2) An exit door serving a Group B, Division 1 occupancy, or an impeded egress zone in other occupancies, is permitted to be a sliding door that does not conform to Sentence 3.3.1.12.(1) provided it is designed to be released in conformance with Article 3.3.1.13.
3.4.6.15 Revolving Doors

1) Except as permitted by Sentence (3), a revolving door, if used, shall
   a) be collapsible,
   b) have hinged doors providing equivalent exiting capacity located adjacent to it,
   c) be used as an exit from the ground floor level only,
   d) not be used at the foot of any stairway, and
   e) have all glass in door leaves and enclosure panels conforming to
      i) CAN/CGSB-12.1-M, “Tempered or Laminated Safety Glass,” or

2) Except as permitted by Sentence (3), a revolving door shall not be considered to have an exiting capacity for more than 45 persons.

3) An electrically powered revolving door is not required to conform to Sentences (1) and (2) provided
   a) the door leaves will collapse and stop automatic rotation of the door system and not obstruct the doorway if a force not more than that specified in Sentence 3.4.6.16.(2) is applied at the centre of a door leaf,
   b) the door leaves are capable of being opened from inside the building without requiring keys, special devices, or specialized knowledge of the door opening mechanism,
   c) the allowable exiting capacity is based on the clear width of passage through the door enclosure when the doors are fully collapsed,
   d) a permanent sign, whose centre line is between 1 000 mm and 1 500 mm above the floor, is placed on each face of each door leaf indicating the method for collapsing the door leaf in an emergency, and
   e) glass used for door leaves and enclosure panels is safety glass conforming to
      i) CAN/CGSB-12.1-M, “Tempered or Laminated Safety Glass,” or

3.4.6.16 Door Release Hardware

1) Except for devices on doors serving a contained use area or an impeded egress zone designed to be remotely released in conformance with Article 3.3.1.13., and except as permitted by Sentences (4) and (5) and Article 3.4.6.17., locking, latching and other fastening devices on a principal entrance door to a building as well as those on every exit door shall include release hardware complying with Clause 3.8.3.8.(1)(c) to permit the door to be readily opened from the inside with not more than one releasing operation and without requiring keys, special devices or specialized knowledge of the door-opening mechanism. (See Note A-3.4.6.16.(1).)

2) If a door is equipped with a latching mechanism, a device that will release the latch and allow the door to swing wide open when a force of not more than 90 N is applied to the device in the direction of travel to the exit shall be installed on
   a) every exit door from a floor area containing an assembly occupancy having an occupant load more than 100,
   b) every door leading to an exit lobby from an exit stair shaft, and every exterior door leading from an exit stair shaft in a building having an occupant load more than 100, and
   c) every exit door from a floor area containing a high-hazard industrial occupancy.

3) Except as required by Sentence 3.8.3.6.(8), every exit door shall be designed and installed so that, when the latch is released, the door will open under a force of not more than 90 N, applied at the knob or other latch releasing device.

4) Except as permitted in Sentence (7), electromagnetic locks that do not incorporate latches, pins or other similar devices to keep the door in the closed position are permitted to be installed on doors, other than those leading directly from a high-hazard industrial occupancy, provided
   a) the building is equipped with a fire alarm system,
b) the locking device releases upon actuation of the alarm signal from the building's fire alarm system,
c) the locking device releases immediately upon loss of power controlling the electromagnetic locking mechanism and its associated auxiliary controls,
d) except for locking devices installed in conformance with Sentence (5), the locking device releases immediately upon actuation of a manually operated switch readily accessible only to authorized personnel,
e) except as provided in Clause (k), a force of not more than 90 N applied to the door opening hardware initiates an irreversible process that will release the locking device within 15 s and not re-lock until the door has been opened,
f) upon release, the locking device must be reset manually by the actuation of the switch referred to in Clause (d),
g) a legible sign is permanently mounted on the door to indicate that the locking device will release within 15 s of applying pressure to the door-opening hardware,
h) the total time delay for all electromagnetic locks in any path of egress to release is not more than 15 s (See note A-3.4.6.16.(4)(h).),
i) where a bypass switch is installed to allow testing of the fire alarm system, actuation of the switch
   i) can prevent the release of the locking device by the fire alarm system, as stated in
      Clause (b), during the test, and
   ii) causes an audible and visual signal to be indicated at the fire alarm annunciator panel
      required by Article 3.2.4.9. and at the monitoring station specified in Sentence 3.2.4.8.(4),
j) emergency lighting is provided at each door, and
k) where they are installed on doors providing emergency crossover access to floor areas from exit
   stairs directly into a public corridor in accordance with Sentence 3.4.6.18.(2),
   i) the locking device releases immediately upon the operation of a manual station for the
      fire alarm system located on the wall on the exit stair side not more than 600 mm from the
      door, and
   ii) a legible sign with the words "re-entry door unlocked by fire alarm" written in letters at
      least 25 mm high with a stroke of at least 5 mm is permanently mounted on the door on
      the exit stair side.

(See Notes A-3.4.6.16.(4). and A-3.3.1.13.(7).)

5) Electromagnetic locks that do not incorporate latches, pins or other similar devices to keep the door in the
closed position are permitted to be installed on doors in Group B, Division 2 and Division 3 occupancies, provided

a) the building is
   i) equipped with a fire alarm system, and
   ii) sprinklered,
b) the electromagnetic lock releases upon
   i) actuation of the alarm signal from the building's fire alarm system,
   ii) loss of its power supply and of power to its auxiliary controls,
   iii) actuation of a manually operated switch that is readily accessible at a constantly
       attended location within the locked space, and
   iv) actuation of the manual station installed within 0.5 m of each door and equipped with
       an auxiliary contact, which directly releases the electromagnetic lock,
c) upon release, the electromagnetic lock requires manual resetting by actuation of the switch
   referred to in Subclause (b)(iii),
d) a legible sign with the words "EMERGENCY EXIT UNLOCKED BY FIRE ALARM" written in
   letters at least 25 mm high with a stroke at least 5 mm wide is permanently mounted on the door,
e) the operation of any by-pass switch, where provided for testing of the fire alarm system, sets off
   an audible signal and a visual signal at the fire alarm annunciator panel and at the monitoring
   station referred to in Sentence 3.2.4.7.(4), and
f) emergency lighting is provided at the doors.
(See Note A-3.4.6.16.(5).)

6) Except as provided in Sentence 3.4.6.17.(9), door release hardware for the operation of the doors referred to in this Section shall be installed at a height between 900 mm and 1 100 mm above the finished floor.
(See also Subclause 3.8.3.6.(6)(a)(v).)

7) As an alternative to the requirements of Clauses (e), (f) and (g) in Sentence 3.4.6.16.(4), acceptable door release hardware for an electromagnetic lock shall be located in close proximity to the exit door and shall be equipped with
   a) a push button together with a motion sensor or a pressure sensitive pad that will immediately release the locking device,
   b) a push button that is
      i) directly connected to the electrical circuit that provides power to the locking device, without any intervening mechanism,
      ii) embossed with the word “EXIT” on the activation surface in text with dimensions of no less than 25 mm,
      iii) internally illuminated by a permanent LED type light source, and
      iv) labeled “DOOR RELEASE” in plain and legible characters,
   c) an electromagnetic lock that
      i) will reset automatically, except as provided in (c)(ii),
      ii) has an automatic reset feature that is not activated for at least 15 seconds, and
      iii) can only be reset by manual means after the activation of the fire alarm system.
(See Note A-3.4.6.16.(7).)

3.4.6.17. Security for Banks and Mercantile Floor Areas
1) If a building is sprinklered throughout, the requirements of Sentence 3.4.6.16.(1) are permitted to be waived for exit and egress doors complying with Sentences (2) to (9) that serve a floor area or part of a floor area used exclusively for
   a) a bank, or
   b) the sale of retail merchandise.
(See Note A-3.4.6.17.(1).)

2) Exit and egress doors referred to in Sentence (1) shall be designed to prevent locking at any time that the part of the floor area that they serve is open to the public.
3) A sign with the words “This door shall not be locked at any time that the public is present” in letters not less than 50 mm high shall be permanently affixed to both sides of doors referred to in Sentence (1).

4) Exit and egress facilities complying with Sentences (5) to (9) shall be incorporated for egress by persons other than the public from a floor area or a part of a floor area referred to in Sentence (1) during times when the public is neither present nor being admitted to the area that they serve.

5) In exit and egress facilities referred to in Sentence (4), at least one door at each exit and egress location shall
   a) be operable in conformance with Sentence 3.4.6.16.(1), or
   b) be equipped with locks conforming to Sentence 3.4.6.16.(4) that release immediately
      i) if an alert signal or alarm signal is initiated in the fire alarm system, or
      ii) the sprinkler system is actuated.

6) A door referred to in Sentence (5) shall be permanently and distinctly marked to indicate that it is an emergency exit.

7) Exit and egress facilities required for evacuation of persons other than the public from a floor area or a part of a floor area referred to in Sentence (1) shall have an aggregate width based on the maximum number of persons other than the public and determined in accordance with Articles 3.4.3.1. to 3.4.3.3.

8) Travel distance to an exit referred to in Sentence (7) shall not exceed the travel distance determined in accordance with Subsection 3.4.2.
9) Exit and egress doors serving a floor area or part of a floor area referred to in Sentence (1) are permitted to be equipped with locks that require keys, special devices or specialized knowledge of the door opening mechanism provided
   a) the doors do not lead into exit stairs,
   b) the doors do not lead from exit stairs to the exterior of the building,
   c) the doors do not serve any other occupancy,
   d) the area served contains at least one telephone
      i) that is accessible and in operation at all times,
      ii) that is not coin or card operated, and
      iii) marked to indicate that it is for emergency use,
   e) the area served is illuminated by normal power or by emergency power when the doors are locked,
   f) there are provisions that enable an announcement to be made throughout the area served before the locks are fastened, and
   g) the locks are designed for use during times that the building is not occupied.

3.4.6.18. Emergency Crossover Access to Floor Areas
   1) Except as permitted in Sentence (2), doors providing access to floor areas from exit stairs shall not have locking devices to prevent entry into any floor area from which the travel distance up or down to an unlocked door is more than 2 storeys.
   2) Doors referred to in Sentence (1) are permitted to be equipped with electromagnetic locks, provided they open directly into a public corridor and comply with Sentences 3.4.6.16.(4) and (5).
   3) Doors referred to in Sentence (1) shall be identified by a sign on the stairway side to indicate that they are openable from that side.
   4) Locked doors intended to prevent entry into a floor area from an exit stair shall
      a) be identified by a sign on the stairway side to indicate the location of the nearest unlocked door in each direction of travel, and
      b) be openable with a master key that fits all locking devices and is kept in a designated location accessible to firefighters or be provided with a wired glass panel not less than 0.0645 m² in area and located not more than 300 mm from the door opening hardware.
   5) Where access to floor areas through unlocked doors is required by Sentence (1), it shall be possible for a person entering the floor area to have access through unlocked doors within the floor area to at least one other exit.

3.4.6.19. Floor Numbering
   1) Arabic numerals indicating the assigned floor number shall
      a) be mounted permanently on the stair side of the wall at the latch side of doors to exit stair shafts,
      b) be not less than 60 mm high, raised approximately 0.7 mm above the surface,
      c) be located 1 500 mm from the finished floor and not more than 300 mm from the door, and
      d) be contrasting in colour with the surface to which they are applied. (See Note A-3.4.6.19.(1)(d).)

3.4.7. Fire Escapes

3.4.7.1. Scope
   1) Except as permitted by Sentence (2), fire escapes shall not be erected on a building.
   2) If it is impracticable to provide one or more of the exit facilities listed in Article 3.4.1.4., fire escapes conforming to Articles 3.4.7.2. to 3.4.7.7. are permitted to serve floor areas in an existing building provided the floor areas served are not more than
      a) 2 storeys above ground level in care, treatment or detention occupancies, and
      b) 5 storeys above ground level in other occupancies.
3.4.7.2. Fire Escape Construction
1) Fire escapes shall be of metal or concrete, of the stair type extending to ground level, constructed throughout in a strong substantial manner and securely fixed to the building, except that wooden fire escapes are permitted to be used on buildings of combustible construction if all posts and brackets are not less than 89 mm in their least dimension and all other woodwork is not less than 38 mm in its least dimension.

3.4.7.3. Access to Fire Escapes
1) Access to fire escapes shall be from corridors through doors at floor level, except that access from a dwelling unit is permitted to be through a casement window having an unobstructed opening not less than 100 mm high by 550 mm wide with a sill height of not more than 900 mm above the inside floor.
2) The clear area of a fire escape balcony onto which a door opens, shall be not less than 1 m².

3.4.7.4. Protection of Fire Escapes
1) If a fire escape serves any storey above the second, openings located in a zone described in Sentence (2), including access doorways in the exterior walls of the building to which the fire escape is attached, shall be protected by closures conforming to Subsection 3.1.8.
2) The zone referred to in Sentence (1) extends from any balcony, platform or stairway of a fire escape to a distance
   a) 3 m horizontally,
   b) 10 m below, or
   c) 1.8 m above.

3.4.7.5. Stairs
1) Stairs shall be inclined at an angle of not more than 45° with the horizontal, and their steps shall have risers not more than 210 mm high and treads not less than 220 mm wide exclusive of nosing.
2) Stairway headroom shall be not less than 1 950 mm plus the height of one riser measured vertically above the nosing of any tread or platform.
3) The width of a fire escape shall conform to Articles 3.4.3.1. to 3.4.3.3., except that the width is permitted to be reduced to 550 mm provided the fire escape serves
   a) not more than 3 storeys, and
   b) not more than 15 persons.
4) If a flight of stairs leading to the ground at the foot of a fire escape is not fixed in position, it shall be held in the raised position without a latch or locking device, and shall be fitted with a counterbalancing device that will permit it to be easily and quickly brought into position for use.

3.4.7.6. Guards and Railings
1) The open sides of every platform, balcony and stairway forming part of a fire escape shall be protected by guards not less than 920 mm high measured vertically above the nosing of any tread or platform.
2) The top rail of a guard is permitted to serve as a handrail if it is free from obstructions which could break a handhold.
3) A wall handrail shall be installed if the fire escape is more than 550 mm wide.
4) Unless it can be shown that the size of openings that exceed this limit does not present a hazard, there shall be no opening that permits the passage of a sphere whose diameter is more than 100 mm through a guard for a fire escape.
5) Unless it can be shown that the location and size of an opening do not present a hazard, a guard for a fire escape shall be designed so that no member, attachment or opening located between 140 mm and 900 mm above a platform or the nosing of any tread will facilitate climbing.

3.4.7.7. Landings
1) Platforms for a fire escape shall be provided in conformance with the requirements for stair landings in Articles 3.4.6.3. and 3.4.6.4.

Section 3.5. Vertical Transportation

3.5.1. General

3.5.1.1. Scope
1) This Section applies to vertical transportation facilities installed in a building, including elevators, escalators and dumbwaiters.
2) Elevators in a building within the scope of Subsection 3.2.6. shall conform to Articles 3.2.6.4., 3.2.6.5. and 3.2.6.6.

3.5.2. Standards

3.5.2.1. Elevators, Escalators and Dumbwaiters
1) The design, construction, installation and alteration of every elevator, escalator and dumbwaiter shall conform to the Elevating Devices Safety Regulation.
(See Note A-3.5.2.1.(1).)
2) Before being placed in service, every elevator, escalator or dumbwaiter installation, including safety and control devices, shall be inspected and tested in accordance with the Elevating Devices Safety Regulation.

3.5.3. Fire Separations

3.5.3.1. Fire Separations for Elevator Hoistways
1) Except as permitted by Sentence (2), a vertical service space used as an elevator hoistway shall be separated from all other portions of each adjacent storey by a fire separation having a fire-resistance rating conforming to Table 3.5.3.1. for the fire-resistance rating required by Subsection 3.2.2. for
   a) the floor assembly above the storey, or
   b) the floor assembly below the storey, if there is no floor assembly above.

2) Passenger elevators, other than those provided for firefighters in accordance with Article 3.2.6.5., are permitted to be located within interconnected floor space without being enclosed in a hoistway separated from the remainder of the building, provided the elevator machinery is located in a room separated from the remainder of the building by a fire separation having a fire-resistance rating not less than that required for hoistways by Sentence (1).

3.5.3.2. Vertical Service Spaces for Dumbwaiters
1) A vertical service space containing a dumbwaiter shall be separated from all other portions of each adjacent storey by a fire separation having a fire-resistance rating conforming to Table 3.5.3.1. for the fire-resistance rating required by Subsection 3.2.2. for
   a) the floor assembly above the storey or
   b) the floor assembly below the storey, if there is no floor assembly above.

3.5.3.3. Fire Separations for Elevator Machine Rooms
1) Except as permitted by Sentence (2), a room containing elevator machinery shall be separated from all other parts of the building by a fire separation having a fire-resistance rating not less than that required for the vertical service space containing the elevator hoistway.
2) A room containing elevator machinery need not be separated from the elevator hoistway that it serves provided the room and the hoistway are separated from all other parts of the building by a fire separation having a fire-resistance rating not less than that required for the vertical service space containing the elevator hoistway.

3.5.4. Dimensions and Signs

3.5.4.1. Elevator Car Dimensions
1) Except as permitted in Sentence (3), if one or more elevators are provided in a building, each storey with access to an elevator shall be served by at least one elevator which has inside dimensions that will accommodate and provide adequate access for a patient stretcher 2 010 mm long and 610 mm wide in the prone position. (See Note A-3.5.4.1.(1).)
2) An elevator satisfying the requirements of Sentence (1) shall be clearly identified on the main entrance level of the building.
3) The requirement in Sentence (1) to accommodate and provide adequate access for a patient stretcher
   a) is waived for a limited-use / limited-application elevator designed and installed in accordance with ASME A17.1/CSA-B44, “Safety Code for Elevators and Escalators” and
   b) does not apply to a lift designed and installed in accordance with CAN/CSA-B355 “Lifts for Persons with Physical Disabilities”.

3.5.4.2. Floor Numbering
1) Arabic numerals indicating the assigned floor number shall be mounted permanently on both jambs of passenger elevator hoistway entrances in conformance with Appendix E of ASME A17.1/CSA B44, “Safety Code for Elevators and Escalators.”

Section 3.6. Service Facilities

3.6.1. General

3.6.1.1. Scope
1) The provisions of this Section apply to horizontal service spaces, vertical service spaces, attic or roof spaces, ducts, crawl spaces, shaft spaces, service rooms, and mechanical penthouses, and facilities contained therein.
3.6.1.2. Electrical Wiring and Equipment
1) The installation of electrical wiring and electrical equipment shall conform to the requirements of the Electrical Safety Regulation.

3.6.1.3. Lightning Protection Systems
1) A lightning protection system, when provided, shall conform to the requirements of CAN/CSA-B72-M, “Installation Code for Lightning Protection Systems.”

3.6.1.4. Storage Use Prohibition
1) Service spaces shall not be designed to facilitate subsequent use as storage space.

3.6.1.5. Appliances Installed outside a Building
1) A fuel-fired appliance installed on the roof of a building or in another location outside the building shall be installed not less than
   a) 1.2 m from a property line, measured horizontally, and
   b) 3 m from an adjacent wall of the same building if that wall contains any opening within 3 storeys above and 5 m horizontally from the appliance, unless every opening within these limits is protected by
      i) a closure having a fire-protection rating not less than 45 min determined in accordance with Article 3.1.8.4., or
      ii) a wired glass assembly permitted for use in a vertical fire separation and described in D-2.3.15. in Appendix D.

3.6.2. Service Rooms

3.6.2.1. Fire Separations around Service Rooms
1) Except as permitted by Sentences (2), (8), (9) and (10), fuel-fired appliances shall be installed in service rooms separated from the remainder of the building by fire separations having a fire-resistance rating not less than 1 h.
2) Except as required by Sentence (3), a fuel-fired appliance that serves only one room or suite is not required to be installed in a service room separated from the remainder of the building.
3) A solid-fuel-burning appliance shall not be located in a repair garage, a storage garage, or any other location where it could be exposed to flammable vapours or gases, unless
   a) it is enclosed in a service room that is separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h,
   b) it is supplied with combustion air directly from outside the building, and
   c) the heat that it generates is supplied indirectly to the space served by means of ducts or piping.
4) A service room containing an incinerator shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 2 h.
5) Equipment that uses a liquid having a flash point below 93.3°C shall be installed in a service room separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h.
6) Electrical equipment that is required to be located in a service room according to the Electrical Safety Regulation shall be installed in a service room separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h.
7) Except as permitted by Sentence (8), in a storey that is not sprinklered throughout, a service room that contains service equipment other than that addressed by Sentences (1) to (6) shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 1 h.
8) Where a service room contains a limited quantity of service equipment, and the service equipment neither constitutes a fire hazard nor is essential to the operation of fire safety systems in the building, the requirements for a fire separation shall not apply.

9) A fire separation is not required between a fireplace and the space it serves.

10) A fire separation is not required between a roof-top appliance and the building it serves.

3.6.2.2. Service Rooms under Exits

1) A service room containing service equipment subject to possible explosion, such as boilers operating in excess of 100 kPa (gauge) and some types of refrigerating machinery and transformers, shall not be located directly under a required exit.

3.6.2.3. Service Equipment

1) A service room containing space heating, space cooling and service water heating appliances is permitted to contain other service equipment such as electrical service equipment.

3.6.2.4. Incinerator Rooms

1) A service room containing an incinerator shall not contain other fuel-fired appliances.

3.6.2.5. Combustible Refuse Storage

1) Except as required by Sentence 3.6.3.3.(9), a room for the storage of combustible refuse shall be

   a) separated from the remainder of the building by a fire separation with a fire-resistance rating not less than 1 h, and
   b) sprinklered.

   (See Note A-3.6.2.5.(1).)

3.6.2.6. Door Swing for Service Rooms

1) A swing-type door from a service room containing a boiler or incinerator shall swing outward from the room, except that the door shall swing inward if the door opens onto a corridor or any room used for an assembly occupancy. (See also Sentence 3.4.4.4.(7).)

3.6.2.7. Electrical Equipment Vaults

1) An electrical equipment vault the Electrical Safety Regulation shall conform to Sentences (2) to (8).

2) An electrical equipment vault referred to in Sentence (1) shall be separated from the remainder of the building by a fire separation of solid masonry or concrete construction having a fire-resistance rating not less than

   a) 3 h if the vault is not protected by an automatic fire extinguishing system, or
   b) 2 h if the vault is protected by an automatic fire extinguishing system.

3) If a building is sprinklered throughout, an electrical equipment vault referred to in Sentence (1) need not be sprinklered provided

   a) the vault is designed for no purpose other than to contain the electrical equipment, and
   b) the vault contains a smoke detector which will actuate the building fire alarm system in the event of a fire in the vault.

4) Only pipes or ducts necessary for fire protection or the proper operation of the electrical installation shall penetrate the fire separation referred to in Sentence (2).

5) Explosion-relief devices and vents or other protective measures conforming to Sentence 3.3.1.20.(3) shall be provided for an electrical equipment vault referred to in Sentence (1) that contains dielectric-liquid-filled electrical equipment. (See Note A-3.6.2.7.(5).)

6) An electrical equipment vault referred to in Sentence (1) shall be provided with a ventilation system designed in conformance with Part 6 to prevent the ambient temperature in the vault from exceeding 40°C.

7) The ventilation system required by Sentence (6) shall be separate from the system for the remainder of the building and shall be designed so that it is automatically shut off in the event of a fire in the vault.
8) The floor of an electrical equipment vault referred to in Sentence (1) shall be liquid tight and surrounded by liquid tight walls and sills of sufficient height to confine within the vault all of the liquid from the largest item of electrical equipment, but to a height of not less than 100 mm.
9) Electrical equipment vaults shall be secured against unauthorized entry.

3.6.2.8. Emergency Power Installations
1) Where a generator intended to supply emergency power for lighting, fire safety and life safety systems is located in a building, except where such building is used solely for the purpose of housing the generator and its ancillary equipment, it shall be located in a room that
   a) is separated from the remainder of the building by a fire separation having a fire-resistance rating not less than 2 h, and
   b) contains only the generating set and equipment related to the emergency power supply system.

3.6.3. Vertical Service Spaces and Service Facilities

3.6.3.1. Fire Separations for Vertical Service Spaces
1) Except as provided in Articles 3.6.3.3. and 3.6.3.5. and Section 3.5., a vertical service space shall be separated from all other portions of each adjacent storey by a fire separation having a fire-resistance rating conforming to Table 3.6.3.1. for the fire-resistance rating required by Subsection 3.2.2. for
   a) the floor assembly above the storey, or
   b) the floor assembly below the storey, if there is no floor assembly above.
(See Note A-3.6.3.1.(1).)

2) A vertical service space that does not extend through the roof of a building shall be enclosed at the top with construction having a fire-resistance rating not less than that required for the vertical service space walls.
3) A vertical service space that does not extend to the bottom of a building shall be enclosed at the lowest level with construction having a fire-resistance rating not less than that required for the vertical service space walls.
4) A vent from a vertical service space not extending to the roof shall be enclosed within the building with construction having a fire-resistance rating not less than that required for the vertical service space walls.
5) Only openings that are necessary for the use of the vertical service space shall be permitted through a vertical service space enclosure.

3.6.3.2. Foamed Plastic Protection
1) Foamed plastic insulation in a *vertical service space* shall be protected in conformance with Article 3.1.5.14.

### 3.6.3.3. Linen and Refuse Chutes

1) A linen chute or refuse chute shall
   a) be impervious to moisture,
   b) have a smooth internal surface,
   c) be corrosion-resistant,
   d) be constructed of *noncombustible* material, and
   e) be located in a shaft in which there are no services other than *noncombustible* drain, waste and vent piping or *noncombustible* water piping.

2) A shaft containing a linen chute or refuse chute shall have a *fire-resistance rating* conforming to Sentence 3.6.3.1.(1), but not less than
   a) 1 h if the chute outlet for the discharge room is protected by an automatic, self-latching *closure* held open by a fusible link, or
   b) 2 h if no *closure* is provided at the chute outlet into the discharge room.

3) An interior linen chute or refuse chute shall extend not less than 1 m above the roof and shall be vented above the roof with a vent which
   a) has an unobstructed area not less than the cross-sectional area of the chute, and
   b) is equipped with a cover that will open automatically, or that can be opened manually, in the event of a fire in the chute.

4) Intake openings for a linen chute or a refuse chute shall
   a) have an area not more than 60% of the cross-sectional area of the chute, and
   b) be fitted with *closures* designed to close automatically and latch after use.

5) Intake openings for a linen chute or a refuse chute shall be located in rooms or compartments that
   a) have no dimension less than 750 mm,
   b) are separated from the remainder of the *building* by a *fire separation* with a *fire-resistance rating* not less than 45 min,
   c) are designed for no other purpose, and
   d) do not open directly into an *exit*.

6) Sprinklers shall be installed at the top of each linen chute or refuse chute, at alternate floor levels and in the room or bin into which the chute discharges.

7) The room into which a linen chute discharges shall be separated from the remainder of the *building* by a *fire separation* with a *fire-resistance rating* not less than 1 h.

8) A refuse chute shall be equipped at the top with spray equipment for washing-down purposes.

9) A refuse chute shall discharge only into a room or bin separated from the remainder of the *building* by a *fire separation* with a *fire-resistance rating* not less than 2 h.

10) The room or bin into which a refuse chute discharges shall be of sufficient size to contain the refuse between normal intervals of emptying, be impervious to moisture and be equipped with a water connection and floor drain for washing-down purposes.

11) A room into which a refuse chute discharges shall contain no service equipment that is not related to refuse handling and disposal.

### 3.6.3.4. Exhaust Duct Negative Pressure

1) If a *vertical service space* contains an *exhaust duct* that serves more than one *fire compartment*,
   a) the duct shall have a fan located at or near the exhaust outlet to ensure that the duct is under negative pressure, and
   b) the individual *fire compartments* shall not have individual fans that exhaust directly into the duct in the *vertical service space*.

### 3.6.3.5. Grease Duct Enclosures
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

(See Note A-3.6.3.5.)

1) Except as provided in Sentence (2), fire separations enclosing grease ducts for commercial cooking operations shall conform to NFPA 96, “Ventilation Control and Fire Protection of Commercial Cooking Operations.”

2) The fire-resistance rating of field-applied and factory-built grease duct enclosure assemblies shall be determined in conformance with CAN/ULC-S144, “Fire Resistance Test – Grease Duct Assemblies.”

3.6.4. Horizontal Service Spaces and Service Facilities

3.6.4.1. Scope

1) This Subsection applies to horizontal service spaces and service facilities, including ceiling spaces, duct spaces, crawl spaces and attic or roof spaces.

3.6.4.2. Fire Separations for Horizontal Service Spaces

1) Except as provided in Article 3.6.3.5., a horizontal service space that penetrates a required vertical fire separation shall be separated from the remainder of the building it serves in conformance with Sentence (2).

2) If a horizontal service space or other concealed space is located above a required vertical fire separation other than a vertical shaft, this space need not be divided at the fire separation as required by Article 3.1.8.3. provided the construction between this space and the space below is a fire separation with a fire-resistance rating equivalent to that required for the vertical fire separation, except that the fire-resistance rating is permitted to be not less than 30 min if the vertical fire separation is not required to have a fire-resistance rating more than 45 min. (See Note A-3.6.4.2.(2).)

3.6.4.3. Plenum Requirements

1) A concealed space used as a plenum within a floor assembly or within a roof assembly need not conform to Sentence 3.1.5.18.(1) and Article 3.6.5.1., provided

   a) all materials within the concealed space have a flame-spread rating not more than 25 and a smoke developed classification not more than 50, except for

      i) tubing for pneumatic controls,
      ii) optical fibre cables and electrical wires and cables with combustible insulation, jackets or sheathes that are used for the transmission of voice, sound or data and conform to Sentences 3.1.4.3.(2) and 3.1.5.21.(2) (FT6 Rating), and
      iii) totally enclosed non-metallic raceways with an FT6 rating, when tested in accordance with Clause 3.1.5.23.(1)(a), in buildings required to be of noncombustible construction,

   b) the supports for the ceiling membrane are of noncombustible material having a melting point not below 760°C.

2) If a concealed space referred to in Sentence (1) is used as a return-air plenum and incorporates a ceiling membrane that forms part of the required fire-resistance rating of the assembly, every opening through the membrane shall be protected by a fire stop flap that

   a) stops the flow of air into the concealed space in the event of a fire,
   b) is supported in a manner that will maintain the integrity of the ceiling membrane for the duration of time required to provide the required fire-resistance rating,
   c) conforms to CAN/ULC-S112.2, “Fire Test of Ceiling Firestop Flap Assemblies,” and
   d) activates at a temperature approximately 30°C above the normal maximum temperature that occurs in the return-air plenum, whether the air duct system is operating or shut down.

3) Notwithstanding Sentence (1), all optical fibre cables and electrical wires and cables installed in a concealed space used as a plenum shall:

   a) have a flame spread of no more than 1.5 m, a smoke density of not more than 0.5 at peak optical density and a smoke density not more than 0.15 at average optical density when tested in
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

conformance with the Horizontal Flame and Smoke Test referenced in Clause 4.11.6. of CAN/CSA C22.2 No. 0.3, “Test Methods for Electrical Wires and Cables” (FT6 Rating),
b) be located in totally enclosed noncombustible raceways (See Note A-3.1.4.3.(1)(b)(i).), or
c) be located in totally enclosed nonmetallic raceway conforming to Article 3.1.5.23.

4) Notwithstanding Clause (3)(a), minor components of wiring systems such as communication conductors no more than 9 m in length, including the drop down to floor level, that exhibit a vertical char of no more than 1.5 m when tested in conformance with the Vertical Flame Test - Cables in Cable trough in Clause 4.11.4. of the CAN/CSA C22.2 No. 0.3, “Test Methods for Electrical Wires and Cables” (FT4 Rating), may be installed in a concealed space used as a plenum.

3.6.4.4. Attic or Roof Space Access
1) An attic or roof space more than 600 mm high shall be provided with access from the floor immediately below by a hatchway not less than 550 mm by 900 mm or by a stairway.

3.6.4.5. Horizontal Service Space Access
1) A horizontal service space, consisting of ceiling and duct spaces, which is more than 1200 mm high and 600 mm wide shall have inspection doors not less than 300 mm in both horizontal and vertical dimensions placed so that the entire interior of the duct or space can be viewed.

3.6.4.6. Crawl Space Access
1) A crawl space shall have at least one access opening not less than 550 mm by 900 mm.

3.6.5. Air Duct and Plenum Systems

3.6.5.1. Duct Materials
1) Except as permitted by Sentences (2) to (5) and Article 3.6.4.3., all ducts, duct connectors, associated fittings and plenums used in air duct systems shall be constructed of steel, aluminum alloy, copper, clay, asbestos-cement or other noncombustible material.
2) Except as permitted by Sentence (3), ducts, associated fittings and plenums are permitted to contain combustible material provided they
   a) conform to the appropriate requirements for Class 1 duct materials in CAN/ULC-S110, “Test for Air Ducts,”
   b) conform to Article 3.1.5.18. in a building required to be of noncombustible construction,
   c) conform to Subsection 3.1.9.,
   d) are used only in horizontal runs in a building required to be of noncombustible construction,
   e) are not used in vertical runs serving more than 2 storeys in a building permitted to be of combustible construction, and
   f) are not used in air duct systems in which the air temperature could be more than 120°C.
3) Combustible ducts which are part of a duct system conveying only ventilation air and are contained entirely within a dwelling unit need not comply with the requirements of Sentences (1) and (2).
4) Duct sealants shall have a flame-spread rating not more than 25 and a smoke developed classification not more than 50.
5) Duct connectors that contain combustible materials and that are used between ducts and air outlet units shall
   a) conform to the appropriate requirements for Class 1 air duct materials in CAN/ULC-S110, “Test for Air Ducts,”
   b) be not more than 4 m long,
   c) be used only in horizontal runs, and
   d) not penetrate a required fire separation.

3.6.5.2. Vibration Isolation Connectors
1) Except as permitted by Sentence (2), vibration isolation connectors in air duct systems shall be noncombustible.

2) Combustible fabric vibration isolation connectors are permitted provided they
   a) are not more than 250 mm long,
   b) comply with the flame-resistance requirements of CAN/ULC-S109, “Flame Tests of Flame-Resistant Fabrics and Films,” and
   c) are not used in a location where they are exposed to heated air or radiation from heat sources that could cause the exposed surface temperature to be more than 120°C.

3.6.5.3. Tape
1) Tape used to seal joints in air ducts, plenums and other parts of air duct systems shall meet the flame-resistance requirements for fabric in CAN/ULC-S109, “Flame Tests of Flame-Resistant Fabrics and Films.”

3.6.5.4. Coverings, Linings, Adhesives and Insulation
1) Coverings, linings and associated adhesives and insulation for air ducts, plenums and other parts of air duct systems that would have an exposed surface temperature more than 120°C when exposed to heated air or radiation from heat sources shall be of noncombustible material.

2) Except as permitted by Sentence (3), combustible coverings and linings, including associated adhesives and insulation, shall have
   a) a flame-spread rating not more than 25 on any exposed surface or any surface that would be exposed by cutting through the material in any direction, and
   b) a smoke developed classification not more than 50.

3) The outer covering of ducts, plenums and other parts of air duct systems used within an assembly of combustible construction is permitted to have
   a) an exposed surface flame-spread rating not more than 75, and
   b) a smoke developed classification not more than 50.

4) Combustible coverings and linings referred to in Sentences (2) and (3) shall not flame, glow, smoulder or smoke when tested in accordance with the method of test in ASTM C 411, “Hot-Surface Performance of High-Temperature Thermal Insulation,” at the maximum temperature to which the coverings and linings are to be exposed in service.

5) Except as permitted by Sentence (6), foamed plastic insulation shall not be used as part of an air duct system or for insulating an air duct.

6) Foamed plastic insulation is permitted to be installed in a ceiling space that is used as a return air plenum provided the foamed plastic insulation is protected from exposure to the plenum in accordance with Article 3.1.5.14.

7) Combustible coverings and linings of ducts, including associated adhesives and insulation, shall be interrupted where the duct penetrates a fire separation and at the immediate area of operation of heat sources in a duct system, including electric resistance heaters or fuel-burning heaters or furnaces.

3.6.5.5. Insulation and Coverings
1) Insulation and coverings on pipes in which the temperature of the fluid exceeds 120°C shall
   a) be made of noncombustible material, or
   b) not flame, glow, smoulder or smoke when tested in accordance with ASTM C 411, “Hot-Surface Performance of High-Temperature Thermal Insulation,” at the maximum temperature to which the insulation or covering is to be exposed in service.

2) Except as permitted by Sentence (5), where combustible insulation is used on piping in a horizontal service space or a vertical service space, the insulation and coverings on that piping shall have a flame-spread rating, on any exposed surface and on any surface that would be exposed by cutting through the material in any direction,
   a) not more than 25 in a building required to be of noncombustible construction, or
   b) not more than 75 in a building permitted to be of combustible construction.
3) Except as permitted by Sentence (5), insulation and coverings on piping located in rooms and spaces other than the service spaces described in Sentence (2) shall have a flame-spread rating not more than that required for the interior finish of the ceiling of the room or space.

4) Except as permitted by Sentence (5), combustible insulation and covering used on piping in a building within the scope of Subsection 3.2.6. shall have a smoke developed classification not more than 100.

5) No flame-spread rating or smoke developed classification limits are required for combustible insulation and coverings used on piping located within a
   a) concealed space in a wall,
   b) floor slab, or
   c) noncombustible enclosure.

3.6.5.6. Clearance of Ducts and Plenums

1) The clearance of furnace plenums from combustible material shall conform to the requirements of the appropriate standards referenced in Sentence 6.2.1.5.(1).

2) If the plenum clearance required in accordance with Sentence (1) is not more than 75 mm, the clearance between a supply duct and combustible material shall be not less than
   a) the required plenum clearance within a horizontal distance of 450 mm from the plenum, and
   b) 12 mm at a horizontal distance of 450 mm or more from the plenum, except that this clearance is permitted to be reduced to zero beyond a bend or offset in the duct sufficiently large to shield the remainder of the supply duct from direct radiation from the furnace heat exchanger.

(See Note A-3.6.5.6.(2).)

3) If the plenum clearance required in accordance with Sentence (1) is more than 75 mm but not more than 150 mm, a) the clearance between a supply duct and combustible material shall be not less than
   a) the required plenum clearance within a horizontal distance of 1 800 mm from the plenum, and
   b) 12 mm at a horizontal distance of 1 800 mm or more from the plenum, except that this distance is permitted to be reduced to zero beyond a bend or offset in the duct sufficiently large to shield the remainder of the supply duct from direct radiation from the furnace heat exchanger.

(See Note A-3.6.5.6.(3).)

4) If the plenum clearance required in accordance with Sentence (1) is more than 150 mm, the clearance between a supply duct and combustible material shall be not less than
   a) the required plenum clearance within a horizontal distance of 1 000 mm from the plenum,
   b) 150 mm within a horizontal distance between 1 000 mm and 1 800 mm from the plenum, and
   c) 25 mm at a horizontal distance of 1 800 mm or more from the plenum, except that this distance is permitted to be reduced to 8 mm beyond a bend or offset in the duct sufficiently large to shield the remainder of the supply duct from direct radiation from the furnace heat exchanger.

(See Note A-3.6.5.6.(4).)

5) If a register is installed in a floor directly over a pipeless furnace, a double-walled register box with not less than 100 mm between walls, or a register box with the warm-air passage completely surrounded by the cold-air passage, shall be permitted instead of the clearances listed in Sentences (2), (3) and (4).

3.6.5.7. Supply, Return, Intake and Exhaust-Air Openings

1) Combustible grilles, diffusers and other devices for supply, return, and exhaust-air openings in rooms shall conform to the flame-spread rating and smoke developed classification requirements for the interior finish of the surface on which they are installed.

3.6.5.8. Return-Air System

1) Except as required by Sentences (2) and (3), return ducts shall be constructed of material having a flame-spread rating not more than 150.

2) If any part of a return duct will be exposed to radiation from the furnace heat exchanger or other radiating part within the furnace, that part of a return duct directly above or within 600 mm of the outside furnace casing shall be noncombustible.
Division B: Acceptable Solutions

3) Return ducts serving solid-fuel-burning furnaces shall be constructed of noncombustible material.

4) Combustible return ducts shall be lined with noncombustible material
   a) below floor registers,
   b) at the bottom of vertical ducts, and
   c) under furnaces having a bottom return.

3.6.5.9. Location of Exhaust Vents in a Building Containing not more than Two Principal Dwelling Units

1) In exhaust vents serving heating and air conditioning equipment and similar appliances, other than direct vented fireplaces, shall be directed
   a) vertically through the roof of a building, with the discharge located at least 1.5 m away from any property line, or
   b) horizontally through an exterior wall which faces a street, with the discharge located at least 3 m away from any property line.

Section 3.7. Health Requirements

3.7.1. Height of Rooms

3.7.1.1. Room and Space Height

1) The height of every room and space shall be sufficient so that the ceiling or ceiling fixtures do not obstruct movement or activities below.

2) The unobstructed height in dwelling units shall conform to Subsection 9.5.3.

3.7.2. Plumbing Facilities

3.7.2.1. Plumbing and Drainage Systems

1) Except as permitted in Sentence (2), if the installation of a sanitary drainage system is not possible because of the absence of a water supply, sanitary privies, chemical closets or other means for the disposal of human waste shall be provided.

2) Waterless urinals are permitted to be used in buildings provided with a water supply.

3.7.2.2. Water Closets

1) Except as permitted by Sentence (4), water closets shall be provided for each sex assuming that the occupant load is equally divided between males and females, unless the proportion of each sex expected in the building can be determined with reasonable accuracy. (See Note A-3.7.2.2.(1).)

2) Deleted.

3) Deleted.

4) Both sexes are permitted to be served by a single water closet if the occupant load in an occupancy referred to in Sentence (6), (10), (12), (13), (14) or (16) is not more than 25.

5) Urinals are permitted to be substituted for two thirds of the number of water closets required by this Article for males, except that if only 2 water closets are required for males, one urinal is permitted to be substituted for one of the water closets.

6) Except as permitted by Sentences (4), (7), (8), (17) and (18), the number of water closets required for assembly occupancies shall conform to Table 3.7.2.2.-A.
### Table 3.7.2.2.-A

8) The number of water closets required for places of worship and undertaking premises shall be at least one for each 150 persons of each sex.

9) The number of water closets required for a treatment or detention occupancy shall be determined on the basis of the special needs of the occupancy.

10) Except as permitted by Sentences (4) and (7), the number of water closets required for a care or residential occupancy shall be at least one for each 10 persons of each sex.

11) At least one water closet shall be provided for each dwelling unit.

12) Except as permitted by Sentences (4) and (17), the number of water closets required for a business and personal services occupancy shall conform to Table 3.7.2.2.-B.

15) In a building whose floor area is more than 600 m² and that includes one or more individual tenant spaces for a business and personal services occupancy or mercantile occupancy, water closets shall be located so that they are accessible to the public when the building is occupied.

16) The number of water closets required in a suite of mercantile occupancy whose area is not more than 500 m² is permitted to be determined in accordance with Table 3.7.2.2.-B based solely on the total number of staff.

17) Two unisex toilet rooms may serve an assembly occupancy, a business and personal services occupancy, a mercantile occupancy, or an industrial occupancy provided
   a) the suite area of the occupancy is not more than 200 m²,
   b) the total occupant load of the occupancy is no more than 60 persons,
   c) each toilet room is fitted out with one water closet and one lavatory, and
   d) at least one of the toilet rooms complies with the requirements of Sentence 3.7.2.10.(9)

18) Three unisex toilet rooms are permitted to serve 61 to 100 persons in an assembly occupancy provided
   a) each toilet room is fitted out with one water closet and one lavatory, and
b) at least one of the unisex toilet rooms complies with the requirements of Sentence 3.7.2.10.(9).

3.7.2.3. Lavatories
1) Except as permitted by Sentence (2), at least one lavatory shall be provided in a room containing one or 2 water closets or urinals, and at least one additional lavatory shall be provided for each additional 2 water closets or urinals.  
2) Wash fountains in circular form are permitted to be provided in lieu of lavatories required by Sentence (1) provided each 500 mm of circumference is considered to be the equivalent of one lavatory.  
3) Any shelf or projection above a lavatory shall be located so that it will not be a hazard.  
4) Lavatories required by Sentence (1) shall be equipped with faucets that  
   a) operate automatically, or  
   b) have a manual control that  
      i) complies with Clause 3.8.3.8.(1)(c),  
      ii) does not require the application of continuous force to maintain water flow, and  
      iii) where metered, provides at least 10 s of water flow.

3.7.2.4. Mobile Home Facilities  
1) If mobile homes do not have individual sanitary facilities connected to a central water supply and drainage system, a service building shall be provided for public use.  
2) The service building required by Sentence (1) shall contain  
   a) at least one water closet for each sex if the service building facilities serve not more than 10 mobile homes, and  
   b) an additional water closet for each sex for each additional 10 mobile homes.  
3) If a service building is required by Sentence (1), it shall contain lavatories as required by Sentence 3.7.2.3.(1) and at least  
   a) one laundry tray or similar facility, and  
   b) one bathtub or shower for each sex.

3.7.2.5. Safety Glass  
1) Glass, other than safety glass, shall not be used for a shower or bathtub enclosure.

3.7.2.6. Surface Protection  
1) Wall and floor surfaces below the uppermost surfaces of a urinal shall be protected from deterioration by impervious and durable material for a distance from the urinal to a point not less than 900 mm from the projected outline of the urinal on to the wall or floor.  
2) Floor surfaces around a water closet shall be protected from deterioration by an impervious and durable material for a distance not less than 900 mm from the projected outline of the water closet on the floor.

3.7.2.7. Floor Drain  
1) A floor drain shall be installed in a washroom containing a urinal equipped with an automatic flushing device.

3.7.2.8. Grab Bars Installation  
1) Grab bars shall  
   a) be slip-resistant and free of any sharp or abrasive elements,  
   b) be mounted on surfaces that are free of any sharp or abrasive elements,  
   c) be able to resist a load of not less than 1.3 kN applied vertically or horizontally,  
   d) be 30 mm to 40 mm in diameter, and  
   e) where mounted on a wall, have a clearance of 35 mm to 45 mm from the wall.

3.7.2.9. Bathtubs and Showers
1) Where a bathtub is installed in a hotel or a motel, it shall
   a) have a clear floor space at least 750 mm wide along its length, except that a water closet and a
      lavatory are permitted to project into this space provided they do not restrict access to the bathtub,
   b) have faucets and other controls that conform to Clause 3.8.3.8.(1)(c),
   c) have a slip-resistant bottom surface,
   d) have grab bars that
      i) conform to Sentence 3.7.2.8.(1),
      ii) are not less than 1 200 mm long located vertically at the end of the bathtub that is
          adjacent to the clear floor space, with the lower end between 180 mm and 280 mm above
          the bathtub rim, and
      iii) are not less than 1 200 mm long located horizontally along the length of the bathtub at
          180 mm to 280 mm above the bathtub rim, and
   e) be capable of being accessed along its full length with no tracks mounted on the bathtub rim.

2) A shower door that swings on a vertical axis shall be capable of opening outwards from a shower stall
    forming part of a site constructed fixture.

3.7.2.10. Accessible Washrooms
1) Where washrooms, baths or showers are required to be accessible, they shall conform to Subsection
   3.8.3.
   (See Note A-3.8.)

3.7.2.11. Gender Neutral Washroom Requirements
(See Note A-3.7.2.11.)
1) Individual toilet stalls in gender neutral washroom facilities shall
   a) have partition walls and doors that are full height with a clear opening height of no less than 150
      mm and no more than 300 mm, measured from the finished floor to the underside of the partition
      wall or door, and
   b) have a locking devices equipped with display mechanisms to indicates on the outside of the stall
      door if the stall is occupied.

2) The main entrance door serving the gender neutral washroom facility shall
   a) have no door, or
   b) have a door with an open transom or louvered grill.

3.7.3. Medical Gas Piping Systems

3.7.3.1. Medical Gas Piping
1) If a non-flammable medical gas piping system is installed, it shall be installed in conformance with
   a) CSA Z7396.1, "Medical Gas Pipeline Systems – Part 1: Pipelines for Medical Gases, Medical
      Vacuum, Medical Support Gases, and Anaesthetic Gas Scavenging Systems," and
   b) Part 3 of Division B of the Fire By-law.

Section 3.8. Accessibility

Section 3.8. Accessibility
(See Note A-3.8.)

3.8.1. Scope

3.8.1.1. Scope
1) This Section is concerned with the design and construction of buildings and occupancies to make them accessible.
2) Buildings and facilities required to be accessible in accordance with Subsection 3.8.2. shall be designed in accordance with Subsection 3.8.3.
3) Access to existing buildings shall be provided to the extent required in Division B, Part 11.
4) Adaptable dwelling units shall be designed and constructed in accordance with Subsection 3.8.5.

### 3.8.2. Application

#### 3.8.2.1. General

(See Note A-3.8.2.1.)

1) Except as provided in Clause 3.8.2.3.(2)(j), the requirements of this Section apply to all buildings and all areas of buildings where work functions can reasonably be expected to be performed by persons with disabilities except:
   a) dwelling units, row houses, boarding houses, lodging houses and construction camps, except as required by
      i) Article 3.8.2.12., or
      ii) Subsection 3.8.5.,
   b) apartment and condominiums buildings except that an accessible path of travel conforming to Subsection 3.8.3. from accessible entrances as described in Article 3.8.2.2. throughout common areas and, if provided, to parking areas and passenger loading zones as described in Article 3.8.2.5. is required unless the building is not equipped with a passenger-elevating device, in which case an accessible path of travel as described in Article 3.8.2.3.
      i) need only be provided on the levels with accessible entrances, and
      ii) need not be provided where the difference in floor elevation between the entrance level or levels and every dwelling unit exceeds 600 mm,
   c) high-hazard industrial occupancies,
   d) buildings that are not intended to be occupied on a daily or full-time basis, including but not limited to automatic telephone exchanges, pump houses and substations,
   e) public toilet buildings in locations such as highway rest areas, campgrounds, picnic grounds, parks and recreational vehicle parks where an accessible path of travel conforming to Subsection 3.8.3. is provided from a roadway or street to at least one other accessible public toilet building,
   f) the storey next above or below the accessible storey in a building of not more than two storeys in building height provided the storey next above or below the accessible storey
      i) is less than 600 m² in floor area,
      ii) contains only facilities that are also contained on the accessible storey,
      iii) does not contain an assembly major occupancy with an area more than 100 m², and
      iv) is not served by a passenger-elevating device connecting the storey next above or below the accessible storey (See Note A-3.8.2.1.(1)(f) and (g).), and
   g) the storey next above or below the accessible storey in a building with not more than one storey above the first storey, provided the storey next above or below the accessible storey
      i) is less than 600 m² in floor area,
      ii) contains only facilities that are also contained on the accessible storey,
      iii) does not contain an assembly major occupancy with an area more than 100 m², and
      iv) is not served by a passenger-elevating device connecting the storey next above or below the accessible storeys. (See Note A-3.8.2.1.(1)(f) and (g).)

2) Buildings and parts of buildings required by Sentence (1) and this Subsection to be accessible shall comply with Subsection 3.8.3. including, without limitation, exterior paths and stairs within property lines from roadways, streets, parking areas, exterior passenger-loading zones, and ancillary areas to all accessible entrances of these buildings.
3) The requirements of this Section take precedence over other requirements contained in this Part and in Part 9.

4) Where an accessible path of travel connects to a path of travel on the adjacent side of a firewall through a doorway, the requirements of this Section shall apply to the floor areas on both sides of the firewall as if they were in the same building.

5) Access shall be provided to alterations, additions and changes in occupancy to the extent required in Subsection 3.8.4.

6) Notwithstanding the exceptions of Sentence (1), the Enhanced Accessibility requirements of Sentence 3.8.3.1.(2) shall apply to all apartments and condominiums which contains three or more principal dwelling units served by an elevator and a public corridor.

3.8.2.2. Entrances
(See Note A-3.8.2.2.)

1) In addition to the accessible entrances required by Sentence (2), the principal entrance and not less than 50% of all pedestrian entrances of a building referred to in Sentence 3.8.2.1.(1) shall be accessible and shall lead from
   a) the outdoors at sidewalk, roadway or street level, or
   b) an accessible path of travel that complies with Subsection 3.8.3. and leads from a sidewalk, roadway or street.

2) A suite of assembly occupancy, business and personal services occupancy or mercantile occupancy that is located in the first storey of a building, or in a storey to which an accessible path of travel is provided, and that is completely separated from the remainder of the building so that there is no access to the remainder of the building, shall have at least one accessible entrance.

3) An accessible entrance required by Sentence (1) or (2) shall be designed in accordance with Subsection 3.8.3.

4) At an accessible entrance that includes more than one doorway, only one of the doorways is required to be designed in accordance with Subsection 3.8.3.

5) If a walkway or pedestrian bridge connects two accessible storeys in different buildings, the path of travel from one storey to the other storey by means of the walkway or bridge shall be accessible.

6) Where provided, an intercom system shall be installed at the principal entrance to an apartment or condominium building conforming to Sentence (1).

3.8.2.3. Areas Requiring Access
(See Note A-3.8.2.3.)

1) Except as permitted by Sentence (2), access from the accessible entrances required by Sentences 3.8.2.2.(1) and (2) shall be provided throughout the entrance storey or storeys and within all other normally occupied floor areas as required by Sentence 3.8.2.1.(1).

2) Except as required by Sentence (3), access is not required
   a) to service rooms,
   b) to elevator machine rooms,
   c) to janitor’s rooms,
   d) to service spaces,
   e) to crawl spaces,
   f) to attic or roof spaces,
   g) reserved,
   h) reserved,
   i) within portions of a floor area with fixed seats in an assembly occupancy where those portions are not part of the accessible path of travel to spaces designated for wheelchair use,
   j) within floor levels of a suite of residential occupancy that are not at the same level as the entry level to the suite,

3.8.2.4. Path of Travel to Storeys Served by Escalators and Moving Walks

1) In a building in which an escalator or inclined moving walk provides access to any floor level above or below the entrance floor level, an interior accessible path of travel shall also be provided to hose floor levels. (See Note A-3.8.2.4.(1).)

2) The route from the escalator or inclined moving walk to the accessible path of travel that leads from floor to floor as required by Sentence (1) shall be clearly indicated by appropriate signs. (See also Article 3.8.2.10.)

3.8.2.5. Path of Travel to Parking Areas and Passenger-Loading Zones

(See Note A-3.8.2.5.)

1) An accessible path of travel shall be provided between parking stalls for persons with disabilities and an accessible entrance referred to in Article 3.8.2.2. (See Note A-3.8.2.5.(1).)

2) Where a passenger-elevating device serves one or more indoor parking levels, an accessible path of travel shall be provided between each parking level containing stalls for persons with disabilities and all other parts of the building required to be accessible in accordance with Subsection 3.8.3.

3) Passenger-loading zones shall comply with Subsection 3.8.3. and be provided with an accessible path of travel to an accessible entrance referred to in Article 3.8.2.2.

3.8.2.6. Controls and Outlets

1) Except as provided in Sentence 3.5.2.1.(3), controls for the operation of building services or safety devices, including electrical switches, thermostats, faucets, door and window hardware and intercom switches, that are intended to be operated by the occupant and are located in an accessible floor area shall comply with Subsection 3.8.3. (See Note A-3.8.2.6.(1).)

2) Electrical outlets that are intended for occupant use and are located in an accessible floor area shall be located in conformance with Subsection 3.8.3. (See Note A-3.8.2.6.(2).)

3.8.2.7. Power Door Operators
1) Except as provided in Sentences (2) and (3), every door that provides an accessible path of travel through an entrance referred to in Article 3.8.2.2., including the interior doors of a vestibule where provided, shall be equipped with a power door operator that complies with Subsection 3.8.3. and allows persons to activate the opening of the door in the intended direction of travel, where the entrance serves
   a) a hotel,
   b) a building of treatment major occupancy, or
   c) a building of assembly, care, business and personal service or mercantile major occupancy more than 500 m² in building area.

2) The requirements of Sentence (1) do not apply to an individual suite having an area less than 500 m² in a building having only suites of assembly, care, business and personal services or mercantile occupancy if the suite is completely separated from the remainder of the building so that there is no access to the remainder of the building.

3) Only the active leaf in a multiple leaf door in an accessible path of travel need conform to the requirements of this Article.

3.8.2.8. Plumbing Facilities

1) Except as permitted by Sentences (2) and (12), and as required by Sentence (3), a washroom in a storey to which access is required in accordance with Article 3.8.2.3., shall be accessible to the extent required by this Article and in accordance with Subsection 3.8.3. (See Note A-3.8.2.8.(1) to (3).)

2) A washroom need not conform to the requirements of Sentence (1) provided
   a) it is located within a suite of residential occupancy or a suite of care occupancy,
   b) other accessible washrooms are provided on the same floor area within 45 m along an accessible path of travel,
   c) reserved, or
   d) it is located in a business and personal services or mercantile occupancy, with multiple suites, where at least one accessible washroom complying with Subsection 3.8.3. is either
      i) available to all suites, or
      ii) provided in each suite not having access to a washroom described in Subclause (i).
   (See Note A-3.8.2.8.(1) to (3).)

3) In buildings and occupancies in which water closets are required in accordance with Subsection 3.7.2., at least one universal washroom complying with Subsection 3.8.3. shall be provided in the entrance storey, unless
   a) an accessible path of travel is provided to a universal washroom complying with Subsection 3.8.3. elsewhere in the building, or
   b) the water closets required by Subsection 3.7.2. are for dwelling units only.
   (See Note A-3.8.2.8.(1) to (3).)

4) Reserved.

5) At least one water-closet stall or enclosure in a washroom required by Sentence (1) to be accessible shall comply with Subsection 3.8.3.

6) Where urinals are provided in an accessible washroom, at least one urinal shall comply with Subsection 3.8.3.

7) An accessible washroom shall be provided with at least one lavatory that complies with Subsection 3.8.3.

8) Where mirrors are provided in an accessible washroom, at least one mirror shall comply with Subsection 3.8.3.

9) Except as permitted in Sentence (12), in each location where drinking fountains are provided, at least one shall comply with Subsection 3.8.3. (See Note A-3.8.2.8.(9).)

10) Except within a suite of residential occupancy, where showers are provided in a building, at least one shower stall in each group of showers shall comply with Subsection 3.8.3.

11) Where a bathtub is installed in a suite required to be accessible, it shall comply with Subsection 3.8.3.

12) In occupancies or parts of occupancies designed to be accessible and used predominantly by children, in patient areas in treatment occupancies, and in resident areas in care occupancies, it is permissible to
design and locate plumbing fixtures and grab bars differently than described in Subsection 3.8.3. to accommodate the special needs of children, patients, residents and care providers.

3.8.2.9. Assisting Listening Devices
(See Note A-3.8.2.9.)
1) In a building of assembly occupancy, all classrooms, auditoria, meeting rooms and theatres with an area of more than 100 m² shall be equipped with an assistive listening system complying with Subsection 3.8.3.
2) Courtrooms shall be equipped with an assistive listening system complying with Subsection 3.8.3.

3.8.2.10. Signs and Indicators
1) Unless the degree of access provided is such as to make these signs unnecessary, signs complying with Subsection 3.8.3. shall be installed in an accessible floor area to indicate the location of
   a) accessible entrances,
   b) alternate access routes,
   c) accessible spaces in seating areas,
   d) accessible refreshment facilities,
   e) accessible checkout lanes,
   f) accessible public telephones,
   g) accessible washrooms,
   h) accessible showers,
   i) accessible passenger-elevating devices,
   j) accessible parking stalls,
   k) accessible passenger-loading zones, and
   l) facilities for persons that are deaf or hard of hearing.
2) Where a washroom is not designed to accommodate persons with physical disabilities in a storey to which an accessible path of travel is required, signs shall be provided to indicate the location of accessible washrooms.
3) Except as provided in Sentence (4) and Sentence 3.4.6.3.(4), tactile walking surface indicators complying with Subsection 3.8.3. shall be provided
   a) at landings at the top of flights of stairs,
   b) at an entry to a vehicular route or area where no curbs or any other element separate the vehicular route or area from a pedestrian route, and
   c) along any edge of a platform that is not protected by a guard, and
      i) higher than 250 mm above the adjacent surface, or
      ii) above an adjacent slope having a gradient of more than 1 in 3.
4) Sentence (3) does not apply to stages or loading docks.

3.8.2.11. Counters and Counters for Telephones
1) Every counter at which the public is served and intended as a work surface for extended business transactions shall comply with Subsection 3.8.3. (See Note A-3.8.2.11.(1).) (See also Note A-3.8.2.3.)
2) Built-in shelves and counters provided for public telephones shall comply with Subsection 3.8.3.

3.8.2.12. Sleeping Rooms and Bed Spaces
1) Sentences (2) and (3) apply to sleeping rooms and bed spaces provided in
   a) residential clubs,
   b) residential schools and colleges,
   c) dormitories, and
   d) hotels and motels.
2) When sleeping rooms or bed spaces are provided, at least one for every 40 or part thereof shall conform to Subsection 3.8.3.
3) Where sleeping rooms or bed spaces are provided
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

3.8.3. Design

3.8.3.1. Design Standards

1) Buildings or parts thereof and facilities that are required to be accessible shall be designed in accordance with

a) this Subsection, or
b) the provisions of CSA B651, “Accessible Design for the Built Environment,” listed in Table 3.8.3.1., in their entirety.

(See Note A-3.8.3.1.(1).)

2) Notwithstanding the requirements of Sentence (1), buildings required to comply with the requirements of Article 3.8.2.1.(6) shall be equipped with the following (See Note A-3.8.3.1.(2))

a) interior and exterior stairs and ramps that are accessible to the public, with a colour contrast or distinctive pattern, visible from both directions of travel, demarcating the leading edge of treads,
b) door opening hardware within dwelling units and common amenity areas which may be operated
   i) without tight grasping or twisting of the wrist, and
   ii) by application, of a force of not more than 38 N for exterior doors or 22 N for interior doors, at the handle, push plate or latch-releasing device, except where the Chief Building Official determines that a greater force is necessary to ensure proper building function,
c) kitchen sinks and washbasins within dwelling units and common amenity spaces with faucets activated by levers or by devices that do not require tight grasping or twisting of the wrist,
d) wall assemblies reinforced adjacent to the toilet and bathtub to accommodate the future installation of grab bars,
e) an accessible path of travel from the main entrance and from any parking area or parking facility serving the building to the entry doors of dwelling units and to common amenity areas,
f) a clearance of not less 450 mm beside the latching jamb of dwelling unit entry doors
   i) notwithstanding Clause 3.8.3.5.(1)(c),
   ii) Despite the provisions of Clause (4)(f), if the dwelling unit contains pre-wired outlet boxes for a residential style automatic door opener and related controls, and the Chief Building Official determines that provision of the required clearance is impractical, the Chief Building Official may waive the clearance requirement.
g) accessible gender neutral washrooms in public or common amenity areas of the building,
h) entry doors with level thresholds leading into each dwelling unit, except for ramps or other devices conforming to Article 3.8.3.10.,
i) a washroom at the main entry level of each dwelling unit, containing a washbasin and toilet, with a minimum clear doorway opening of 800 mm and a minimum floor space, clear of the door swing, of 750 mm by 1 200 mm in front of each of the washbasin and toilet,
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

j) all doors in the accessible path of travel equipped with a self-closer with a closing period of no less than 3 seconds, measured from a door open position of 70 degrees to a point 75 mm from the door closed position,
k) power-operated doors at the main building entrance and the entrance from the parking area, and
l) signage in public areas, amenity spaces and exits in multi-unit residential buildings in conformance with Sentence 3.8.3.12.(3) of Division B.

3.8.3.2. Accessible Path of Travel

1) Except as required elsewhere in this Part or as permitted by Article 3.8.3.6. pertaining to doorways, an accessible path of travel shall have
   a) except for handrails, that are permitted to project not more than 100 mm from either or both sides into the clear area, an unobstructed width of not less than 1 500 mm except that the unobstructed width may be reduced to not less than
      i) 1 100 mm between any two structures or fixtures in public aisles in merchandising establishments and exhibition facilities,
      ii) 920 mm for permanent food service lines, and
      iii) 810 mm through turnstiles, controlled checkout lanes or other restricted passageways constructed to control the flow or pedestrian traffic, and
   b) an unobstructed height of not less than 1 980 mm for the full width of the route.

2) Interior and exterior walking surfaces that are within an accessible path of travel shall
   a) have no opening that will permit the passage of a sphere more than 13 mm in diameter,
b) have any elongated openings oriented approximately perpendicular to the direction of travel,
c) be stable, firm and slip-resistant,
d) have a cross slope no steeper than 1 in 50,
e) be beveled at a maximum slope of 1 in 2 at changes in level between 6 mm and 13 mm,
f) be provided with sloped floors or ramps at changes in level more than 13 mm, and
g) be designed as a ramp complying with Article 3.8.3.5. where the floor or walk has a slope
steeper than 1 in 20.

(See Note A-3.8.3.2.(2).)

3) An accessible path of travel is permitted to include ramps, passenger elevators or other platform-equipped passenger-elevating devices to overcome a difference in level. (See Note A-3.8.3.2.(3).)

4) The width of an accessible path of travel that is more than 30 m long shall be increased to not less than 800 mm for a length of 800 mm at intervals not exceeding 30 m.

5) An accessible path of travel shall be equipped to provide illumination in accordance with Sentences 3.2.7.1.(1) and (2). (See also Sentence 3.2.7.1.(3) and Article 9.34.2.7.)

6) An exterior mechanical lift and its controls provided in accordance with Sentence (3), shall be provided
   a) where existing exterior site constraints make use of a ramp or elevator infeasible, and
   b) sufficiently protected from inclement weather by
      i) weather and moisture resistant construction, and
      ii) sufficient cover or enclosure so as to ensure its continued safe operation.

(See Note A-3.8.3.2.(6)(a).)

3.8.3.3. Exterior Walks

1) Exterior walks that form part of an accessible path of travel shall
   a) have a slip-resistant, continuous and even surface,
   b) be not less than 500 mm wide, and
   c) have a level area conforming to Clause 3.8.3.5.(1)(c) adjacent to an entrance doorway.

2) Exterior walks that form part of an accessible path of travel may contain curb ramps that shall
   a) have a running slope
      i) between 1 in 8 to 1 in 10 where the vertical rise is less than 75 mm, and
      ii) between 1 in 10 to 1 in 12 where the vertical rise is 75 mm to 200 mm,
   b) have a width of not less than 1 500 mm exclusive of flared sides,
   c) have a surface including flared sides that shall
      i) be slip-resistant,
      ii) have tactile walking surface indicators conforming to Article 3.8.3.9., and
      iii) have a smooth transition from the curb ramp to the adjacent surfaces, and
   d) have flared sides with a slope of not more than 1 in 12 where pedestrians are likely to walk across them.

3) Curb ramps described in Sentence (2) do not require handrails or guards.

3.8.3.4. Passenger-Loading Zones and Parking Requirements

1) If a passenger-loading zone is provided, it shall have
   a) an access aisle not less than 1 500 mm wide and 6 000 mm long adjacent and parallel to the vehicle pull-up space,
   b) a curb ramp constructed in accordance with Sentence 3.8.3.3.(2), where there are curbs between the access aisle and the vehicle pull-up space and the difference in elevation between levels is not more than 200 mm, and
   c) a clear height of not less than 2 750 mm at the pull-up space and along the vehicle access and egress routes.

2) Parking stalls for persons with disabilities shall comply with the Parking By-law (See Note A-3.8.3.4.(2).), and shall
   a) have a firm, slip-resistant and level surface,
b) be located adjacent to an accessible entrance conforming to Article 3.8.3.5., and
c) be marked with signage or symbols identifying such stalls as exclusively for the use of persons with disabilities.

3) Where parking stalls are provided for persons with disabilities, entry and exit controls, security controls, ticketing equipment, and pay stations serving such parking stalls shall be designed and installed so that all user functions are located no more than 1 200 mm above the finished paved area, and are accessible.

4) This Article does not apply to existing buildings except for spaces created by
   a) an addition,
   b) the reconstruction of an existing space, and
   c) the conversion of an existing space into an ancillary residential unit.

3.8.3.5. Ramps

1) Except as provided in Sentence 3.8.3.3.(2), a ramp located in an accessible path of travel shall
   a) have a clear width not less than
      i) 1 500 mm,
      ii) 915 mm if the ramp serves a passageway that is 6 m or less in width, or
      iii) 915 mm if a second ramp with a clear width not less than 915 mm also serves a
           passageway that is greater than 6 m in width,
           (See Note A-3.4.3.4.),
   b) have a slope not more than 1 in 12 (See Note A-3.8.3.5.(1)(b).),
   c) have a level area not less than 1 500 by 1 500 mm at the top and bottom and at intermediate
      levels of a ramp leading to a door, so that on the latch side the level area extends not less than
      i) 600 mm beyond the edge of the door opening where the door opens towards the ramp,
      or
      ii) 300 mm beyond the edge of the door opening where the door opens away from the
          ramp,
      (See Note A-3.8.3.5.(1)(c).),
   d) have a level area not less than 1 500 mm long and at least the same width as the ramp
      i) at intervals not more than 9 m along its length, and
      ii) where there is an abrupt change in the direction of the ramp, and
   e) except as provided in Sentences (2) and (3), be equipped with a handrail on each side of the
      ramp conforming to Article 3.4.6.5., except that they shall be not less than 865 mm and not more
      than 965 mm high, and
   f) be equipped with guards conforming to Article 3.4.6.6.

2) Handrails installed in addition to required handrails need not comply with the height requirements stated in Clause (1)(e).

3) The requirement for handrails in Clause (1)(e) need not apply to a ramp serving as an aisle for fixed
   seating.

4) The surfaces of ramps and landings shall
   a) be hard or resilient where the ramp is steeper than 1 in 15 (See Note A-3.8.3.5.(4)(a).),
   b) have a cross slope no steeper than 1 in 50, and
   c) where exposed to water, be designed to drain.

5) Ramps and landings not at grade or adjacent to a wall shall have edge protection consisting of
   a) a curb not less than 75 mm high, or
   b) a raised barrier or rail located not more than 100 mm from the ramp or landing surface.

6) Reserved.

3.8.3.6. Doorways and Doors

1) Except where stated otherwise, this Article applies to swinging and sliding doors.

2) Every doorway that is located in an accessible path of travel shall have a clear width not less than 850 mm
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

3) Doorways in an accessible path of travel to at least one bathroom within an accessible suite of residential occupancy shall have a clear width not less than 810 mm when measured in accordance with Clauses (2)(a) and (b). (See Article 3.8.2.12. and Note A-3.8.3.6.(3).)

4) Door-operating devices shall be graspable and operable
   a) in accordance with Clause 3.8.3.8.(1)(c), and
   b) at a height between 900 mm and 1 100 mm above the floor.
   (See also Sentence 3.3.1.13.(4) regarding door release operation.)
   (See Note A-3.8.3.6.(4).)

5) A threshold for a doorway referred to in Sentences (2) and (3) shall conform to Sentence 3.3.1.13.(11).

6) Power operated doors required by Sentence 3.8.2.7.(1) shall
   a) have operators that activate automatically or through the use of controls that
      i) function for passage in both directions when located in an accessible path of travel,
      ii) are marked with the International Symbol of Access,
      iii) are located clear of the door swing and not less than 600 mm and no more than 1 500 mm from that door swing,
      iv) comply with Subclause 3.8.3.8.(1)(b),
      v) are operable from a height between 150 mm and 300 mm as well as between 900 mm and 1 100 mm above the floor, and
      vi) are operable by touching or approaching any part of their surface with a fist, arm or foot, and
   b) unless equipped with safety sensors, have operators that
      i) fully open the door in not less than 3 s, and
      ii) require a force not more than 65 N to stop movement of the door, and
   c) have a clear and level space extending the height of the doorway and not less than 1 100 mm long by the width of the door assembly on both sides of the assembly plus the arc of the door swing on any side into which the door swings.
   (See Note A-3.8.3.6.(6) and (7).)

7) A cane-detectable guard shall be installed on the hinged side of power-assisted doors that swing open into the path of travel. (See Note A-3.8.3.6.(6) and (7).)

8) Except as provided in Sentence (9) and except for a door with a power door operator complying with Sentence (6), when unlatched, a door in an accessible path of travel shall open when the force applied to the handle, push plate or latch-releasing device is not more than
   a) 38 N in the case of an exterior swinging door,
   b) 22 N in the case of an interior swinging door, or
   c) 22 N in the case of a sliding door.

9) Sentence (8) does not apply to a door at the entrance to a dwelling unit, or where greater forces are required in order to close and latch the door against the prevailing difference in air pressure on opposite sides of the door. (See Note A-3.8.3.6.(9).)

10) Except for a door at the entrance to a dwelling unit, a closer for a door in an accessible path of travel shall have a closing period of not less than 3 s measured from when the door is in an open position of 70° to the doorway, to when the door reaches a point 75 mm from the closed position, measured from the leading edge of the latch side of the door. (See Note A-3.8.3.6.(10).)

11) Unless equipped with a power door operator complying with Sentence (6), a door in an accessible path of travel shall have a clear and level space extending the height of the doorway and not less than
   a) 1 500 mm deep by the width of the door assembly plus not less than 600 mm beside the latching jamb of the door on any side of the assembly into which a swinging door swings,
b) 1 200 mm deep by the width of the door assembly plus not less than 300 mm beside the latching jamb of the door on any side of the assembly into which a swinging door does not swing,
c) 1 200 mm deep by a width not less than 900 mm, including not less than 50 mm on the latching jamb side where the approach is perpendicular to a sliding door, and
d) 1 050 mm deep by a width not less than 1 390 mm, including not less than 540 mm on the latching jamb side where the approach is parallel to a sliding door.

(See Note A-3.8.3.6.(11).)

12) Doors in an accessible path of travel which are installed in series shall be separated by a distance of not less than 1 500 mm plus the width of any door that swings into the space in the path of travel from one door to another. (See also Clauses 3.2.8.4.(1)(a) and 3.3.5.7.(4)(a).)

13) Only the active leaf in a multiple-leaf door in an accessible path of travel need conform to the requirements of this Article.

14) Except as provided in Clause 3.8.3.5.(1)(c), the floor surface on each side of a door in an accessible path of travel shall be level within a rectangular area
a) as wide as the door plus the clearance required on the latch side by Sentence (11), and
b) whose dimension perpendicular to the closed door is not less than the width of the accessible path of travel but need not exceed 1 500 mm.

3.8.3.7. Passenger-Elevating Devices
1) A passenger-elevating device in an accessible path of travel shall conform to
   a) Appendix E of ASME A17.1/CSA B44, “Safety Code for Elevators and Escalators,” (See also Sentence 3.5.2.1.(3).), or
(See also Sentence 3.5.4.1.(3).)

3.8.3.8. Controls and Outlets
1) Controls described in this Section shall
   a) be mounted 455 mm to 1 200 mm above the floor,
   b) be adjacent to and centred on either the length or the width of a clear floor space of 1 350 mm by 800 mm, and
   c) be operable
      i) with one hand in a closed fist position, without requiring tight grasping, pinching with fingers, or twisting of the wrist, and
      ii) unless otherwise stated, with a force not more than 22 N.
2) Electrical outlets described in this Section shall be located in conformance with Clause (1)(a).
(See Note A-3.8.2.6.(2).)

3.8.3.9. Signs and Indicators
1) Signs required by Article 3.8.2.10. shall incorporate the International Symbol of Access or the International Symbol of Access for Hearing Loss and appropriate graphical or textual information that clearly indicates the type of facilities available. (See Note A-3.8.3.9.(1).)
2) Signs required by Sentence (1) shall
   a) be located so as to be easily read and understood,
   b) be located so as to be seen by a person using a wheelchair,
   c) be located so as to avoid shadow areas and surface glare, and
   d) have characters and symbols in colours that contrast highly with their backgrounds.
3) Where provided, tactile walking surface indicators shall
   a) be slip-resistant,
   b) be durable,
   c) be not more than 3 mm above or below the surrounding surface,
   d) be detectable when walked upon, as being different from the surrounding surface,
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

3.8.3.9. Warning Devices

e) be in a contrasting colour to the surrounding surface, and
f) when provided at stairs,
   i) be located one tread width back from the top riser, and
   ii) measure 600 mm to 650 mm by the full width of the stair, and

g) when provided on ramps or platforms,
   i) be located 150 mm to 200 mm back from the lower end of the ramp or edge of platform, and
   ii) measure 600 mm to 650 mm by the full width of the ramp or platform, but not including flared sides of the ramp.

(See Note A-3.8.3.9.(5).)

3.8.3.10. Drinking Fountains

1) Drinking fountains required by Sentence 3.8.2.8.(9) shall
   a) be located along an accessible path of travel,
   b) have a minimum clear floor space of 800 mm by 1 350 mm in front of it,
   c) where it has frontal access, provide a knee clearance in accordance with Clause 3.8.3.15.(1)(d),
   d) have a spout that
      i) is located near the front of the unit, at a height between 750 mm and 915 mm above the floor, and
      ii) directs water flow in a trajectory that is nearly parallel to the front of the unit, at a height not less than 100 mm, and
   e) be equipped with controls that
      i) activate automatically, or
      ii) are located either on the front or on both sides of it and comply with Clause 3.8.3.8.(1)(c).

3.8.3.11. Water-Closet Stalls

1) Water-closet stalls and enclosures required by Sentence 3.8.2.8.(5) shall
   a) be not less than 1 500 mm wide by 1 500 mm deep,
   b) have a clear floor space of not less than 1 500 mm by 1 500 mm in front of the accessible stall,
   c) be equipped with a door that
      i) can be latched from the inside with a mechanism conforming to Clause 3.8.3.8.(1)(c),
      ii) is aligned with either the transfer space adjacent to the water closet or with a clear floor space not less than 1 500 mm by 1 500 mm within the stall,
      iii) provides a clear opening not less than 850 mm wide when measured in accordance with Clauses 3.8.3.6.(2)(a) and (b),
      iv) is self-closing so that, when at rest, the door is ajar by not more than 50 mm beyond the jamb,
      v) swings outward, unless there is clear floor space within the stall of at least 800 mm by 1 350 mm plus the arc of the door swing (See Note A-3.8.3.11.(1)(c)(v).),
      vi) where the door swings outward, is provided with a horizontal, D-shaped, visually contrasting door pull not less than 140 mm long located on the inside such that its midpoint is 200 mm to 300 mm from the hinged side of the door and 900 mm to 1 100 mm above the floor (See Note A-3.8.3.11.(1)(c)(vi).), and
      vii) is provided with a horizontal, D-shaped, visually contrasting door pull not less than 140 mm long located on the outside such that its midpoint is 120 mm to 220 mm from the latch side and 900 mm to 1 100 mm above the floor,
   d) have a water closet located so that the distance between the centre line of the fixture and the wall on one side is 460 mm to 480 mm,
   e) be equipped with an L-shaped grab bar that
      i) is mounted on the side wall closest to the water closet,
**Division B: Acceptable Solutions**

**Part 3 – Fire Protection, Occupant Safety and Accessibility**

ii) has horizontal and vertical components not less than 760 mm long mounted with the horizontal component 750 mm to 850 mm above the floor and the vertical component 150 mm in front of the water closet (See Note A-3.8.3.11.(1)(e)(ii).), and

iii) complies with Article 3.7.2.8.,

f) be equipped with either one grab bar at least 600 mm long and centred over the water closet, or two grab bars at least 300 mm long and located either side of the flush valve, that

i) conform to Article 3.7.2.8.,

ii) are mounted on the rear wall, and

iii) are mounted at the same height as the grab bar on the side wall or 100 mm above the top of the attached water tank, if applicable,

g) be equipped with a coat hook mounted not more than 1 200 mm above the floor on a side wall and projecting not more than 50 mm from the wall, and

h) be equipped with a toilet paper dispenser mounted on the side wall closest to the water closet such that

i) the bottom of the dispenser is 600 mm to 800 mm above the floor, and

ii) the closest edge of the dispenser is not more than 300 mm from the front of the water closet.

**3.8.3.12. Universal Washrooms**

(See Note A-3.8.3.12.)

1) A universal washroom shall

a) be served by an accessible path of travel,

b) have a door complying with Article 3.8.3.6. that

i) has a latch-operating mechanism located 900 mm to 1 100 mm above the floor that complies with Clause 3.8.3.8.(1)(c) and is capable of being locked from the inside, and released from the outside in case of emergency, and

ii) if it is an outward swinging door that is not self-closing, is provided with a horizontal, D-shaped, visually contrasting door pull not less than 140 mm long located on the inside such that its midpoint is ii) 200 mm to 300 mm from the hinged side of the door and 900 mm to 1 100 mm above the floor (See Note A-3.8.3.11.(1)(c)(vi).),

c) have one lavatory and one mirror conforming to Article 3.8.3.15.,

d) have one water closet conforming to Article 3.8.3.13. and Clause 3.8.3.11.(1)(d), with a clear floor space at least 900 mm wide that is parallel and adjacent to the open side of the water closet,

e) have grab bars conforming to Clauses 3.8.3.11.(1)(e) and (f),

f) have a coat hook conforming to Clause 3.8.3.11.(1)(g),

g) have a toilet paper dispenser conforming to Clause 3.8.3.11.(1)(h),

h) unless counter space of not less than 200 mm by 400 mm is provided, have a shelf located not more than 1 200 mm above the floor with a useable surface of not less than 200 mm by 400 mm, and

i) have a clear floor space of not less than

i) 3.7 m² with no dimension less than 1 700 mm when the door swings out, and

ii) 4.0 m² with no dimension less than 1 800 mm when the door swings in.

**3.8.3.13. Water Closets**

1) A water closet for a person with physical disabilities shall

a) be equipped with a seat that is not the spring-up type located 430 mm to 480 mm above the floor,

b) flush automatically or be equipped with a flushing control that

i) is located 500 mm to 900 mm above the floor,

ii) is located not more than 350 mm from the transfer side, and

iii) complies with Clause 3.8.3.8.(1)(c),
c) be equipped with a seat lid or other back support, and
d) where it has a tank, have a securely attached tank top.
(See Note A-3.8.3.13.(1).)

3.8.3.14. Urinals
1) Urinals described in Sentence 3.8.2.8.(6) shall
   a) be wall-mounted or floor mounted, with the opening of the basin located not more than 430 mm
      above the floor,
   b) be adjacent to an accessible route,
   c) have a clear width of approach of 800 mm centred on the urinal and unobstructed by privacy
      screens,
   d) have no step in front of it,
   e) have a flush control that
      i) is automatic, or
      ii) complies with Clause 3.8.3.8.(1)(c) and is located 900 mm to 1 100 mm above the floor,
      and
   f) have a vertically mounted grab bar installed on each side that
      complies with Article 3.7.2.8.,
   g) is not less than 600 mm long, with its centre line 1 000 mm above the floor, and
   h) is located not more than 380 mm from the centre line of the urinal.

3.8.3.15. Lavatories and Mirrors
1) Lavatories required by Sentence 3.8.2.8.(7) shall
   a) be equipped with faucets complying with Sentence 3.7.2.3.(4),
   b) be located to provide a clear floor space in front of the lavatory of not less than 920 mm wide by
      1 350 mm deep centered on the lavatory,
   c) have a rim height not more than 865 mm above the floor,
   d) have a clearance beneath the lavatory not less than
      i) 760 mm wide,
      ii) 735 mm high at the front edge,
      iii) 685 mm high at a point 250 mm back from the front edge, and
      iv) 250 mm high to a point 500 mm back from the front edge, (See Note A-3.8.3.15.(1)(d).)
   e) have insulated water supply and drain pipes where these pipes are exposed (See Note A-
      3.8.3.15.(1)(e).),
   f) have a soap dispenser that
      i) is automatic, or
      ii) complies with Clause 3.8.3.8.(1)(c) and is located not more than 1 100 mm above the
      floor, within 500 mm from the front of the lavatory (See Note A-3.8.3.15.(1)(f).), and
   g) have a towel dispenser or other hand-drying equipment located close to the lavatory, with
      operating controls not more than 1 200 mm above the floor in an area that is accessible to persons
      using wheelchairs.
2) Mirrors required by Sentence 3.8.2.8.(8) shall be
   a) mounted with their bottom edge not more than 1 000 mm above the floor, or
   b) fixed in an inclined position so as to be usable by a person using a wheelchair.

3.8.3.16. Showers
1) Showers required by Sentence 3.8.2.8.(10) shall
   a) have an entrance not less than 1 500 mm wide and be not less than 900 mm deep,
   b) have a clear floor space at the entrance to the shower that is not less than 900 mm deep and
      the same width as the shower, except that fixtures are permitted to project into that space provided
      they do not restrict access to the shower (See Note A-3.8.3.16.(1)(b).),
c) have no doors or curtains that obstruct the controls or the clear floor space at the entrance to the shower,
d) have a slip-resistant floor surface,
e) have a threshold not more than 13 mm higher than the finished floor, and where it is higher than 6 mm, beveled to a slope no steeper than 1 in 2,
f) have 2 grab bars that
   i) conform to Sentence 3.7.2.8.(1),
   ii) one of which is not less than 1 000 mm long and located vertically on the side wall 50 mm to 80 mm from the adjacent clear floor space, with its lower end 600 mm to 650 mm above the floor, and,
   iii) one of which is L-shaped and located on the wall opposite the entrance to the shower, with a horizontal member not less than 1 000 mm long mounted 750 mm to 870 mm above the floor and a vertical member not less than 750 mm long mounted 400 mm to 500 mm from the side wall on which the other vertical grab bar is mounted, (See Note A-3.8.3.16.(1)(f).),
g) have a hinged seat that is not spring-loaded or a fixed seat with a smooth, slip-resistant surface and no rough edges, the seat being
   i) not less than 450 mm wide and 400 mm deep,
   ii) mounted on the same side wall as the vertical grab bar, at 460 mm to 480 mm above the floor,
   iii) designed to carry a minimum load of 1.3 kN,
   iv) impervious to water, and
   v) designed to be easily cleaned,
h) have a pressure-equalizing or thermostatic-mixing valve and other controls that
   i) comply with Clause 3.8.3.8.(1)(c), and
   ii) are mounted on the wall opposite the entrance to the shower at not more than 1 200 mm above the floor and within reach of the seat,
i) have a hand-held shower head with not less than 1 800 mm of flexible hose located so that it
   i) can be reached from a seated position,
   ii) can be used in a fixed position at a height of 1 200 mm and 2 030 mm, and
   iii) does not obstruct the use of the grab bars, and
j) have recessed soap holders that can be reached from the seated position.

3.8.3.17. Bathtubs

1) Bathtubs required by Sentence 3.8.2.8.(11) shall
   a) be located in a room with a clear floor space not less than 1 500 mm in diameter,
   b) be not less than 1 500 mm long,
   c) have a clear floor space at the entrance to the bathtub not less than 900 mm wide and the same length as the bathtub, except that fixtures are permitted to project into that space provided they do not restrict access to the bathtub,
   d) be capable of being accessed along its full length with no tracks mounted on its rim,
   e) have a pressure-equalizing or thermostatic-mixing valve and other controls that
      i) conform to Clause 3.8.3.8.(1)(c), and
      ii) are located on the centre line or between the centre line of the bathtub and the exterior edge of the bathtub rim, at a maximum height of 450 mm above the rim and within reach of the seat,
   f) have three grab bars
      i) that conform to Sentence 3.7.2.8.(1),
      ii) that are not less than 1 200 mm long,
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

iii) two of which are located vertically at each end of the bathtub, set 80 mm to 120 mm in from the outside edge of the bathtub, with their lower end 180 mm to 280 mm above the bathtub rim, and

iv) one of which is located horizontally along the length of the bathtub at 180 mm to 280 mm above the bathtub rim,

g) have a slip-resistant bottom surface,
h) be equipped with a hand-held shower head that complies with Clause 3.8.3.16.(1)(i),

i) have a removable seat with a smooth, slip-resistant surface and no rough edges that is

i) wide enough to give stability to the user (See Subclause 3.8.3.16.(1)(g)(i).), and

ii) complies with Subclauses 3.8.3.16.(1)(g)(iii) to (v), and

j) have recessed soap holders that can be reached from the seated position.

(See Note A-3.8.3.17.)

3.8.3.18. Assistive Listening Devices

(See Note A-3.8.3.18.)

1) Except as provided in Sentence (2), assistive listening systems required by Article 3.8.2.9. shall encompass the entire seating area.

2) If an assistive listening system referred to in Article 3.8.2.9. is an induction loop system, only half the seating area in the room need be encompassed.

3.8.3.19. Counters

1) Counters required by Sentence 3.8.2.11.(1) shall have

a) at least one accessible section not less than 760 mm long, adjacent to a clear floor space of not less than 800 mm by 1 350 mm, centred over a knee space conforming to Clause (c),

b) a surface not more than 865 mm above the floor, and

c) except as provided in Sentence (2) and where the counter is intended to be used as a work surface, a knee space underneath it that is

i) not less than 760 mm wide,

ii) not less than 685 mm high, and

iii) not less than 485 mm deep.

2) A counter that is used in a cafeteria, or one that performs a similar function where movement takes place parallel to the counter, need not be provided with a knee space underneath it.

3.8.3.20. Shelves or Counters for Telephones

(See Note A-3.8.3.20.)

1) Shelves or counters required by Sentence 3.8.2.11.(2) shall have

a) be level,

b) be not less than 350 mm deep,

c) have, for each telephone provided, a clear space not less than 250 mm wide having no obstruction within 250 mm above the surface,

d) have a section with a surface not more than 865 mm above the floor serving at least one telephone, and

e) have a clear floor space of not less than 800 mm by 1 350 mm centred on and within 300 mm in front of the telephone.

2) Where a wall-hung telephone is provided above the shelf or counter section described in Clause (1)(d), it shall be located so that the receiver and coin slot are not more than 1 200 mm above the floor.

3.8.3.21. Spaces in Seating Area

1) Spaces designated for wheelchair use referred to in Sentence 3.8.2.3.(3) shall be

a) clear and level, or level with removable seats,
b) not less than 900 mm wide and 1 525 mm long to permit a wheelchair to enter from a side
approach and 1 350 mm long where the wheelchair enters from the front or rear of the space,
c) arranged so that at least 2 designated spaces are side by side,
d) located adjoining an accessible path of travel without infringing on egress from any row of
seating or any aisle requirements, and
e) situated, as part of the designated seating plan,
   i) to provide a choice of viewing location,
   ii) to provide a clear view of the event taking place, and
   iii) in motion picture theatres, to not be in the front third of the seating area.

3.8.3.22. Sleeping Rooms and Bed Spaces
(See Note A-3.8.3.22.)
1) Sleeping rooms and bed spaces required to be accessible in Sentence 3.8.2.12.(1) shall have
   a) a turning area of not less than 1 500 mm in diameter on one side of a bed,
   b) a clearance of not less than 900 mm to allow for functional use of the room or space by persons
      using wheelchairs,
   c) when a balcony is provided, an accessible balcony,
   d) at least one closet that provides
      i) a clear opening not less than 900 mm wide,
      ii) clothes hanger rods capable of being lowered to a height of 1 200 mm,
      iii) at least one shelf capable of being lowered to a height of 1 200 mm,
   e) accessible light switches, thermostats and other controls that are specifically provided for use by
      the occupant located between 900 mm and 1 200 mm above the finished floor and operable in
      accordance with Clause 3.8.3.8.(1)(c),
   f) accessible electrical outlets located in conformance with Clause 3.8.3.8.(1)(a), and
   g) a bathroom, where provided as part of the sleeping room or bed space, or access to a
      bathroom, where not provided as part of the sleeping room or bed space
      i) conforming to Clauses 3.8.3.11.(1)(a) and (d) with a water closet conforming to Article
         3.8.3.13.,
      ii) provided with grab bars conforming to Clauses 3.8.3.11.(1)(e) and (f),
      iii) provided with a lavatory and mirror conforming to Article 3.8.3.15., and
      iv) provided with a bathtub conforming to Article 3.8.3.17. or a shower conforming to
         Article 3.8.3.16.

3.8.4. Alterations and Additions to Existing Buildings

3.8.4.1. Application
   1) All existing buildings shall be upgraded in accordance with Part 11.
   2) Deleted.

3.8.4.2. Deleted.

3.8.4.3. Deleted.

3.8.4.4. Deleted.

3.8.4.5. Deleted.

3.8.4.6. Deleted.

3.8.4.7. Deleted.
3.8.5. **Adaptable Dwelling Units**

3.8.5.1. **Application**

1) Except as permitted by Sentences (2) and (3), this Subsection applies to
   a) the design and construction of *dwelling units* in *residential occupancy buildings*, and
   b) the interior paths of travel and common facilities intended for use by the residents.

2) This Subsection need not apply to
   a) hotels, motels, *single room accommodation* and similar commercial occupancies,
   b) boarding houses, lodging houses, dormitories and similar facilities, or
   c) *dwelling units* subsidiary to non-residential uses.

3) This Subsection does not apply to *existing buildings*, except for *additions* or spaces created by
   a) the reconstruction of an existing space, or
   b) the conversion of an existing space into a new *dwelling unit*.

4) *Dwelling units* required by Article 3.8.5.1. to comply with this Subsection shall be considered *adaptable dwelling units*.

3.8.5.2. **Construction Requirements**

1) The construction of *adaptable dwelling units* and the *building* in which they are located shall conform to
   the requirements in this Subsection and to *access requirements for residential occupancy buildings* elsewhere in this *By-law*.

3.8.5.3. **Entrance Doors to Dwelling Units**

1) *Adaptable dwelling units* shall have at least one entrance door no less than 865 mm wide, equipped with
   a) two peepholes, one located at 1067 mm above the floor and the other located at 1524 mm above the floor, or a glass sidelight or intercom security type system (See Note A-3.8.5.3.(1).),
   b) a beveled threshold not more than 13 mm above the floor level, except for entrance doors serving balconies and basements, and
   c) door opening hardware that does not require a tight grasp or twisting action of the wrist, and can be opened with a force of not more than 38 N.

3.8.5.4. **Interior Doors, Corridors, and Stairs in Dwelling Units**

1) Doorways in *adaptable dwelling units* shall have
   a) a clear width of at least 800 mm,
   b) door opening hardware that does not require a tight grasp or twisting action of the wrist and can be opened with a force of not more than 22 N, and
   c) beveled thresholds no more than 13 mm above the floor.

2) Corridors in *adaptable dwelling units* shall have a clear width of at least 900 mm.

3) Except for interior stairs within *laneway houses*, at least one staircase within a *adaptable dwelling unit* shall have a minimum width of 915 mm.

3.8.5.5. **Adaptable Dwelling Unit Bathrooms**

(See Note A-3.8.5.5.)

1) One bathroom in an *adaptable dwelling unit* of more than 40 m² shall
   a) have a minimum clear floor space of 750 mm by 1200 mm in front of a washbasin, toilet, bathtub or shower,
   b) be configured to accommodate the future installation of a low barrier shower and shall be constructed with
      i) double floor joists under a bathtub on timber construction,
ii) a second shower drain under a bathtub on timber construction with concrete topping,
iii) a second shower drain under a bathtub on a concrete slab, or
iv) measures to the satisfaction of the Chief Building Official where it can be
demonstrated that the future installation of a low barrier shower can be installed without
substantial changes to the building structure or layout, and
c) be located on an accessible floor level or the largest floor level where there is no accessible
floor.

2) Walls adjacent to the water closet and bathtub or shower shall accommodate the future installation of
grab bars conforming to
   a) Clauses 3.8.3.11.(1)(e) and (f) for water closets, and
   b) Clause 3.8.3.16.(1)(f) for showers or 3.8.3.17.(1)(f) for bathtubs.
(See Note A-3.8.5.5.(2).)

3) All bath and shower controls in adaptable dwelling units shall be easily accessible from an open floor
space or offset.
4) All washbasins in adaptable dwelling units shall be equipped with lever-type faucets or hardware that
does not require a tight grasp or twisting action of the wrist.

3.8.5.6. Adaptable Dwelling Unit Kitchens
1) The kitchen in an adaptable dwelling unit shall be designed so that the cooktop and sink are adjacent or
can have a continuous counter between them.
2) Kitchen sinks in adaptable dwelling units, shall use lever-type faucets or hardware that does not require a
tight grasp or twisting action of the wrist.
3) All waste pipes running from under-sink “P” traps to drain stacks shall be installed no higher than 305
mm above the finished floor.

3.8.5.7. Controls, Switches and Outlets
1) Controls and switches in an adaptable dwelling unit intended for regular occupant use, including
electrical, telephone, cable and data outlets shall be mounted 455 mm to 1 200 mm above the floor, except
where
   i) in the opinion of the Chief Building Official, a different height is necessary to accommodate
      appliances or equipment, or
   ii) otherwise required for safety or other regulatory enactments.
2) Controls for the operation of building services or safety devices, electrical switches, thermostats and
intercoms in a adaptable dwelling unit shall be located no more than 1 200 mm above the finished floor,
except where, in the opinion of the Chief Building Official, a different height is necessary for safety reasons.
3) At least one electrical receptacle shall be provided in the vicinity of the stair required by Sentence
3.8.5.4.(3).

3.8.5.8. Living Room Window Requirements
1) In an adaptable dwelling unit, at least one window in a living room shall have a window sill no higher than
800 mm above the finished floor.

Section 3.9. Reserved.

Section 3.10. Objectives and Functional Statements

3.10.1. Objectives and Functional Statements

3.10.1.1. Attributions to Acceptable Solutions
1) For the purpose of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 3.10.1.1. (See Note A-1.1.2.1.(1).)

#### 3.2.2.44. Group B, Division 3, up to 3 Storeys, Sprinklered

(1) [F02,F04-OS1.2,OS1.3] Applies to portion of By-law text: "... a) ... the building is sprinklered throughout ..."

(2) [F03-OS1.2] [F04-OS1.2,OS1.3] Applies to portion of By-law text: "...a) ... floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h, ..." and to Clause (c).

#### 3.2.2.45. Group B, Division 3, up to 2 Storeys, Sprinklered

(1) [F02,F04-OS1.2,OS1.3] Applies to portion of By-law text: "... a) ... the building is sprinklered throughout ..."

(2) (a),(c) [F03-OS1.2] [F04-OS1.2,OS1.3]

#### 3.2.2.46. Group B, Division 3, One Storey, Sprinklered

(1) [F02,F04-OS1.2,OS1.3] Applies to portion of By-law text: "... a) ... the building is sprinklered throughout ..."

#### 3.2.2.47. Group C, Any Height, Any Area, Sprinklered, Noncombustible Construction

(2) [F02-OS1.2] Applies to portion of By-law text: "... the building referred to in Sentence (1) shall be of noncombustible construction ..."

#### 3.2.2.48. Group C, up to 6 Storeys, Sprinklered, Noncombustible Construction

(1) [F02,F04-OS1.2,OS1.3] Applies to portion of By-law text: "... a) ... the building is sprinklered throughout ..."
### 3.2.2.49. Group C, up to 3 Storeys, Noncombustible Construction

(2) [F02-OS1.2] Applies to portion of By-law text: “... the building referred to in Sentence (1) shall be of noncombustible construction ...”

[F02-OP1.2] Applies to portion of By-law text: “... the building referred to in Sentence (1) shall be of noncombustible construction ...”

(a),(c) [F03-OS1.2] [F04-OS1.2,OS1.3]

(a),(c) [F03-OP1.2] [F04-OP1.2,OP1.3]

(b),(c) [F04-OS1.3]

(b),(c) [F04-OP1.3]

### 3.2.2.50. Group C, up to 6 Storeys, Sprinklered

(1) (a) [F02,F04-OS1.2,OS1.3]

(a) [F02,F04-OP1.2,OP1.3]

(2) [F03-OS1.2] [F04-OS1.2,OS1.3] Applies to portion of By-law text: “a) ... floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h, ...” and to Clause (d).

[F03-OP1.2] [F04-OP1.2,OP1.3] Applies to portion of By-law text: “… a) ... floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h, ...” and to Clause (d).

(b),(d) [F04-OS1.3]

(b),(d) [F04-OP1.3]

(c),(d) [F04-OS1.3]

(c),(d) [F04-OP1.3]

### 3.2.2.51. Group C, up to 4 Storeys, Sprinklered

(1) [F02,F04-OS1.2,OS1.3] Applies to portion of By-law text: “… a) ... the building is sprinklered throughout …”

[F02,F04-OP1.2,OP1.3] Applies to portion of By-law text: “… a) ... the building is sprinklered throughout …”

(2) [F03-OS1.2] [F04-OS1.2,OS1.3] Applies to portion of By-law text: “…a) ... floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h, ...” and to Clause (c).

[F03-OP1.2] [F04-OP1.2,OP1.3] Applies to portion of By-law text: “…a) ... floor assemblies shall be fire separations with a fire-resistance rating..."

1. (F02,F04-OS1.2,OS1.3) Applies to portion of By-law text: "... a) ... the building is sprinklered throughout ..."
2. (F02,F04-OP1.2,OP1.3) Applies to portion of By-law text: "... a) ... the building referred to in Sentence (1) shall be of noncombustible construction ..."
### 3.2.2.83. Group F, Division 3, up to 4 Storeys

(2) [F04-OS1.3] Applies to portion of By-law text: "... c) roof assemblies shall have, if of combustible construction, a fire-resistance rating not less than 45 min..." and to Clause (d).

[F04-OP1.3] Applies to portion of By-law text: "... c) roof assemblies shall have, if of combustible construction, a fire-resistance rating not less than 45 min, ..." and to Clause (d).

(a) [F03-OS1.2] Applies to the requirement that noncombustible floor assemblies be fire separations.

(a) [F03-OP1.2] Applies to the requirement that noncombustible floor assemblies be fire separations.

(a),(c) [F03-OS1.2] [F04-OS1.2,OS1.3]

(a),(c) [F03-OP1.2] [F04-OP1.2,OP1.3]

(b),(c) [F04-OS1.3]

(b),(c) [F04-OP1.3]

### 3.2.2.84. Group F, Division 3, up to 4 Storeys, Sprinklered

(1) [F02,F04-OS1.2,OS1.3] Applies to portion of By-law text: "... a) ... the building is sprinklered throughout ..."

[F02,F04-OP1.2,OP1.3] Applies to portion of By-law text: "... a) ... the building is sprinklered throughout ..."

(2) (a) [F03-OS1.2] Applies to the requirement that noncombustible floor assemblies be fire separations.

(a) [F03-OP1.2] Applies to the requirement that noncombustible floor assemblies be fire separations.

(a),(c) [F03-OS1.2] [F04-OS1.2,OS1.3]

(a),(c) [F03-OP1.2] [F04-OP1.2,OP1.3]

(b),(c) [F04-OS1.3]

(b),(c) [F04-OP1.3]

### 3.2.2.85. Group F, Division 3, up to 2 Storeys

(2) (a) [F03-OS1.2] Applies to the requirement that noncombustible floor assemblies be fire separations.

(a) [F03-OP1.2] Applies to the requirement that noncombustible floor assemblies be fire separations.

[F03-OS1.2] [F04-OS1.2,OS1.3]

[F03-OP1.2] [F04-OP1.2,OP1.3]

### 3.2.2.86. Group F, Division 3, up to 2 Storeys, Sprinklered

(1) [F02,F04-OS1.2,OS1.3] Applies to portion of By-law text: "... a) ... the building is sprinklered throughout ..."

[F02,F04-OP1.2,OP1.3] Applies to portion of By-law text: "... a) ... the building is sprinklered throughout ..."

(2) (a) [F03-OS1.2] Applies to the requirement that noncombustible floor assemblies be fire separations.

(a) [F03-OP1.2] Applies to the requirement that noncombustible floor assemblies be fire separations.
3.2.2.87. Group F, Division 3, One Storey

(1) [F02-OS1.2] Applies to portion of By-law text: “A building classified as Group F, Division 3 is permitted to be of heavy timber construction or noncombustible construction used singly or in combination …”

3.2.2.88. Group F, Division 3, One Storey, Sprinklered

(1) [F02-OS1.2] Applies to portion of By-law text: “A building classified as Group F, Division 3 is permitted to be of heavy timber construction or noncombustible construction used singly or in combination …”

3.2.2.89. Group F, Division 3, One Storey, Any Area, Low Fire Load Occupancy

(2) [F02-OS1.2]

3.2.2.90. Group F, Division 3, Storage Garages up to 22 m High

(1) [F02-OS1.2] Applies to portion of By-law text: “A building used as a storage garage with all storeys constructed as open-air storeys and having no other occupancy above it is permitted to have its floor, wall, ceiling and roof assemblies constructed without a fire-resistance rating provided it is:
a) of noncombustible construction…”

3.2.3.1. Limiting Distance and Area of Unprotected Openings

(1) [F03-OP3.1]

3.2.3.2. Area of Exposing Building Face

(2) [F03-OP3.1]

3.2.3.4. Party Wall

(1) [F03-OP3.1]
### Division B: Acceptable Solutions

#### Part 3 – Fire Protection, Occupant Safety and Accessibility

#### 3.2.3.5. Wall with Limiting Distance Less Than 1.2 m

| (1) | [F03-OP3.1] |

#### 3.3.4.4. Egress from Dwelling Units

---

*Vancouver Building Bylaw 2019* Division B 3-243
### Division B: Acceptable Solutions

#### Part 3 – Fire Protection, Occupant Safety and Accessibility

| 2 | [F10,F05-OS3.7] |
| 3 | [F10-OS3.7] |
| 4 | [F05-OS1.2,OS1.5] |
| 5 | [F10,F05-OS3.7] |
| 6 | [F10,F05-OS3.7] |
| 7 | [F10-OS3.7] |

#### 3.3.4.5. Automatic Locking Prohibition

| 1 | [F10-OS3.7] |

#### 3.3.4.8. Protection of Openable Windows

| 1 | [F30-OS3.1] |

#### 3.3.5.2. Fire Extinguishing Systems

| 1 | [F03-OS1.2] |

|  | [F03-OP1.2] |

#### 3.3.5.3. Basements

| 1 | [F12-OS1.2,OS1.5] [F01-OS1.1] |

|  | [F12-OP1.2] |

| 2 | [F06-OS1.5,OS1.2] Applies to the separation of entrances to basements and to rooms containing building services from the remainder of the building. |

|  | [F06-OP1.2] Applies to the separation of entrances from the remainder of the building. |

|  | [F05-OS1.5] [F06-OS1.2,OS1.5] Applies to the separation of exits from the remainder of the building. |

|  | [F06-OP1.2] Applies to the separation of exits from the remainder of the building. |

| 3 | [F44-OS1.1] |

#### 3.3.5.4. Repair and Storage Garages

| 2 | [F30-OS3.1] [F10,F12-OS3.7] |

| 5 | [F30-OS3.1] |

| 6 | [F30-OS3.1] |

#### 3.3.5.5. Repair Garage Separation

| 1 | [F03-OS1.2] |

|  | [F03-OP1.2] |

#### 3.3.5.6. Storage Garage Separation

| 1 | [F03-OS1.2] |

|  | [F03-OP1.2] |

#### 3.3.5.7. Vestibules
3.3.5.8. Dispensing of Fuel

(1) [F01-OS1.1]
(2) [F01-OS1.1]

3.3.5.9. Multiple-Tenant Self-Storage Warehouses

(1) [F03-OS1.2]

3.3.6.2. Storage of Dangerous Goods

(1) [F03-OP1.2]

(2) [F03-OS1.2]

(3) [F01,F02,F03,F81-OS1.1,OS1.2]

(4) [F01-OS1.1]

3.3.6.3. Indoor Storage of Anhydrous Ammonia and Flammable, Toxic and Oxidizing Gases

(1) (a) [F03-OS1.2] [F44-OS1.1]

(a) [F03-OP1.2]

(a) [F44-OS1.2,OS1.5,OS1.1] Applies to gas-tight fire separations.

(b) [F12-OS1.2] [F01-OS1.1] [F02-OS1.3]

(b) [F02-OP1.3]

(c) [F12-OS1.1]

(d) [F44-OS1.1]

(2) (a) [F03-OP1.2]

(a) [F03-OS1.2] [F44-OS1.1]

(a) [F44-OS1.2,OS1.5,OS1.1] Applies to gas-tight fire separations.

(b) [F12-OS1.2] [F01-OS1.1]

(c) [F12-OS1.1]

(d) [F44-OS1.1]

3.3.6.4. Storage and Dispensing Rooms for Flammable Liquids and Combustible Liquids

(1) [F03-OS1.2] [F03-OP1.2]
### 3.3.6.5. Tire Storage

1. [F03-OS1.2]  
   [F03-OP1.2]

### 3.3.6.6. Ammonium Nitrate Storage

1. [F03-OS1.2] [F01-OS1.1] [F02,F12-OS1.2]  
   [F02,F12-OP1.2]

2. [F03-OP1.2] [F01-OP1.1]

3. [F03-OP1.2] [F01-OP1.1]

4. [F12,F02-OS1.1]  
   [F12,F02-OP1.2]

5. [F44-OH5]  
   [F01-OS1.1] [F02-OS1.2]  
   [F43-OS3.4]

6. [F01,F81-OS1.1]

### 3.3.6.7. Flooring Materials

1. [F43-OS3.4]  
   [F44-OH5]  
   [F01-OS1.1]

### 3.3.6.8. Fire Separations in Process Plants

1. [F03-OP1.2]  
   [F03-OS1.2]

### 3.3.6.9. Basements and Pits

1. [F01-OS1.1]  
   [F01-OP1.1]

### 3.3.7.2. Skylights

1. [F34-OS4.1]

2. [F34-OS4.1]

### 3.3.7.5. Exterior Sliding Windows

1. [F34-OS4.1]

### 3.3.7.6. Security Gates for Storage Garages

1. [F36-OS3.6]
### 3.3.7.7. Security for Storage Garages

   - [F12-OP1.2]
   - [F12-OS1.2, OS1.5]
5. [F10-OS3.7]

### 3.4.6.19. Floor Numbering

1. [F10, F12, F73-OS3.7]
2. [F73-OA1]
3. [F12-OP1.2]
4. [F12-OS1.2]

### 3.4.7.1. Scope

1. [F10, F12-OS3.7]
2. [F10-OS3.7] [F30-OS3.1]
3. [F10-OS1.5] [F12-OS1.2]

### 3.4.7.2. Fire Escape Construction

1. [F05-OS1.5] [F06-OS1.2] Applies to the combustibility of materials used in the construction of fire escapes.
   - [F10, F12-OS3.7] [F20-OS3.1] Applies to the type and construction of fire escapes.
   - [F20-OS2.1] Applies to the type and construction of fire escapes.

### 3.4.7.3. Access to Fire Escapes

1. [F10-OS3.7] Applies to portion of By-law text: “Access to fire escapes shall be from corridors through doors at floor level …”
2. [F30-OS3.1] [F10-OS3.7]

### 3.4.7.4. Protection of Fire Escapes

1. [F05, F06-OS1.5]

### 3.4.7.5. Stairs

1. [F10-OS3.7]
2. [F10-OS3.7]
3. [F10-OS3.7] Applies to the reduction in width permitted under certain conditions.
Division B: Acceptable Solutions

(5) [F30-OS3.1]

3.5.2.1. Elevators, Escalators and Dumbwaiters

(1) [F30,F81-OS3.1] [F32,F81-OS3.3] [F36,F81-OS3.6]

(2) [F82-OS3.1,OS3.3,OS3.6]

(3) [F73-OA1]

3.5.3.1. Fire Separations for Elevator Hoistways

(1) [F03-OS1.2]

3.5.3.2. Vertical Service Spaces for Dumbwaiters

(1) [F03-OS1.2]

3.5.3.3. Fire Separations for Elevator Machine Rooms

(1) [F03-OS1.2]

3.5.4.1. Elevator Car Dimensions

(1) [F12-OS3.7]

(2) [F12-OS3.7]

3.5.4.2. Floor Numbering

(1) [F73-OA1]

3.6.1.2. Electrical Wiring and Equipment

(1) [F01-OS1.1] [F02,F03-OS1.2] [F81-OS1.4]

[F01-OP1.1] [F02,F03-OP1.2] [F81-OP1.4]

[F32-OS3.3]

3.6.1.3. Lightning Protection Systems

(1) [F01,F81-OS1.1]
3.6.1.4. Storage Use Prohibition

(1) [F01-OS1.1] [F02-OS1.2]

3.6.1.5. Appliances Installed outside a Building

(1) [F03-OS1.2]
   (b) [F03-OP1.2]
   (a) [F03-OP3.1]

3.6.2.1. Fire Separations around Service Rooms

(1) [F03-OS1.2,OS1.4]
   [F03-OP1.2,OP1.4]

(3) [F01-OS1.1] [F03-OS1.2]
   [F01-OP1.1] [F03-OP1.2]

(4) [F03-OS1.2,OS1.4]
   [F03-OP1.2,OP1.4]

(5) [F03-OS1.2,OS1.4]
   [F03-OP1.2,OP1.4]

(6) [F03-OS1.2,OS1.4]
   [F03-OP1.2,OP1.4]

(7) [F03-OS1.2,OS1.4]
   [F03-OP1.2,OP1.4]

3.6.2.2. Service Rooms under Exits

(1) [F06,F05-OS3.7]
   [F02-OS1.2]

3.6.2.4. Incinerator Rooms

(1) [F02-OS1.2]

3.6.2.5. Combustible Refuse Storage

(1) [F03-OS1.2]
   [F03-OP1.2]

3.6.2.6. Door Swing for Service Rooms

(1) [F10-OS1.5] Applies to portion of By-law text: “A swing-type door from a service room containing a boiler or incinerator shall swing outward from the room ...”

[F30-OS3.1] Applies to portion of By-law text: “A swing-type door from a service room containing a boiler or incinerator shall swing ... inward if the door opens onto a corridor or any room used for an assembly occupancy.”

3.6.2.7. Electrical Equipment Vaults
3.6.2.8. Emergency Power Installations

(1) [F03-OS1.2,OS1.4] [F06-OS1.2,OS1.5] [F03-OP1.2,OP1.4] [F06-OP1.2]

3.6.3.1. Fire Separations for Vertical Service Spaces

(1) [F03-OS1.2] [F03-OP1.2]

(2) [F03-OS1.2] [F03-OP1.2]

(3) [F03-OS1.2] [F03-OP1.2]

(1) See Parts 2 and 3 of Division A.
Notes to Part 3

Fire Protection, Occupant Safety and Accessibility

A-3 Application of Part 3. In applying the requirements of this Part, it is intended that they be applied with discretion to buildings of unusual configuration that do not clearly conform to the specific requirements, or to buildings in which processes are carried out which make compliance with particular requirements in this Part impracticable. The definition of “building” as it applies to this By-law is general and encompasses most structures, including those which would not normally be considered as buildings in the layman’s sense. This occurs more often in industrial uses, particularly those involving manufacturing facilities and equipment that require specialized design that may make it impracticable to follow the specific requirements of this Part. Steel mills, aluminum plants, refining, power generation and liquid storage facilities are examples. A water tank or an oil refinery, for example, has no floor area, so it is obvious that requirements for exits from floor areas would not apply. Requirements for structural fire protection in large steel mills and pulp and paper mills, particularly in certain portions, may not be practicable to achieve in terms of the construction normally used and the operations for which the space is to be used. In other portions of the same building, however, it may be quite reasonable to require that the provisions of this Part be applied (e.g., the office portions). Similarly, areas of industrial occupancy which may be occupied only periodically by service staff, such as equipment penthouses, normally would not need to have the same type of exit facility as floor areas occupied on a continuing basis. It is expected that judgment will be exercised in evaluating the application of a requirement in those cases when extenuating circumstances require special consideration, provided the occupants’ safety is not endangered.

The provisions in this Part for fire protection features installed in buildings are intended to provide a minimum acceptable level of public safety. It is intended that all fire protection features of a building, whether required or not, will be designed in conformance with good fire protection engineering practice and will meet the appropriate installation requirements in relevant standards. Good design is necessary to ensure that the level of public safety established by the By-law requirements will not be reduced by a voluntary installation.

Firefighting Assumptions

The requirements of this Part are based on the assumption that firefighting capabilities are available in the event of a fire emergency. These firefighting capabilities may take the form of a paid or volunteer public fire department or in some cases a private fire brigade. If these firefighting capabilities are not available, additional fire safety measures may be required.

Firefighting capability can vary from municipality to municipality. Generally, larger municipalities have greater firefighting capability than smaller ones. Similarly, older, well established municipalities may have better firefighting facilities than newly formed or rapidly growing ones. The level of municipal fire protection considered to be adequate will normally depend on both the size of the municipality (i.e., the number of buildings to be protected) and the size of buildings within that municipality. Since larger buildings tend to be located in larger municipalities, they are generally, but not always, favoured with a higher level of municipal protection.

Although it is reasonable to consider that some level of municipal firefighting capability was assumed in developing the fire safety provisions in Part 3, this was not done on a consistent or defined basis. The requirements in the By-law, while developed in the light of commonly prevailing municipal fire protection levels, do not attempt to relate the size of building to the level of municipal protection. The responsibility for controlling the maximum size of building to be permitted in a municipality in relation to local firefighting capability rests with the municipality. If a proposed building is too large, either in terms of floor area or building height, to receive reasonable protection from the municipal fire department, fire protection...
requirements in addition to those prescribed in this By-law, may be necessary to compensate for this deficiency. Automatic sprinkler protection may be one option to be considered.

Alternatively, the municipality may, in light of its firefighting capability, elect to introduce zoning restrictions to ensure that the maximum building size is related to available municipal fire protection facilities. This is, by necessity, a somewhat arbitrary decision and should be made in consultation with Vancouver Fire and Rescue Services, who should have an appreciation of their capability to fight fires.

The requirements of Subsection 3.2.3. are intended to prevent fire spread from thermal radiation assuming there is adequate firefighting available. It has been found that periods of from 10 to 30 minutes usually elapse between the outbreak of fire in a building that is not protected with an automatic sprinkler system and the attainment of high radiation levels. During this period, the specified spatial separations should prove adequate to inhibit ignition of an exposed building face or the interior of an adjacent building by radiation. Subsequently, however, reduction of the fire intensity by firefighting and the protective wetting of the exposed building face will often be necessary as supplementary measures to inhibit fire spread.

In the case of a building that is sprinklered throughout, the automatic sprinkler system should control the fire to an extent that radiation to neighbouring buildings should be minimal. Although there will be some radiation effect on a sprinklered building from a fire in a neighbouring building, the internal sprinkler system should control any fires that might be ignited in the building and thereby minimize the possibility of the fire spreading into the exposed building. NFPA 80A, “Protection of Buildings from Exterior Fire Exposures,” provides additional information on the possibility of fire spread at building exteriors.

The water supply requirements for fire protection installations depend on the requirements of any automatic sprinkler installations and also on the number of fire streams that may be needed at any fire, having regard to the length of time the streams will have to be used. Both these factors are largely influenced by the conditions at the building to be equipped, and the quantity and pressure of water needed for the protection of both the interior and exterior of the building must be ascertained before the water supply is decided upon. Acceptable water supplies may be a public waterworks system that has adequate pressure and discharge capacity, automatic fire pumps, pressure tanks, manually controlled fire pumps in combination with pressure tanks, gravity tanks, and manually controlled fire pumps operated by remote control devices at each hose station.

A-3.1.2. Use Classification. The purpose of classification is to determine which requirements apply. This By-law requires classification in accordance with every major occupancy for which the building is used or intended to be used. Where necessary, an application clause has been inserted in this Part to explain how to choose between the alternative requirements which multiple occupancy classification may present.

A-3.1.2.1.(1) Major Occupancy Classification. The following are examples of the major occupancy classifications described in Table 3.1.2.1.:

Group A, Division 1
- Motion picture theatres
- Opera houses
- Television studios admitting a viewing audience
- Theatres, including experimental theatres

Group A, Division 2
- Art galleries
- Auditoria
- Bowling alleys
- Churches and similar places of worship
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

Clubs, nonresidential
Community halls
Courtrooms
Dance halls
Daycare Facilities for Children
Exhibition halls (other than classified in Group E)
Gymnasia
Lecture halls
Libraries
Licensed beverage establishments
Museums
Passenger stations and depots
Recreational piers
Restaurants
Schools and colleges, nonresidential
Undertaking premises

Group A, Division 3
Arenas
Indoor swimming pools, with or without spectator seating
Rinks

Group A, Division 4
Amusement park structures (not elsewhere classified)
Bleachers
Grandstands
Reviewing stands
Stadia

Group B, Division 1
Jails
Penitentiaries
Police stations with detention quarters
Prisons
Psychiatric hospitals with detention quarters
Reformatories with detention quarters

Group B, Division 2
Care facilities with treatment
Convalescent/recovery/rehabilitation centres with treatment
Hospices with treatment
Hospitals
Infirmaries
Nursing homes with treatment
Psychiatric hospitals without detention quarters
Respite centres with treatment

Group B, Division 3
Assisted/supportive living facilities
Care facilities without treatment
Children’s custodial homes
Convalescent/recovery/rehabilitation centres without treatment
Group homes
Hospices without treatment
Nursing homes without treatment
Division B:  Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

Reformatories without detention quarters
Respite centres without treatment

Group C
- Apartments
- Boarding houses
- Clubs, residential
- Colleges, residential
- Convents
- Dormitories
- Hotels
- Houses
- Lodging houses
- Monasteries
- Motels
- Schools, residential

Group D
- Banks
- Barber and hairdressing shops
- Beauty parlours
- Dental offices
- Dry cleaning establishments, self-service, not using flammable or explosive solvents or cleaners
- Laundries, self-service
- Medical offices
- Offices
- Police stations without detention quarters
- Radio stations
- Small tool and appliance rental and service establishments

Group E
- Department stores
- Exhibition halls
- Markets
- Shops
- Stores
- Supermarkets

Group F, Division 1
- Bulk plants for flammable liquids
- Bulk storage warehouses for hazardous substances
- Cereal mills
- Chemical manufacturing or processing plants
- Distilleries
- Dry cleaning plants
- Feed mills
- Flour mills
- Grain elevators
- Lacquer factories
- Mattress factories
- Paint, varnish and pyroxylin product factories
- Rubber processing plants
- Spray painting operations
- Waste paper processing plants

Group F, Division 2
Aircraft hangars
Box factories
Candy plants
Cold storage plants
Dry cleaning establishments not using flammable or explosive solvents or cleaners
Electrical substations
Factories
Freight depots
Helicopter landing areas on roofs
Laboratories
Laundries, except self-service
Mattress factories
Planing mills
Printing plants
Repair garages
Salesrooms
Service stations
Storage rooms
Television studios not admitting a viewing audience
Warehouses
Wholesale rooms
Woodworking factories
Workshops

Group F, Division 3
Creameries
Factories
Laboratories
Light-aircraft hangars (storage only)
Power plants
Salesrooms
Sample display rooms
Storage garages, including open air parking garages
Storage rooms
Warehouses
Workshops

A-3.1.2.3.(1) Arena Regulation. The use of an arena is regulated in the Fire By-law.

A-3.1.2.6. Group A, Division 2, Low Occupant Load. A suite of Group A, Division 2 assembly is permitted to be classified as a Group D business and personal services occupancy provided the requirements of Article 3.1.2.6. are complied with. This re-classification permits the suite to be located in a building to which Part 9 of the By-law is applicable.

A-3.1.2.8. Child Care Facilities. A child care facility is regulated under the provincial enactments, and includes facilities more simply identified as “daycare” facilities which are typically occupied for a period of less than 24 hours each day (i.e., is not a residential facility). The term “daycare” is not meant to exclude facilities that provide short term care during the night for a period of less than 24 hours each day.

A-3.1.4.1.(1) Combustible Construction and Materials Permitted. The permission to use combustible construction or combustible materials stated in Articles 3.1.4.1., 3.1.5.5., 3.1.5.14. and 3.1.5.15. does not waive the requirements regarding construction type and cladding stated in Article 3.2.3.7.
A-3.1.4.2. **Protection of Penetrations.** Where foamed plastics are required to be protected from adjacent spaces within a building, the protection should be continuous so as to cover the foamed plastics so they are not exposed to the interior of the building. However, minor penetrations of the protective covering by small electrical and mechanical components, such as electrical outlets and fixtures, sprinkler piping, and mechanical vents, are acceptable because the penetrant and associated fittings and seals will prevent the small amount of foamed plastic surrounding the penetration from being exposed to the interior of the building.

Foamed plastics that are penetrated by larger components or assemblies, such as windows, are unlikely to be exposed to the interior of the building as they are protected by associated framing and finishes and/or the installation of a closure.

Small amounts of foamed plastics, such as air sealants used between major components of exterior wall construction, are not required to be protected. (See Sentence 3.1.5.2.(1).)

Penetrations of a fire separation or of a membrane forming part of an assembly required to have a fire-resistance rating are nevertheless required to be provided with a fire stop in accordance with Subsection 3.1.9.

A-3.1.4.2.(1) **Concealed Space.** The term “concealed space” includes any space that is not visibly apparent and that is provided with an opening to allow access for repair and periodic inspections.

A-3.1.4.2.(1)(c) **Thermal Barrier in Combustible Construction.** Any thermal barrier that is accepted under the requirements of Sentence 3.1.5.15.(2) for noncombustible construction is also acceptable for combustible construction.

A-3.1.4.2.(2) and 3.1.5.7.(3) **Walk-in Coolers and Freezers.** Sentences 3.1.4.2.(2) and 3.1.5.7.(3) are intended to apply to walk-in coolers and freezers that are constructed as stand-alone structures within a building.

A-3.1.4.3.(1)(b)(i) **Raceway Definition.** The term raceway is defined in CSA C22.1, “Canadian Electrical Code, Part I,” and includes both rigid and flexible conduit.

A-3.1.4.3.(1) **Wire and Cable Equivalence.** Electrical wires and cables that conform to the requirements of Sentence 3.1.5.21.(1) are deemed to satisfy the requirements of Sentence 3.1.4.3.(1).

3.1.4.3.(2) **FT6 Rating.** Wires and cables are required by Sentences 3.1.4.3.(2) and 3.1.5.23.(2), and Article 3.6.4.3. to be FT6 rated are required to not only meet the requirements of the By-law, but are also required to be tested and listed to meet the appropriate requirements of the Canadian Electrical Code as referenced by the Electrical By-law.

A-3.1.4.8.(1) **Exterior Cladding.** The requirements in Sentence 3.1.4.8.(1) are intended to limit the potential for fire spread on the exterior cladding of buildings of combustible construction through the use of noncombustible finishes on the exterior of the wall assembly or the use of a cladding/wall assembly that has been assessed with regard to its ability to resist flame propagation up the outside of a building. These cladding and wall assembly combinations can be used as infill or panel-type walls between structural elements, or attached directly to a loadbearing structural system. Note that these requirements apply independently of the provisions contained in Subsection 3.2.3. regarding spatial separation and exposure protection.

A-3.1.5.4.(1) **Skylight Spacing.** The minimum spacing dimensions for skylight assemblies are based on the distance that flame must travel along a flat ceiling surface. If ceilings have projecting beams or other features that would increase the distance the flame would have to travel along the surface, the distances specified may be measured accordingly.
A-3.1.5.5. Combustible Cladding on Exterior Walls. The requirements of Article 3.1.5.5. are not intended to limit the permissions for minor combustible components permitted by Article 3.1.5.2. For the purposes of this Article, a cladding system is considered as those materials outboard of the sheathing membrane.

A-3.1.5.5.(1)(b) Combustible Cladding on Exterior Walls. The performance of the wall assembly is assessed with regard to its ability to resist flame propagation up the outside of a building.

A-3.1.5.5.(1)(b)(i) Flame-Spread Distance. The maximum flame-spread distance referred to in Subclause 3.1.5.5.(1)(b)(i) means the distance between the top of the opening and the highest observable instance of flaming along the wall assembly; thus, intermittent flaming to a height of 5 m above the opening is acceptable.

A-3.1.5.5.(1)(b)(ii) Heat Flux Measurement. The heat flux to the assembly referred to in Subclause 3.1.5.5.(1)(b)(ii) is the maximum one-minute averaged heat flux measured by transducers located 3.5 m above the top of the opening. The intent of this criterion is to limit the spread of fire on the wall assembly to a height of 3.5 m above the opening.

Fire tests have shown that flame does not spread on the exterior surface of a wall assembly where the heat flux is less than 35 kW/m² above the opening.

A-3.1.5.6. Combustible Components in Exterior Walls. The requirements of Article 3.1.5.6. are not intended to limit the permissions for minor combustible components permitted by Article 3.1.5.2. The requirements of this article do not waive others specifically intended for the protection of combustible insulation in buildings of noncombustible construction.

A-3.1.5.21.(1) Wire and Cable Flammability. In regulating the flammability characteristics of electrical wires and cables installed in a building, it is intended that the requirements of this Sentence and of other similar Sentences in the Code apply to wires and cables that are essentially a part of the distribution systems for power or communications. These distribution systems will normally include branch circuits that terminate at an outlet box in the space to be served and at that location cable terminators or plugs for individual items of equipment will be plugged in.

A-3.1.6. Tents and Air-Supported Structures. The requirements in this Subsection are intended to be limited to certain types of structure. For instance, the word “tent” as used in the By-law is intended to refer to a temporary shelter which is used at an open air event such as a fair or an exhibition. A tent will normally be constructed of a fabric held up by poles and attached to the ground by ties. The requirements for tents, however, are not intended to be applied to fabric structures located on buildings.

The term “air-supported structure,” as used in the By-law, refers to an envelope which is held up by air pressure alone and which is erected on the ground or above a basement. The structure will usually require ballast or a positive ground anchorage system around the entire perimeter to secure it to the ground or basement. To reinforce this intent, the By-law prohibits the location of an air-supported structure above the first storey of any building.

The requirements of Subsection 3.1.6. are not intended to apply to air-supported roof assemblies on buildings, such as domed stadia, or to other types of air-supported structures, such as those over swimming pools situated on the roofs of buildings, which would not be anchored at or near ground level. These assemblies or structures are normally designed and evaluated on the basis of alternative solutions as permitted by Article 1.2.1.1. of Division A.
A-3.1.8.1.(1)(b) Barrier to Control Smoke Spread. Although a fire separation is not always required to have a fire-resistance rating, the fire separation should act as a barrier to the spread of smoke and fire until some response is initiated. When choosing products for fire stopping, the physical characteristics of the material used at the joints as well as the nature of the assembly and its potential movement should be taken into consideration. If the fire-resistance rating of a fire separation is waived on the basis of the presence of an automatic sprinkler system, it is intended that the fire separation will be constructed so that it will remain in place and act as a barrier against the spread of smoke for a period of time until the sprinklers have actuated and controlled the fire.

A-3.1.8.1.(2) Installation of Closures. Although there is no explicit performance statement in the Building By-law that means of egress should be free of smoke, it is the intent that during the period when occupants are using a means of egress to evacuate from a floor area, the smoke contamination should not reach levels that would inhibit movement to the exit. This is particularly critical for persons with disabilities, who may not move at the same rate as other persons and who could be more susceptible to the effects of smoke contamination. NFPA 80, "Fire Doors and Other Opening Protectives," requires that a fire door protecting a means of egress be designed to minimize the possibility of smoke passing through the opening.

Although self-closing devices are not required for all doors in a fire separation (See Article 3.1.8.13.), it is assumed that in a fire situation every door in a fire separation is closed. Article 3.3.3.5. prohibits grilles and similar openings for certain doors in hospitals and nursing homes with treatment.

Although fire dampers that release on the fusion of a fusible link will help to control the spread of fire, a substantial quantity of smoke could have passed through the opening before that event. They are frequently located below the upper levels of a room and so the release of the fusible link of the fire damper that protects an opening will be delayed until the temperature at the level of the opening becomes high enough to fuse the link. Similar concern has to be considered for other closure devices that are permitted to remain open on fusible links, and their location should be restricted in accordance with NFPA 80 and the Building By-law, except where their installation in another location will not allow the products of combustion to spread into means of egress.

A-3.1.8.3.(4) Fire Separation Continuity. The continuity of a fire separation where it abuts against another fire separation, a floor, a ceiling or an exterior wall assembly is maintained by filling all openings at the juncture of the assemblies with a material that will ensure the integrity of the fire separation at that location.

A-3.1.8.10.(1) Combination Smoke/Fire Dampers. A combination smoke/fire damper may be used in lieu of a fire damper to meet the requirement of Sentence 3.1.8.10.(3).

A-3.1.8.10.(5) Damper Access. It is intended that an access door be provided in the duct and, if the duct is enclosed with an architectural finish, that a second access door be provided through that finish.

A-3.1.8.18.(1) Wired Glass and Glass Block. The permission to include wired glass and glass block in doors and fire separations between an exit and the adjacent floor area does not permit the inclusion of those items in fire separations between exits and other parts of the building that are not included in the floor area. Examples include other exit facilities and vertical service spaces, including those used for building services and elevator hoistways.

A-3.1.8.19.(1) Fire-Protection Rating for Doors. The provisions in Articles 3.1.8.17., 3.1.8.18. and 3.1.8.19. do not waive a requirement for a door to have a fire-protection rating. To achieve this rating in a door test, it may be necessary to limit the area of glass in the door. If this area is less than the area limits of Article 3.1.8.18., it is the governing criterion. Conversely, if the area limits of Article 3.1.8.18. are less than the area required to achieve a fire-protection rating, then the area limits of this Article govern.

A-3.1.9. Penetrations. In the application of Subsection 3.1.9., a building service is considered to penetrate an assembly if it passes into or through the assembly. In some situations a service item enters an assembly through a
membrane at one location, runs within the assembly, and then leaves the assembly through a membrane at another location.

The term “membrane penetration” usually designates an opening made through one side (wall, floor or ceiling membrane) of an assembly, whereas the term “through-penetration” designates an opening that passes through an entire assembly. Fire stopping of membrane penetrations involves installing a material, device or construction to resist for a prescribed time period the passage of flame and heat through openings in a protective membrane caused by cables, cable trays, conduit, tubing, pipes or similar items.

Fire stopping of a through-penetration involves installing an assemblage of specific materials or products that are designed, tested and fire-resistance rated to resist for a prescribed period of time the spread of fire through penetrations.

Products for fire stopping within a barrier are required to address movement of the assembly and to control smoke spread; as such, the flexibility of the material used at the flexible joints as well as the nature of the assembly and its potential movement must be taken into consideration.

A-3.1.9.1.(1)(b) Cast in Place Penetrations. The intention behind the use of the term “cast in place” is to reinforce that there are to be no gaps between the building service or penetrating item and the membrane or assembly it penetrates. The term "cast in place" describes a typical means of fire stopping for a service penetration through a concrete slab or wall.

A-3.1.9.1.(1)(c) Tightly Fitted Penetrations. The intention behind the term “tightly fitted” is to reinforce that there are to be no substantial gaps between the building service or penetrating item and the membrane or assembly it penetrates.

A-3.1.9.2.(1) Penetration of Fire Separations by Electrical Boxes. The provisions dealing with outlet boxes assume size, quantities and concentrations of partial depth penetrations that would not significantly affect the fire resistance of the assembly, including the temperature rise on the unexposed side of a wall. Sentence 3.1.9.2.(1) is not intended to allow large electrical distribution and control boxes to be recessed into an assembly required to have a fire-resistance rating unless they were incorporated in the assembly at the time of testing.

A-3.1.9.4. Outlet Boxes. For the purposes of Article 3.1.9.4., outlet boxes include, but are not limited to, electrical boxes, junction boxes, high and low voltage outlets, switches, enclosures for electrical equipment, laundry boxes, and shower diverters.

A-3.1.10.2.(4) Firewall Construction. Inherent in the use of a firewall is the intent that this specialized wall construction provide the required fire-resistance rating while also being designed to resist physical damage – arising out of normal use – that would compromise the rating of the assembly. Traditionally, this has been accomplished by prescribing the use of noncombustible materials, which was in fact restricted to concrete or masonry. Sentences 3.1.10.2.(3) and (4) are intended to retain both of the characteristics of firewalls, while permitting greater flexibility in the use of materials and designs. The fire-resistance rating and damage protection attributes of a firewall may be provided by a single fire- and damage-resistant material such as concrete or masonry, by a fire- and damage-resistant membrane on a structural frame, or by separate components – one that provides the fire-resistance rating and another one that protects the firewall against damage.

If the firewall is composed of separate components, the fire-resistance rating of the fire-resistive component needs to be determined for this assembly on its own. In addition, if the damage protection component is physically attached to the fire-resistive component (for example, as a sacrificial layer), then for the purposes of determining the overall performance of the assembly, it is also necessary to determine through testing whether failure of the damage protection component during a fire affects the performance of the fire-resistive component.
A-3.1.11.5.(1) Fire Blocks in Combustible Construction. Combustible construction referred to in Sentence 3.1.11.5.(1) includes all types of construction that do not comply with the requirements for noncombustible construction. All the elements within the concealed space can be combustible, unless required to be of noncombustible materials (e.g., certain categories of pipework and ducts), but the value of the flame-spread rating of the combustible materials determines the permitted extent of the concealed space between fire blocks. The materials to be considered include all construction materials regulated by this By-law, including the framing and building services that are located in the concealed space. When designing fire blocking, consideration should be given to avoid restricting venting capabilities within concealed spaces. (See also Note A-5.6.2.1.)

A-3.1.11.5.(3) Fire Blocks in Concealed Spaces. To reduce the risk of fire spread in combustible concealed spaces within the types of buildings referred to in Sentence 3.1.11.5.(3), fire blocking is required regardless of whether the horizontal concealed space is protected by sprinklers or not, unless the space is filled with noncombustible insulation so that any air gap at the top of the insulation is very small. See also Note A-3.1.11.5.(1) for roof venting. A 5- or 6-storey building constructed in accordance with Article 3.2.2.50. and buildings constructed in accordance with Article 3.2.2.58. are required to be sprinklered in accordance with NFPA 13, “Installation of Sprinkler Systems” (See Article 3.2.5.12.).

NFPA 13 generally requires sprinklering of any concealed spaces of combustible construction or where large amounts of combustibles are present. However, NFPA 13 allows combustible concealed spaces to be unsprinklered in certain cases, including where concealed spaces are filled almost entirely with noncombustible insulation, where spaces contain only materials with a low flame-spread rating, and where limited access or the size of the space makes it impractical to install sprinklers. For certain types of construction in unsprinklered combustible concealed spaces, NFPA 13 mandates fire blocking beyond the minimum specified in Sentence 3.1.11.5.(3).

A-3.1.11.7.(6) Integrity of Fire Blocks. Sentence 3.1.11.7.(6) together with Article 3.1.9.1., is intended to ensure that the integrity of fire blocks is maintained at areas where they are penetrated. This requirement is satisfied by the use of generic fire stops such as mineral wool, gypsum plaster or Portland cement morter, as well as rated fire stops.

A-3.1.11.7.(7) Fire Blocks. Figure A-3.1.11.7.(7) shows the location of the semi-rigid fibre insulation board at the intersection between walls and floors in wood-frame construction. The figure is intended to illustrate the fire block detail and not a design of a fire separation.
A-3.1.13.2.(2) Folding Partition. Folding partitions used to divide a space into separate rooms are not considered as doors for the purposes of this Sentence.

A-3.1.14.3. Skylight Glazing. This sentence requires glazing to remain in place when fractured and when subject to impact by flying objects for conditions not regulated elsewhere in this By-law. Other types of glazing such as tempered, annealed or heat strengthened glass have long been recognized as a potential hazard when located overhead and normally requires protective screens to protect occupants below from injury caused by falling glass.

A-3.1.17.1. Exercise Rooms. Fitness centres, yoga studios, tai-chi studios, martial arts training centres and other similar uses are considered exercise rooms. Where an exercise room, without equipment, is exclusively used as a yoga studio, a tai-chi studio or a martial arts training centre an occupant load factor of 4.6m² per person is permitted.

A-3.2.1.1.(1) Roof-top Enclosures for Private Residential Decks. Roof-top enclosures containing stairs for the exclusive purpose of providing access to private residential decks may be considered as part of the storey below. Such enclosures may not include spaces that could be otherwise used or occupied. Likewise, the roof deck associated with a private residential suite may not include any enclosed occupiable floor area or the requirements applicable to a storey would apply.

Regardless of whether an enclosure is considered a storey or not, designers must remain aware that the roof-top location of the deck is inherently remote from the remainder of the suite, and consider the ability of the deck occupants to remain aware of conditions within the suite and building below. Measures to promote situational awareness are appropriate and could include the installation of an audible and visual fire alarm signaling device in the vicinity of the egress door, and direct line of sight to the egress door from any location on the deck.

A-3.2.1.1.(3) Mezzanine Area. The following sketches illustrate the intent of this Sentence.
Figure A-3.2.1.1.(3)-A
Concept of Horizontal Plane

Notes to Figure A-3.2.1.1.(3)-A
(1) The horizontal plane (A, the dashed line) is measured at the mezzanine floor finish line.
(2) At least 60% of the horizontal plane (B) must be open to the floorspace below.

Figure A-3.2.1.1.(3)-B
Intersection Point

Notes to Figure A-3.2.1.1.(3)-B
(1) This Figure describes Clause 3.2.1.1.(3)(a).
(2) The length of the horizontal plane (A) is taken from the rear of the mezzanine to the point at which it intersects a wall, ceiling, roof or other major component.

Figure A-3.2.1.1.(3)-C
Projections, Including Guards

Notes to Figure A-3.2.1.1.(3)-C
(1) This Figure describes Clause 3.2.1.1.(3)(b).
(2) Projections should not be permitted below the horizontal plane (A, the dashed line). This includes large beams, trusses, the roofline, or any other projection that will impede vision lines.
(3) Visual obstructions on the mezzanine may include 1 070 mm high guards, and columns, posts and other structural elements of a minor nature.

Figure A-3.2.1.1.(3)-D
Enclosed Spaces within a Mezzanine

Notes to Figure A-3.2.1.1.(3)-D
(1) This Figure describes Sentence 3.2.1.1.(7).
(2) The horizontal plane is demonstrated by the dashed line, A.
(3) Up to 10% of the horizontal plane may be enclosed. This must be located so as to avoid contravening the open requirements of Clause 3.2.1.1.(3)(b); in effect no dead areas are permitted.

If a floor has more than one mezzanine, each may be treated individually. For example in a one storey building with five tenancies, each tenant would be permitted to have a mezzanine up to the limits indicated, without the building being considered two storeys in building height. However, should one of the mezzanines exceed any of the limitations, the building would then be considered to be two storeys in building height.

Regarding the floor space under a mezzanine, there are no restrictions on partition construction in this area. The space on the floor beyond the mezzanine, i.e. below the open portion of the horizontal plane, should, with discretion, be visually open to view from the mezzanine.

A-3.2.1.1.(4) Mezzanines in Suites. The defined term “suite” in this case could be equally applicable to a suite in an apartment or commercial building, or even an entire storey such as may occur in a curling rink. There may be more than one enclosed mezzanine in the suite but in no instance can the combined total mezzanine area exceed 10% of the suite in which they are located.
Figure A-3.2.1.1.(4)-A  
Mezzanines in Suites

Notes to Figure A-3.2.1.1.(4)-A  
(1) This Figure describes Clause 3.2.1.1.(4)(b).  
(2) Mezzanines up to 10% of area of a suite (A) may be enclosed.  
(3) More than one mezzanine (B) is permitted in a suite provided the total area of mezzanines does not exceed 10% of the suite in which they are located.

Figure A-3.2.1.1.(4)-B  
Mezzanines in Multi-Room Suites

Notes to Figure A-3.2.1.1.(4)-B  
(1) This Figure describes Clauses 3.2.1.1.(4)(a) and (b)  
(2) The curling rink has several ‘rooms,’ but should be regarded as ‘one suite.’ The enclosed mezzanine may be up to 10% of the area of the entire suite.

Figure A-3.2.1.1.(4)-C  
Mezzanines in Multi-Tenanted Suites

Notes to Figure A-3.2.1.1.(4)-C  
(1) This Figure describes Clauses 3.2.1.1.(4)(a) and (b).  
(2) In this example, the 10% of the suite area is of Suite ‘A’ as if it is part of that series of rooms, or suite. It has no user-of-tenancy relationship with Suite ‘B.’ (Suite ‘B’ may also have 10% of totally enclosed mezzanines.)

A-3.2.1.1.(8) Accessible Service Space. These service spaces are often referred to as interstitial spaces and are designed to allow service personnel to enter and undertake maintenance or installation within the space. Catwalks or flooring are usually included to provide a walking or access surface. Even when flooring is included, it is not intended that the interstitial space should be considered as a storey for the purposes of the By-law unless the space is used.
for purposes other than servicing or the storage of materials and equipment to be used for building services within that space.

A-3.2.1.7.(4) Major Occupancies Other than Group C or D in 6 Storey Combustible Buildings. The requirements of 3.2.2.50. and 3.2.2.58. enable the introduction of major occupancies into buildings of predominantly residential or office occupancy that exceed the normal size limits permitted under the present construction requirements of Subsection 3.2.2. In order to ensure that an appropriate level of fire and life safety is being met, additional fire compartmentation and protection of floor areas above the 3rd storey is required by this By-law.

The requirements of 3.2.1.7.(4) are intended to supplement the requirements of 3.2.1.7.(1) by creating further compartmentation subdividing a building into floor areas not exceeding 1,000 m². The terminology “horizontal fire compartment on each storey” is intended to require that floor areas on each storey be individually broken up into fire compartments that are both horizontal and vertically separated from each other. Furthermore, each compartment thus created is required to have direct access to at least one exit in addition to the applicable requirements of Sections 3.3. and 3.4. of this By-law. In the case of ground level suites, this may be achieved by exits directly to the exterior, in addition to protected exits as otherwise required by this By-law.

A-3.2.1.7.(5) Encapsulated Mass Timber. The provisions of Sentence 3.2.1.7.(5) are intended to provide a pathway for the limited use of mass timber with certain protective features, and in certain specific circumstances. It is not intended to be a general endorsement of construction of mass timber. A great deal of research has been undertaken by the National Research Council of Canada, and general requirements that would permit a broader use of these materials in a building of noncombustible construction outside of an alternative solution will require specific construction requirements to be endorsed at the national and provincial levels.

A-3.2.2.2.(1) Special and Unusual Structures. Examples of structures which cannot be identified with the descriptions of buildings in Articles 3.2.2.20. to 3.2.2.90. include grain elevators, refineries and towers. Publications that may be consulted to establish good engineering practice for the purposes of Article 3.2.2.2. include the NFPA “Fire Protection Handbook,” Factory Mutual Data Sheets, and publications of the Society for Fire Protection Engineering.

A-3.2.2.7.(2) Fire Separations and Fire-Resistance Ratings. Fire separations and their corresponding fire resistance rating if required may or may not be governed by the structural fire requirements under Subsection 3.2.2. In establishing the fire separation and fire-resistance rating requirements the practitioner must remember to consult all requirements for fire separations and fire resistance ratings as detailed in Division B Sections 3.1, 3.2, 3.3, 3.4, and 3.5. (See Article 3.1.3.1.)

A-3.2.2.15.(2) Storeys below Ground. Occupancies located below grade represent an unusual level of challenge for both occupant egress and emergency response since the availability of paths of travel to enter or leave the underground space is usually limited. This may subject occupants to a greater risk of exposure to untenable conditions during evacuation. Similarly, emergency responders must share limited means of egress with occupants which could further impact occupant evacuation, impede an effective response, or expose first responders to unsafe conditions.

It is not the intent of the Building By-law to limit the inclusion of occupancies below grade where they can be shown to demonstrate an appropriate level of fire and life safety. Rather the intent of this requirement is to cause a conscientious review of certain underground occupancies to ensure that they are sufficiently protected, and that the arrangement can provide an acceptable level of emergency response for a variety of conditions. The measures described in Sentence 3.2.2.15.(2) provide a minimum for fire safety under many circumstances, but may not be sufficient to address all potential uses or occupancies below grade. It should be confirmed that the proposed use and building design is acceptable to the Chief Building Official.
A-3.2.2.18.(2) Sprinkler Extent. A literal interpretation of Article 3.2.2.6. and Sentences 3.2.2.4.(1) and (2) could require installation of an automatic sprinkler system throughout all storeys of a building regardless of options in Articles 3.2.2.20. to 3.2.2.90. to construct one or more storeys without installation of sprinklers. It is the intent of the By-law that all storeys below a storey in which an automatic sprinkler system is installed should also be protected by an automatic sprinkler system to ensure that a fire in a lower storey does not incapacitate the automatic sprinkler system or overwhelm an automatic sprinkler system in an upper storey. Persons in an upper storey in which waivers or reductions of other fire safety systems are permitted would be exposed to an increased risk from a fire on a lower storey. This concept also applies to situations in which an automatic sprinkler system has been installed within a floor area in order to modify other safety requirements applying within the floor area. If the uppermost storey or storeys of a building can be constructed without the installation of an automatic sprinkler system it is not necessary that an automatic sprinkler system required in a lower storey be extended into the upper storey or storeys.

A-3.2.2.35.(4) Sprinkler Requirements. Spaces in a building of Group A, Division 4 occupancy that are intended to be equipped with sprinklers include, but are not limited to, dressing and changing rooms, concession stands and areas, toilet rooms, locker rooms, storage areas, service rooms, offices and other spaces that provide service to the building. The enclosure of seating areas with glazing needs special consideration in determining the requirements for sprinklers. For example, if the enclosed area is used for the consumption of food and beverages, it should be classified as Group A, Division 2 and the appropriate requirements of that classification applied. Enclosure of limited spaces above seating areas for press and media purposes is not considered to require the installation of sprinklers.

A-3.2.2.50.(5) and 3.2.2.58.(4) Occupancy Combinations in Buildings of Mixed Construction Hybrid Structures. Buildings conforming to the building height and area limits, as well as the other fire protection requirements of Articles 3.2.2.50. or 3.2.2.58. are permitted to be entirely constructed of combustible construction and incorporate the occupancies specifically permitted by Sentences 3.2.2.50.(5) or 3.2.2.58.(4), for example, Group A, Division 2 or Group E major occupancies on the first to second storeys, and a parking garage on the first to third storeys. Alternatively, the requirements of Articles 3.2.2.4. to 3.2.2.8. for superimposed major occupancies can be applied, resulting in buildings of mixed (hybrid) construction conforming to the building height and area limits for combustible construction where the lower storeys are of noncombustible construction and the upper storeys are of combustible construction. For example, a Group B, Division 3 or a Group A, Division 2 major occupancy could be located on the first 4 storeys of a 6-storey Group C building constructed in accordance with Article 3.2.2.50., provided that these first 4 storeys are constructed of noncombustible construction in accordance with Article 3.2.2.24. for a Group A, Division 2 major occupancy or Article 3.2.2.42. for a Group B, Division 3 major occupancy. (See also Articles 3.2.2.6. and 3.2.2.7.)

A-3.2.3. Fire Protection Related to Limiting Distance versus Separation Between Buildings. By-law provisions that address protection against fire spread from building to building use the limiting distance (See the definition in Article 1.4.1.2. of Division A.) for a building rather than using the distance between adjacent buildings on separate properties, since this would result in situations where the design and construction of a building on one property affects the design and construction of a building on an adjacent property.

The By-law requirements that deal with reducing the probability of building-to-building fire spread were originally developed based on the assumption that the exposing building faces of adjacent buildings are of similar size and configuration, and are equidistant from the shared property line. Where buildings are of different sizes, the smaller building may be subject to a higher heat flux in the event of a fire compared to the larger building. Where buildings are closely spaced and not equidistant from the property line, the construction of the building with the greater limiting distance does not recognize the proximity of the building with the lesser limiting distance.

The By-law has more stringent requirements for buildings with lesser limiting distance as regards the maximum area and spacing of unprotected openings, and the construction, cladding and fire resistance of walls. This increased stringency recognizes that the fire hazard is greater where buildings are closer together and that adjacent buildings...
may have exposing building faces of different sizes, configurations or limiting distances, which could further increase the hazard.

The Chief Building Official may also address limiting distances through legal agreements with the parties involved that stipulate that the limiting distance be measured to a line that is not the property line. Such agreements would normally be registered with the titles of both properties.

**A-3.2.3.1.(4) Spatial Separation Design.** In the application of Sentences 3.2.3.1.(3) and (4), it is intended that Sentence (3) be used first to establish the basic requirements for the exterior wall in terms of fire-resistance rating, type of construction and type of cladding. The percentage of unprotected openings determined from the application of Sentence (3) would be unnecessarily restrictive if the actual unprotected openings occur in a plane that is set back from the front of the building face. Sentence (4) applies to the calculation of the allowable percentage of unprotected openings based upon projection onto a plane that is in front of all unprotected openings. The application of these two Sentences is shown in Figure A-3.2.3.1.(4). The modifications permitted by Article 3.2.3.12. would be applied, if applicable, to the area of unprotected openings derived from Sentence (4).

![Spatial Separation Design](image)

A-3.2.3.1.(8) Intervention Time and Limiting Distance. The total time from the start of a fire until fire suppression by the fire department depends on the time taken for a series of actions. Sentence 3.2.3.1.(8) is only concerned with the time from receipt of notification of a fire by the fire department until the arrival of the first fire department vehicle at the building. It specifies a 10-min time limit which must be met in more than 90% of the calls to the building served by the fire department. This reliability level and provision for flexibility is essentially consistent with NFPA 1710, “Organization and Deployment of Fire Suppression Operations, Emergency Medical Operations, and Special Operations to the Public by Career Fire Departments.”

Clause 4.1.2.1 of NFPA 1710 establishes “time objectives” for fire incidents as follows:

- 1 min (60 s) for turn-out of responders after receipt of notification of a fire, and
- 4 min (240 s) or less for arrival of the first arriving engine company at a fire suppression incident and/or 8 min (480 s) or less for the deployment of a full first alarm assignment at a fire suppression incident.

The standard requires that the fire department establish a “performance objective” of not less than 90% for each response time objective. This reliability level is referred to in NFPA 1710 as a “performance objective.”

Where the 10-min limit cannot be met by the fire department at least 90% of the time, Sentence 3.2.3.1.(8) specifies that a value corresponding to half the actual limiting distance be used in requirements that depend on limiting distance to define other criteria. For new subdivisions, legal agreements may be made for the construction of fire
stations to serve those areas. The fire department response time in those subdivisions may temporarily exceed 10 min until the fire station is constructed.

See also Sentences 9.10.14.3.(1) and 9.10.15.3.(1).

**A-3.2.3.4.(1) Party Walls.** By definition, a party wall is a wall jointly owned and used by two parties under easement agreement or by right in law, and is erected at or upon a line that separates two parcels of land that are, or are capable of being, separate real estate entities. With the exception of some Part 9 residential occupancies, both Part 3 and Part 9 of the By-law require that, where party walls are constructed on property lines, they be constructed as a 2- or 4-hour firewall (See also Article 9.10.11.1.).

Buildings on each side of a party wall that is constructed as a firewall are considered as separate buildings (See Article 1.3.3.4. of Division A.).

In a Part 9 residential building that has no dwelling unit above another, a party wall constructed on a property line between two dwelling units need not be constructed as a firewall, but must be constructed as a continuous fire separation that extends from the top of the footings to the underside of the roof, with a fire-resistance rating of at least 1 hour (See Article 9.10.11.2.). These party walls do not create separate buildings.

Where two parties share a party wall on a property line, each party is responsible for fire safety in their unit, but is still subject to possible fire risks from activities in the adjoining units. The separating party wall is intended to provide a significant degree of fire protection between the adjacent units, often exceeding even that required between suites in multiple-unit residential and non-residential occupancies.

When a building spans a property line, constructing a party wall on the property line is not mandated by the By-law, but subdividing the building at the property line is an option the owner can consider. The By-law permits a building constructed on more than one property to be designed as a single undivided building, whether the properties have a common owner or not. However, if a subdividing wall is constructed on the property line within the building for the purpose of separating the two real estate entities and is shared by two different owners, the wall would, by definition, be deemed a party wall. As such, this party wall would need to meet the construction requirements described above, depending on the building’s occupancy classification and size.

A building that spans two or more properties, but that does not have a party wall at the property line, may need to address the By-law requirements for party walls in the future.

**A-3.2.3.6.(2) Protection of Roof Soffits Near Property Lines.** Sentences 3.2.3.6.(2) to (5) and parallel Sentences 9.10.14.5.(5) to (7) and 9.10.15.5.(5) to (7) provide requirements for the protection of soffits where the soffit of the subject building is located close to the property line or to an imaginary line between two buildings on the same property. Fire from inside the roof space of the subject building can exit unprotected soffits and expose the adjacent building to flames.

**A-3.2.3.14.(1) Wall Exposed to Another Wall.** The requirements of Article 3.2.3.14. are to ensure that the control of fire spread by the interior fire separations between fire compartments is not defeated through the spread of fire by thermal radiation outside the building. Minimum spatial separations are specified between the openings in separate fire compartments where the exterior faces of these compartments are deemed to expose each other to a thermal radiation hazard. This situation may arise where the angle, \( \theta \), between the intersecting planes of the exposing building faces is 135° or less. Examples of situations that would be addressed by this Article are shown in Figures A-3.2.3.14.(1)-A, A-3.2.3.14.(1)-B and A-3.2.3.14.(1)-C.
A-3.2.4. Fire Alarm System. The term "fire alarm system" used in this Subsection applies to fire alarm systems with or without voice communication capability.

Figure A-3.2.3.14.(1)-A
Openings in walls at a right-angle corner

Figure A-3.2.3.14.(1)-B
Openings in walls that are parallel to one another

Figure A-3.2.3.14.(1)-C
Openings in walls with an included angle of 45°
A-3.2.4.4.(1) Single Stage Fire Alarm System. This requirement, in combination with Article 3.2.4.22., is intended to allow for the provision of voice communication capability as an integral part of a single stage fire alarm system.

A-3.2.4.4.(2)(c) Fire Alarm Alert Signal. In a 2-stage fire alarm system described in Sentence 3.2.4.4.(2), the alert signal may be transmitted to audible signal devices in designated locations or to audible signal devices throughout the building. If actuated, the second stage alarm signal in a 2-stage fire alarm system may sound throughout all zones in the building. All manual station key switches would typically initiate the alarm signal.

Sentence 3.2.4.4.(2) also allows the implementation of a “zoned 2-stage” sequence of operation, whereby the alarm signal sounds in the zone of key switch actuation (and perhaps in the adjacent zones, which may be the storey above and the storey below) and the alert signal sounds throughout the rest of the building. This sequencing would be created automatically by the fire alarm control unit. The key or special device referred to in Clause 3.2.4.4.(2)(c) should be immediately available to all persons on duty who have been given authority to sound an alarm signal.

A-3.2.4.4.(2) Two-Stage Fire Alarm System. Sentence 3.2.4.4.(2), in combination with Article 3.2.4.22., is intended to allow for the provision of voice communication capability as an integral part of a 2-stage fire alarm system.

A-3.2.4.6.(2) Access to Silencing Switches. This requirement is intended to prevent easy access to silencing switches. The satisfactory operation of a fire alarm system to alert the occupants of a building to an emergency is predicated on the assumption that the alarm signal will be silenced only after responsible staff have verified that no emergency exists. Details on the emergency procedures to be used in case of fire are contained in the Fire By-law.

A-3.2.4.6.(3) Silencing Alarms. This requirement is intended to provide the Vancouver Fire Department and building management the ability to silence the fire alarm at the main annunciator (in addition to the main control panel). A special keyed switch is considered to meet the intent of this requirement.

A-3.2.4.7.(4) Design and Installation of Fire Department Notification. In some jurisdictions, the fire department may utilize, or have available, a municipal fire alarm system or equipment intended for receiving notification by means of a direct connection. If used, it is expected that these systems and installations conform to the requirements of Sentence (4) so as to achieve and provide a uniform and reliable level of service. It is also intended that a proprietary central station as well as a fire brigade used by a large corporation, university campus or similar site comply with Sentence (4).

CAN/ULC-S561, “Installation and Services for Fire Signal Receiving Centres and Systems,” which is referenced in Sentence 3.2.4.7.(4), and CAN/ULC-S524, “Installation of Fire Alarm Systems,” which is referenced in Sentence 3.2.4.5.(1), go hand-in-hand: conformity to CAN/ULC-S561 entails conformity with the fire alarm system components required in that standard, which include the fire alarm transmitter (signal transmitting unit), the interconnections, and the communication path.

A-3.2.4.7.(5)(b) Emergency Telephone Number. In many municipalities an emergency telephone number, for example 911, is used for all emergency services and it is preferable to post that number.

A-3.2.4.8.(2) Fire Alarm Zones. Alarm initiating devices referred to in this Sentence include fire detectors, waterflow switches and manual stations. If a room or space in a building extends through more than one storey of the building, as in the case of multi-level dwelling units and machinery rooms, judgment must be exercised in the zoning and annunciation of the fire detectors in that room or space. In general, the lowest storey on which access is provided into the room or space should be indicated on the annunciator to avoid unnecessary delays for the responding firefighters. Consideration should also be given to the use of numbers or letters on the annunciator that correspond to those used in the building elevators.

A-3.2.4.8.(11) Annunciator Zone Indication. Although an alphanumeric display can identify any specific alarm

A-3.2.4.11.(1) Smoke Detector Location. In the design and installation of the smoke detection system, consideration must be given to all features which could have a bearing on the location and sensitivity of the detectors, including ceiling height, sloped ceilings, diffusion from air conditioning and ventilating currents, obstructions, baffles, and other pertinent physical configurations that might interfere with the proper operation of the system.

A-3.2.4.11.(3) Visible Signals. If staff located in each zone or compartment can see each sleeping room door, visible signals may be located above each door. If staff cannot see every door, it is intended that the visible signals be provided at the location where the staff are normally in attendance. The audible signal is intended to alert staff of the need to check the visible signals.

A-3.2.4.16.(1) Manual Station. Only one manual station need be provided near a group of doors serving as a principal entrance or as a single exit facility. Egress facilities that are provided for convenience and that do not include all the features of required exits need not be provided with a manual pull station.

A-3.2.4.18. Acoustic Measurement and Terminology. The following notes on acoustic measurement and terminology are intended to assist in the application of the requirements for audibility of fire alarm system sounding devices.

The background or ambient measurement should be a spatial averaged A-weighted equivalent sound level measured for 60 s. This can be obtained using an integrating sound level meter with the integration time set to 60 s. During the measurement period the meter should be slowly moved about so as to sample the space uniformly but coming no closer than 0.5 m from any solid wall, floor or ceiling. Alternatively, measurements can be made at 3 or more positions throughout the space and an energy average calculated.

The measurement of the alarm level depends on the type of alarm signal. If the signal is a continuous signal from a bell or siren, the spatial averaged A-weighted equivalent sound level should be obtained. The integration time should be long enough to obtain a reasonable spatial average of the space, but not less than 10 s.

If the alarm has a temporal pattern, then the A-weighted sound level should be measured using the ‘fast’ time constant during the ‘on’ part of the cycle. In this situation it is not appropriate to use an integrating sound level meter. Since the duty cycle of the alarm is only 37.5% at best, that type of meter would give a reading that is 4 or more decibels lower than the level while the alarm is ‘on.’ A number of measurements should be made about the space in question and the average value used to obtain a good spatial representation.

Strictly speaking, the energy average of the measurements should be used; however, the frequency spectrum associated with most alarms is of a type that should give little variation about the space. If the measured levels don’t vary by more than 2 to 3 dB, then an arithmetic average rather than an energy average can be used.

**Effect of Furnishings**

The final inspection of a fire alarm system is seldom made when the building is furnished and ready for occupancy. This results in measured levels which may be several decibels higher than will be found in the occupied building. The importance of this difference depends on the situation.
If the building is complete except for furnishings, so that the sources of ambient noise are present, then the amount by which the alarm signal exceeds the ambient level will not change appreciably with the introduction of furnishings. In this case both levels will be reduced by about the same amount.

If the primary source of ambient noise will be office equipment and workers, as would be expected in an open plan office, then measurements made prior to occupancy may differ substantially from those made afterwards. This may be true for both the absolute sound levels and the difference between the alarm level and the ambient.

A problem arises in trying to estimate what the absolute sound levels will be after the building is occupied. In general, if the measurement is made in a totally bare room then the level will be about 3 dB higher than if the room were carpeted, assuming a reasonable carpet with an underlay. In most cases this will account for most of the absorption in the room and no further correction will be necessary. Adding heavy drapes and absorptive furnishings to a carpeted room can reduce the sound level by a further 2 to 3 dB.

Commercial buildings are more problematic. For example, if an open plan office is measured before any office screens are installed, there could be a substantial difference in the before and after levels, depending on the distance to the nearest alarm device.

Glossary of Acoustical Terms

**Audible**: A signal is usually considered to be clearly audible if the A-weighted sound level exceeds the level of ambient noise by 15 dB or more.

**Awakening threshold**: The level of sound that will awaken a sleeping subject 50% of the time.

**A-weighted**: A frequency weighting network which emphasizes the middle frequency components similar to the response of the human ear. The A-weighted sound level correlates well with subjective assessment of the disturbing effects of sounds. The quantity is expressed in dBA.

**Masked threshold**: The level of sound at which a signal is just audible in ambient noise.

**Sound level**: A sound pressure level obtained using a signal to which a standard frequency-weighting has been applied.

**Sound pressure**: A fluctuating pressure superimposed on the static pressure by the presence of sound. The unqualified term means the root-mean-square sound pressure. In air, the static pressure is barometric pressure.

**Sound pressure level**: Ten times the common logarithm of the ratio of the square of the sound pressure under consideration to the square of the standard reference pressure of 20 mPa. The quantity obtained is expressed in decibels.

A-3.2.4.18.(1) Alert and Alarm Signals. Alert signals are part of a 2 stage fire alarm system. The intent of the first, alert, stage is to notify persons in authority of a potential threat to building occupants. If a continuously staffed location is available, the alert signal can be restricted to that location.

A-3.2.4.18.(2) Alarm Signal Temporal Pattern. The temporal pattern of an alarm signal relates to the time during which the signal is produced and the intervals between the individual signal pulses. The international standard ISO 8201, “Acoustics – Audible emergency evacuation signal,” includes a pattern that is becoming widely used in different countries and it is appropriate for this pattern to be adopted in Canada. The temporal pattern can be produced on most signalling devices. Most existing alarm systems can be modified, and this pattern could be phased in when the
systems require modification. The characteristic of the pattern is a 3-pulse phase followed by an off phase. The 3
pulses each consist of an on phase lasting for 0.5 ± 0.05 s followed by an off phase lasting for 0.5 ± 0.05 s sounded
for 3 successive on periods and then followed by an off phase lasting for 1.5 ± 0.15 s.
Figure A-3.2.4.18.(2)-A indicates the pattern that is intended.

![Temporal pattern for fire alarm signal](image)

Although the diagram shows a square wave form, the wave can have other shapes that produce a similar effect.
If single stroke bells are to be used, the temporal pattern can be produced by having the bell struck three times at a
rate of one stroke per second followed by an interval of 2 s of silence. Figure A-3.2.4.18.(2)-B shows the pattern that
results.

![Temporal pattern imposed on a single stroke bell or chime](image)

**Note to Figure A-3.2.4.18.(2)-B:**
(1) The on phase represents the time that the striker mechanism is actuated. The sound produced by the bell or chime will continue at a level
that decreases until the striker mechanism is re-actuated.

A-3.2.4.18.(3) Audibility of Alarm Systems. It is very difficult to specify exactly what types of sound patterns are
considered to be “significantly different” from one another. The intent is to ensure that there is a noticeable or
measurable difference between the alert signals and the alarm signals such that it reduces the possibility of
confusion.

A-3.2.4.18.(4) Sound Pressure Level. For the purposes of this requirement, an audible signalling device should not
produce a sound pressure level more than 110 dBA when measured at a distance of 3 m.

A-3.2.4.18.(5) Residential Sound Level. In a building in which corridors or hallways serve more than one suite or
dwelling unit, there will be situations in which an audible signal device cannot be placed in the corridor or hallway to
alert persons sleeping in suites and dwelling units, because the sound level in the vicinity of the device would exceed
that permitted by Sentence 3.2.4.18.(4).

In these situations it will be necessary to supplement the building fire alarm system with an audible signal device in
the suite or dwelling unit. These devices could be piezoelectric devices similar to the sounding units in many smoke
alarms, subject to the device emitting the appropriate temporal pattern required by Sentence 3.2.4.18.(2).

A-3.2.4.18.(7) Disconnect Device for Dwelling Units. In order to minimize the annoyance caused by false and
unwanted alarms, the disconnect will permit a person to silence the local audible device within the dwelling unit. At
that time the person would be aware of sounds from devices in common spaces and could plan appropriate action. The disconnect will reduce the possibility of tampering with the audible devices.

**A-3.2.4.18.(8) and (9) Signal Circuits.** Clause 3.2.4.18.(8)(a) permits Class A wiring, or Class B wiring with signal circuit isolators located outside of the suites, to serve audible signal devices within residential suites.

Clause 3.2.4.18.(8)(b) permits a separate signal circuit to serve each suite without the need for signal circuit isolators or Class A wiring.

Open circuits and Class A and Class B wiring circuits are terms defined in CAN/ULC-S524, “Installation of Fire Alarm Systems.”

**A-3.2.4.19.(2) Visual Alarm Signal.** CAN/ULC-S526, “Visible Signal Devices for Fire Alarm Systems, Including Accessories,” applies to visual signalling units. This document is referenced by the most recent standard for the installation of fire alarm systems and would automatically apply. Current Canadian technology does not integrate visual and audible alarms to have the same temporal pattern. Visual and audible alarms should have as close a temporal pattern as possible but without interference beats that might have a deleterious effect on some persons. Visual signalling devices with the same temporal pattern as required for audible devices are available from some sources and they should become available in Canada. Not all units that comply with the ULC standard will have sufficient power to adequately cover large areas; care will have to be taken to specify units with adequate power when large spaces are being designed.

**A-3.2.4.20.(7)(a) Smoke Alarm Installation.** CSA C22.1, “Canadian Electrical Code, Part I,” which is adopted by the Electrical Safety Regulation, permits a smoke alarm to be installed on most residential circuits that carry lighting outlets and receptacles. It is the intent of the Building By-law that any other item on a circuit with a smoke alarm should be unlikely to be overloaded and trip the breaker with a resultant loss of power that is not sufficiently annoying for the breaker to be restored to the on position. It is considered that an interior bathroom light or a kitchen light fulfills this intent, but that circuits restricted to receptacles do not fulfill this intent.

**A-3.2.4.20.(8) Smoke Detectors in lieu of Smoke Alarms.** It is intended that the smoke detector in this application will function as per the requirements of a smoke alarm; specifically, it will be a localized alarm to that suite. The advantage of this type of installation is that the detector would be monitored by the fire alarm panel, which would provide notification to supervisory personnel and be inspected as per CAN/ULC-S524, “Installation of Fire Alarm Systems.”

**A-3.2.4.22.(1)(b) Voice Messages.** The concept of intelligibility expressed in Clause 3.2.4.22.(1)(b) is intended to mean that a person with average hearing and cognitive abilities is able to understand the messages that are transmitted into the space occupied by the person. There is no absolute measure to predetermine the effect of loudspeakers and it may be necessary, once the building has been furnished and occupied, to increase the number of loudspeakers to improve the quality of the messages.

The intelligibility of the message depends on the speech level, the background level, and the reverberation time of the space. ISO 7731, “Ergonomics – Danger signals for public and work areas – Auditory danger signals,” addresses audibility. The standard suggests that an A-weighted sound level at least 15 dBA above the ambient is required for audibility, but allows for more precise calculations using octave or 1/3 octave band frequencies to tailor the alarm signal for particular ambient noise conditions. Design of the alarm system is limited to ensuring that all areas receive an adequately loud alarm signal.

If a public address system is to be used to convey instructions during an emergency, then the requirements of the system are less straightforward. In general, however, a larger number of speakers operating at lower sound levels would be required.
Additional guidance on how to design and evaluate the intelligibility of a communication system can be found in the following documents:

- **NEMA SB 50, “Emergency Communications Audio Intelligibility Applications Guide”**
- **Annex A.7.4.1.4 of NFPA 72, “National Fire Alarm and Signaling Code”**

**A-3.2.5.4.1 Fire Department Access for Detention Buildings.** Buildings of Group B, Division 1 used for housing persons who are under restraint include security measures that would prevent normal access by local fire departments. These security measures include fencing around the building site, exterior walls without openings or openings which are either very small or fitted with bars, and doors that are equipped with security hardware that would prevent easy entry. These buildings would have firefighting equipment installed and the staff would be trained to handle any small incipient fires. It is expected that appropriate fire safety planning would be undertaken in conjunction with local fire departments in order that special emergencies could be handled in a cooperative manner.

**A-3.2.5.5. Location of Access Routes and Paths of Travel.** The national building code and the provincial building code prescriptive requirements for access routes, paths of travel and hydrant locations, currently, do not reflect the operational requirements of the Vancouver Fire and Rescue Services nor the existing City of Vancouver fire hydrant locations. Therefore, the VBBL has been modified from the national and provincial building codes to reflect the unique to Vancouver requirements.
A-3.2.5.5.(1), (2) and (3)(d) Access Route and Path of Travel Except as indicated below, no building face or portion thereof should be located less than 3m from an access route nor should the principal entrance of each building be located more than 15m from an access route. These provisions are provided to facilitate Fire Department vehicle staging to the building and to provide direct access for fire fighters from the access route to the principal entrance of each building. For sprinklered detached houses or sprinklered residential row houses, the path of travel from the access route to the entrance door of each residential suite may not be more than 45 m. See Figure A-3.2.5.5.-A, Figure A-3.2.5.5.-B and Figure A-3.2.5.5.-C.

A-3.2.5.5.(4), (5) and (6) Location of Hydrant and Principal Entrance In the City of Vancouver, hydrants are normally located at street intersections with typical City block lengths of approximately 200 m. If the principal entrance of a building is located mid-block, then the operational procedures and equipment used by the Fire Department will facilitate the 90 m distance between the hydrant location and the principal entrance location as measured in Figure A-3.2.5.5.-D, Figure A-3.2.5.5.-E and Figure A-3.2.5.5.-F.

A-3.2.5.6.(1) Design of Access Routes and Paths of Travel. The design and construction of fire department access routes involves the consideration of many variables, some of which are specified in the requirements in the By-law. All these variables should be considered in relation to the type and size of fire department vehicles available in the municipality or area where the building will be constructed. It is appropriate, therefore, that the local fire department be consulted prior to the design and construction of access routes.

A-3.2.5.6.(3) Width of Fire Department Access Path. The required unobstructed width of the fire department access path assumes that the access path serving one or more dwelling units may be shared. Portions of a path serving only one dwelling unit (whether principal or ancillary) may be 900 mm in width, but where those path are conjoined thereby serving more than one dwelling unit, the path is to be increased from that point to a minimum 1200 mm until it reaches the curb of the access route.
A-3.2.5.7.(1) Water Supply. The intent of Sentence 3.2.5.7.(1) is that an adequate water supply for firefighting be readily available and of sufficient volume and pressure to enable emergency response personnel to control fire growth so as to enable the safe evacuation of occupants and the conduct of search and rescue operations, prevent the fire from spreading to adjacent buildings, and provide a limited measure of property protection.

The water supply requirements for buildings containing internal fire suppression systems, including sprinkler systems and standpipe systems, are contained in specific standards referenced in the By-law. Compliance with the referenced standard, including any variations made by this By-law, is deemed to satisfy the intent of Sentence 3.2.5.7.(1). However, it will be necessary to verify that an adequate source of water is available at the building site to meet the required quantities and pressures. For a building with no internal fire suppression system, the determination of the minimum requirements applicable to the water supply for firefighting is relevant mainly to building sites not serviced by municipal water supply systems. For building sites serviced by municipal water supply systems, where the water supply duration is not a concern, water supply flow rates at minimum pressures is the main focus of this provision. However, where municipal water supply capacities are limited, it may be necessary for buildings to have supplemental water supplies on site or readily available.

The sources of water supply for firefighting purposes may be natural or developed. Natural sources may include ponds, lakes, rivers, streams, bays, creeks, and springs. Developed sources may include aboveground tanks, elevated gravity tanks, cisterns, swimming pools, wells, reservoirs, aqueducts, artesian wells, tankers, hydrants served by a public or private water system, and canals.

Consideration should be given to ensuring that water sources will be accessible to fire department equipment under all climatic conditions.

The volume of on-site water supply is dependent on the building size, construction, occupancy, exposure and environmental impact potential, and should be sufficient to allow at least 30 minutes of fire department hose stream use.

For the purposes of calculating adequate water supply requirements for firefighting, the following documents may be useful:
- NFPA 1142, “Standard on Water Supplies for Suburban and Rural Fire Fighting,” and

A-3.2.5.9.(5)(c) Fire Department Pumping Equipment. Availability of appropriate pumping equipment from the local fire department or, in the case of industrial plants or complexes, from their fire brigade, is considered sufficient to meet the intent of this requirement.

A-3.2.5.11.(2) Hose Stations. A building that is partially sprinklered may have some floor areas where local sprinklers are installed that do not cover the entire floor area. It is intended that hose stations be provided in these floor areas to allow emergency responders to fight fires that cannot be controlled by local sprinklers.

A-3.2.5.12.(1) Sprinkler System Design. In NFPA 13, “Installation of Sprinkler Systems,” reference is made to other NFPA standards that contain additional sprinkler design criteria. These criteria apply to industrial occupancies with high fire loads and industrial occupancies intended for the use, manufacture or storage of highly flammable materials. Therefore, while only NFPA 13 is called up directly by Sentence 3.2.5.12.(1), the additional criteria in the other NFPA standards are included automatically.

In some NFPA standards, certain aspects of sprinkler protection are dependent on the fire-resistance rating of the vertical structural members. In these cases, the sprinkler system design options can be affected by the fire-resistance rating of these elements.
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

For example, in buildings used for the storage of rubber tires, sprinklers directed at the sides of a column are required if the column does not have the required fire-resistance rating.

Other NFPA standards may require that certain occupancies be sprinklered in conformance with NFPA 13, as in the case of some garages. These requirements do not supersede the requirements in the By-law. An occupancy is required to be sprinklered only when this is specified in the By-law, but when it is so required, it must be sprinklered in conformance with NFPA 13 and its referenced standards.

Additionally, while Part 4 contains seismic force provisions that apply to the design of sprinklers, NFPA 13 contains other structural requirements for sprinklers that are also required to be met.

A-3.2.5.12.(2) Sprinklering of Residential Buildings above a Storage Garage Considered as a Separate Building. For the purpose of determining whether NFPA 13R, “Installation of Sprinkler Systems in Low-Rise Residential Occupancies,” applies to a residential building constructed over a storage garage, it is not intended that a storage garage constructed as a separate building in accordance with Article 3.2.1.2. be considered as a storey when determining the building height of the residential building. Similarly, this would not preclude the use of NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes,” for any one- or two-family home constructed above such a storage garage.

A-3.2.5.12.(6) Sprinklering of Roof Assemblies. Sprinkler protection for roof assemblies in lieu of fire resistance is based on the assumption that the sprinklers will protect the roof assembly from the effects of fire in spaces below the roof. If a ceiling membrane is installed, the sprinklers would have to be located below the membrane in order to react quickly to the fire. In certain instances, however, sprinklers may be required within the concealed spaces as well as below the membrane. NFPA 13, “Installation of Sprinkler Systems,” requires sprinklers in certain concealed spaces.

According to NFPA 13 and 13R, some small rooms and closets within a dwelling unit in a sprinklered building, including those that may be in the storey immediately below the roof assembly, do not require sprinklers. However, the Building By-law requires sprinkler protection within all rooms and closets immediately below the roof so as to control any fire that might start in that space and thereby limit the probability of the fire spreading into the roof assembly.

Moreover, NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes,” also allows the omission of sprinklers in such rooms and closets under certain circumstances, provided the building is sprinklered in conformance with this standard. In this case, the Building By-law concurs with the provisions of the NFPA 13D standard.

A-3.2.5.12.(7) Fast-Response Sprinklers. Several types of sprinkler will respond to a fire faster than a conventional standard response sprinkler. The Response Time Index (RTI) is used to quantify the sensitivity of the sprinkler link for any given sprinkler. The RTI for the group of fast-response sprinklers described below will on average range from 22 s^{0.5} m^{0.5} to 33 s^{0.5} m^{0.5}. RTI values for standard response sprinklers will typically be in the range of 83 s^{0.5} m^{0.5} to 110 s^{0.5} m^{0.5}. Any confusion as to the appropriate type of fast-response sprinkler for different types of building should be alleviated by considering the testing criteria described below and the reference to the appropriate NFPA installation standards.

Although the By-law specifies where fast-response sprinklers are required, it does not prevent the appropriate use of fast-response sprinklers in other occupancies.

Residential sprinklers are tested in accordance with ANSI/UL-1626, “Residential Sprinklers for Fire-Protection Service.” They are installed in accordance with NFPA 13R, “Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height,” with NFPA 13D, “Installation of Sprinkler Systems in One-
and Two-Family Dwellings and Manufactured Homes,” and with Section 5-4.5 of NFPA 13, “Installation of Sprinkler Systems,” for residential occupancies and for dwelling units.

Quick-response sprinklers are tested in accordance with ANSI/UL-199, “Automatic Sprinklers for Fire-Protection Service.” They are installed in accordance with NFPA 13, “Installation of Sprinkler Systems,” for spacing, density and location. They are acceptable for limited use as described in NFPA 13R, “Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height,” but are not permitted for use under NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes.”

Early-suppression fast-response sprinklers are tested in accordance with FM Approvals Class Number 2008, “Approval Standard for Quick Response Storage Sprinklers for Fire Protection.” They are installed in accordance with NFPA 13, “Installation of Sprinkler Systems,” but are not accepted for use under either NFPA 13R, “Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height,” or NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes.”

Quick-response extended-coverage sprinklers are tested in accordance with ANSI/UL 199, “Automatic Sprinklers for Fire-Protection Service.” They are installed in accordance with NFPA 13, “Installation of Sprinkler Systems,” for spacing, density and location. They are acceptable for limited use as permitted by NFPA 13R, “Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height,” but are not permitted for use under NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes.”

A-3.2.5.12.(8) Balconies and Decks. The intent of Sentence 3.2.5.12.(7) is to suppress or control the spread of a fire originating from a balcony or deck to the roof assembly or other parts of the building.

A-3.2.5.12.(9) Sprinkler Rating. The requirements of this Sentence can be met by using sprinklers with a rating of 79°C to 107°C.

A-3.2.5.13.(1) Hazard Classification for Sprinkler Selection. The reference to light hazard occupancies is based on the descriptions of these occupancies given in NFPA 13, “Installation of Sprinkler Systems,” and is intended only for use in the design of sprinkler systems. These descriptions should not be confused with the occupancy classifications in the By-law.

In NFPA 13, a light hazard occupancy is one in which the quantity or combustibility of contents is low and fires with relatively low rates of heat release are expected. Typical buildings or parts of buildings include: churches; clubs; eaves and overhangs, if of combustible construction with no combustibles beneath; educational buildings; hospitals; institutional buildings; libraries, except very large stack rooms; museums; nursing or convalescent homes; offices, including data processing rooms; residential buildings; restaurant seating areas; theatres and auditoria, excluding stages and proscenia; and unused attics.

Although NFPA 13R, “Installation of Sprinkler Systems in Low-Rise Residential Occupancies,” and NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes,” as referenced by NFPA 13, are concerned with specific types of residential occupancy, namely apartment buildings up to four storeys, houses containing up to two dwelling units, and mobile homes, for the purpose of acceptance of combustible sprinkler piping these occupancies are considered to be included in the category of residential buildings under light hazard occupancies.

A-3.2.5.18.(1) Fire Pumps. In order to ensure an adequate water supply, it may be necessary to install a fire pump for a building that has either a standpipe system or an automatic sprinkler system installed.

A-3.2.5.20. Radio Antenna System. Buildings of noncombustible construction or buildings that have glazing with a
low emissivity rating can cause interference with radio signals that are necessary for emergency, firefighting and rescue operations. The installation of a radio antenna system should be shown on drawings submitted for building permit, and related permits. A complete design of the radio antenna system will be required on plans to be submitted for the building permit and should be design in accordance with the general specification provided by Vancouver Fire and Rescue Services. See Fire Department publication “Vancouver Fire Rescue Services Specifications for Radio Antenna System Design, Installation and Acceptance Testing” as updated from time to time. By-law users are advised to keep up-to-date. The technical specifications as of May 2019 are reproduced here for convenience.

1. SCOPE
1.1. This Specification describes the requirements for the design, installation, and acceptance testing of a radio antenna system in a building.
1.2. The installation of radio antenna system equipment and devices not covered by this Specification shall be in accordance with good engineering practice and the manufacturer’s installation instructions.
1.3. The work in this section shall be performed under the supervision of a registered professional engineer in British Columbia.

2. REQUIREMENTS OF RADIO ANTENNA SYSTEMS
2.1. GENERAL
2.1.1. Radio antenna systems for emergency responders are an integral component of the life safety equipment of a building or structure. The primary function is to provide reliable emergency responder communications at the required signal strength within the specified areas.
2.1.2. Provide an in-building radio antenna system to provide coverage in the building for the public safety agencies as required by the local fire department and other agencies and authorities having jurisdiction. System users shall receive and transmit radio broadcasts from their portable radio units within the building. This shall be accomplished utilizing the following components, which if applicable shall conform to UL 2524 “Standard for In-building 2-Way Emergency Radio Communication Enhancement Systems”:
   a) Bi Directional Amplifiers (Signal Boosters)
   b) Coaxial Cable
   c) Frequency filters
   d) Donor and discrete antennas
   e) Other components and interconnecting circuitry as required
2.1.3. Radio antenna systems shall not rely on mobile repeaters installed on fire department apparatus.
2.1.4. The entire system shall meet with approval of the Fire Chief, Chief Building Official, and Director of Planning for the City of Vancouver (the authorities having jurisdiction, AHJ).
2.1.5. All permits necessary for the installation of the work shall be obtained from the AHJ prior to the commencement of the work. All permit costs and inspection fees shall be included as the part of the required work.

2.2. FEDERAL LICENSE
2.2.1. All active systems shall be licensed by the federal regulator, Innovation, Science & Economic Development Canada (ISED), and shall comply with the applicable Standard Radio Systems Plan (SRSP).
2.2.2. The installing contractor shall arrange to obtain the federal license to operate on behalf of the owner.
2.2.3. The installing contractor shall be responsible for any fees and costs to obtain the federal license for the first year of operation.
2.2.4. Any license required shall be renewed annually by the building owner and the cost of the licensing borne solely by the building owner.

3. PLANS AND SUPPORTING DOCUMENTS
3.1. The plans and supporting documents for the radio antenna system shall include a complete and detailed description of the following:
   a) Installation instructions
   b) Location of in-building antenna
   c) Location of donor antenna
   d) Location of riser and trunk on each floor
   e) Location of amplifier, repeater, and head-end equipment
   f) Connection to the fire alarm system for a common trouble zone
   g) Critical locations requiring coverage
   h) Method of Acceptance Testing

4. INSTALLATION OF RADIO ANTENNA EQUIPMENT
4.1. AMPLIFIERS, REPEATERS AND HEAD-END EQUIPMENT

4.1.1. Amplifiers, repeaters, and head-end equipment shall be located in a service room that is provided with not less than 1 h fire-resistance rating.

4.1.2. All amplifiers, repeaters, and head-end equipment required by the radio antenna system shall be protected by enclosures rated CSA Type 3 or higher.

4.1.3. All amplifiers, repeaters and head-end equipment shall be provided with drip shield to guard against water spray from fire sprinklers located in the room unless the enclosures are rated CSA Type 4 or higher.

4.2. DISTRIBUTED ANTENNA SYSTEM

4.2.1. One in-building antenna shall be located within 20 m of the elevator door opening at each odd-numbered storey.

4.2.2. One in-building antenna shall be located inside each exit stair shaft at the landing of each even numbered storey.

4.2.3. Additional in-building antennas shall be installed to provide 98 percent radio coverage inside each critical area as described in the Vancouver Building By-law.

4.2.4. Sufficient antenna isolation shall be maintained between the donor antenna and all in-building antenna (D.A.S.) under all operating conditions.

4.3. WIRING

4.3.1. Cables and wires shall be FT-4 rated, and where installed inside plenums, cables and wires shall be FT-6 rated.

4.3.2. Except within service rooms containing the amplifiers, repeaters and head-end equipment, cables and wires installed in the risers shall be mechanically protected per the Electrical Code.

4.4. INTERCONNECTION TO THE FIRE ALARM SYSTEM

4.4.1. The radio antenna system shall be monitored by the building fire alarm system for common trouble.

4.5. PROVISION FOR RADIO ANTENNA SYSTEM EXPANSION

4.5.1. Raceways shall be installed to allow installation of future in-building antenna in the floor area of each storey not already provided with wiring or horizontal distribution.

5. ACCEPTANCE TESTING

5.1. Adequate Radio Coverage

5.1.1. The intent is to achieve -95 dBm on the current public safety bands. Good design should provide a margin of not less than 10 dB to allow for uncontrolled variables. Based on the foregoing, the design target for indoor coverage should be -85 dBm.

5.1.2. The radio frequency range to be supported shall be any frequencies used by the public safety communications service provider’s network. If signal amplifiers are used, they shall include filters that will protect the amplifiers from overload and the system from interference by out-of-band signals.

5.1.3. In the event that active amplification is required to meet the foregoing communication quality requirements in the building, coordination with the public safety communications service provider is required to ensure that its outdoor radio communication performance is not degraded. If there is a trade-off to be made between maintaining the public safety communications service provider’s outdoor radio communication performance and restoration of signal strength in the building, the trade-off decision shall be made by the public safety communications service provider and communicated to the Fire Chief by the building owner.

5.2. System Verification Procedures

5.2.1. Tests shall be performed by RF technicians under supervision of a professional engineer registered in the Province of British Columbia. Test reports shall bear the seal of the engineer.

5.2.2. If required by the engineer, during the engineer’s acceptance test, portable handheld radios used for speech and coverage acceptance shall be the same type used by Vancouver Fire and Rescue Services.

5.2.3. Acceptance tests and measurements shall be performed after completion of installation of the Radio Antenna System. Tests shall be performed using radio frequencies assigned by the public safety communications service provider, after proper coordination with an authorized representative of that system and with the Fire Chief.

5.2.4. Where the floor area of a critical location is greater than 4,500 m² the area shall be divided into a uniform grid of not more than 15 m on a side, or if the floor area is smaller than 4,500 m² it shall be divided into a uniform grid of approximately 20 equal areas, to a minimum of 9 m², and measurements shall be taken in each grid area. The size of the grids shall also be reduced, or the number of grids increased, upon recommendation of the Fire Chief or inspector in areas where special construction or other obstruction may significantly affect communications.

5.2.5. If the Radio Antenna System fails to provide acceptable communication in any of the critical locations as stipulated in the Building By-law, the building owner shall have the system rectified to meet the 98% coverage requirement for these areas; otherwise the Radio Antenna System will not be accepted.

5.3. Tests for Optimization

5.3.1. The radio antenna system shall be optimized to provide maximum coverage of the remainder of the floor areas while providing 98 % coverage in the critical locations.
5.4. Tests of Power Supply

5.4.1. Backup batteries and power supplies shall be tested under full load using a minimum of a 90% duty cycle for a period of at least one hour. If within the one-hour period, the battery shows no symptom of failure or impending failure, the test shall be continued for additional one-hour periods to determine the integrity of the battery. The battery shall not fail within a four-hour continuous test period.

5.4.2. Alternatively, the power supply may be connected to the building emergency generator with the backup batteries to supply a four-hour continuous power supply.

6. DOCUMENTATION

6.1. DOCUMENTATION REQUIRED

6.1.1. The documentation required by this section shall be maintained on site in a box located in a location acceptable to the Fire Chief.

6.1.2. Documentation for the radio antenna system shall include the following description of the radio antenna system:

   a) Instructions for resetting the system
   b) Equipment operating instructions or manuals
   c) Equipment maintenance instructions
   d) Equipment testing instructions
   e) Optimization tests
   f) Signal strength tests at critical locations
   g) Results of battery test
   h) Results of testing of connection to the fire alarm system

6.1.3. The designer of the radio antenna system shall prepare the Health SC6 report which certifies the system meets Safety Code 6.

6.1.4. After installation of the radio antenna system is completed, the designer shall provide confirmation that the radio antenna system meets Safety Code 6.

6.1.5. A copy of the annual operating licence issued by Federal communications agency shall be included in the fire safety plan for the building.

A-3.2.6. Smoke Control for High Buildings. Experience with high buildings has shown that the time required for complete evacuation can exceed that which is considered necessary for the safe egress of all occupants. Studies of the "chimney effect" and observations of smoke movement in actual fires have shown that fire compartmentation to contain a fire on any one storey will not usually prevent the movement of smoke through elevator, stair and other vertical shafts to the upper floors of a high building.

Occupants of a high building in which an automatic sprinkler system is not installed, and particularly those on upper storeys, could be faced with severe smoke conditions from fires occurring in storeys below them before their own evacuation is possible.

The requirements of Subsection 3.2.6. are intended to maintain safe conditions for occupants of a high building who may have to remain in the building during a fire, and to assist the firefighters by providing efficient access to the fire floor. The Notes for Subsection 3.2.6. are intended to assist a designer in complying with the requirements of Subsection 3.2.6. The knowledge requirements are well within the capabilities of a competent designer. The designer should appreciate, however, that successful application requires a clear understanding of the principles that govern smoke movement. Subsection 3.2.6. contains only those items that relate to the design and construction of a building; operation of the facilities and recommended actions to be taken by the building owner, occupant and fire department are covered by the Fire By-law.

The designer is cautioned that the tabular and graphical information in the Notes for Subsection 3.2.6. was developed for buildings having conventional configurations. The designer has to judge the extent to which the building under consideration has characteristics that will allow the application of this information; this is particularly true of designs employing air-handling systems for which a realistic assessment of the leakage characteristics of the enclosures of spaces may be critical.

It is assumed that buildings regulated by Subsection 3.2.6. will be in an area served by a fire department capable of an early response and that all firefighting and rescue situations will be under the direct control of the officer-in-charge.
of the fire department responding to the emergency. It is important that firefighters be provided with a smoke-free access to fire floors below grade. Provisions are included to separate exit stairways serving storeys above grade from those serving storeys below grade, and to limit entry of smoke into these shafts. Similarly, elevator hoistways and service shafts are required to be provided with a separation near grade, or be designed to limit their functioning as paths of smoke movement into upper floor areas from storeys below grade.

It is assumed that in the event of fire, occupants of the floor on which the fire occurs will leave by exit stairs immediately following the sounding of a fire alarm, and that occupants of the floor immediately above the floor on which the fire occurs will be advised to leave by the first fire department officer on the scene or other person assigned this responsibility. Occupants of all other floors may remain on their floors unless otherwise directed. It is also assumed that the owner of the building has complied with the Emergency Planning Section of the Fire By-law by preparing a comprehensive fire safety plan to safeguard the building occupants and that the building supervisory staff are familiar with the requirements of Subsection 3.2.6. and with their responsibilities under the fire safety plan.

The Building By-law requires that a check be made of the smoke control and mechanical venting systems.

Testing will indicate deficiencies caused by inexact estimates of the leakage characteristics or of air supply requirements and, in all but the most extreme cases, will provide an opportunity for appropriate adjustments before the system is put into service.

3.2.6.1.(2) Six Storey Buildings. One of the key concerns for high-buildings is the potential for increased smoke movement in a fire as a consequence of stack-effect. One of the provisions of 3.2.6.1.(2) is to prohibit stairs or elevators from directly connecting more than 6 storeys consecutively. This prohibition is intended to limit the potential for smoke to enter the stairs or elevator shafts and contaminate floor areas above. However, this prohibition is not intended to restrict the potential for stairs or elevators to serve other floors or levels as long as they are provided with acceptable measures to limit the uncontrolled movement of smoke between floor levels. Designers may wish to consider the use of vestibules or other measures described in note A-3.2.6.2.(4) as part of a design solution to control smoke movement.

A-3.2.6.2.(2) Stairway Protection Below Lowest Exit Level. A stairway serving floors below the lowest exit level is considered to comply with the intent of Sentence 3.2.6.2.(2) if the following conditions are satisfied.

1) The stairway has a vent or door to the outdoors at or near the top of the stair shaft that has an openable area of not less than 0.1 m² for each storey served by the stairway, less 0.01 m² for each weatherstripped door and 0.02 m² for each door that is not weatherstripped opening into the stairway.

2) The stairway is enclosed in a shaft that
   a) does not pass through the floor above the lowest exit level and is separate from a shaft that contains a stairway serving upper storeys, or
   b) contains a stairway serving upper storeys, but is separated from that stairway at the lowest exit level by a fire separation having a fire-resistance rating not less than that required for the shaft enclosure.

3) The stairway is provided with equipment capable of maintaining a flow of air introduced at or near the bottom of the stair shaft, at a rate equal to 0.47 m³/s for each storey served by the stairway.

A-3.2.6.2.(3) Pressurization of Stair Shafts. The purpose of providing open doors and vents at the bottom of a stair shaft is to create a positive pressure in the shaft relative to adjacent floor areas and thus keep it free of smoke. The pressure depends on the temperature differential between the interior and the exterior of the building which is most pronounced during winter months when stack effect is greatest. If a shaft does not have a direct opening to the exterior, alternative means must be provided to achieve smoke control. If a corridor or vestibule is used as a link between the exit level of an interior stair shaft and the outdoors to provide a venting system, it will be necessary to assess the reliability of the overall system. The probability of all doors or closures being opened at the same time has to be addressed, as well as the size of the vestibule and its impact on the overall smoke control system.
If mechanical methods are used to develop a positive pressure in a stair shaft, a minimum pressure differential of 12 Pa is recommended to prevent smoke migration from floor areas in a sprinklered building where fire temperatures are controlled and smoke movement may be dominated by stack effect in a stair shaft. During a fire emergency, persons will be entering and exiting a stair shaft as they move to a place of safety and under these conditions the number of doors open to the stair shaft cannot be predetermined.

The number will vary depending on the occupancy of the building, population density and the evacuation plan for the building.

It should be assumed that two doors are open. This is based in part as a practical level for most buildings and considers the positive fire experience in sprinklered buildings.

The maximum pressure differential created by a mechanical system should not prevent doors to the stair shafts from being opened.

A specific maximum value cannot be given, as this value will depend on the door opening force and size of the door. These values should be calculated for each specific case. Although a maximum value of 130 N is suggested by research as the force that can be opened by the majority of people in most occupancies, this value is above the maximum value of 90 N generally specified in this By-law.

The use of values below 130 N can create a practical problem in achieving effective smoke control as it is difficult to design for the acceptable minimum and maximum pressure differential range. Special consideration may need to be given for doors located in an accessible path of travel.

Care should be taken by designers and by building and fire officials in implementation of these requirements. Assumptions involved in the design of a smoke control system may be different from final construction conditions. For this reason each system should be tested after installation to ensure that the design intent is met. The minimum pressure differential is not intended to apply to locations in stair shafts when doors in their proximity are open to adjacent floor areas.

A-3.2.6.2.(4) Limiting Smoke Movement. Measures to prevent the migration of smoke from floor areas below the lowest exit storey into upper storeys include the following.

1) An elevator hoistway that passes through the floor above the lowest exit storey should not penetrate the floor of the storey immediately below the lowest exit storey, unless there is a vestibule between the shaft and each floor area below the lowest exit storey that
   a) has a fire separation, with a fire-resistance rating not less than 45 min, between the vestibule and any public corridor,
   b) has a fire separation, with a fire-resistance rating not less than that required for an exit by Article 3.4.4.1., between the vestibule and any stair or elevator enclosure or any part of a floor area, other than a public corridor, and
   c) except for elevator hoistway entrances, has a self-closing device on any door through the fire separation required by Clauses (a) and (b), with the door opening in the direction of travel from the floor area to the exit stairway.
Figure A-3.2.6.2.(4)-A
Vent to a vertical service space with no other pressurized shaft in the building

Notes to Figure A-3.2.6.2.(4)-A:
(1) Curve A applies to a vertical service space that is enclosed by unplastered unit masonry or by plaster and steel stud construction with all openings in the shaft sealed to the degree required by Articles 3.1.9.1. to 3.1.9.5.
(2) Curve B applies to a vertical service space that is enclosed by monolithic concrete or by plastered unit masonry with all openings in the shaft sealed tightly to minimize air leakage.
(3) A shaft having a vent that is 100% of the cross-sectional area of the shaft is acceptable for buildings up to 1.5 times the height shown by the appropriate curve in Figures A-3.2.6.2.(4)-A and A-3.2.6.2.(4)-B.
(4) The total leakage area, based on measurements in typical high buildings, is assumed to be 0.025 m² for every 10 m² of shaft wall area in the case of Curve A and 0.015 m² for every 10 m² of shaft wall area in the case of Curve B.

2) A vertical service space, other than an elevator hoistway, that passes through the floor assembly above the lowest exit storey, should be provided with a tight-fitting noncombustible seal or fire stop at the floor assembly of the storey immediately below the lowest exit storey, unless
   a) the vertical service space is vented to the outdoors at the top and the vent has an openable area that is not less than
      i) that obtained from Figure A-3.2.6.2.(4)-A if the vertical service space is in a building in which other shafts are not mechanically pressurized, or
      ii) that obtained from Figure A-3.2.6.2.(4)-B if the vertical service space is in a building in which other shafts are mechanically pressurized,
   b) for a shaft that serves floor areas above the lowest exit storey, a vent is located
      i) at or near the top of the shaft if the shaft is above the mid-height of the building, or
      ii) at or near the foot of the shaft at or near the exit level if the top of the shaft is below the mid-height of the building, or
   c) for a shaft that serves floor areas below the lowest exit storey, a vent is located at or near the top of the shaft.

3) Any closure provided for a vent opening referred to in Sentence (2) must be openable:
   a) manually,
   b) on a signal from a smoke detector located at or near the top of the shaft, and
   c) by a control device located at the central alarm and control facility.
Figure A-3.2.6.2.(4)-B
Vent to a vertical service space with other pressurized shafts in the building

Notes to Figure A-3.2.6.2.(4)-B:
(1) Curve A applies to a vertical service space that is enclosed by unplastered unit masonry or by plaster and steel stud construction with all openings in the shaft sealed to the degree required by Articles 3.1.9.1. to 3.1.9.5.
(2) Curve B applies to a vertical service space that is enclosed by monolithic concrete or by plastered unit masonry with all openings in the shaft sealed tightly to minimize air leakage.
(3) A shaft having a vent that is 100% of the cross-sectional area of the shaft is acceptable for buildings up to 1.5 times the height shown by the appropriate curve in Figures A-3.2.6.2.(4)-A and A-3.2.6.2.(4)-B.
(4) The total leakage area, based on measurements in typical high buildings, is assumed to be 0.025 m² for every 10 m² of shaft wall area in the case of Curve A and 0.015 m² for every 10 m² of shaft wall area in the case of Curve B.

A-3.2.6.3.(1) Connected Buildings. The measures described here are intended to prevent movement of smoke from one building to another. They are of particular significance for two buildings of unequal height that are joined together. The techniques suggested are the provision of a large opening to the outdoors in a connecting vestibule so that smoke entering through leakage areas around doors will be vented to the outdoors, or pressurization to maintain a higher pressure in the vestibule than in adjacent spaces, as illustrated in Figures A-3.2.6.3.(1)-A, A-3.2.6.3.(1)-B and A-3.2.6.3.(1)-C.

The provisions for protection of openings are described in terms appropriate to a doorway. Openings other than doorways should be avoided if possible. Openings should be protected by an airlock that gives the same standard of protection as the vestibule referred to below.

The requirement of Article 3.2.6.3. that limits movement of smoke from one building to another may be met by incorporating in the link between the buildings the provisions of Sentences (1) and (2).

1) A firewall conforming to Subsection 3.1.10. is constructed between one building and the other with any opening in the firewall protected against the passage of smoke by a vestibule that has
   a) a fire separation between the vestibule and a public corridor with a fire-resistance rating not less than 45 min,
   b) a fire separation between the vestibule and the remainder of the floor area, other than a public corridor, with a fire-resistance rating not less than that required by Article 3.4.4.1. for an exit,
   c) a fire separation between the vestibule and a stair enclosure or elevator hoistway with a fire-resistance rating not less than that required by Article 3.4.4.1. for an exit, and
d) any door in the fire separation required by Clauses (a), (b) or (c), except for an elevator entrance, provided with a self-closing device as required by Article 3.1.8.13. and opening in the direction of travel from the floor area to the exit stairway.

2) The vestibule referred to in Sentence (1) should have

a) a vent to the outdoors that has a net area of $10(0.023d + 0.00045a) \text{ m}^2$, where ‘$d$’ is the number of doors having a perimeter not more than 6 m that open into the vestibule, or if the perimeter of doors exceeds 6 m, the value ‘$d$’ is increased in direct proportion to the increase in the perimeter, and ‘$a$’ is the area in square metres of enclosing walls, floors and ceilings whose outer face is in contact with the outside air, except that where the outer face of a wall is in contact with the ground or fill, it is assumed that there is no leakage through that portion, and the value of ‘$a$’ is assumed to be zero, or

b) equipment capable of maintaining a supply of air into the vestibule sufficient to ensure that the air pressure in the vestibule when the doors are closed is higher by at least 12 Pa than that in adjacent floor areas when the outdoor temperature is equal to the January design temperature on a 2.5% basis.

Figure A-3.2.6.3.(1)-B
Buildings connected at a firewall

Figure A-3.2.6.3.(1)-C
Buildings connected by a bridge
A-3.2.6.5.(6)(b) Electrical Cable Protection. Electrical cables that provide continuous operation for 1 h when subjected to the fire exposure of the time/temperature curve of CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials,” do not need additional protection against exposure to fire.

A-3.2.6.6.(1) Venting to Aid Firefighting. The requirements of Sentence 3.2.6.6.(1) are met by incorporating in a floor area windows or wall panels, as described in Sentence (1), by smoke shafts as described in Sentences (2) to (8), or by the use of building exhaust systems as described in Sentence (9).

1) If windows or wall panels are used for venting, they must
   a) be uniformly distributed along the exterior wall of each storey,
   b) have a total area not less than 1% of the exterior wall area of each storey,
   c) be readily openable from the interior without the use of wrenches or keys,
   d) be readily identified from the interior, and from the exterior where they are accessible to firefighters, and
   e) be designed so that when opened they will not endanger persons outside the building during a fire.

2) If one or more smoke shafts or vertical service spaces are used for venting, they must
   a) have an opening or openings into each storey with an aggregate area not less than that obtained from Table A-3.2.6.6.(1)-A for the height of the building and the area of the largest floor area served by the smoke shaft, and the leakage characteristics of the shaft wall and closures obtained from Tables A-3.2.6.6.(1)-B and A-3.2.6.6.(1)-C,
   b) have an aggregate unobstructed cross-sectional area equal to that required by Clause (a), and
   c) be designed to comply with the requirements of Sentence (3).

3) Each smoke shaft or vertical service space described in Sentence (2) must
   a) be separated from the remainder of the building by a fire separation that has a fire-resistance rating not less than that required for the floor assembly through which it passes, or be designed as a chimney conforming to Part 6, except that flue liners need not be provided,
   b) have an opening to the outdoors at the top that has an area not less than the cross-sectional area of the shaft, with the opening protected from the weather,
   c) terminate not less than 900 mm above the roof surface where it penetrates the roof, and
   d) contain no combustible material, fuel lines or services that are required for use in an emergency.

4) Each opening required by Clause (2)(a) must be located so that the top of the opening is not more than 250 mm below the ceiling, except that the opening may be above the ceiling if the ceiling freely allows passage of air.

5) The opening into the smoke shaft must be provided with a closure that
   a) has a fire-protection rating conforming to Sentence 3.1.8.4.(2), except that the temperature on the unexposed face of the closure shall be not more than 250 °C after 30 min during the fire test used to determine its rating,
   b) is no closer to combustible material, except for paint or tightly-adhering paper covering not more than 1 mm thick applied to a noncombustible backing, than the distances described in Table A-3.2.6.6.(1)-D,
   c) can be opened from a remote location such as a stair shaft, the storey immediately below, or the central alarm and control facility, and
   d) does not open automatically on any floor, other than the fire floor, when smoke and hot gases pass through the shaft.

6) Closures for openings described in Clause (3)(b) must
   a) be openable from outside the shaft, and
   b) open automatically
      i) on a signal from a smoke detector in the shaft,
      ii) by operation of the fire alarm system, and
      iii) when the closure required by Sentence (5) opens.
7) A smoke shaft opening referred to in Sentence (2) that is less than 1,070 mm above the floor must conform to Article 3.3.1.18.

8) If a closure is required to comply with Sentence (5), the leakage area between closure components and between closure and frame must not be more than 3% of the openable area of the closure.

9) The building air handling system may be used for smoke venting, provided
   a) the system can maintain an exhaust to the outdoors at the rate of 6 air changes per hour from any floor area, and
   b) emergency power to the fans providing the exhaust required by Clause (a) is provided as described in Article 3.2.7.9.

### Notes to Table A-3.2.6.6.(1)-A:
1. The minimum size of a vent opening into a smoke shaft is obtained from Table A-3.2.6.6.(1)-A and is dependant on the floor area and total leakage area of the smoke shaft walls and closures. This total leakage area may be estimated by adding the leakage areas for the shaft wall obtained from Table A-3.2.6.6.(1)-B and for the dampered openings obtained from Table A-3.2.6.6.(1)-C, provided the cross-sectional area of the smoke shaft, the opening into the shaft and the opening to the outdoors at the top of the shaft are equal.
2. The size of the vent opening refers to the free or unobstructed area of the opening.
3. Leakage area is the total of the leakage area of smoke shaft wall obtained from Table A-3.2.6.6.(1)-B and the leakage area of openings in smoke shafts obtained from Table A-3.2.6.6.(1)-C.

</tbody>
</table>
### Notes to Table A-3.2.6.6.(1)-D:

1. For closure areas between those given in Table A-3.2.6.6.(1)-D, interpolation may be used to determine the appropriate distances.
2. For closure areas greater than 2.5 m², the minimum distance in front of or above the closure shall be one half of the square root of the closure area, and the minimum distance to the sides or below the closure shall be one quarter of the square root of the closure area.

### A-3.2.6.7.(1) Protection of Central Control Room.

The design of a room provided for a central alarm and control facility should take into account the nature and sensitivity of the electronic components of the equipment and the room should be adequately protected from fire and smoke. The room should be ventilated with a supply of fresh air so that it has a clean environment and should be provided with adequate lighting.

### A-3.2.6.7.(2) Central Control Room Air Control.

Depending on the method of mechanical venting and air control that is selected for the building, additional controls may be required at the central alarm and control facility. These additional controls include those with a capability of opening closures to vents in shafts, stopping air-handling systems, and initiating mechanical air supply to stair shafts.

### A-3.2.6.9.(1) Testing for Smoke Control.

The efficiency of a smoke control system may be checked by measuring pressure differences and the directions of airflow around doors and through separating walls of compartments. A pressure meter can be used to measure pressure differences on either side of a door or partition. Where this is impracticable, a punk stick held near a crack will indicate the direction of airflow. Measurements of airflow may be taken on the intake side of supply fans or in supply ducts to determine whether the specified airflow is being provided. In general, airflow should be from the spaces which may be occupied for various lengths of time during a fire emergency (e.g., vestibules, stair shafts, and elevator hoistways) toward the space in which the fire is assumed to have occurred. Measurements may be taken at certain critical locations to check the overall efficiency of the smoke control system.

In buildings where protection is obtained by venting corridors or vestibules to the outdoors, inspection of the building to determine whether the requirements have been met should be sufficient. Where service shafts are vented to the outdoors at the top, a check may be made of the wall between the shaft and the uppermost occupied floor areas, to ensure that the direction of flow is from each floor area into the shaft, when the vent to the outside is open and the outdoor air temperature is significantly less than that indoors.

Where mechanically pressurized vestibules are used, a check may be made to ensure that the pressure in each vestibule or area of refuge is greater than that in the adjacent floor areas at each floor level.

Doors to stair shafts, elevator hoistways and vestibules in locations subject to pressure differences that may interfere with normal opening should be checked when the outdoor temperature is near the January design temperature, with the air injection system operating and a number of windows open to the outdoors on each floor in turn.

### A-3.2.7.4.(1) Emergency Power Reliability.

In some areas power outages are frequent and may be of long duration. These local conditions should be taken into account in determining the type of system for supplying emergency power for lighting. This should be studied at the planning stage of a building project in conjunction with the local fire safety and building officials.

### A-3.2.7.6.(1) Emergency Power for Treatment Occupancies.

CSA Z32, “Electrical Safety and Essential Electrical Systems in Health Care Facilities,” contains requirements for three classes of health care facilities – Class A, Class B and Class C. The intent of Article 3.2.7.6. is to apply specific requirements to emergency equipment for Class A facilities, which are designated as hospitals by the authorities having jurisdiction and where patients are accommodated on the basis of medical need and are provided with continuing medical care and supporting diagnostic and therapeutic services.
A-3.2.7.8.(3) Emergency Power Duration. The times indicated in this Sentence are the durations for which emergency power must be available for a building under fire emergency conditions. Additional fuel for generators or additional battery capacity is required to handle normal testing of the equipment, as indicated in the Fire By-law. If the operation of emergency generators or batteries is intended for other than fire emergency conditions, such as power failures, fuel supplies or battery capacity must be increased to compensate for that use.

A-3.2.7.9.(1) Emergency Power Reliability. In some areas power outages are frequent and may be of long duration. These local conditions should be taken into account in determining the type of system for supplying emergency power for building services. This should be studied at the planning stage of a building project in conjunction with the local fire safety and building officials.

A-3.2.7.10.(1) Electrical Conductors. The intent of this Sentence is to provide protection of riser conductors serving components of a building fire alarm and voice communication system and equipment required for smoke control and smoke venting such as fans and dampers. Conductors supplying fire alarm and voice communication system devices, smoke control and smoke venting equipment on individual floors are not intended to be protected in conformance with this requirement.

Conductors supplying fire-fighters’ elevators and fire pumps are intended to be protected in accordance with this requirement from the source of the emergency power supply (emergency generator) to the terminals of the equipment (fire pump or elevator motors).

The following issues for conductor protection are required to be considered:
1. A list of emergency equipment served by the protected conductors,
2. Specific methods of the conductor protection utilized for the project. (See note (a).)
3. Electrical plans indicating the routes for protected conductors from the emergency power supply to the equipment served.
4. The satisfactory operation of electrical equipment supplied by the protected conductors while operating at elevated temperatures (more than 30° C).
5. The protection of riser conductors from potential pressurized hot gases which could travel inside the electrical conduits originating from the fire floor. (See note (b).)
6. Access to electrical riser conductor junctions for maintenance or testing. (See notes (a) & (c).)
   (a) Acceptable protection methods for electrical conductors to ensure the operation of equipment for a period of at least one (1) hour are illustrated in the table below.
   (b) Derating of a conductors’ ampacity may be required. Where conductors are protected in accordance with methods B to F, as illustrated in the table below and where the conductors are sized to accommodate 110% of the rated load current, then no additional derating of conductors is required. Where conductors are protected in accordance with method A, an assessment of the conductors performance (MI cables) under exposure to fire, would need to be provided by an electrical engineer.
   (c) Location of riser conductor junctions in exit stairwells is not acceptable.

Submission of the chosen methods of compliance and the submission of a Schedule B Letter of Assurance needs to be provided by the professional electrical engineer responsible for the project at the design stage. Upon completion of the installation, a Schedule C-B Letter of Assurance would be required.

Acceptable methods for the protection of electrical conductors from fire exposure to ensure operation of the emergency equipment for a period of at least one (1) hour (based on a sprinklered building) are illustrated in the table below.
### Table A-3.2.7.10.

<table>
<thead>
<tr>
<th>Method of Protection</th>
</tr>
</thead>
<tbody>
<tr>
<td>A Provide mineral insulated cables or other cables that conform with the ULC S139 circuit integrity test and are marked “ULC S139 2 hr fire rated” cables.</td>
</tr>
<tr>
<td>B Provide a minimum cover over the conduit of at least 100 mm in concrete, floor slabs or walls that form part of fire separations. Cover from the ends of slabs or walls that form part of the fire separations shall be at least 125 mm.</td>
</tr>
<tr>
<td>C Provide a minimum cover over the conduit of at least 125 mm in concrete columns, beams or walls that are not forming part of a fire separation.</td>
</tr>
<tr>
<td>D Enclose conductors in a shaft enclosure of at least two hour fire resistance construction. These shaft enclosure walls can be of concrete or any ULC, cUL or WH listed wall or shaft wall assembly.</td>
</tr>
<tr>
<td>E Any junction boxes or access points required for the protected conductors shall be protected with listed access panels which have been tested to limit the temperature rise on unexposed side to less than 90° C for one (1) hour. An air space shall be provided between the access panel and the conductors, to ensure that there will be no contact.</td>
</tr>
<tr>
<td>F Conduits leading from protected enclosures to branch circuits must be protected at junction boxes at both ends of the connecting conduit. This protection will consist of plugging the conduits to a depth of at least 12 mm with an approved firestop caulking. An acceptable alternative to the above is to use an EYS fitting at the protected enclosure end.</td>
</tr>
</tbody>
</table>

The above provides options for the protection of electrical conductors. Other solutions may be proposed by a Fire Protection Engineer retained to analyze the arrangement and develop a solution on an equivalency basis for acceptance by the Chief Building Official.

**A-3.2.7.10.(2)(a) and (3)(a) Protection of Electrical Conductors.** It is important to understand that electrical conductors are part of a system that includes – among other components – raceways, conduits, splices, couplings, vertical supports, grounds and pulling lubricants. When selecting electrical conductors to provide a circuit integrity rating, it is therefore important to understand how they will be installed and to know if the fire performance of the system as a whole was tested.

**A-3.2.7.10.(5)(b) Electrical Conductors in the Same Room.** If the distribution panel and the equipment it serves are within the same room, only the electrical conductors leading up to the distribution panel need to be protected. It is assumed that the distribution panel and the equipment it serves are within sufficient proximity to each other such that a fire in the same area of origin would affect both.

**A-3.2.7.10.(7) Fire Alarm Branch Circuits.** In order to ensure continuous operation of the fire alarm and voice communication systems in a high-rise building for a sufficient duration of time to control and direct the evacuation of building occupants, a level of protection is required by Sentence 3.2.7.10.(2) for those electrical conductors interconnecting the major elements of the fire alarm system. Sentence 3.2.7.10.(7) permits the protection of electrical conductors to be waived for portions connecting a transponder or fault isolation device to fire alarm input devices (fire detectors, manual stations, etc.) or a voice communication transponder to a fire alarm audible signalling device, provided all circuits or portions of the circuits are contained within the same storey.

**A-3.2.8.2.(3) Special Protection of Opening.** In manufacturing operations involving the use of conveyor systems to transport material through fire separations, it may not be possible to use standard closure devices. NFPA 80, “Fire Doors and Other Opening Protectives,” includes appendix information concerning protection of openings through vertical fire separations. NFPA 13, “Installation of Sprinkler Systems,” includes methods of protecting openings through floor assemblies, however, it is assumed by that standard that the remainder of the building would be sprinklered. Combinations of methods may be required to ensure that the level of safety inherent in the requirements of the Code is maintained.
A-3.2.8.2.(6)(b) Restriction on Size of Openings Through Floors. The phrase “used only for stairways, escalators or moving walks” is intended to restrict the size of a floor opening to what is necessary to accommodate the stairway, escalator or moving walk.

A-3.2.8.2.(6)(c) Waiver of Occupancy Separation Continuity. The typical application of this Sentence is to buildings with a mixture of occupancies that are randomly located throughout the building. Examples include shopping centres, podiums of large commercial and business complexes, and recreational buildings that are combined with mercantile and business operations. A shopping mall with two interconnected storeys is an example that is frequently encountered in many jurisdictions. The permission to breach the floor assembly between the storeys does not override requirements for separation of specific suites or occupancies.

For instance, although storage garages are Group F, Division 3 occupancies, the requirement in Article 3.3.5.6. for the storage garage to be separated from other occupancies by a fire separation with at least a 1.5 h fire-resistance rating must be observed. In a similar manner, a theatre or cinema (Group A, Division 1 occupancy) must be separated from other occupancies in accordance with Sentence 3.3.2.2.(1) and seats in an arena-type building (Group A, Division 3) must be separated from space below in accordance with Sentence 3.3.2.2.(3).

A-3.2.8.4.(1)(c) Contamination of Vestibule. The vestibule should have equipment capable of maintaining a supply of air into the vestibule that is sufficient to ensure that the air pressure in the vestibule when the doors are closed is higher by at least 12 Pa than the air pressure in the adjacent floor areas when the outdoor temperature is equal to the January design temperature on a 2.5% basis.

A-3.2.8.7.(1) Smoke Exhaust System. The mechanical exhaust system is intended as an aid to firefighters in removing smoke and is to be designed to be actuated manually by the responding fire department. Although smoke is normally removed from the top of the interconnected floor space, exhaust outlets at other locations may be satisfactory.

A-3.2.9.1.(1) Testing of Fire Protection and Life Safety Systems. Building owners should verify that fire protection and life safety systems and their components (i.e. fire alarm systems, sprinklers, standpipes, smoke control, ventilation, pressurization, door hold-open devices, elevator recalls, smoke and fire shutters and dampers, emergency power, emergency lighting, fire pumps, generators, etc.), including their interconnections with other building systems, are functioning according to the intent of their design.

CAN/ULC-S1001, “Integrated Systems Testing of Fire Protection and Life Safety Systems,” provides the methodology for verifying and documenting that interconnections between building systems satisfy the intent of their design and that the systems function as intended by the By-law.

Clause 6.1.5 of CAN/ULC-S1001 allows the Integrated Testing Coordinator to accept documented evidence of any tests that have been performed on a system as part of its acceptance testing for the purpose of demonstrating compliance with the integrated testing requirements of that standard, so as to avoid duplication of work.

A-3.3. Safety Within Floor Areas. Section 3.3. regulates safety within floor areas including rooms and other spaces within a building. The requirements are grouped according to the occupancy of the floor area, room or space, which is not necessarily the same as the major occupancy for which the building is classified. For example, a building may be classified by major occupancy as an office building; therefore, the provisions for structural fire protection and fire protection equipment for office buildings prescribed in Section 3.2. apply. However, within that building, a room or floor area may be used for mercantile, care, treatment, detention, business, residential, industrial or other occupancy.

Life safety for the occupants of any floor area depends in the first instance on the use or occupancy of that floor area. The risks to the occupants occur in the early stages of a fire. These special life risks differ from one occupancy to
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

another and, consequently, must be regulated differently. Section 3.3. regulates risks within floor areas: these requirements apply regardless of the major occupancy of the building that contains the floor areas. For example, an assembly room must comply with the requirements for assembly occupancy whether it is contained in an office building, hospital, hotel, theatre, industrial building or other major occupancy.

Since this By-law regulates new construction, alterations and changes of occupancy, the construction of kiosks and similar structures in public corridors must take into consideration all the requirements that apply to the remainder of the building, including structural fire protection, construction type, finish materials, egress widths and sprinkler installations. Special activities of an occasional nature that were not contemplated in the original design of a public corridor and that represent only a temporary change in occupancy are regulated by the Fire By-law. These regulations include maintaining egress paths clear of obstructions, controlling combustible contents and providing measures to ensure quick response for firefighting.

A-3.3.1.2.(1) Hazardous Substances. The term “hazardous substances” refers to dangerous goods that are regulated by TC SOR/2008-34, “Transportation of Dangerous Goods Regulations (TDGR),” or that are classified as “controlled products” under the “Workplace Hazardous Materials Information System (WHMIS)” established to meet the requirements of HC SOR/2015-17, “Hazardous Products Regulations.” It also refers to materials and products that are not regulated by the TDGR or WHMIS, but that pose a fire or explosion hazard due to their own properties or because of the manner in which they are stored, handled or used.

These include combustible products, rubber tires, combustible fibres, combustible dusts, products producing flammable vapours or gases, etc.

A-3.3.1.2.(2) Cooking Equipment Ventilation. Cooking equipment manufactured for use in dwelling units and other residential suites is often installed in buildings used for assembly and care, treatment or detention purposes. It is not obvious from the By-law requirements or those of NFPA 96, “Ventilation Control and Fire Protection of Commercial Cooking Operations,” whether a ventilation and grease removal system is required in all assembly and care, treatment or detention uses. If the equipment is to be used in a manner that will produce grease-laden vapours that are substantially more than would be produced in a normal household environment, then it would be appropriate to apply the requirements of NFPA 96. If the equipment is used primarily for reheating food prepared elsewhere or is used occasionally for demonstration or educational purposes, there would be no expectation of applying the requirements of NFPA 96. In all cases the circumstances should be reviewed with the authority having jurisdiction.

A-3.3.1.9.(4) Obstruction in Corridor. The sweep of a cane used by blind or visually impaired persons normally detects obstructions that are within 680 mm of the floor. Any obstruction above this height would not normally be detected and can, therefore, create a hazard if it projects more than 100 mm into the path of travel.

A-3.3.1.12.(3) Movable Partitions. Should an emergency situation arise outside of normal working hours but when occupants are still in the space, they could be left without a clear way out. This could occur during inventory or after closing time when all occupants have not yet left, but staff close the door to prevent other persons from entering. In many small tenant areas, the movable partitions (store fronts) provide the only way out. There should always be a second way out or a swinging door within or adjacent to the sliding partitions.

A-3.3.1.13.(4) Door Hardware. The permission to have additional door releasing devices is intended to allow the use of a security chain, night latch or dead bolt to supplement the normal door latching device. These are permitted for dwelling units and locations where guests in a hotel or motel require additional security. The height of these items is also governed by the maximum height stipulated in Sentence 3.3.1.13.(5) to ensure that they can be operated by persons with physical disabilities. This additional hardware should not require appreciable dexterity by the user and the general requirements on the ability to operate the device without the use of keys, special tools or specialized knowledge still apply.
A-3.3.1.13.(6) Controlled Egress Doors. It is intended that Sentence 3.3.1.13.(6) apply to doors used at the perimeter of a contained use area or an impeded egress zone. If the contained use area consists of a single room, the requirements would apply to that room. In the case of individual cells within a contained use area, exterior keyed locks could be used on the cell doors consistent with the fire safety plan and continuous supervision by staff who can release the doors in an emergency.

A-3.3.1.13.(7) Electromagnetic Locking Devices. Electromagnetic locks and similar door control security devices are not intended to be used indiscriminately as alternative to proper security design. Where improperly designed or installed, these may inadvertently entrap or delay persons during an emergency as a result of physically impeding egress or confining egress to high traffic areas. Designers and installers wishing to install electromagnetic locking devices are to demonstrate that the requirements of the By-law have been met.

This demonstration is to include a sequence of operation for the installation of any new maglocks and similar security devices that could singly or in combination, prevent, impede, or otherwise delay occupant egress or emergency responder access. This is to be provided to the Chief Building Official for acceptance, along with any necessary supporting documentation to demonstrate by-law compliance. (See also note A-3.4.6.16.(4).)

A-3.3.1.23.(1) Obstructions in Means of Egress. Obstructions including posts, counters or turnstiles should not be located in a manner that would restrict the width of a normal means of egress from a floor area or part of a floor area unless an alternative means of egress is provided adjacent to and plainly visible from the restricted means of egress.

A-3.3.2.1.(2) Use of NFPA 101. The intention of Sentence (2) is to allow By-law users the option of using NFPA 101, "Life Safety Code," to address the following issues: means of egress; egress routes within assembly occupancies; aisles and access serving seating not at tables; guards and railings; life safety evaluation; and smoke-protected assembly seating. However, opting to use NFPA 101 under this application entails adherence to all the provisions listed in Sentence (2): it is not intended that By-law users randomly select and apply a mix of provisions from both the Building By-law and the NFPA.

A-3.3.2.4.(2) Tablet Arms. Although it is intended that the motion to raise the tablet arm be essentially a single fluid motion, it is acceptable that the motion be a compound motion of raising the tablet arm and including an articulation to allow the tablet to fall back alongside the arm rest.

A-3.3.2.10. Installation Configurations of Handrails in Aisles with Steps. Figure A-3.3.2.10. illustrates possible installation configurations of handrails serving aisles with steps.
A-3.3.1.1 (1) Safety in Care, Treatment and Detention Occupancies. Fire safety for patients in bedroom areas in hospitals and nursing homes with treatment is predicated on the ability of staff to carry out at all times essential life safety functions in accordance with the fire safety plan. Details for a plan are contained in the Fire By-law.

Many factors may affect the ability of staff to carry out life safety functions, including the mobility of patients who cannot fend for themselves and the built-in protection for patients who cannot be moved except under exceptional circumstances.

Should a patient area in a hospital or nursing home with treatment contain factors which would increase the time normally required for staff to evacuate patients or to undertake other life safety measures, consideration should be given to providing additional fire protection measures to ensure that equivalent safety is available.

A-3.3.3.4 (2) Doorway Width. The 1050 mm minimum clear width of doorways accounts for door stops and, thus, is intended to allow for the use of 1100 mm doors.

A-3.3.3.5 (9) Intercommunicating Rooms. Rooms that are interconnected can include more than one sleeping room, together with ensuite toilet rooms, shower rooms, and storage closets used for the storage of personal items of the persons occupying the sleeping rooms. It is not intended that storage rooms for other purposes be included within the group of interconnected rooms.

A-3.3.3.5 (13) Grilles and Louvres. In order to permit the supply of make-up air to compensate for the removal of exhaust air from these toilet rooms, shower rooms and similar spaces, it is permitted to incorporate grilles and
louvres for the transfer of air provided the air movement cannot allow smoke to pass through these spaces to other parts of the building. It is considered that in normal designs the air is exhausted directly to the exterior and is not circulated. If air is to be circulated back to other parts of the building, smoke operated dampers should be included in the air circulating system.

**A-3.3.3.5.(17) Fire Damper Activation.** This requirement is to ensure that fire dampers are activated by any smoke detector in either zone or fire compartment.

**A-3.3.4.4.(1) Landing in Egress Stairway.** A landing level used in an egress stairway from a dwelling unit is not considered to be a storey of that dwelling unit if the landing is used only for pedestrian travel purposes.

**A-3.3.4.4.(7) Travel Distance in a Dwelling Unit.** The egress requirements of 3.3.4.4.(7)(a) are limited by the total travel distance within the dwelling unit. For the purposes of determining this travel distance, only the horizontal component of the travel of travel within the exterior envelope, including any stairs, need be considered.

**A-3.3.4.5.(1) Automatic Locking Prohibited.** Doors that must be manually reset to lock them when they are opened from the inside meet the intent of this requirement.

**A-3.3.6.1.(1) Design of Buildings Containing Dangerous Goods.** Subsection 3.3.6. applies to the short- or long-term storage of products, whether raw or waste materials, goods in process, or finished goods.

This Subsection does not deal with products or materials that are directly supplied to appliances, equipment or apparatus through piping, hose, ducts, etc. For example, the gas cylinders that are mounted on propane barbecues are not covered by Subsection 3.3.6.; they are considered to be “in use” as opposed to “in storage” and are not intended to be regulated by the storage requirements stated in the Fire By-law.

**A-3.3.6.2.(2) Storage of Reactive Materials.** Reactive materials include various classes of unstable or reactive dangerous goods, such as flammable solids, pyrophoric materials, oxidizers, corrosives, water-reactive substances and organic peroxides.

In general, it is unsafe to store highly reactive oxidizers close to liquids with low flash points, combustible products or chemically incompatible products. Quantities of oxidizers or other dangerously reactive materials should therefore be limited and the storage area should be constructed of noncombustible materials, should be kept cool and ventilated, and should not impede egress. In some cases, depending on the quantity and nature of the oxidizing agent, normal fire protection measures (e.g. sprinklers, fire hose and extinguishers) are ineffective due to the self-yielding of oxygen by the oxidizing agent.

When containers of highly reactive oxidizers become damaged or are exposed to excessive heat, humidity or contamination (e.g. sawdust, petroleum products, or other chemicals), a very violent fire or explosion can result. The following oxidizing substances, among others, are known to supply oxygen: organic and inorganic peroxides; pool chemicals (e.g. calcium hypochlorite, sodium dichloroisocyanurate); oxides; permanganates; perhenates; chlorates; perchlorates; persulfates; organic and inorganic nitrates; bromates; iodates; peroxides; perselenates; chromates, dichromates; ozone; perborates.

When containers of dangerously reactive materials become damaged or are exposed to water or humidity, a flammable gas (such as hydrogen, ammonia or methane) or a toxic gas (such as hydrogen chloride, hydrogen bromide or phosphine) can be released.

The following dangerously reactive materials, among others, are known to release a flammable gas in reaction to contact with water or humidity: alkali metals (e.g. sodium, potassium, cesium); reactive metals (e.g. zinc, aluminum, magnesium); metallic hydride (e.g. sodium borohydride, germanium tetrahydride, calcium hydride).
The following dangerously reactive materials, among others, are known to release a toxic gas in reaction to contact with water or humidity: organic and inorganic chloride (e.g. phosphorus trichloride, phosphorus oxide trichloride, acetyl chloride); organic and inorganic bromide (e.g. phosphorus tribromide, aluminum tribromide, acetyl bromide).

A-3.3.6.4.(2) Explosion Venting in Hazardous Locations. When a flammable mixture of air and vapour/gas/dust is ignited and causes an explosion, the exothermic reaction results in the rapid expansion of heated gases and the corresponding pressure waves travel through the mixture at sonic or supersonic velocities. The pressures developed by an explosion very rapidly reach levels that most buildings and equipment cannot withstand unless specifically designed to do so. Explosion venting consists of devices designed to open at a predetermined pressure to relieve internal pressure build-up inside a room or enclosure, hence limiting the structural and mechanical damage. The major parameters to be considered in designing an explosion venting system for a building are:

- the physical and chemical properties of the flammable air mixture, such as the particle size or the droplet diameter, the moisture content, the minimum ignition temperature and explosive concentration, the burning velocity or explosibility classification, the maximum explosion pressure and the rate of pressure rise,
- the concentration and dispersion of the flammable mixture in the room,
- the turbulence and physical obstructions in the room,
- the size and shape of the room, the type of construction and its ability to withstand internal pressures, and
- the type, size and location of relief panels, which should also be designed to reduce the possibility of injury to people in the immediate vicinity of the panels.

A-3.3.6.5.(1) Measurement of Tire Storage Volume. The volume of tires in a storage area can be determined by measuring to the nearest 0.1 m the length, width and height of the piles or racks intended to contain the tires. In racks, the top shelf is assumed to be loaded to maximum possible height, while observing required clearances between structural elements and sprinklers.

A-3.3.6.6.(6) Products Stored with Ammonium Nitrate. Copper and its alloys should not be used where they can come into contact with ammonium nitrate. The presence of copper represents the single biggest hazard with respect to the accidental detonation of ammonium nitrate during a fire.

Steel and wood can be protected with special coatings such as sodium silicate, epoxy, or polyvinyl chloride. Asphalt and similar hydrocarbon-based roof coverings should not be used. Stored ammonium nitrate may become sensitized during a fire if such roof coverings melt and leak into the interior of the building, causing burning droplets to fall on the stored product.

A-3.3.7.7.(2) Security for Storage Garage The requirements of Sentence 3.3.7.7.(2) are intended to provide improved visibility into or out of a stair tower or vestibule which might otherwise occlude the line of sight of building occupants as a result of intervening construction. Glazing must provide the maximum practical improvement to visibility to improve occupant safety. The term ‘stair tower’ used in this Sentence is intended to apply to vertical stair enclosures connecting more than one floor or containing superimposed flights of stairs.

A-3.3.7.9. Multi-family Residential Mailbox Construction. The direct and indirect cost to persons as a result of mail theft are of increasing significance. The minimum construction requirements of the Building By-law are intended to reduce the risk of letter mail theft by resisting or discouraging this form of crime of opportunity. These requirements are not specifically intended to address parcel theft. The requirements of Article 3.3.7.9. are intended to conform with minimum standards required by Canada Post as required by Schedules II and III of the Federal Mail Receptacles Regulations SOR-83-743 as it pertains to “mail box assemblies” (defined term).

A-3.4.1.1.(1) Type of Exit Facility. The requirements for exits in Section 3.4. were developed for new construction. If alterations are made to an existing building or changes of occupancy occur, other design solutions than those in Section 3.4. may have to be developed to maintain an acceptable level of safety if it is not practicable to fully conform
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

to the requirements of this Section. In some cases the use of fire escapes to supplement the existing exit facilities may be the only practicable solution. Because of the variety of conditions that may be encountered in existing buildings, it is difficult to standardize or codify such requirements.

Alternative means of providing acceptable levels of safety may have to be tailored to the particular building design. In all cases, however, the requirements described in Section 3.4. are intended to provide the level of safety to be achieved. If alternative measures are used, they should develop the level of safety implied in these requirements.

A-3.4.1.6.(2) Sleeping Area. Areas serving patients’ sleeping rooms include sleeping areas and areas where patients are taken for treatment.

A-3.4.2.3.(1) Least Distance Between Exits. The least distance measurement does not apply to each combination of exits on a multi-exit storey. It only applies to at least 2 of the required exits from that storey.

A-3.4.3.2.(6) Evacuation of Interconnected Floor Space. This Sentence ensures that egress facilities allow for the simultaneous evacuation of all portions of an interconnected floor space. It does not contemplate the phased evacuation of occupants; thus in buildings where that type of evacuation is intended, fire protection requirements in addition to those prescribed in the By-law may be necessary.

In the first instance, this Sentence provides for cumulative exiting that can accommodate the efficient movement of all occupants in the exit stairs. Clause 3.4.3.2.(6)(a) permits an alternative approach that will accommodate all the occupants in the stairs but will restrict the egress flow rate. Clause 3.4.3.2.(6)(b) provides a second alternative that assumes the occupants must queue before entering the stair. A “protected floor space” conforming to Article 3.2.8.5. is intended to provide an intermediate area of safety that is protected from the hazards of the interconnected floor space. It does not provide a holding or refuge area for all occupants of a floor area for an extended period of time. To ensure that evacuation is not unduly delayed and that queuing of the occupants in the protected floor space can be accommodated, requires careful consideration in the design of the interface between the interconnected floor space/protected floor space/exit.

It is not appropriate, for example, to share a common vestibule in complying with Sentences 3.2.8.4.(1) and 3.2.8.5.(1). Under evacuation conditions, occupants entering the vestibule would flow towards the exit, as opposed to the protected floor space, thus resulting in queuing outside the vestibule and potential exposure to fire. To comply with the intent, it is necessary to design the egress path such that the occupants enter the protected floor space through a vestibule, then in turn enter the exit stair from the protected floor space. In addition, sufficient space should be provided between the vestibule and the exit to allow for the queuing of occupants in the protected floor space.

A-3.4.3.2.(6)(a) Temporary Safety Area. The objective of Clause 3.4.3.2.(6)(a) is to provide an area of temporary safety in the exit stair shafts for the occupants of the interconnected floor space. This requirement is considered to be met if 0.3 m² per person is provided in the stair shaft between the floor level served and the floor level immediately beneath it.

A-3.4.3.4. Clear Height and Width. Clear height is intended to be measured from a line tangent to the nosings extended to the underside of the lowest element above the walking surface, over the clear width of the exit (See Figure A-3.4.3.4.). Examples of low elements above the walking surface include light fixtures or sprinkler heads and piping. Clear width is intended to be measured from a line tangent to horizontal protrusions such as handrails.
A-3.4.4.2.(2)(e) Requirements for Lobby. If an exit is permitted to lead through a lobby, the lobby must provide a level of protection approaching that of the exit. As well as meeting the width and height requirements for exits, the lobby must be separated from the remainder of the building by a fire separation having a fire-resistance rating at least equal to that required for the exit, unless one of the exceptions in this Clause is applied.

A-3.4.5.1.(2)(c) Graphical Symbols for Exit Signs. ISO 7010, “Graphical symbols – Safety colours and safety signs – Registered safety signs,” identifies the following internationally recognized symbols for use at required exits.

Figure A-3.4.5.1.(2)(c)-A
“E001 Emergency exit (left hand)” (E001) symbol from ISO 7010

Figure A-3.4.5.1.(2)(c)-B
“E005 Direction, arrow (90°-degree directional arrow (E005) increments), safe condition” symbol from ISO 7010

A-3.4.5.1.(3) Internally Illuminated Signs. Photoluminescent signs are not internally illuminated and therefore must conform to Sentence 3.4.5.1.(4).
A-3.4.5.1.(4) Externally Illuminated Signs. An external lighting source is required to properly charge photoluminescent signs. In addition to being continuously illuminated as required by Sentence 3.4.5.1.(4), these types of signs must be lit in conformance with the charging requirements indicated on the exit signs in accordance with CAN/ULC-S572, “Photoluminescent and Self-Luminous Exit Signs and Path Marking Systems.”

A-3.4.6. Application to Means of Egress. The requirements in Subsection 3.4.6. apply to interior and exterior exits, as well as to ramps, stairways and passageways used by the public as access to exit. The treads, risers, landings, handrails and guards for the latter access to exit facilities must thus be provided in conformance with the appropriate requirements for exit facilities.

A-3.4.6.4. Dimensions of Landings. A landing is a floor area provided at the top or bottom of a flight of stairs or a ramp, or a platform built as part of a stairway or ramp. Landings provide a safe surface for users to rest upon, allow design flexibility, and facilitate a change in direction.

Figure A-3.4.6.4. illustrates how to measure the length of a landing for various landing configurations turning less than 90°, including straight landings.
Notes to Figure A-3.4.6.4.: 
(1) $L_1 + L_2 =$ length of the landing = the lesser of the required width of the stair or ramp, or 1 100 mm 
See Sentences 3.4.6.4.(2) and 9.8.6.3.(2).
(2) $D =$ distance from the narrow edge where the length of the landing is measured = half the required length of the landing 
See Sentences 3.4.6.4.(3) and 9.8.6.3.(3).

A-3.4.6.5.(4) Wider Stairs than Required. The intent of Sentence 3.4.6.5.(4) is that handrails be installed in relation to the required exit width only, regardless of the actual width of the stair and ramp. The required handrails are provided along the assumed natural path of travel to, from and within the building.
A-3.4.6.5.(10) Continuity of Handrail. Blind or visually-impaired persons rely on handrails to guide them on stairways. A continuous handrail will assist them in negotiating stairs at changes in direction. The extended handrail is useful to persons with physical disabilities to steady themselves before using the stairs. Handrails should, however, return to the wall, floor or post, so as not to constitute a hazard to blind or visually-impaired persons.

A-3.4.6.10.(5) Door Swing. Although it is required that the door on the right hand side of a pair of doors shall swing in the direction of travel through the exit, the direction of swing of the door on the left side will depend on the function of the horizontal exit. If the horizontal exit provides for movement from one building to the adjacent building but does not require movement in the reverse direction, both doors must swing in the direction of travel to the adjacent building. If the design is based upon both buildings providing complementary movement in either direction, then the doors must swing in opposite directions. Location of a required exit sign directly above a door that swings in the direction of travel is deemed to meet the intent of Clause 3.4.6.10.(5)(b).

A-3.4.6.11.(4) Exit Concealment. Hangings or draperies placed over exit doors may conceal or obscure them.

A-3.4.6.16.(1) Fastening Device. Turnpieces of a type which must be rotated through an angle of more than 90° before releasing a locking bolt are not considered to be readily openable. The release of a locking bolt should allow the door to open without having to operate other devices on the door.

A-3.4.6.16.(4) Electromagnetic Lock. Electromagnetic locks are intended for use where there is a need for security additional to that provided by traditional exit hardware. They are not intended for indiscriminate use as alternative locking devices.

The design of these devices requires evaluation to ensure that their operation will be fail-safe in allowing exiting in the event of foreseeable emergencies. If more than one locking device is used in a building, it is expected that one switch will release and reset all devices simultaneously.

A-3.4.6.16.(4)(h) Time Delay for Electromagnetic Locks with Proximity Sensors. For the purposes of Clause 3.4.6.16.(4)(h), a door provided with a hardware arrangement complying with Sentence 3.4.6.16.(7) is not considered to have a delay.

A-3.4.6.16.(5) Electromagnetic Locks in Care and Treatment Occupancies. The installation of electromagnetic locks in care and treatment occupancies requires special provisions to address the compromised condition of residents and the nature of daily operations. Accordingly, to reduce the incidence of false operation by residents, transparent boxes that set off an audible signal when opened can be installed to cover the manual stations. Also, one optional additional release device (e.g. swipe card device, key pad) can be installed to facilitate the free movement of staff and visitors in the building.

A-3.4.6.17.(1) Special Security for Doors. The need for security in banks and in mercantile occupancies requires the ability to use positive locking devices on doors that may not readily be opened from inside the building. In a fully sprinklered building, the risk to persons inside the building is substantially reduced. The provisions of Sentences 3.4.6.17.(2) to (9) assume that the area is illuminated and that a means of communication is available to any occupant during times that the doors are locked.

A-3.4.6.19.(1)(d) Colour Contrast. The identification of floor and other signs intended to facilitate orientation for visually-impaired persons should offer maximum colour contrast to be effective. For this reason, it is recommended that white on black or black on white be used, as this combination produces the best legibility. It is also recommended that the sign surfaces be processed to prevent glare.
A-3.5.2.1.(1) Elevator Design. The reference to the Elevating Devices Safety Regulation in this Sentence implies conformance with all requirements of that standard for elevator cars, hoistways, pits and machine rooms, including restrictions on other services in these areas and detailed design criteria.

A-3.5.4.1.(1) Elevator Car Dimensions. In some circumstances it is necessary to maintain a patient on a stretcher in the prone position during transit to a hospital or to treatment facilities. Inclining the stretcher to load it into an elevator could be fatal or at the very least detrimental to the patient’s health. Many ambulance services use a mobile patient stretcher whose size is 2010 mm, long and 610 mm wide. As well as space for the stretcher in the elevator, there should be sufficient additional space for at least two attendants who may also be providing treatment during transit. Common elevator units that can satisfy this requirement include:

- a 1134 kg elevator car with minimum interior dimensions of 2032 mm wide and 1295 mm deep with a right or left hand access door. The minimum access door width is 1067 mm and it must be on the 2032 mm side of the car.
- a 1134 kg elevator car with minimum interior dimensions of 2 032 mm deep and 1295 mm wide with a minimum 915 mm wide access door located on the 1295 mm side.

Limited-use/limited-application (LULA) elevators are limited in size, capacity, speed and rise and are not expected to meet the minimum elevator car dimensions stated in Sentence (1).

A-3.6.2.5.(1) Combustible Refuse Storage. Storage of refuse consisting of combustible materials including waste paper, cardboard and plastic, and noncombustible materials such as glass and metallic containers can be accumulated in these rooms for the purpose of recycling. This storage is allowed in consideration of a less stringent collection schedule when compared to that of garbage or refuse, which is collected regularly.

A-3.6.3.1.(1) Vertical Service Spaces. Sentence 3.6.3.1.(1) does not prohibit the internal subdivision of a vertical service space to allow different building services to be installed in physically separated spaces unless other requirements apply (See, for example, Sentences 3.2.7.10.(2) and (3)). Fire separation requirements apply to the perimeter of the group of service spaces.

Article 3.6.3.3. has special requirements for linen chutes and refuse chutes.

A-3.6.3.5. Grease Duct Enclosures. NFPA 96, “Ventilation Control and Fire Protection of Commercial Cooking Operations,” presents two options for enclosing grease ducts for commercial cooking equipment: the first option is to use continuous fire-rated building component assemblies to enclose the ducts and the second one consists of installing proprietary, fire-rated, field-applied or factory-built grease duct assemblies in accordance with the manufacturer’s instructions. These types of enclosure assemblies are evaluated for their resistance to fire and their ability to protect adjacent combustibles through reduced clearances.

Although NFPA 96 references other standards that deal with grease duct assemblies, Sentence 3.6.3.5.(2) requires that CAN/ULC-S144, “Fire Resistance Test – Grease Duct Assemblies,” be used to determine the fire-resistance rating of factory-built and field-applied grease duct assemblies.

A-3.6.4.2.(2) Ceiling Membrane Rating. In construction assemblies that utilize membrane ceiling protection and have been assigned a fire-resistance rating on the basis of a fire test, the membrane is only one of the elements that contribute to the performance of the assembly and does not in itself provide the protection implied by the rating. For
the fire-resistance rating of membrane materials used in this form of construction, reference should be made to the results of fire tests which have been conducted to specifically evaluate the performance of this element.

**A-3.6.5.6.(2) Clearance for Warm-Air Supply Ducts.** Applicable to forced-air furnaces where permissible clearance $C$ above plenum is 75 mm or less.

![Figure A-3.6.5.6.(2) Clearance for warm-air supply ducts](image)

**A-3.6.5.6.(3) Clearance for Warm-Air Supply Ducts.** Applicable to forced-air furnaces where permissible clearance $C$ above plenum is more than 75 mm but not more than 150 mm.

![Figure A-3.6.5.6.(3) Clearance for warm-air supply ducts](image)

**A-3.6.5.6.(4) Clearance for Warm-Air Supply Ducts.** Applicable to forced-air furnaces where permissible clearance $C$ above plenum is more than 150 mm.

![Figure A-3.6.5.6.(4) Clearance for warm-air supply ducts](image)

**A-3.7.2.2.(1) Water Closets.** Other than where gender neutral washrooms (See 3.7.2.11.) are provided, Sentence 3.7.2.2.(1) assumes that there will be a sufficient number of persons in the building to justify the provision of separate water closet facilities for both males and females. In some circumstances overall low occupant loads would not require more than one water closet for males and one water closet for females and yet the building has more than one storey.

It is deemed that rooms each containing a single water closet available for both males and females would satisfy the intent of the By-law. The total number of water closets must be adequate for the total number of occupants.
case of universal and gender neutral washroom facilities, the acceptable number of water closets should be based upon the equivalent number of fixtures that would otherwise be provided.

Requirements for accessibility also need to be considered. If the entrance storey is accessible and the upper storeys are not required to be accessible, a room in the accessible storey must meet the requirements of Section 3.8. and can serve both males and females. If provided, a nonaccessible room, designed to serve both males and females, in each nonaccessible upper storey would be acceptable. Sentence 3.7.2.2.(4) permits a single water closet to serve both males and females if the total occupant load is low.

**A-3.7.2.11. Gender Neutral Washroom Requirements**

The gender neutral washroom requirements of the Building Bylaw introduce a new option for owners, operators, and employers to provide washroom facilities that do not impose unreasonable restrictions on persons who wish to use the washroom facility. The requirements of the Building Bylaw represent the minimum level of performance necessary to achieve the goals of personal security and functionality for all persons.

The intent of the gender neutral washroom is that they may replace washrooms that would otherwise be required by the Building By-law. Where gender neutral washrooms are provided, these are to be assigned proportionally as male or female, for the purposes of determining the building washroom capacity under Section 3.7 of the Building By-law. It is not intended that the gender neutral washrooms be assigned solely as contributing to the male or female washroom capacity exclusively, nor were these to be considered supplemental to the minimum washroom requirements of the building.

Signage for gender neutral washrooms are to reflect the intended use not only by persons outside the gender binary, but also by people with disabilities, the elderly, and anyone else who may require the assistance from someone of another gender. As such, signage denoting this use is recommended to be neutral in tone and nature. Likewise, the iconography associated with these signs is also suggested to be indicative of the facility usage and function, and not of the individual who may use the facility.

The provision of regulations for gender neutral washrooms does not mean the elimination of gender-type washrooms. Typed washrooms, such as men’s or women’s multi-stall washrooms, and universal single-user washrooms may remain. It is up to each person to self-determine which washroom is most appropriate for them based on their gender identity. Further clarifying text may be added to washroom signage to signal that all persons are welcome.

**A-3.8. Accessible Design Assumptions.** This Section contains minimum provisions to persons with disabilities.

**Building Access Handbook**

An illustrated guide and commentary has been produced to assist users of Section 3.8. and other access requirements of the British Columbia Building Code. This handbook contains the entire text of Section 3.8. and other access requirements, and is supplemented by commentary and illustrations on specific requirements.

**A-3.8.2.1. Accessibility.** Industrial buildings often pose a greater risk to their occupants due to the presence of significant quantities of dangerous materials or the use of hazardous processes. For example, plants which are classified as Group F, Division 2 or 3, may store and use toxic or highly flammable substances in significant quantities, or house processes which involve very high temperatures and which have a high degree of automation. In some facilities, particularly in primary industries such as forestry and metallurgy, the construction normally used and the operations carried out within the space can make compliance with the requirements of Section 3.8. impracticable. It is therefore intended that these requirements be applied with discretion in buildings of Group F, Division 2 or 3 major occupancy. However, where industrial buildings contain subsidiary occupancies, such as offices or showrooms, it is reasonable to require that accessibility be provided in these spaces.
A-3.8.2.1.(1)(f) and (g) Access to Small Storeys. Elevators and elevating devices can be expensive and in small buildings may form a significant percentage of a building’s cost. This Clause is intended to exempt such small second storeys or basements from access requirements when they are self-contained or contain the same facilities as on the accessible storey. An example where access is not required is the second storey of a restaurant which contains only additional seating. If, on the other hand, the restaurant’s washrooms are in the less than 600 m² basement there must be access to them as they are an integral part of the principle function and occupancy on the accessible storey. Likewise, staff lunchrooms and washrooms are integral with the principle function and when they are on a small second storey or mezzanine they must be accessible when a person with disabilities could reasonably be expected to be employed there.

This exemption applies to buildings with not more than one storey above the first storey. A building with two or more storeys above the first storey must be fully accessible. Mezzanines that are not considered as storeys for the purposes of determining building height are considered storeys for the purposes of applying Clauses 3.8.2.1.(1)(f) and (g).

A-3.8.2.2. Entrances. An accessible route should exist from the sidewalk or roadway and parking area to an accessible building entrance. This route should be located so that persons with physical disabilities do not have to pass through dedicated smoking areas or behind parked cars. Accessible routes should coordinate with the routes to other buildings and to public transportation stops.

To provide more general access to buildings, not less than 50% of the pedestrian entrances are required to be accessible. This should include a principal entrance. If the 50% calculation results in a fraction, the number of accessible entrances should be the next higher unit value. For the purpose of determining the number of entrances to a building, several adjacent doors in a bank of doors are considered to be a single entrance. If an intercom system is provided, the system shall comply with the requirements for controls and should be usable by persons who communicate using visual language such as a video system.

A-3.8.2.3. Access to Rooms and Facilities. If access is required into suites or rooms in Subsection 3.8.2., it is intended that access be provided, with some exceptions identified in Sentence 3.8.2.3.(2), throughout each room or suite including access to all facilities and areas. Some examples of where access is required are as follows:
- within each suite (subject to Clauses 3.8.2.3.(2)(h) to (j).)
- within rooms or areas that serve the public or are designated for use by visitors, including interview rooms, holding rooms, changing rooms, areas in assembly occupancies with fixed seats so as to provide viewing of any entertainment areas, display areas and merchandising departments,
- within each type of membership facility,
- within rooms or areas for student use in assembly occupancies,
- within general work areas, including office areas and areas with lockers,
- within general use or general service areas, including shared laundry areas in residential occupancies, recreational areas, cafeterias, lounge rooms, lunch rooms and infirmaries,
- within sleeping rooms in hospitals and nursing homes with treatment,
- (if installed), into at least one passenger elevator or elevating device conforming to Articles 3.5.2.1. and 3.8.3.7.,
- into washrooms described in Sentences 3.8.2.8.(1) to (3),
- to any facility required by this Section to be designed to accommodate persons with physical disabilities,
- onto every balcony provided in conformance with Clause 11.3.7.1.(1)(c),
- to service counters used by the general public (examples include sales counters, refreshment stands, drinking fountains, cafeteria counters, checkout counters and bank service counters), and
Division B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

• to equipment designed to serve the public including self-serve kiosks, automated banking machines and night deposit boxes.

Where one or more hairdressing sinks are provided in barber shops, hairdressing shops and beauty parlors, at least one shall be useable by persons using in wheelchairs. Where fitting rooms are provided in a store, an accessible fitting room is required. An enclosure not less than 1 500 mm by 1 500 mm is suggested.

The permission to waive an accessible path of travel for wheelchair access to certain specified areas of a building is not intended to waive accessibility requirements for persons whose physical disabilities do not require special provision for access to raised or sunken levels. Persons with vision impairments or who are deaf or hard of hearing that do not require the use of a wheelchair can be expected to move throughout a building.

The concept of providing similar amenities and facilities applies, among other things, to food, beverage, and entertainment facilities within restaurants, to smoking and non-smoking areas permitted in accordance with local regulations, and to window areas providing a view of an exterior attraction.

Availability of specific spaces depends on reservation policy and the sequence in which patrons arrive at a restaurant or other facility, and therefore is beyond the scope of this By-law.

Accessibility “within” a floor area means that in general all normally occupied spaces and levels are to be accessible, except those areas which are deemed not to require access. Examples of normally occupied floor areas include lobbies and passageways where persons are intended to use or pass through, but do not include spaces that are not normally used by the occupants such as storage platforms in industrial and other occupancies.

Further, an accessible path of travel should be provided where buildings are networked together and as a connection to public transportation stops.

A-3.8.2.4.(1) Path of Travel to Storeys Served by Escalators and Moving Walks. In some buildings, escalators and inclined moving walks are installed to provide transportation from one floor level to another floor level so as to increase the capacity to move large numbers of persons. Some buildings located on a sloping site are accessible from street level on more than one story and an escalator or inclined moving walk is provided for internal movement from floor to floor. In both these situations, a person with a physical disability must be provided with an equally convenient means of moving between the same floor levels within the building. This can be accomplished by providing elevators or a platform-equipped passenger-elevating device.

A-3.8.2.5. Parking Areas. In localities where local regulations or bylaws do not govern the provision of or dimensions of accessible parking spaces, the following provides guidance to determine appropriate provisions. If more than 50 parking spaces are provided, parking spaces for use by persons with physical disabilities should be provided in the ratio of one for every 100 parking spaces or part thereof. Where parking spaces are provided, parking spaces for use by persons with physical disabilities should also be provided for each accessible viewing position and for each accessible sleeping room or bed space. Parking spaces for use by persons with physical disabilities should (1) be not less than 2400 mm wide and provided on one side with an access aisle not less than 1500 mm wide, (2) have a firm, slip-resistant and level surface, (3) be located close to an entrance required to conform to Article 3.8.2.2., (4) be clearly marked as being for the use of persons with physical disabilities, and (5) be identified by a sign located not less than 1500 mm above ground level, with the International Symbol of Access (Figure A-3.8.2.5.-A).
Divison B: Acceptable Solutions

Part 3 – Fire Protection, Occupant Safety and Accessibility

Figure A-3.8.2.5.-A
International Symbol of Access™ sign

Asphalt, concrete and firm, compacted gravel are acceptable parking surfaces. Curb ramps should be not less than 1,500 mm wide. Parallel parking spaces should be not less than 7,000 mm long. If more than one parking space is provided for persons with physical disabilities, a single access aisle can serve two adjacent parking spaces. The arrangement shown in Figure A-3.8.2.5.-B allows the shared use of an access aisle to serve two adjacent parking spaces provided for use by persons with physical disabilities. Parking to accommodate vans and other vehicles equipped with platform lifts or side ramps should be provided greater dedicated space.

The design of the path of travel should accommodate loading to and from lifts and ramps, where intended. Vertical clearance must also be considered.

Figure A-3.8.2.5.-B
Shared access aisle

A-3.8.2.5.(1) Path of Travel to Parking. It is not intended that a separate accessible entrance must be provided from the parking area. The designer may choose to designate the entrance leading to the parking area as the required entrance or to provide a properly identified and unobstructed path of travel from the parking area to the entrance which is accessible. The entrance chosen should, in any case, be the closest entrance to the parking area and one normally used by the occupants of the building. Long paths of travel are not recommended.
A-3.8.2.6.(1) Application to Security Access Systems. Sentence 3.8.2.6.(1) is not intended to reduce the functionality of security devices that limit access to secure areas and are addressed by other Sections of the Building By-law.

A-3.8.2.6.(2) Electrical Outlets. Electrical outlets intended for occupant use shall be located so that their height above the finished floor is not a barrier to use. Outlets that are dedicated for specific equipment or functions and not intended to be readily available to occupants need not conform to the location requirements.

A-3.8.2.8.(1) to (3) Washrooms. The primary intent of this requirement is that all regular washrooms be made accessible to all persons, including persons with disabilities, primarily persons who must use a wheelchair. Well-designed washrooms which can accommodate persons with disabilities need not be much larger than conventional washrooms.

The exception in Clause 3.8.2.8.(2)(b) recognizes situations where several washrooms may be provided on a large floor area. In such a case, not all washrooms need to be accessible, provided that an accessible washroom is available within a reasonable distance (45 m) of one that is not and that the location of that accessible washroom is clearly indicated as required by Sentence 3.8.2.10.(2). However, where several washrooms are provided in an area together, the accessible washrooms should be included among them.

Clause 3.8.2.8.(2)(d) is intended to address “strip malls” (a shopping mall with no public corridor). Section 3.7., which requires plumbing facilities, does not address the concept of suite and could permit, for instance, a shopping mall containing only mercantile occupancies to have only one washroom for each sex located in any one of the suites. It is desirable, however, that washrooms be located so as to be accessible at all times, since the owner or tenant of one suite has no control over the activities of another. These buildings may have either public accessible washrooms in a central location or washrooms which can accommodate persons with physical disabilities in each suite. This arrangement relieves any one tenant from having to provide “public” washrooms. Hence, the exception is meant as a relaxation to avoid an unnecessary burden on small facilities but should not be construed as meaning that these buildings need not provide accessible Sentence (3) requires an accessible universal washroom in every building required to have water closets. There are a significant number of persons with disabilities whose daily lives depend on assistance from their spouse or a care giver of the opposite sex. Providing this assistance in multiple stall public washrooms can be an added challenge. The universal washroom not only solves this problem but also serves the needs of other persons with disabilities who simply prefer the relative ease of using a universal washroom. It can also serve as a washroom for parents with small children and, with the addition of a counter, as a changing room for infants.

A-3.8.2.8.(9) Drinking Fountains. Similar to drinking fountains designed and located to be accessible, bottle filling stations should also be designed and located to be accessible. Drinking fountains and bottle filling stations should be indicated with appropriate signage.

A-3.8.2.9. Assistive Listening Devices. Assistive listening devices may be used where audible communication is expected but may be obstructed, such as at screened ticket windows or service counters in noisy areas. Available assistive listening devices should be indicated with appropriate signage.

A-3.8.2.11.(1) Counters with Work Surfaces. It is not intended that all counters be accessible, but that sufficient accessible counter space be available. Examples of counters that should be accessible for the purposes of extended business transactions include teller counters in financial institutions and reception areas as well as any counter at which processing and signing of documents takes place. The provision is not intended to apply to the simple exchange of money for goods or services such as at a retail check-out counter or check-in counters where tickets are presented, or to work surfaces in industrial occupancies.
A-3.8.3.1.(2) Enhanced Accessibility for Residential Buildings. These measures are designed to provide a series of modest accessibility improvements to multi-unit residential buildings at minimal cost, using some of the concepts of universal design. They are designed to enable disabled persons to visit and socialize with people in their homes. They also include simple provisions which will facilitate future adaptation of a dwelling unit so that the unit may be occupied by a person with a range of physical mobility restrictions, and are intended to extend the length of time that elderly persons may remain safely in their own homes.

It should be noted that these improvements apply only to newly constructed multi-unit residential buildings containing three or more suites and served by an elevator and a common corridor. They are NOT intended to provide full accessibility and do not, except where explicitly stated, require conformance to Article 3.7.2.10. and Articles 3.8.1.1. to 3.8.2.3.

A-3.8.3.1.(1) Accessible Design Standards. By-law users who opt to apply the CSA B651 provisions listed in Table 3.8.3.1. must do so without exception: they cannot randomly select and apply a mix of provisions from the Building By-law and that standard.

A-3.8.3.2.(2) Surfaces in an Accessible Path of Travel. Floor finishes, including walk-off matts and carpet, should be selected, installed and securely fixed to provide a firm and stable surface so that persons using wheelchairs, walkers or other mobility aids can easily travel over them without tripping or expending undue energy. Other than very high-density, short-pile carpeting, most carpeting does not meet these criteria. Furthermore, where the path of travel is exposed to intense light conditions, such as daylight or directional lighting, a low-glare or matte floor surface should be selected, as glare from floor surfaces can influence all users' perception and be particularly problematic for persons with low vision. For the same reasons, heavily patterned flooring should also be avoided.

A-3.8.3.2.(3) Passenger-Elevating Devices. Inclined moving walkways that are used to provide access should not have a running slope steeper than 1 in 20.

A-3.8.3.2.(6)(a) Mechanical Lifts. The provisions for mechanical lifts are not intended for general use to provide accessibility in an exterior location due to its susceptibility to weather or lack of maintenance. It is therefore intended that these be installed only where topography or other similar existing site constraints necessitate the use of a platform lift as the only feasible alternative. USADA While the site constraint must reflect exterior conditions, the lift can be installed in the interior of a building. For example, a new building constructed between and connected to two existing buildings may have insufficient space to coordinate floor levels and also to provide ramped entry from the public way. In this example, an exterior or interior platform lift could be used to provide an accessible entrance or to coordinate one or more interior floor levels.

A-3.8.3.4.(2) Parking Requirements for Persons with Disabilities. The number, size and headroom clearance required for parking stalls for persons with disabilities must comply with the City of Vancouver Parking By-law. It should be noted that under the authority of the Parking By-law, the number of parking stalls for persons with disabilities may be relaxed by the Director of Planning. Unless specifically relaxed by the Director of Planning, the following table outlines the required number of parking stalls for persons with disabilities in accordance with Section 4 of the Parking By-law:

In accordance with Section 4 of the Parking By-law, all parking stalls for persons with disabilities are required to be provided with a minimum width of 4.0 m, a length of 5.5 m and a vertical clearance of 2.3 m. The minimum 2.3 m vertical clearance must be provided above the disability parking stall as well as above the entrance and drive aisle providing access to the required disability parking space in accordance with Section 4 of the Parking By-law. These requirements are intended to apply to existing buildings only where it is reasonable. In cases where no development permit is required, the Chief Building Official, in consultation with the Director of Planning and the City Engineer, may relax the length, width and vertical clearance.
requirements for existing buildings where the provisions cannot be reasonably accommodated. Relaxations for the size and vertical height clearance of disabled parking stalls may be granted to development permit applications by the Director of Planning in consultation with the Chief Building Official and City Engineer.

One additional disability parking space

For any portion of each additional 50 parking spaces

For any portion of each additional 15 parking spaces

For any portion of each additional 100 parking spaces

Notes to Table A-3.8.3.4.(2):

Column 1 – Multiple dwelling units, retail uses, hospitals, health care offices, health enhancement centres, animal clinics, hotels, churches, chapels, funeral homes, places of worship or similar places of assembly.

Column 3 – Office, theatre uses and all other uses not mentioned for Columns 1 and 2.

A-3.8.3.5.(1)(b) Ramp Slopes. Ramps with a slope of more than 1 in 16 can be very difficult for persons with certain physical disabilities to manage. Even though they pose less of a problem for persons using motorized wheelchairs, these ramps can be unsafe to descend, especially in cold climates. Although Article 3.8.3.5. permits slopes on ramps as great as 1 in 12 for distances of up to 9 m, slopes of 1 in 20 are safer and less strenuous. When limited space is available, as may be the case during renovations, ramps with a slope of up to 1 in 12 should be restricted to lengths not exceeding 3 m whenever possible. A strip contrasting in colour and texture should be used at the top and bottom of ramps to warn persons with low or no vision.
Figure A-3.8.3.5.(1)(c)
Landing design at doorways leading to ramps

**A-3.8.3.5.(4)(a) Surface of Ramps.** Sentence 3.8.3.2.(2) requires that all walking surfaces in an accessible path of travel be stable and firm to limit the effort required by persons using wheelchairs or other mobility aids. Therefore, Sentence 3.8.3.5.(4) requires that hard or resilient flooring be used on the surfaces of steeper ramps. Furthermore, carpet and like materials should not be installed on any ramp.

**A-3.8.3.6.(2) Doorway Width.** Standard wheelchair width specifications indicate a range of sizes from 584 mm overall to 685 mm overall. Every doorway that is located in an accessible path of travel must have a clear width of not less than 850 mm when the door is in the open position and therefore it is important that this dimension be measured correctly. Figure A-3.8.3.6.(2) shows a door opened to 90°. It is clear that the door, and to a lesser extent the stop, impinges on the space within the door frame. The clear width of not less than 850 mm is measured from the face of the door in the open position of 90° to the doorway to the outside edge of the stop on the door frame. It is not sufficient just to measure the inside width of the door frame. The hardware selected on sliding doors, such as d-shaped handles, may result in a clear width being substantially less than the inside dimension of the door frame. The clear width for sliding doors is measured from the edge of the open door to the outside edge of the stop on the door frame. Other factors, including location of door stops other than on the door frame, and the installation of door closers and exit devices, should be taken into account. The intrusion of a door handle or an exit device into the space is of lesser importance because its height above the floor does not typically obstruct passage of a wheelchair. It is recognized that there are many types of door frame and door mounts but the overall objective is to maintain a clear width of not less than 850 mm. The diagram Figure 3.8.3.6.(2) depicts a somewhat restrictive scenario, as many doors can open wider than 90°, however, a door smaller than 914 mm would not likely be wide enough to ensure the minimum clear width of 800-850 mm that is required. Swing of a door beyond 90° may be of less benefit as extended reach to close the door may be required once the doorway is passed through.

In a doorway with multiple swinging leaves, the active leaf must be capable of providing the required clear width in the open position. The clear width is then measured from the face of the active leaf, in the open position of 90° to the doorway, to the outside edge of the adjacent leaf when the adjacent leaf is in the closed position.
A-3.8.3.6.(3) **Washrooms in Residential Occupancies.** This requirement ensures that the doorway to the washroom in a dwelling unit or a hotel or motel suite is at least large enough to accommodate someone using a wheelchair. The By-law does not require these washrooms to be accessible, in order to avoid a set of prescriptive requirements which could limit design flexibility.

However, it is relatively simple to make washrooms accessible through careful planning and positioning of fixtures and this can be achieved in an area not much larger than that of conventional washrooms.

![Residential washrooms](image)

A-3.8.3.6.(4) **Lever Handles.** Lever handles are usable by most persons with limited hand mobility and will meet the intent of this requirement. Lever handles with an end return towards the door are less prone to catch the clothing of someone passing through the doorway. Large D-shaped handles should be used on sliding doors.

A-3.8.3.6.(6) and (7) **Doors with Power Operators.** Doors equipped with a power operator actuated by a pressure plate identified with the international symbol for accessibility or, where security is required, by a key, card or radio transmitter, and that can otherwise be opened manually, meet the intent of the requirement. The location of these actuating devices should ensure that a wheelchair will not interfere with the operation of the door once it is actuated. Swinging doors equipped with power operators which are actuated automatically and open into passing pedestrian traffic should be provided with a guard or other device designed to prevent pedestrians from stepping in the swing area of the door. These guards or devices should be detectable by blind persons. For example, inverted U-shaped guards should have an additional rail at a height not more than 680 mm so that it is detectable by the long cane. These doors should also have a device (mat or other sensor) on the swing side to prevent the door from opening if someone is standing in the swing area.
A-3.8.3.6.(9) **Air Pressure Differences.** Differences in air pressure on opposite sides of a door may be due to the operation of mechanical systems such as those associated with smoke control. So-called "stack action" in buildings in winter can also cause differential pressures due to the buoyancy of warm air. Stack action is usually most noticeable between stairwells and the remainder of the building, and at the entrances to buildings; the taller the building, the greater the effect. Doors with automatic closers have to operate with sufficient opening force to allow the return action to overcome the differential pressure.

A-3.8.3.6.(10) **Delayed Action on Door Closers.** In some circumstances, closers with a delay feature which keeps the door open for several seconds before it begins to close might be desirable. However, closers with this feature have limited back-check, a feature of a normal door closer where resistance to opening increases as the door reaches the full arc of swing. Doors equipped with a to force it closed, thinking the closer has failed to operate. Delayed action closers are not recommended for such occupancies as schools.
A-3.8.3.6.(11) Clearance at Doorways. Sufficient clearance must be provided on the latch side of doors for a user to operate the door-opening mechanism and open the door without interference from the wheelchair. This is particularly important for a door swinging towards the approach side. See Figure A-3.8.3.6.(11).

Figure A-3.8.3.6.(11)
Doorway clearance

A-3.8.3.9.(1) Accessibility Signs. The International Symbol of Access shown in Figure A-3.8.3.9.(1)-A indicates to persons with physical disabilities that they will have reasonable freedom of movement within a building so signed. The symbol is usually white on a blue background; where these colours do not stand out, the sign can be set on a white background. An arrow can be added to indicate direction or the location of an accessible space or facility.

Figure A-3.8.3.9.(1)-A
Signs indicating accessible facilities
The International Symbol of Access for Hearing Loss shown in Figure A-3.8.3.9.(1)-B, which indicates accessibility for persons who are deaf or hard of hearing, should be used to indicate the availability of variable volume controls on telephones, assistive listening systems, and text telephones (TT). These latter devices may also be referred to as teletypewriters (TTY) or telecommunications devices for the deaf (TDD).

![Figure A-3.8.3.9.(1)-B](image)

**Figure A-3.8.3.9.(1)-B**  
Signs for assistive listening facilities

When characters are used on signs to indicate accessible features, Arabic numerals and sans-serif letters with a stroke width to height ratio from 1 in 6 to 1 in 10 and a character width to height ratio from 3 in 5 to 1 in 1 should be used. Characters identifying doors and openings that lead from public areas and through which the public is permitted to pass should consist of Arabic numerals or sans-serif letters or both, be not less than 25 mm high and raised between 0.7 mm and 3 mm with a stroke to height ratio for ease of reading by touch. This identification should be located at the side of the doors or openings, centred 1 350 mm above the finished floor and within 150 mm of the jamb.

**A-3.8.3.9.(5) Tactile Walking Surface Indicators.** Figure 3.8.3.9.(5) illustrates acceptable designs of tactile walking surface indicators.

![Figure A-3.8.3.9.(5)](image)

**Figure A-3.8.3.9.(5)**  
Tactile walking surface indicators

**A-3.8.3.11.(1)(c)(v) Water-closet Stalls.** Doors to water-closet stalls for persons with physical disabilities should swing outward, preferably against a side wall.
Figure A-3.8.3.11.(1)(c)(v)
Water-closet stalls

**A-3.8.3.11.(1)(c)(vi) Door Pulls.** The door pull should consist of a D-shaped handle mounted horizontally. The centre lines are the lines drawn through the long axis and the short axis of the handle. The midpoint of the handle must be located horizontally at 200 to 300 mm from the hinged side of the door and vertically at 900 to 1 100 mm above the finished floor surface.

Figure A-3.8.3.11.(1)(c)(vi)-A
Door pull location

Figure A-3.8.3.11.(1)(c)(vi)-B
Door pull details
A-3.8.3.11.(1)(e)(ii) Additional Grab Bars. It is the designer’s prerogative to exceed the minimum requirements found in the Building By-law and specify the installation of additional grab bars in other locations. These additional grab bars may be of different configurations and can be installed in other orientations.

A-3.8.3.12. Universal Washrooms. Unobstructed areas in front of the lavatory, in front of the water closet and on one side of the water closet are necessary for maneuverability of a wheelchair. Fixtures, including additional fixtures, should be located so as to be useable and also to provide maneuverability for persons using wheelchairs. Wall-mounted fixtures may project into the required floor space, provided that such projections do not restrict the maneuvering space required for persons using wheelchairs. Although power operated and outward swinging doors are preferable for accessibility, manually operated as well as inward swinging doors are also permitted. Figures A-3.8.3.12.-A and A-3.8.3.12.-B show design options that meet the intent of Article 3.8.3.12.
Universal washroom with inward swinging door

A-3.8.3.13.(1) Water Closets. Wall- or floor-mounted water closets with recessed bases are preferable because they provide the least amount of obstruction.

Wheelchair users generally require a higher water closet seat to facilitate transfer from their chair to the water closet. Removable high-lift seats are not recommended in public washrooms as they could be removed or damaged by vandals. Permanently installed vandal resistant high-lift seats are available for installation on standard height water closets and these could be considered in place of the high bowl required.

A-3.8.3.15.(1)(d) Clearances Beneath a Lavatory.

Figure A-3.8.3.15.(1)(d)
Clearances beneath a lavatory

A-3.8.3.15.(1)(e) Pipe Protection. The pipes referred to in Clause 3.8.3.15.(1)(e) include both supply and waste pipes. The hazard can be prevented by insulating the pipes, by locating the pipes in enclosures, or avoided by limiting the temperature of the hot water to a maximum of 45°C.

A-3.8.3.15.(1)(f) Soap Dispenser Location. The location of accessories, such as soap dispensers and faucets, serving accessible lavatories should be established while taking into consideration that their controls must be usable by and within the direct reach of a person in a seated position directly in front of the accessible lavatory.

A-3.8.3.16.(1)(b) Clear Space at Entrances to Showers. The clear space at the entrance to a shower may be encroached upon by fixtures such as a wall hung sink which does not interfere with the leg rests of the wheelchair. However, this sink could restrict movement for persons who need to make a lateral transfer if it were installed at the seat end of the shower.
A-3.8.3.16.(1)(f) Grab Bars. One L-shaped grab bar is required to be installed on the wall next to the seat. A grab bar behind the seat would prevent the user from leaning back against the wall, while one located on the wall opposite the seat cannot be reached from the seated position. The seat itself may be used in conjunction with the bar for transfer. If design flexibility is required, fold away grab bars can be used as an alternative.

A-3.8.3.17. Bathtubs. Hand showers should be located at the same end of the bath as the controls and accessories such as soap holders should be located and useable within direct reach of a person in a seated position.

A-3.8.3.18. Assistive Listening Systems. Wireless sound transmission systems, including FM, infrared or magnetic induction loop systems, improve sound reception for persons who are deaf or hard of with hearing disabilities by providing amplification which can be adjusted by each user while blocking out unwanted background noise. These systems transmit a signal that is picked up by a special receiver available for use by a person who is deaf or hard of with a hearing disability, whether or not a hearing aid is used. Neither system interferes with the listening enjoyment of others.

The transmitter can be jacked into an existing P.A. system amplifier or used independently with microphones. The induction loop system requires users to sit in the area circumscribed by the loop; though installation of the loop is relatively simple, the installer should be knowledgeable about these systems if proper functioning is to be achieved. FM or infrared systems can be designed to broadcast signals which cover the entire room and thus do not restrict seating to any one area. Figures A-3.8.3.18.-A and A-3.8.3.18.-B show the general configuration of FM and infrared systems. Although portable systems (FM in particular) are available, these are best suited to small audiences. Generally, the systems installed in church halls, auditoria, theatres and similar places of assembly are not easily portable, as they are installed in a fixed location by a sound technician and form an integral part of the P.A. system of the room or building.

Hard-wired systems (where a jack is provided at a particular seat) will not meet this requirement unless adequate provisions are made to accommodate persons with hearing aids. In choosing the most appropriate system, a number of factors must be taken into account including cost, installation and maintenance, suitability to the audience, ease of operation and the need for privacy. Information on designers and suppliers of these systems may be obtained from the Canadian Hearing Society.
A-3.8.3.20. Telephone Shelves or Counters. Built-in shelves or counters for public telephones must be designed to accommodate persons using text telephones (TT). These devices may also be referred to as teletypewriters (TTY) or telecommunication devices for the deaf (TDD). These devices require a level surface at least 305 mm deep by 250 mm wide with no obstruction above that space within 250 mm. If a wall-hung telephone or other obstruction extends to less than 250 mm from the shelf or counter, an equivalent clear space must be provided on either side of each telephone. At least one telephone should be equipped with a volume control on a receiver that generates a magnetic field compatible with the T-switch of a hearing aid. The lower portion of the shelf or counter is intended for persons using a wheelchair; therefore all parts of the operating mechanism of the telephone above this portion should be within reach of a wheelchair user.

Signage should identify accessible public telephones as being useable by persons using wheelchairs and persons who are deaf or hard of hearing.

A-3.8.3.22. Sleeping Rooms and Bed Spaces. Figure A-3.8.3.22. illustrates an acceptable layout of an accessible sleeping area.
A-3.8.5.3.(1) Entrance Doors to Dwelling Units. The Chief Building Official will accept the addition of one or two peepholes in a listed door in order to meet the requirements of Clause (1)(a) and to meet the required fire protection rating.

A-3.8.5.4.(1). Adaptable Dwelling Unit Doorways. Where sliding doors are used to provide access, it is necessary to consider the door hardware when determining clear width. Accessible hardware described in Sentence 3.8.3.6.(4) may result in a sliding door standing out from the jamb when in the open position. If not provided with the door during initial construction, accessible hardware when installed must not reduce the clear width of opening to less than required for access.

A-3.8.5.5. Adaptable Dwelling Unit Bathrooms. Figure A-3.8.5.5. illustrates an acceptable layout of an adaptable dwelling unit bathroom.
Despite the requirements of Article 3.8.5.5., the Chief Building Official may accept a lesser standard.

**A-3.8.5.5.(3) Grab Bar Installation.** This provision is intended to ensure there is adequate backing for the installation of grab bars by the occupant of the adaptable dwelling unit in the future. For example, plywood or solid lumber behind the wall finish and encompassing the location of future grab bars located as described in Clause 3.8.3.11.(1)(e) and Clause 3.8.3.16.(1)(f) or 3.8.3.17.(1)(f) would provide suitable backing for the grab bar fasteners.
Part 4
Structural Design

Section 4.1. Structural Loads and Procedures

4.1. General

4.1.1. Scope
1) The scope of this Part shall be as described in Subsection 1.3.3. of Division A.

4.1.1. Definitions
1) Words that appear in italics in this Part are defined in Article 1.4.1.2. of Division A.

4.1.1.3. Design Requirements
1) Buildings and their structural members and connections, including formwork and falsework, shall be designed to have sufficient structural capacity and structural integrity to safely and effectively resist all loads, effects of loads and influences that may reasonably be expected, having regard to the expected service life of buildings, and shall in any case satisfy the requirements of this Section. (See Note A-4.1.1.3.(1).)
2) Buildings and their structural members shall be designed for serviceability, in accordance with Articles 4.1.3.4., 4.1.3.5. and 4.1.3.6. (See Note A-4.1.1.3.(2).)
3) All permanent and temporary structural members, including the formwork and falsework of a building, shall be protected against loads exceeding the specified loads during the construction period except when, as verified by analysis or test, temporary overloading of a structural member would result in no impairment of that member or any other member.
4) Falsework, scaffolding, and formwork shall be designed in conformance with
   a) CSA S269.1, “Falsework for Construction Purposes,”
   b) CAN/CSA-S269.2-M, “Access Scaffolding for Construction Purposes,” or
   c) CAN/CSA-S269.3-M, “Concrete Formwork.”
5) Precautions shall be taken during all phases of construction to ensure that the building is not damaged or distorted due to loads applied during construction.

4.1.1.4. Structural Drawings and Related Documents
1) Structural drawings and related documents shall conform to the appropriate requirements of Section 2.2. of Division C. (See Subsection 2.2.4. of Division C.)

4.1.1.5. Design Basis
1) Except as provided in Sentence (2), buildings and their structural members shall be designed in conformance with the procedures and practices provided in this Part.
2) Provided the design is carried out by a person especially qualified in the specific methods applied and provided the design demonstrates a level of safety and performance in accordance with the requirements of Part 4, buildings and their structural components falling within the scope of Part 4 that are not amenable to analysis using a generally established theory may be designed by
   a) evaluation of a full-scale structure or a prototype by a loading test, or
   b) studies of model analogues.
   (See Note A-4.1.1.5.(2).)

4.1.2. Specified Loads and Effects

4.1.2.1. Loads and Effects
1) Except as provided in Article 4.1.2.2., the following categories of loads, specified loads and effects shall be taken into consideration in the design of a building and its structural members and connections:

- **D** dead load – a permanent load due to the weight of building components, as specified in Subsection 4.1.4.,
- **E** earthquake load and effects – a rare load due to an earthquake, as specified in Subsection 4.1.8.,
- **H** a permanent load due to lateral earth pressure, including *groundwater*,
- **L** live load – a variable load due to intended use and *occupancy* (including loads due to cranes and the pressure of liquids in containers), as specified in Subsection 4.1.5.,
- **L\_C** live load exclusive of crane loads,
- **C** live load due to cranes including self weight,
- **C\_d** self weight of all cranes positioned for maximum effects,
- **C\_f** crane bumper impact load,
- **P** permanent effects caused by pre-stress,
- **S** variable load due to snow, including ice and associated rain, as specified in Article 4.1.6.2., or due to rain, as specified in Article 4.1.6.4.,
- **T** effects due to contraction, expansion, or deflection caused by temperature changes, shrinkage, moisture changes, creep, ground settlement, or a combination thereof (See Note A-4.1.2.1.(1).), and
- **W** wind load – a variable load due to wind, as specified in Subsection 4.1.7.,

where

a) load means the imposed deformations (i.e. deflections, displacements or motions that induce deformations and forces in the structure), forces and pressures applied to the building structure,

b) permanent load is a load that changes very little once it has been applied to the structure, except during repair,

c) variable load is a load that frequently changes in magnitude, direction or location, and

d) rare load is a load that occurs infrequently and for a short time only.

2) Minimum specified values of the loads described in Sentence (1), as set forth in Subsections 4.1.4. to 4.1.8., shall be increased to account for dynamic effects where applicable.

3) For the purpose of determining specified loads S, W or E in Subsections 4.1.6., 4.1.7. and 4.1.8., buildings shall be assigned an Importance Category based on intended use and occupancy, in accordance with Table 4.1.2.1. (See Note A-4.1.2.1.(3).)

### Table 4.1.2.1.
Importance Categories for Buildings
Forming Part of Sentence 4.1.2.1.(3)

<td>- as an elementary, middle or secondary school</td>
<td>High</td>
</tr>
</tbody>
</table>
• as a community centre
Manufacturing and storage facilities containing toxic, explosive or other hazardous substances in sufficient quantities to be dangerous to the public if released\(^1\)

**Post-disaster buildings** are **buildings** that are essential to the provision of services in the event of a disaster, and include:

- hospitals, emergency treatment facilities and blood banks
- telephone exchanges power generating stations and electrical substations
- control centres for air, land and marine transportation
- public water treatment and storage facilities, and pumping stations
- sewage treatment facilities and **buildings** having critical national defence functions
- **buildings** of the following types, unless exempted from this designation by the Chief Building Official:\(^2\)
  - emergency response facilities
  - fire, rescue and police stations, and housing for vehicles, aircraft or boats used for such purposes
  - communications facilities, including radio and television stations

**Post-disaster**

Notes to Table 4.1.2.1.:

\(^1\) See Note A-Table 4.1.2.1.
\(^2\) See Note A-1.4.1.2.(1), Post-disaster Buildings, in Division A.

### 4.1.2.2. Loads Not Listed

1) Where a **building** or structural member can be expected to be subjected to loads, forces or other effects not listed in Article 4.1.2.1., such effects shall be taken into account in the design based on the most appropriate information available.

### 4.1.3. Limit States Design

(See Note A-4.1.3.)

### 4.1.3.1. Definitions

1) In this Subsection, the term
   a) limit states means those conditions of a **building** structure that result in the **building** ceasing to fulfill the function for which it was designed (those limit states concerning safety are called ultimate limit states (ULS) and include exceeding the load-carrying capacity, overturning, sliding and fracture; those limit states that restrict the intended use and **occupancy** of the **building** are called serviceability limit states (SLS) and include deflection, vibration, permanent deformation and local structural damage such as cracking; and those limit states that represent failure under repeated loading are called fatigue limit states),
   b) specified loads (C, D, E, H, L, P, S, T and W) means those loads defined in Article 4.1.2.1.,
   c) principal load means the specified variable load or rare load that dominates in a given load combination,
   d) companion load means a specified variable load that accompanies the principal load in a given load combination,
   e) service load means a specified load used for the evaluation of a serviceability limit state,
   f) principal-load factor means a factor applied to the principal load in a load combination to account for the variability of the load and load pattern and the analysis of its effects,
   g) companion-load factor means a factor that, when applied to a companion load in the load combination, gives the probable magnitude of a companion load acting simultaneously with the factored principal load,
h) importance factor, I, means a factor applied in Subsections 4.1.6., 4.1.7. and 4.1.8. to obtain the specified load and take into account the consequences of failure as related to the limit state and the use and occupancy of the building,

i) factored load means the product of a specified load and its principal-load factor or companion-load factor,

j) effects refers to forces, moments, deformations or vibrations that occur in the structure,

k) nominal resistance, $R$, of a member, connection or structure, is based on the geometry and on the specified properties of the structural materials,

l) resistance factor, $\phi$, means a factor applied to a specified material property or to the resistance of a member, connection or structure, and that, for the limit state under consideration, takes into account the variability of dimensions and material properties, workmanship, type of failure and uncertainty in the prediction of resistance, and

m) factored resistance, $\phi R$, means the product of nominal resistance and the applicable resistance factor.

### 4.1.3.2. Strength and Stability

1) A building and its structural components shall be designed to have sufficient strength and stability so that the factored resistance, $\phi R$, is greater than or equal to the effect of factored loads, which shall be determined in accordance with Sentence 4.1.3.2.(2).

2) Except as provided in Sentence (3), the effect of factored loads for a building or structural component shall be determined in accordance with the requirements of this Article and the following load combination cases, the applicable combination being that which results in the most critical effect:
   a) for load cases without crane loads, the load combinations listed in Table 4.1.3.2.-A, and
   b) for load cases with crane loads, the load combinations listed in Table 4.1.3.2.-B.

(See Note A-4.1.3.2.(2).)

3) Other load combinations that must also be considered are the principal loads acting with the companion loads taken as zero.

4) Where the effects due to lateral earth pressure, $H$, restraint effects from pre-stress, $P$, and imposed deformation, $T$, affect the structural safety, they shall be taken into account in the calculations, with load factors of 1.5, 1.0 and 1.25 assigned to $H$, $P$ and $T$ respectively. (See Note A-4.1.3.2.(4).)

5) Except as provided in Sentence 4.1.8.16.(2), the counteracting factored dead load – 0.9$D$ in load combination cases 2, 3 and 4 and 1.0$D$ in load combination case 5 in Table 4.1.3.2.-A, and 0.9$D$ in load combination cases 1 to 5 and 1.0$D$ in load combination case 6 in Table 4.1.3.2.-B – shall be used when the dead load acts to resist overturning, uplift, sliding, failure due to stress reversal, and to determine anchorage requirements and the factored resistance of members. (See Note A-4.1.3.2.(5).)

6) The principal-load factor 1.5 for live loads $L$ in Table 4.1.3.2.-A and $L_{XC}$ in Table 4.1.3.2.-B may be reduced to 1.25 for liquids in tanks.

7) The companion-load factor for live loads $L$ in Table 4.1.3.2.-A and $L_{XC}$ in Table 4.1.3.2.-B shall be increased by 0.5 for storage areas, and equipment areas and service rooms referred to in Table 4.1.5.3.

</table>

Notes to Table 4.1.3.2.-B:
(1) See Sentences 4.1.3.2.(2), (3) and (4).
(2) See Sentence 4.1.3.2.(8).
(3) See Sentence 4.1.3.2.(5).
(4) See Article 4.1.5.5.
(5) See Sentence 4.1.3.2.(6).
(6) See Sentence 4.1.3.2.(7).
(7) See Sentence 4.1.3.2.(10).
(8) See Article 4.1.5.5.

8) Except as provided in Sentence (9), the load factor 1.25 for dead load, \(D\), for soil, superimposed earth, plants and trees given in Tables 4.1.3.2.-A and 4.1.3.2.-B shall be increased to 1.5, except that when the soil depth exceeds 1.2 m, the factor may be reduced to \(1 + 0.6/h_s\) but not less than 1.25, where \(h_s\) is the depth of soil in metres supported by the structure.

9) A principal-load factor of 1.5 shall be applied to the weight of saturated soil used in load combination case 1 of Table 4.1.3.2.-A.
10) Earthquake load, \( E \), in load combination cases 5 of Table 4.1.3.2.-A and 6 of Table 4.1.3.2.-B includes horizontal earth pressure due to earthquake determined in accordance with Sentence 4.1.8.16.(7).

11) Provision shall be made to ensure adequate stability of the structure as a whole and adequate lateral, torsional and local stability of all structural parts.

12) Sway effects produced by vertical loads acting on the structure in its displaced configuration shall be taken into account in the design of buildings and their structural members.

4.1.3.3. Fatigue

1) A building and its structural components, including connections, shall be checked for fatigue failure under the effect of cyclical loads, as required in the standards listed in Section 4.3. (See Note A-4.1.3.3.(1).)

2) Where vibration effects, such as resonance and fatigue resulting from machinery and equipment, are likely to be significant, a dynamic analysis shall be carried out. (See Note A-4.1.3.3.(2).)

4.1.3.4. Serviceability

1) A building and its structural components shall be checked for serviceability limit states as defined in Clause 4.1.3.1.(1)(a) under the effect of service loads for serviceability criteria specified or recommended in Articles 4.1.3.5. and 4.1.3.6. and in the standards listed in Section 4.3. (See Note A-4.1.3.4.(1).)

4.1.3.5. Deflection

1) In proportioning structural members to limit serviceability problems resulting from deflections, consideration shall be given to
   a) the intended use of the building or member,
   b) limiting damage to non-structural members made of materials whose physical properties are known at the time of design,
   c) limiting damage to the structure itself, and
   d) creep, shrinkage, temperature changes and pre-stress.

(See Note A-4.1.3.5.(1).)

2) The lateral deflection of buildings due to service wind and gravity loads shall be checked to ensure that structural elements and non-structural elements whose nature is known at the time the structural design is carried out will not be damaged.

3) Except as provided in Sentence (4), the total drift per storey under service wind and gravity loads shall not exceed 1/500 of the storey height unless other drift limits are specified in the design standards referenced in Section 4.3. (See Note A-4.1.3.5.(3).)

4) The deflection limits required in Sentence (3) do not apply to industrial buildings or sheds if experience has proven that greater movement will have no significant adverse effects on the strength and function of the building.

5) The building structure shall be designed for lateral deflection due to \( E \), in accordance with Article 4.1.8.13.

4.1.3.6. Vibration

1) Floor systems susceptible to vibration shall be designed so that vibrations will have no significant adverse effects on the intended occupancy of the building. (See Note A-4.1.3.6.(1).)

2) Where the fundamental vibration frequency of a structural system supporting an assembly occupancy used for rhythmic activities, such as dancing, concerts, jumping exercises or gymnastics, is less than 6 Hz, the effects of resonance shall be investigated by means of a dynamic analysis. (See Note A-4.1.3.6.(2).)

3) A building susceptible to lateral vibration under wind load shall be designed in accordance with Article 4.1.7.1. so that the vibrations will have no significant adverse effects on the intended use and occupancy of the building. (See Note A-4.1.3.6.(3).)

4.1.4. Dead Loads
4.1.4.1. Dead Loads

1) The specified dead load for a structural member consists of:
   a) the weight of the member itself,
   b) the weight of all materials of construction incorporated into the building to be supported permanently by the member,
   c) the weight of partitions,
   d) the weight of permanent equipment, and
   e) the vertical load due to earth, plants and trees.

2) Except as provided in Sentence (5), in areas of a building where partitions, other than permanent partitions, are shown on the drawings, or where partitions might be added in the future, allowance shall be made for the weight of such partitions.

3) The partition weight allowance referred to in Sentence (2) shall be determined from the actual or anticipated weight of the partitions placed in any probable position, but shall be not less than 1 kPa over the area of floor being considered.

4) Partition loads used in design shall be shown on the drawings as provided in Clause 2.2.4.3.(1)(d) of Division C.

5) In cases where the dead load of the partition is counteractive, the load allowances referred to in Sentences (2) and (3) shall not be included in the design calculations.

6) Except for structures where the dead load of soil is part of the load-resisting system, where the dead load due to soil, superimposed earth, plants and trees is counteractive, it shall not be included in the design calculations. (See Note A-4.1.4.1.(6).)

4.1.5. Live Loads Due to Use and Occupancy

4.1.5.1. Loads Due to Use of Floors and Roofs

1) Except as provided in Sentence (2), the specified live load on an area of floor or roof depends on the intended use and occupancy, and shall not be less than either the uniformly distributed load patterns listed in Article 4.1.5.3., the loads due to the intended use and occupancy, or the concentrated loads listed in Article 4.1.5.9., whichever produces the most critical effect. (See Note A-4.1.5.1.(1).)

2) For buildings in the Low Importance Category as described in Table 4.1.2.1., a factor of 0.8 may be applied to the live load.

4.1.5.2. Uses Not Stipulated

1) Except as provided in Sentence (2), where the use of an area of floor or roof is not provided for in Article 4.1.5.3., the specified live loads due to the use and occupancy of the area shall be determined from an analysis of the loads resulting from the weight of:
   a) the probable assembly of persons,
   b) the probable accumulation of equipment and furnishings, and
   c) the probable storage of materials.

2) For buildings in the Low Importance Category as described in Table 4.1.2.1., a factor of 0.8 may be applied to the live load.

4.1.5.3. Full and Partial Loading

1) The uniformly distributed live load shall be not less than the value listed in Table 4.1.5.3., which may be reduced as provided in Article 4.1.5.8., applied uniformly over the entire area or on any portions of the area, whichever produces the most critical effects in the members concerned.

Notes to Table 4.1.5.3.:  
(1) See Note A-Table 4.1.5.3.  
(2) See Article 4.1.5.6.  
(3) See Article 4.1.5.4.  
(4) See Sentence 4.1.5.1.(1).  
(5) See Article 4.1.5.5.

4.1.5.4. Loads for Occupancy Served
1) The following shall be designed to carry not less than the specified load required for the occupancy they serve, provided they cannot be used by an assembly of people as a viewing area:
   a) corridors, lobbies and aisles not more than 1200 mm wide,
   b) all corridors above the first storey of residential areas of apartments, hotels and motels, and
   c) interior balconies and mezzanines.

4.1.5.5. Loads on Exterior Areas
(See Note A-4.1.5.5.)
1) Exterior areas accessible to vehicular traffic shall be designed for their intended use, including the weight of firefighting equipment, but not for less than the snow and rain loads prescribed in Subsection 4.1.6.
2) Except as provided in Sentences (3) and (4), roofs shall be designed for either the uniform live loads specified in Table 4.1.5.3., the concentrated live loads listed in Table 4.1.5.9., or the snow and rain loads prescribed in Subsection 4.1.6., whichever produces the most critical effects in the members concerned.
3) Exterior areas accessible to pedestrian traffic, but not vehicular traffic, shall be designed for their intended use, but not for less than the greater of
   a) the live load prescribed for assembly areas in Table 4.1.5.3., or
   b) the snow and rain loads prescribed in Subsection 4.1.6.
4) Roof parking decks shall be designed for either the uniformly distributed live loads specified in Table 4.1.5.3., the concentrated live loads listed in Table 4.1.5.9., or the roof snow load, whichever produces the most critical effect in the members concerned.

4.1.5.6. Loads for Dining Areas
1) The minimum specified live load listed in Table 4.1.5.3. for dining areas may be reduced to 2.4 kPa for areas in buildings that are being converted to dining areas, provided that the floor area does not exceed 100 m² and the dining area will not be used for other assembly purposes, including dancing.

4.1.5.7. More Than One Occupancy
1) Where an area of floor or roof is intended for 2 or more occupancies at different times, the value to be used from Table 4.1.5.3. shall be the greatest value for any of the occupancies concerned.

4.1.5.8. Variation with Tributary Area
(See Note A-4.1.5.8.)
1) An area used for assembly occupancies designed for a live load of less than 4.8 kPa and roofs designed for the minimum loading specified in Table 4.1.5.3. shall have no reduction for tributary area.
2) Where a structural member supports a tributary area of a floor or a roof, or a combination thereof, that is greater than 80 m² and either used for assembly occupancies designed for a live load of 4.8 kPa or more, or used for storage, manufacturing, retail stores, garages or as a footbridge, the specified live load due to use and occupancy is the load specified in Article 4.1.5.3. multiplied by
   \[ 0.5 + \sqrt{\frac{20}{A}} \]
   where A is the tributary area in square metres for this type of use and occupancy.
3) Where a structural member supports a tributary area of a floor or a roof, or a combination thereof, that is greater than 20 m² and used for any use or occupancy other than those indicated in Sentences (1) and (2), the specified live load due to use and occupancy is the load specified in Article 4.1.5.3. multiplied by
   \[ 0.3 + \sqrt{\frac{9.8}{B}} \]
   where B is the tributary area in square metres for this type of use and occupancy.
4) Where the specified live load for a floor is reduced in accordance with Sentence (2) or (3), the structural drawings shall indicate that a live load reduction factor for tributary area has been applied.

4.1.5.9. Concentrated Loads
1) The specified live load due to possible concentrations of load resulting from the use of an area of floor or roof shall not be less than that listed in Table 4.1.5.9., applied over the loaded area noted and located so as to cause maximum effects, except that for occupancies not listed in Table 4.1.5.9., the concentrations of load shall be determined in accordance with Article 4.1.5.2.

Notes to Table 4.1.5.9.:
(1) See Note A-Table 4.1.5.9.

4.1.5.10. Sway Forces in Assembly Occupancies
1) The floor assembly and other structural elements that support fixed seats in any building used for assembly occupancies accommodating large numbers of people at one time, such as grandstands, stadia and theatre balconies, shall be designed to resist a horizontal force equal to not less than 0.3 kN for each metre length of seats acting parallel to each row of seats, and not less than 0.15 kN for each metre length of seats acting at right angles to each row of seats, based on the assumption that these forces are acting independently of each other.

4.1.5.11. Crane-Supporting Structures and Impact of Machinery and Equipment
(See Note A-4.1.5.11.)
1) The minimum specified load due to equipment, machinery or other objects that may produce impact shall be the sum of the weight of the equipment or machinery and its maximum lifting capacity, multiplied by an appropriate factor listed in Table 4.1.5.11.
2) Crane-supporting structures shall be designed for the appropriate load combinations listed in Article 4.1.3.2.
3) Crane runway structures shall be designed to resist a horizontal force applied normal to the top of the rails equal to not less than 20% of the sum of the weights of the lifted load and the crane trolley (excluding other parts of the crane).
4) The force described in Sentence (3) shall be equally distributed on each side of the runway and shall be assumed to act in either direction.

5) Crane runway structures shall be designed to resist a horizontal force applied parallel to the top of the rails equal to not less than 10% of the maximum wheel loads of the crane.

</tbody>
</table>

Notes to Table 4.1.5.11.:  
(1) See the Elevating Devices Safety Regulation

### 4.1.5.12. Bleachers
1) Bleacher seats shall be designed for a uniformly distributed live load of 1.75 kN for each linear metre or for a concentrated load of 2.2 kN distributed over a length of 0.75 m, whichever produces the most critical effect on the supporting members.

2) Bleachers shall be checked by the erector after erection to ensure that all structural members, including bracing specified in the design, have been installed.

3) Telescopic bleachers shall be provided with locking devices to ensure stability while in use.

### 4.1.5.13. Helicopter Landing Areas
1) Helicopter landing areas on roofs shall be constructed in conformance with the requirements for heliports contained in TC SOR/96-433, "Canadian Aviation Regulations – Part III."

### 4.1.5.14. Loads on Guards and Handrails
(See Note A-4.1.5.14. and 4.1.5.15.(1).)
1) The minimum specified horizontal load applied outward at the minimum required height of every required guard shall be
   a) 3.0 kN/m for open viewing stands without fixed seats and for means of egress in grandstands, stadia, bleachers and arenas,
   b) a concentrated load of 1.0 kN applied at any point, so as to produce the most critical effect, for access ways to equipment platforms, contiguous stairs and similar areas where the gathering of many people is improbable, and
   c) 0.75 kN/m or a concentrated load of 1.0 kN applied at any point so as to produce the most critical effect, whichever governs for locations other than those described in Clauses (a) and (b).
2) The minimum specified horizontal load applied inward at the minimum required height of every required guard shall be half that specified in Sentence (1).
3) Individual elements within the guard, including solid panels and pickets, shall be designed for a load of 0.5 kN applied outward over an area of 100 mm by 100 mm located at any point in the element or elements so as to produce the most critical effect.
4) The size of the opening between any two adjacent vertical elements within a guard shall not exceed the limits required by Part 3 when each of these elements is subjected to a specified live load of 0.1 kN applied in opposite directions in the in-plane direction of the guard so as to produce the most critical effect.
5) The loads required in Sentence (3) need not be considered to act simultaneously with the loads provided for in Sentences (1), (2) and (6).
6) The minimum specified load applied vertically at the top of every required guard shall be 1.5 kN/m and need not be considered to act simultaneously with the horizontal load provided for in Sentence (1).
7) Handrails and their supports shall be designed and constructed to withstand the following loads, which need not be considered to act simultaneously:
   a) a concentrated load not less than 0.9 kN applied at any point and in any direction for all handrails, and
   b) a uniform load not less than 0.7 kN/m applied in any direction to handrails not located within dwelling units.

4.1.5.15. Loads on Vehicle Guardrails

1) Vehicle guardrails shall be designed for a concentrated load of 22 kN applied horizontally outward at any point 500 mm above the floor surface so as to produce the most critical effect. (See Note A-4.1.5.14. and 4.1.5.15.1.)
2) The loads required in Sentence (1) need not be considered to act simultaneously with the loads provided for in Article 4.1.5.14.

4.1.5.16. Loads on Walls Acting As Guards

1) Where the floor elevation on one side of a wall, including a wall around a shaft, is more than 600 mm higher than the elevation of the floor or ground on the other side, the wall shall be designed to resist the appropriate outward lateral design loads prescribed elsewhere in Subsection 4.1.5. or 0.5 kPa acting outward, whichever produces the more critical effect.

4.1.5.17. Firewalls

(See Note A-4.1.5.17.)
1) Firewalls shall be designed to resist the maximum effect due to
   a) the appropriate lateral design loads prescribed elsewhere in this Section, or
   b) a factored lateral load of 0.5 kPa under fire conditions, as described in Sentence (2).
2) Under fire conditions, where the fire-resistance rating of the structure is less than that of the firewall, a) lateral support shall be assumed to be provided by the structure on one side only, or b) another structural support system capable of resisting the loads imposed by a fire on either side of the firewall shall be provided.

4.1.5.18. Loads for Building Maintenance

1) Buildings shall be designed to support the loads and forces required to support building maintenance equipment.

4.1.6. Loads Due to Snow and Rain

4.1.6.1. Specified Load Due to Rain or to Snow and Associated Rain
1) The specified load on a roof or any other building surface subject to snow and associated rain shall be the snow load specified in Article 4.1.6.2., or the rain load specified in Article 4.1.6.4., whichever produces the more critical effect.

4.1.6.2. Specified Snow Load

(See Note A-4.1.6.2.)

1) The specified load, S, due to snow and associated rain accumulation on a roof or any other building surface subject to snow accumulation shall be calculated using the formula

\[ S = I_s \left[ S_s \left( C_b C_w C_s C_a \right) + S_r \right] \]

where

- \( I_s \) = importance factor for snow load as provided in Table 4.1.6.2.-A,
- \( S_s \) = 1-in-50-year ground snow load, in kPa, determined in accordance with Subsection 1.1.3.,
- \( C_b \) = basic roof snow load factor in Sentence (2),
- \( C_w \) = wind exposure factor in Sentences (3) and (4),
- \( C_s \) = slope factor in Sentences (5), (6) and (7),
- \( C_a \) = accumulation factor in Sentence (8), and
- \( S_r \) = 1-in-50-year associated rain load, in kPa, determined in accordance with Subsection 1.1.3., but not greater than \( S_s (C_b C_w C_s C_a) \).

2) The basic roof snow load factor, \( C_b \), shall
   a) be determined as follows:
      i) \( C_b = 0.8 \) for \( l_c \leq \left( \frac{70}{C_w^2} \right) \), and
      ii) \( C_b = \frac{1}{C_w} \left[ 1 - (1 - 0.8 C_w) \exp \left( -\frac{l_c C_w^2 - 70}{100} \right) \right] \) for \( l_c > \left( \frac{70}{C_w^2} \right) \)

where

- \( l_c \) = characteristic length of the upper or lower roof, defined as \( 2w - w^2/l \), in m,
- \( w \) = smaller plan dimension of the roof, in m, and
- \( l \) = larger plan dimension of the roof, in m.

b) conform to Table 4.1.6.2.-B, using linear interpolation for intermediate values of \( l_c C_w^2 \).

(See Note A-4.1.6.2.(2).)

3) Except as provided for in Sentence (4), the wind exposure factor, \( C_w \), shall be 1.0.
4) For buildings in the Low and Normal Importance Categories as set out in Table 4.1.2.1., the wind exposure factor, $C_w$, given in Sentence (3) may be reduced to 0.75 for rural areas only, or to 0.5 for exposed areas north of the treeline, where

a) the building is exposed on all sides to wind over open terrain as defined in Clause 4.1.7.3.(5)(a), and is expected to remain so during its life,

b) the area of roof under consideration is exposed to the wind on all sides with no significant obstructions on the roof, such as parapet walls, within a distance of at least 10 times the difference between the height of the obstruction and $C_b C_w S_s / \gamma$ metres, where $\gamma$ is the specific weight of snow on roofs as specified in Article 4.1.6.13., and

c) the loading does not involve the accumulation of snow due to drifting from adjacent surfaces.

5) Except as provided for in Sentences (6) and (7), the slope factor, $C_s$, shall be

a) 1.0 where the roof slope, $\alpha$, is equal to or less than 30°,

b) $(70° - \alpha)/40°$ where $\alpha$ is greater than 30° but not greater than 70°, and

c) 0 where $\alpha$ exceeds 70°.

6) The slope factor, $C_s$, for unobstructed slippery roofs where snow and ice can slide completely off the roof shall be
   a) 1.0 where the roof slope, $\alpha$, is equal to or less than 15°,
   b) $(60° - \alpha)/45°$ where $\alpha$ is greater than 15° but not greater than 60°, and
   c) 0 where $\alpha$ exceeds 60°.

7) Unless otherwise stated in this Subsection, the slope factor, $C_s$, shall be 1.0 when used in conjunction with accumulation factors for increased snow loads.

8) The accumulation factor, $C_a$, shall be 1.0, which corresponds to the uniform snow load case, except that where appropriate for the shape of the roof, it shall be assigned other values that account for
   a) increased non-uniform snow loads due to snow drifting onto a roof that is at a level lower than other parts of the same building or at a level lower than another building within 5 m of it horizontally, as prescribed in Articles 4.1.6.5., 4.1.6.6. and 4.1.6.8.,
   b) increased non-uniform snow loads on areas adjacent to roof projections, such as penthouses, large chimneys and equipment, as prescribed in Articles 4.1.6.7. and 4.1.6.8.,
   c) non-uniform snow loads on gable, arch or curved roofs and domes, as prescribed in Articles 4.1.6.9. and 4.1.6.10.,
   d) increased snow or ice loads due to snow sliding as prescribed in Article 4.1.6.11.,
   e) increased snow loads in roof valleys, as prescribed in Article 4.1.6.12., and
   f) increased snow or ice loads due to meltwater draining from adjacent building elements and roof projections.

9) For shapes not addressed in Sentence (8), $C_a$ corresponding to the non-uniform snow load case shall be established based on applicable field observations, special analyses including local climatic effects, appropriate model tests, or a combination of these methods.

4.1.6.3. Full and Partial Loading

1) A roof or other building surface and its structural members subject to loads due to snow accumulation shall be designed for the specified load given in Sentence 4.1.6.2.(1), distributed over the entire loaded area.
2) In addition to the distribution mentioned in Sentence (1), flat roofs and shed roofs, gable roofs of 15° slope or less, and arch or curved roofs shall be designed for the specified uniform snow load indicated in Sentence 4.1.6.2.(1), which shall be calculated using the accumulation factor $C_a = 1.0$, distributed on any one portion of the loaded area and half of this load on the remainder of the loaded area, in such a way as to produce the most critical effects on the member concerned. (See Note A-4.1.6.3.(2).)

4.1.6.4. Specified Rain Load
1) Except as provided in Sentence (4), the specified load, $S$, due to the accumulation of rainwater on a surface whose position, shape and deflection under load make such an accumulation possible, is that resulting from the one-day rainfall determined in conformance with Subsection 1.1.3. and applied over the horizontal projection of the surface and all tributary surfaces. (See Note A-4.1.6.4.(1).)
2) The provisions of Sentence (1) apply whether or not the surface is provided with a means of drainage, such as rainwater leaders.
3) Except as provided in Sentence 4.1.6.2.(1), loads due to rain need not be considered to act simultaneously with loads due to snow. (See Note A-4.1.6.4.(3).)
4) Where scuppers are provided and where the position, shape and deflection of the loaded surface make an accumulation of rainwater possible, the loads due to rain shall be the lesser of either the one-day rainfall determined in conformance with Subsection 1.1.3. or a depth of rainwater equal to 30 mm above the level of the scuppers, applied over the horizontal projection of the surface and tributary areas.

4.1.6.5. Multi-level Roofs
1) The drifting load of snow on a roof adjacent to a higher roof shall be taken as trapezoidal, as shown in Figure 4.1.6.5.-A, and the accumulation factor, $C_a$, shall be determined as follows:

$$C_a = C_{a0} - (C_{a0} - 1) \left( \frac{x}{x_d} \right) \text{ for } 0 \leq x \leq x_d$$

where

$$C_{a0} = \text{peak value of } C_a \text{ at } x = 0 \text{ determined in accordance with Sentences (3) and (4) and as shown in Figure 4.1.6.5.-B,}$$

$$x = \text{distance from roof step as shown in Figure 4.1.6.5.-A, and}$$

$$x_d = \text{length of drift determined in accordance with Sentence (2) and as shown in Figure 4.1.6.5.-A.}$$

2) The length of the drift, $x_d$, shall be calculated as follows:

$$x_d = 5 \frac{C_b}{\gamma} \frac{S_z}{(C_{a0} - 1)}$$

where

$$\gamma = \text{specific weight of snow as specified in Article 4.1.6.13.}$$
Figure 4.1.6.5.-A
Snow load factors for lower level roofs
Forming Part of Sentences 4.1.6.5.(1) and (3) and 4.1.6.6.(1)

Notes to Figure 4.1.6.5.-A:
(1) If a > 5 m or h ≤ 0.8Ss/γ, drifting from the higher roof need not be considered.
(2) For lower roofs with parapets, Cs = 1.0, otherwise it varies as a function of slope α as defined in Sentences 4.1.6.2.(5) and (6).

3) The value of Ca0 for each of Cases I, II, and III shall be the lesser of

\[ C_{a0} = \beta \frac{\gamma h}{C_b S_z} \]

and

\[ C_{a0} = \frac{F}{C_b} \]
where

\[ \beta = 1.0 \text{ for Case I, and 0.67 for Cases II and III,} \]
\[ h = \text{difference in elevation between the lower roof surface and the top of the parapet on the upper roof as shown in Figure 4.1.6.5.-A, and} \]
\[ F = 0.35 \beta \sqrt[10]{\gamma (l_{cs} - 5h'_{p})/s_{a}} + C_{b}, \text{ but } F \leq 5 \text{ for } C_{wa} = 1.0 \]

where

\[ C_{wa} = \text{value of } C_{w} \text{ applicable to the source of drifting,} \]
\[ l_{cs} = \text{characteristic length of the source area for drifting, defined as } l_{cs} = 2w_{s} - \frac{w_{i}}{l_{s}}, \text{ where } w_{s} \text{ and } l_{s} \text{ are respectively the shorter and longer dimensions of the relevant source areas for snow drifting shown in Figure 4.1.6.5.-B for Cases I, II and III, and} \]
\[ h'_{p} = h_{p} - \left( \frac{0.8s}{v} \right), \text{ but } 0 \leq h'_{p} \leq \left( \frac{l_{cs}}{5} \right) \]

where

\[ h_{p} = \text{height of the roof perimeter parapet of the source area, to be taken as zero unless all the roof edges of the source area have parapets.} \]

4) The value of \( C_{w0} \) shall be the highest of Cases I, II and III, considering the different roof source areas for drifting snow, as specified in Sentence (3) and Figure 4.1.6.5.-B.
Figure 4.1.6.5.-B
Snow load cases I, II and III for lower level roofs
Forming Part of Sentences 4.1.6.5.(1), (3) and (4)

4.1.6.6. Horizontal Gap between a Roof and a Higher Roof
1) Where the roof of one building is separated by a distance, a, from an adjacent building with a higher roof as shown in Figure 4.1.6.5.-A, the influence of the adjacent building on the value of the accumulation factor, Ca, for the lower roof shall be determined as follows:
   a) if a > 5 m, the influence of the adjacent building on Ca for the lower roof can be ignored, and
   b) if a ≤ 5 m, Ca for the lower roof shall be calculated in accordance with Article 4.1.6.5. for values of x ≥ a.

4.1.6.7. Areas Adjacent to Roof Projections
1) Except as provided in Sentences (2) and (3), the accumulation factor, Ca, for areas adjacent to roof-mounted vertical projections shall be calculated in accordance with Sentence 4.1.6.5.(1) using the following values for the peak accumulation factor, Ca₀, and the drift length, x₀:
a) $C_{a0}$ shall be taken as the lesser of
\[ 0.67 \frac{\gamma h}{C_a S_S} \text{ and } \frac{\gamma l_0}{7.5 C_b S_S} + 1, \]
and

b) $x_d$ shall be taken as the lesser of $3.35h$ and $(2/3)l_0$, where
- $h$ = height of the projection, and
- $l_0$ = longest horizontal dimension of the projection.

(See Note A-4.1.6.7.(1).)

2) $C_a$ is permitted to be calculated in accordance with Article 4.1.6.5. for larger projections. (See Note A-4.1.6.7.(2).)

3) Where the longest horizontal dimension of the roof projection, $l_0$, is less than 3 m, the drift surcharge adjacent to the projection need not be considered.

4.1.6.8. Snow Drift at Corners

1) The drift loads on the lower level roof against the two faces of an outside corner of an upper level roof or roof obstruction shall be extended radially around the corner as shown in Figure 4.1.6.8.-A and may be taken as the least severe of the drift loads lying against the two faces of the corner.

2) The drift loads on the lower level roof against the two faces of an inside corner of an upper level roof or a parapet shall be calculated for each face and applied as far as the bisector of the corner angle as shown in Figure 4.1.6.8.-B.
4.1.6.9. Gable Roofs

(See Note A-4.1.6.9.)

1) For all gable roofs, the full and partial load cases defined in Article 4.1.6.3. shall be considered.

2) For gable roofs with a slope $\alpha > 15^\circ$, the unbalanced load case shall also be considered by setting the values of the accumulation factor, $C_a$, as follows:
   a) on the upwind side of the roof peak, $C_a$ shall be taken as 0, and
   b) on the downwind side of the roof peak, $C_a$ shall be taken as
      i) $0.25 + \alpha/20$, where $15^\circ \leq \alpha \leq 20^\circ$, and
      ii) 1.25, where $20^\circ < \alpha \leq 90^\circ$.

3) For all gable roofs, the slope factor, $C_s$, shall be as prescribed in Sentences 4.1.6.2.(5) and (6).

4) For all gable roofs, the wind exposure factor, $C_w$, shall be
   a) as prescribed in Sentences 4.1.6.2.(3) and (4) for the full and partial load cases, and
   b) 1.0 for the unbalanced load case referred to in Sentence (2).

4.1.6.10. Arch Roofs, Curved Roofs and Domes

1) For all arch roofs, curved roofs and domes, the full and partial load cases defined in Article 4.1.6.3. shall be considered.

2) For arch roofs, curved roofs and domes with a rise-to-span ratio $h/b > 0.05$ (See Figure 4.1.6.10.-A), the load cases provided in Sentences (3) to (7) shall also be considered.

3) For arch roofs with a slope at the edge $\alpha_e \leq 30^\circ$ (See Figure 4.1.6.10.-A and Table 4.1.6.10.), $C_a$ shall be
   a) taken as 0 on the upwind side of the peak, and
   b) on the downwind side of the peak, taken as
\[ C_a = \begin{cases} \frac{xh}{0.03cb^2} & \text{for } 0.05 < \frac{h}{b} \leq 0.12 \\ \frac{4x}{Cb} & \text{for } \frac{h}{b} > 0.12 \end{cases} \]

where

- \( x \) = horizontal distance from the roof peak,
- \( h \) = height of arch, and
- \( b \) = width of arch.

**Figure 4.1.6.10.-A**

Accumulation factors for arch roofs and curved roofs
Forming Part of Sentences 4.1.6.10.(2) to (4)

**Note to Figure 4.1.6.10.-A:**
(1) Refer to Table 4.1.6.10. for applicable values of \( C_a \) and Sentences 4.1.6.2.(5) and (6) for applicable values of \( C_s \).

4) For arch roofs with a slope at the edge \( \alpha_e > 30° \) (See Figure 4.1.6.10.-A and Table 4.1.6.10.), \( C_a \) shall be
   a) taken as 0.0 on the upwind side of the peak, and
   b) on the downwind side of the peak,
      i) for the part of the roof between the peak and point where the slope \( \alpha = 30° \), taken as
\[
C_a = \frac{xh}{0.06C_b\alpha_{x30}b} \quad \text{for} \quad 0.05 < \frac{h}{b} \leq 0.12 \text{ and } \frac{x}{b} = x_30
\]
\[
C_a = \frac{2x}{C_b} \quad \text{for} \quad \frac{h}{b} > 0.12
\]

where
- \(x, h, b\) = as specified in Sentence (2), and
- \(x_{30}\) = value of \(x\) where the slope \(\alpha = 30^\circ\), and

ii) for the part of the roof where the slope \(\alpha > 30^\circ\), taken as
\[
C_a = \frac{h}{0.06C_b b} \quad \text{for} \quad 0.05 < \frac{h}{b} \leq 0.12 \text{ and } \frac{x}{b} = x_{30}
\]
\[
C_a = \frac{2}{C_b} \quad \text{for} \quad \frac{h}{b} > 0.12
\]

5) Except as provided in Sentence (6), \(C_a\) for curved roofs shall be determined in accordance with the requirements for arch roofs stated in Sentences (3) and (4).

6) Where the slope, $\alpha$, of a curved roof at its peak is greater than 10°, $C_a$ shall be determined in accordance with the requirements for gable roofs stated in Article 4.1.6.9. using a slope equal to the mean slope of the curved roof.

7) For domes of circular plan form (See Figure 4.1.6.10.-B), $C_a$ shall
   a) along the central axis parallel to the wind, vary in the same way as for an arch roof with the same rise-to-span ratio, $h/b$, and
   b) off this axis, vary according to
   \[ C_a(x, y) = C_a(x, 0) \left(1 - \frac{y}{r}\right) \]
   where
   - $C_a(x, y)$ = value of $C_a$ at location $(x, y)$,
   - $C_a(x, 0)$ = value of $C_a$ on the central axis parallel to the wind,
   - $x$ = distance along the central axis parallel to the wind,
   - $y$ = horizontal coordinate normal to the $x$ direction, and
   - $r$ = radius of dome.

8) For all arch roofs, curved roofs and domes, the slope factor, $C_s$, shall be as prescribed in Sentences 4.1.6.2.(5) and (6).

9) For all arch roofs, curved roofs and domes, the wind exposure factor, $C_w$, shall be as prescribed in Table 4.1.6.10.

---

Figure 4.1.6.10.-B
Unbalanced snow accumulation factor on a circular dome
Forming Part of Sentence 4.1.6.10.(7)

Notes to Figure 4.1.6.10.-B:
1) Refer to Table 4.1.6.10. for applicable values of $C_a$ and Sentences 4.1.6.2.(5) and (6) for applicable values of $C_s$.
2) Refer to Sentences 4.1.6.10.(3) and (4) for the calculation of $C_a(x, 0)$.

4.1.6.11. Snow Loads Due to Sliding

1) Except as provided in Sentence (2), where an upper roof, or part thereof, slopes downwards with a slope $\alpha > 0$ towards a lower roof, the snow load, $S$, on the lower roof, determined in accordance with Articles 4.1.6.2. and 4.1.6.5., shall be augmented in accordance with Sentence (3) to account for the additional load resulting from sliding snow.
Division B: Acceptable Solutions

Part 4 – Structural Design

2) Sentence (1) need not apply where
   a) snow from the upper roof is prevented from sliding by a parapet or other effective means, or
   b) the upper roof is not considered slippery and has a slope of less than 20°.

3) The total weight of additional snow resulting from sliding shall be taken as half the total weight of snow resulting from the uniform load case prescribed in Article 4.1.6.2. with
   a) the accumulation factor \( C_a = 1.0 \) for the relevant part of the upper roof,
   b) the slope factor, \( C_s \), based on the slope of the lower roof, as prescribed in Sentences 4.1.6.2.(5) and (6), and
   c) the sliding snow distributed on the lower roof such that it is a maximum for \( x = 0 \) and decreases linearly to 0 at \( x = x_d \), as shown in Figure 4.1.6.11., where \( x \) and \( x_d \) are as defined in Article 4.1.6.5.

![Figure 4.1.6.11.](image)

Snow distribution on lower roof with sloped upper roof
Forming Part of Sentence 4.1.6.11.(3)

4.1.6.12. Valleys in Curved or Sloped Roofs

1) For valleys in curved or sloped roofs with a slope \( \alpha > 10° \), in addition to the full and partial load cases defined in Article 4.1.6.3., the non-uniform load cases II and III presented in Sentences (2) and (3) shall be considered to account for sliding, creeping and movement of meltwater.

2) For case II (See Figure 4.1.6.12.), the accumulation factor, \( C_a \), shall be calculated as follows:

\[
C_a = \begin{cases} 
\frac{1}{C_b} & \text{for } 0 < x \leq b/4, \\
0.5 & \text{for } b/4 < x \leq b/2
\end{cases}
\]

where

\( x \) = horizontal distance from the bottom of the valley, and
\( b \) = twice the horizontal distance between the bottom of the valley and the peak of the roof surface in question.

3) For case III (See Figure 4.1.6.12.), \( C_a \) shall be calculated as follows:

\[
C_a = \frac{1.5}{C_b} \text{ for } 0 < x \leq b/3, \text{ and}
\]
where \( x, b = \) as specified in Sentence (2).

\[
C_a = \frac{0.5}{C_b} \quad \text{for } b/8 < x \leq b/2
\]

Figure 4.1.6.12.
Snow loads in valleys of sloped or curved roofs
Forming Part of Sentences 4.1.6.12.(2) and (3)

Notes to Figure 4.1.6.12.: 
(1) \( C_\gamma = 1 \), as per Sentence 4.1.6.2.(3).
(2) \( C_s = 1 \), as per Sentence 4.1.6.2.(7).

4.1.6.13. Specific Weight of Snow
1) For the purposes of calculating snow loads in drifts, the specific weight of snow, \( \gamma \), shall be taken as 4.0 kN/m\(^3\) or 0.43\(S_s\) + 2.2 kN/m\(^3\), whichever is lesser.

4.1.6.14. Snow Removal
1) Snow removal by mechanical, thermal, manual or other means shall not be used as a rationale to reduce design snow loads.

4.1.6.15. Ice Loading of Structures
1) For lattice structures connected to the building, and other building components or appurtenances involving small width elements subject to significant ice accretion, the weight of ice accretion and the
Division B: Acceptable Solutions

Part 4 – Structural Design

Vancouver Building Bylaw 2019

4.1.7. Wind Load

4.1.7.1. Specified Wind Load

1) The specified wind loads for a building and its components shall be determined using the Static, Dynamic or Wind Tunnel Procedure as stated in Sentences (2) to (5).

2) For the design of buildings that are not dynamically sensitive, as defined in Sentence 4.1.7.2.(1), one of the following procedures shall be used to determine the specified wind loads:
   a) the Static Procedure described in Article 4.1.7.3.,
   b) the Dynamic Procedure described in Article 4.1.7.8., or
   c) the Wind Tunnel Procedure described in Article 4.1.7.12.

3) For the design of buildings that are dynamically sensitive, as defined in Sentence 4.1.7.2.(2), one of the following procedures shall be used to determine the specified wind loads:
   a) the Dynamic Procedure described in Article 4.1.7.8., or
   b) the Wind Tunnel Procedure described in Article 4.1.7.12.

4) For the design of buildings that may be subject to wake buffeting or channelling effects from nearby buildings, or that are very dynamically sensitive, as defined in Sentence 4.1.7.2.(3), the Wind Tunnel Procedure described in Article 4.1.7.12., shall be used to determine the specified wind loads.

5) For the design of cladding and secondary structural members, one of the following procedures shall be used to determine the specified wind loads:
   a) the Static Procedure described in Article 4.1.7.3., or
   b) the Wind Tunnel Procedure described in Article 4.1.7.12.

6) Computational fluid dynamics shall not be used to determine the specified wind loads for a building and its components. (See Note A-4.1.7.1.(6).)

4.1.7.2. Classification of Buildings

1) Except as provided in Sentences (2) and (3), a building is permitted to be classified as not dynamically sensitive.

2) A building shall be classified as dynamically sensitive if
   a) its lowest natural frequency is less than 1 Hz and greater than 0.25 Hz,
   b) its height is greater than 60 m, or
   c) its height is greater than 4 times its minimum effective width, where the effective width, \( w \), of a building shall be taken as

\[
    w = \frac{\sum h_i w_i}{\sum h_i}
\]

   where the summations are over the height of the building for a given wind direction, \( h_i \) is the height above grade to level \( i \), and \( w_i \) is the width normal to the wind direction at height \( h_i \); the minimum effective width is the lowest value of the effective width considering all wind directions.

3) A building shall be classified as very dynamically sensitive if
   a) its lowest natural frequency is less than or equal to 0.25 Hz, or
   b) its height is more than 6 times its minimum effective width as defined in Clause (2)(c).

4.1.7.3. Static Procedure

1) The specified external pressure or suction due to wind on part or all of a surface of a building shall be calculated as follows:

\[
    p = I_w q C_e C_t C_g C_p
\]

where
Division B: Acceptable Solutions

2) The net wind load for the building as a whole shall be the algebraic difference of the loads on the windward and leeward surfaces, and in some cases, may be calculated as the sum of the products of the external pressures or suctions and the areas of the surfaces over which they are averaged as provided in Sentence (1).

3) The net specified pressure due to wind on part or all of a surface of a building shall be the algebraic difference, such as to produce the most critical effect, of the external pressure or suction calculated in accordance with Sentence (1) and the specified internal pressure or suction due to wind calculated as follows:

\[
p_i = I_w q C_{ei} C_t C_{gi} C_{pi}
\]

where
- \( p_i \) = specified internal pressure acting statically and in a direction normal to the surface, either as a pressure directed towards the surface or as a suction directed away from the surface,
- \( I_w, q, C_t \) = as defined in Sentence (1),
- \( C_{ei} \) = exposure factor for internal pressure, as provided in Sentence (7),
- \( C_{gi} \) = internal gust effect factor, as provided in Sentence (10), and
- \( C_{pi} \) = internal pressure coefficient, as provided in Article 4.1.7.7.

4) The reference velocity pressure, \( q \), shall be the appropriate value determined in conformance with Subsection 1.1.3., based on a probability of being exceeded in any one year of 1 in 50.

5) The exposure factor, \( C_e \), shall be based on the reference height, \( h \), determined in accordance with Sentence (6), for the surface or part of the surface under consideration and shall be

- a) \((h/10)^{0.2}\) but not less than 0.9 for open terrain, where open terrain is level terrain with only scattered buildings, trees or other obstructions, open water or shorelines thereof,
- b) \(0.7(h/12)^{0.3}\) but not less than 0.7 for rough terrain, where rough terrain is suburban, urban or wooded terrain extending upwind from the building uninterrupted for at least 1 km or 20 times the height of the building, whichever is greater, or
c) an intermediate value between the two exposures defined in Clauses (a) and (b) in cases where the site is less than 1 km or 20 times the height of the building from a change in terrain conditions, whichever is greater, provided an appropriate interpolation method is used. (See Note A-4.1.7.3.(5)(c).)

6) The reference height, \( h \), shall be determined as follows:
   a) for buildings whose height is less than or equal to 20 m and less than the smaller plan dimension, \( h \) shall be the mid-height of the roof above grade, but not less than 6 m,
   b) for other buildings, \( h \) shall be
      i) the actual height above grade of the point on the windward wall for which external pressures are being calculated,
      ii) the mid-height of the roof for pressures on surfaces parallel to the wind direction, and
      iii) the mid-height of the building for pressures on the leeward wall, and
   c) for any structural element exposed to wind, \( h \) shall be the mid-height of the element above the ground.

7) The exposure factor for internal pressures, \( C_{ei} \), shall be determined as follows:
   a) for buildings whose height is greater than 20 m and that have a dominant opening, \( C_{ei} \) shall be equal to the exposure factor for external pressures, \( C_e \), calculated at the mid-height of the dominant opening, and
   b) for other buildings, \( C_{ei} \) shall be the same as the exposure factor for external pressures, \( C_e \), calculated for a reference height, \( h \), equal to the mid-height of the building or 6 m, whichever is greater.

8) Except as provided in Sentences (9) and 4.1.7.6.(1), the gust effect factor, \( C_g \), shall be one of the following values:
   a) 2.0 for the building as a whole and main structural members, or
   b) 2.5 for external pressures and suctions on secondary structural members, including cladding.

9) For cases where \( C_{ei} \) and \( C_g \) are combined into a single product, \( C_{gi} \), the values of \( C_{ei} \) and \( C_g \) need not be independently specified. (See Article 4.1.7.6.)

10) The internal gust effect factor, \( C_{gi} \), shall be 2.0, except it is permitted to be calculated using the following equation for large structures enclosing a single large unpartitioned volume that does not have numerous overhead doors or openings:

\[
C_{gi} = 1 + \frac{1}{\sqrt{1 + \frac{V_0}{6950A}}}
\]

where

- \( V_0 \) = internal volume, in m³, and
- \( A \) = total area of all exterior openings of the volume, in m².

(See Note A-4.1.7.3.(10).)

4.1.7.4. Topographic Factor

1) Except as provided in Sentence (2), the topographic factor, \( C_t \), shall be taken as 1.0.

2) For buildings on hills or escarpments with a slope, \( H_h/(2L_h) \), greater than 0.1 (See Figure 4.1.7.4.), the topographic factor, \( C_t \), shall be calculated as follows:

\[
C_t = \left( 1 + \frac{\Delta S}{C_g} \right) (1 + \Delta S)
\]

where

\[
\Delta S = \Delta S_{max} \left( 1 - \frac{|x|}{kL_h} \right) \exp\left(-\alpha z/L_h\right)
\]

where

- \( \Delta S_{max} \) = applicable value from Table 4.1.7.4.,
- \( x \) = horizontal distance from the peak of the hill or escarpment,
\[ L_h = \text{horizontal distance upwind from the peak to the point where the ground surface lies at half the height of the hill or escarpment, or } 2H_h \text{ (where } H_h = \text{height of hill or escarpment), whichever is greater,} \]
\[ z = \text{height above ground, and} \]
\[ k \text{ and } \alpha = \text{applicable constants from Table 4.1.7.4. based on shape of hill or escarpment.} \]

**Figure 4.1.7.4.**
Speed-up of mean velocity on a hill or escarpment

**Notes to Table 4.1.7.4.:**
For \( H_h/L_h > 0.5 \), assume \( H_h/L_h = 0.5 \) and substitute \( 2H_h \) for \( L_h \) in the equation for \( \Delta S \).
4.1.7.5. External Pressure Coefficients

1) Applicable values of external pressure coefficients, \( C_p \), are provided in
   a) Sentences (2) to (5), and
   b) Article 4.1.7.6. for certain shapes of low buildings.

2) For the design of the main structural system, the value of \( C_p \) shall be established as follows, where \( H \) is the height of the building and \( D \) is the width of the building parallel to the wind direction:
   a) on the windward face,
      \[
      C_p = \begin{cases} 
      0.6 & \text{for } H/D < 0.25 \\
      0.27(H/D + 2) & \text{for } 0.25 \leq H/D < 1.0, \text{ and} \\
      0.8 & \text{for } H/D \geq 1.0, 
      \end{cases}
      \]
   b) on the leeward face,
      \[
      C_p = \begin{cases} 
      -0.3 & \text{for } H/D < 0.25, \\
      -0.27(H/D + 0.88) & \text{for } 0.25 \leq H/D < 1.0, \text{ and} \\
      -0.5 & \text{for } H/D \geq 1.0, \text{ and}
      \end{cases}
      \]
   c) on the walls parallel to the wind, \( C_p = -0.7 \).
(See Note A-4.1.7.5.(2) and (3).)

3) For the design of roofs, the value of \( C_p \) shall be established as follows, where \( x \) is the distance from the upwind edge of the roof:
   a) for \( H/D \geq 1.0 \), \( C_p = -1.0 \), and
   b) for \( H/D < 1.0 \),
      \[
      C_p = \begin{cases} 
      -1.0 & \text{for } x \leq H, \text{ and} \\
      -0.5 & \text{for } x > H.
      \end{cases}
      \]
(See Note A-4.1.7.5.(2) and (3).)

4) For the design of the cladding and of secondary structural elements supporting the cladding, the value of \( C_p \) shall be established as follows, where \( W \) and \( D \) are the widths of the building:
   a) on walls, \( C_p \) shall be taken as \( \pm 0.9 \), except that within a distance equal to the larger of 0.1D and 0.1W from a building corner, the negative value of \( C_p \) shall be taken as \( -1.2 \),
   b) on walls where vertical ribs deeper than 1 m are placed on the facade, \( C_p \) shall be taken as \( \pm 0.9 \), except that, within a distance equal to the larger of 0.2D and 0.2W from a building corner, the negative value of \( C_p \) shall be taken as \( -1.4 \), and
   c) on roofs, \( C_p \) shall be taken as \( -1.0 \), except that
      i) within a distance equal to the larger of 0.1D and 0.1W from a roof edge, \( C_p \) shall be taken as \( -1.5 \),
      ii) in a zone that is within a distance equal to the larger of 0.2W and 0.2D from a roof corner, \( C_p \) shall be taken as \( -2.3 \) but is permitted to be taken as \( -2.0 \) for roofs with perimeter parapets that are higher than 1 m, and
      iii) on lower levels of flat stepped roofs, positive pressure coefficients established for the walls of the steps apply for a distance \( b \) (See Figure 4.1.7.6.-D for the definition of \( b \)).
(See Note A-4.1.7.5.(4).)

5) For the design of balcony guards, the internal pressure coefficient, \( C_{pi} \), shall be taken as zero and the value of \( C_p \) shall be taken as \( \pm 0.9 \), except that within a distance equal to the larger of 0.1W and 0.1D from a building corner, \( C_p \) shall be taken as \( \pm 1.2 \).

4.1.7.6. External Pressure Coefficients for Low Buildings

1) For the design of buildings with a height, \( H \), that is both less than or equal to 20 m and less than the smaller plan dimension, the values of the product of the pressure coefficient and gust factor, \( C_p C_g \), provided in Sentences (2) to (9) are permitted to be used.

2) For the design of the main structural system of the building, which is affected by wind pressures on more than one surface, the values of \( C_p C_g \) are provided in Figure 4.1.7.6.-A.
Figure 4.1.7.6.-A
External peak values of $C_pC_g$ for primary structural actions arising from wind load acting simultaneously on all surfaces of low buildings (H ≤ 20 m)
Forming Part of Sentence 4.1.7.6.(2)

Notes to Figure 4.1.7.6.-A:
(1) The building must be designed for all wind directions. Each corner must be considered in turn as the windward corner shown in the sketches. For all roof slopes, Load Case A and Load Case B are required as two separate loading conditions to generate the wind actions, including torsion, to be resisted by the structural system.
(2) For values of roof slope not shown, the coefficient ($C_pC_g$) can be interpolated linearly.
(3) Positive coefficients denote forces toward the surface, whereas negative coefficients denote forces away from the surface.
(4) For the design of foundations, exclusive of anchorages to the frame, only 70% of the effective load is to be considered.

(5) The reference height, h, for pressures is the mid-height of the roof or 6 m, whichever is greater. The eave height, H, may be substituted for the mid-height of the roof if the roof slope is less than 7°.

(6) End-zone width y should be the greater of 6 m or 2z, where z is the width of the gable-wall end zone defined for Load Case B below. Alternatively, for buildings with frames, the end zone y may be the distance between the end and the first interior frame.

(7) End-zone width z is the lesser of 10% of the least horizontal dimension and 40% of height, H, but not less than 4% of the least horizontal dimension or 1 m.

(8) For B/H > 5 in Load Case A, the listed negative coefficients on surfaces 2 and 2E should only be applied on an area whose width is 2.5H measured from the windward eave. The pressures on the remainder of the windward roof should be reduced to the pressures for the leeward roof.

3) For the design of individual walls and wall cladding, the values of $C_pC_g$ are provided in Figure 4.1.7.6.-B.

4) For the design of roofs with a slope less than or equal to 7°, the values of $C_pC_g$ are provided in Figure 4.1.7.6.-C.

5) For the design of flat roofs with steps in elevation, the values of $C_pC_g$ are provided in Figure 4.1.7.6.-D.

6) For the design of gabled or hipped, single-ridge roofs with a slope greater than 7°, the values of $C_pC_g$ are provided in Figure 4.1.7.6.-E.

7) For the design of gabled, multi-ridge roofs, the values of $C_pC_g$ are provided in
   a) Figure 4.1.7.6.-C for roofs with a slope less than or equal to 10°, and
   b) Figure 4.1.7.6.-F for roofs with a slope greater than 10°.

8) For monosloped roofs, the values of $C_pC_g$ are provided in
   a) Figure 4.1.7.6.-C for roofs with a slope less than or equal to 3°, and
   b) Figure 4.1.7.6.-G for roofs with a slope greater than 3° and less than or equal to 30°.

9) For sawtooth roofs, the values of $C_pC_g$ are provided in
   a) Figure 4.1.7.6.-C for roofs with a slope less than or equal to 10°, and
   b) Figure 4.1.7.6.-H for roofs with a slope greater than 10°.

Figure 4.1.7.6.-B
External peak values of $C_pC_g$ on individual walls for the design of cladding and secondary structural members
Forming Part of Sentence 4.1.7.6.(3)

Notes to Figure 4.1.7.6.-B:
(1) These coefficients apply for any roof slope, $\alpha$. 

Vancouver Building Bylaw 2019
(2) End-zone width \( z \) is the lesser of 10% of the least horizontal dimension and 40% of height, \( H \), but not less than 4% of the least horizontal dimension or 1 m.

(3) Combinations of external and internal pressures must be evaluated to obtain the most severe loading.

(4) Positive coefficients denote forces toward the surface, whereas negative coefficients denote forces away from the surface. Each structural element must be designed to withstand forces of both signs.

(5) Pressure coefficients generally apply for facades with architectural features; however, where vertical ribs deeper than 1 m are placed on a facade, a local \( C_pC_g \) of \(-2.8\) applies to zone e.

---

Figure 4.1.7.6.-C

External peak values of \( C_pC_g \) on roofs with a slope of 7° or less for the design of structural components and cladding

Forming Part of Sentences 4.1.7.6.(4), (7), (8) and (9)

Notes to Figure 4.1.7.6.-C:

(1) Coefficients for overhung roofs have the prefix “o” and refer to the same roof areas as referred to by the corresponding symbol without a prefix. They include contributions from both upper and lower surfaces. In the case of overhangs, the walls are inboard of the roof outline.

(2) \( s \) and \( r \) apply to both roofs and upper surfaces of canopies.

(3) End-zone width \( z \) is the lesser of 10% of the least horizontal dimension and 40% of height, \( H \), but not less than 4% of the least horizontal dimension or 1 m.

(4) Combinations of external and internal pressures must be evaluated to obtain the most severe loading.

(5) Positive coefficients denote forces toward the surface, whereas negative coefficients denote forces away from the surface. Each structural element must be designed to withstand forces of both signs.

(6) For calculating the uplift forces on tributary areas larger than 100 m² on unobstructed nearly-flat roofs with low parapets, and where the centre of the tributary area is at least twice the height of the building from the nearest edge, the value of \( C_pC_g \) may be reduced from \(-1.5\) to \(-1.1\) at \( /H = 2 \) and further reduced linearly to \(-0.6\) at \( x/H = 5 \), where \( x \) is the distance to the nearest edge and \( H \) is the height of the building.

(7) For roofs having a perimeter parapet with a height of 1 m or greater, the corner coefficients \( C_pC_g \) for tributary areas less than 1 m² can be reduced from \(-5.4\) to \(-4.4\).
Figure 4.1.7.6.-D
External peak values of $C_pC_g$ for the design of the structural components and cladding of buildings with stepped roofs
Forming Part of Sentence 4.1.7.6.(5)

Notes to Figure 4.1.7.6.-D:
(1) The zone designations, pressure-gust coefficients and notes provided in Figure 4.1.7.6.-C apply on both the upper and lower levels of flat stepped roofs, except that on the lower levels, positive pressure-gust coefficients equal to those in Figure 4.1.7.6.-B for walls apply for a distance, $b$, where $b$ is equal to $1.5h_1$ but not greater than 30 m. For all walls in Figure 4.1.7.6.-D, zone designations and pressure coefficients provided for walls in Figure 4.1.7.6.-B apply.

(2) Note (1) above applies only when the following conditions are met: $h_1 \geq 0.3H$, $h_1 \geq 3$ m, and $W_1$, $W_2$, or $W_3$ is greater than 0.25W but not greater than 0.75W.
Figure 4.1.7.6.-E
External peak values of $C_p C_g$ on single-span gabled and hipped roofs with a slope greater than $7^\circ$ for the design of structural components and cladding
Forming Part of Sentence 4.1.7.6.(6)

Notes to Figure 4.1.7.6.-E:
(1) Coefficients for overhanging roofs have the prefix “o” and refer to the same roof areas as referred to by the corresponding symbol without a prefix. They include contributions from both upper and lower surfaces.
(2) End-zone width $z$ is the lesser of 10% of the least horizontal dimension and 40% of height, $H$, but not less than 4% of the least horizontal dimension or 1 m.
(3) Combinations of external and internal pressures must be evaluated to obtain the most severe loading.
(4) Positive coefficients denote forces towards the surface, whereas negative coefficients denote forces away from the surface. Each structural element must be designed to withstand forces of both signs.
(5) For hipped roofs with $7^\circ < \alpha \leq 27^\circ$, edge/ridge strips and pressure-gust coefficients for ridges of gabled roofs apply along each hip.
Figure 4.1.7.6.-F
External peak values of $C_pC_g$ on multi-span gabled (folded) roofs with a slope greater than 10° for the design of structural components and cladding
Forming Part of Sentence 4.1.7.6.(7)

Notes to Figure 4.1.7.6.-F:
(1) End-zone width $z$ is the lesser of 10% of the least horizontal dimension and 40% of height, $H$, but not less than 4% of the least horizontal dimension or 1 m.
(2) Combinations of external and internal pressures must be evaluated to obtain the most severe loading.
(3) Positive coefficients denote forces towards the surface, whereas negative coefficients denote forces away from the surface. Each structural element must be designed to withstand forces of both signs.
(4) For $\alpha \leq 10^\circ$, the coefficients given in Figure 4.1.7.6.-C apply, but for cases where $\alpha > 7^\circ$, use $\alpha = 7^\circ$. 
Figure 4.1.7.6.-G
External peak values of $C_p C_g$ on monoslope roofs for the design of structural components and cladding
Forming Part of Sentence 4.1.7.6.(8)

Notes to Figure 4.1.7.6.-G:
(1) End-zone width $z$ is the lesser of 10% of the least horizontal dimension and 40% of height, $H$, but not less than 4% of the least horizontal dimension or 1 m.
(2) Combinations of external and internal pressures must be evaluated to obtain the most severe loading.
(3) Positive coefficients denote forces towards the surface, whereas negative coefficients denote forces away from the surface. Each structural element must be designed to withstand forces of both signs.
(4) For $\alpha \leq 3^\circ$, the coefficients given in Figure 4.1.7.6.-C apply.
Figure 4.1.7.6.-H
External peak values of $C_p C_g$ on sawtooth roofs with a slope greater than 10° for the design of structural components and cladding
Forming Part of Sentence 4.1.7.6.(9)

Notes to Figure 4.1.7.6.-H:
(1) End-zone width $z$ is the lesser of 10% of the least horizontal dimension and 40% of height, $H$, but not less than 4% of the least horizontal dimension or 1 m.
(2) Combinations of external and internal pressures must be evaluated to obtain the most severe loading.
(3) Positive coefficients denote forces towards the surface, whereas negative coefficients denote forces away from the surface. Each structural element must be designed to withstand forces of both signs.
(4) Negative coefficients on the corner zones of Span A differ from those on Spans B, C, and D.
(5) For $\alpha \leq 10^\circ$, the coefficients given in Figure 4.1.7.6.-C apply, but for cases where $\alpha > 7^\circ$, use $\alpha = 7^\circ$.

4.1.7.7. Internal Pressure Coefficient

1) The internal pressure coefficient, $C_{pi}$, shall be as prescribed in Table 4.1.7.7.

<table>
<thead>
<tr>
<th>Building Openings</th>
<th>Values for $C_{pi}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Uniformly distributed small openings amounting to less than 0.1% of the total surface area of the building</td>
<td>$-0.15$ to $0.0$</td>
</tr>
<tr>
<td>Non-uniformly distributed openings of which none is significant or significant openings that are wind-resistant and closed during storms</td>
<td>$-0.45$ to $+0.30$</td>
</tr>
</tbody>
</table>
4.1.7.8. Dynamic Procedure

1) For the application of the Dynamic Procedure, the provisions of Article 4.1.7.3. shall be followed, except that the exposure factor, $C_e$, shall be as prescribed in Sentences (2) and (3), and the gust effect factor, $C_g$, shall be as prescribed in Sentence (4), when determining the wind loads on the main structural system.

2) For buildings in open terrain, as defined in Clause 4.1.7.3.(5)(a), the value of $C_e$ for the design of the main structural system shall be calculated as follows:

$$C_e = \left(\frac{h}{10}\right)^{0.28}, \text{ but } 1.0 \leq C_e \leq 2.5$$

(See Note A-4.1.7.8.(2) and (3).)

3) For buildings in rough terrain, as defined in Clause 4.1.7.3.(5)(b), the value of $C_e$ for the design of the main structural system shall be calculated as follows:

$$C_e = 0.5\left(\frac{h}{12.7}\right)^{0.5}, \text{ but } 0.5 \leq C_e \leq 2.5$$

(See Note A-4.1.7.8.(2) and (3).)

4) For the design of the main structural system, $C_g$ shall be calculated as follows:

$$C_g = 1 + g_p - \frac{\sigma}{\mu}$$

where

$$g_p = \text{peak factor calculated as } \sqrt{2\ln(\nu T)} + \frac{0.577}{\sqrt{2\ln(\nu T)}}, \text{ and }$$

$$\sigma/\mu = \frac{K}{\sqrt{C_eH}} \left(B + \frac{SF}{\beta}\right),$$

where

$\nu = \text{average fluctuation rate calculated as } f_{nD} \sqrt{\frac{SF}{SF + \beta B}},$

$T = 3600 \text{ s},$

$K = 0.08 \text{ for open terrain and } 0.10 \text{ for rough terrain},$

$C_{eH} = \text{exposure factor evaluated at reference height } h = H,$

$B = \text{background turbulence factor, a function of } w/H \text{ determined from Figure 4.1.7.8.},$

$S = \text{size reduction factor calculated as } \frac{\pi}{3} \left[\frac{1}{1 + \frac{w_n}{2V_H}}\right] \left[1 + \frac{1}{1 + \frac{10f_n}{V_H}}\right],$

$F = \text{gust energy ratio calculated as } \sqrt{\frac{V}{2\nu}}, \text{ where } x_0 = (1220 f_p/V_H), \text{ and }$

$\beta = \text{damping ratio, which shall be determined by a rational method, or may be taken to be } 0.01 \text{ for steel structures, } 0.02 \text{ for concrete structures, and } 0.015 \text{ for composite structures,}$

where

$f_{nD} = \text{natural frequency of vibration of the building in the along-wind direction, in Hz,}$

$f_n = \text{lowest natural frequency of the building, in Hz, as defined in Sentences 4.1.7.2.(2) and (3),}$

$H = \text{height of the building,}$

$w = \text{effective width of windward face of the building calculated as } \frac{\sum h_i w_i}{\sum h_i}, \text{ where } w_i = \text{width normal to wind direction at height } h_i,$

$V_H = \text{mean wind speed at the top of the structure, in m/s, calculated as } \sqrt{\frac{C_{eH}}{\mu}},$

where

$\nu = \text{reference wind speed at a height of } 10 \text{ m, in m/s, calculated as } \sqrt{\frac{W_d}{\mu} C_{eH}}.$
where
\[ I_w = \text{importance factor}, \]
\[ q = \text{reference velocity pressure, in Pa, and} \]
\[ \rho = \text{air density} = 1.2929 \text{ kg/m}^3. \]
(See Note A-4.1.7.8.(4).)

**Figure 4.1.7.8.**
Background turbulence factor, \( B \)
Forming Part of Sentence 4.1.7.8.(4)

### 4.1.7.9. Full and Partial Wind Loading

1) Except where the wind loads are derived from the combined \( C_p C_g \) values determined in accordance with Article 4.1.7.6., buildings and structural members shall be capable of withstanding the effects of the following loads:

a) the full wind loads acting along each of the 2 principal horizontal axes considered separately,

b) the wind loads described in Clause (a) but with 100% of the load removed from any one portion of the area,
c) the wind loads described in Clause (a) but with both axes considered simultaneously at 75% of their full value, and
d) the wind loads described in Clause (c) but with 50% of these loads removed from any portion of the area.
(See Note A-4.1.7.9.(1).)

4.1.7.10. Interior Walls and Partitions
1) In the design of interior walls and partitions, due consideration shall be given to differences in air pressure on opposite sides of the wall or partition which may result from
   a) pressure differences between the windward and leeward sides of a building,
   b) stack effects due to a difference in air temperature between the exterior and interior of the building, and
   c) air pressurization by the mechanical services of the building.

4.1.7.11. Exterior Ornamentations, Equipment and Appendages
(See Note A-4.1.7.11.)
1) The effects of wind loads on exterior ornamentations, equipment and appendages, including the increase in exposed area as a result of ice buildup as prescribed in CSA S37, “Antennas, Towers, and Antenna-Supporting Structures,” shall be considered in the structural design of the connections and the building.
2) Where there are a number of similar components, the net increase in force is permitted to be based on the total area for all similar components as opposed to the summation of forces of individual elements.

4.1.7.12. Wind Tunnel Procedure
1) Except as provided in Sentences (2) and (3), wind tunnel tests on scale models to determine wind loads on buildings shall be conducted in accordance with ASCE/SEI 49, “Wind Tunnel Testing for Buildings and Other Structures.”
2) Where an adjacent building provides substantial sheltering effect, the wind loads for the main structural system shall be no lower than 80% of the loads determined from tests referred to in Sentence (1) with the effect of the sheltering building removed as applied to
   a) the base shear force for buildings with a ratio of height to minimum effective width, as defined in Sentence 4.1.7.2.(2), less than or equal to 1.0, or
   b) the base moment for buildings with a ratio of height to minimum effective width greater than 1.0.
3) For the design of cladding and secondary structural members, the exterior wind loads determined from the wind tunnel tests shall be no less onerous than those determined by analysis in accordance with Article 4.1.7.3. using the following assumptions:
   a) \( C_p = \pm 0.72 \) and \( C_g = 2.5 \), where the building’s height is greater than 20 m or greater than its minimum effective width, and
   b) \( C_p C_g = 80\% \) of the values for zones w and r provided in Article 4.1.7.6., where the building’s height is less than or equal to 20 m and no greater than its minimum effective width.

4.1.8. Earthquake Load and Effects

4.1.8.1. Analysis
1) Except as permitted in Sentence (2), the deflections and specified loading due to earthquake motions shall be determined according to the requirements of Articles 4.1.8.2. to 4.1.8.22.
2) Where \( I_E F_s S_a(0.2) \) and \( I_E F_s S_a(2.0) \) are less than 0.16 and 0.03 respectively, the deflections and specified loading due to earthquake motions are permitted to be determined in accordance with Sentences (3) to (15), where
   a) \( I_E \) is the earthquake importance factor and has a value of 0.8, 1.0, 1.3 and 1.5 for buildings of Low, Normal, High and Post-Disaster importance respectively,
Division B: Acceptable Solutions

Part 4 – Structural Design

b) $F_s$ is the site coefficient based on the average $N_{60}$ or $S_u$, as defined in Article 4.1.8.2., for the top 30 m of soil below the footings, pile caps, or mat foundations and has a value of

i) 1.0 for rock sites or when $N_{60} > 50$ or $S_u > 100$ kPa,

ii) 1.6 when $15 \leq N_{60} \leq 50$ or $50 \text{kPa} \leq S_u \leq 100 \text{kPa}$, and

iii) 2.8 for all other cases, and

c) $S_a(T)$ is the 5% damped spectral response acceleration value for period $T$, determined in accordance with Subsection 1.1.3.

3) The structure shall have a clearly defined

a) Seismic Force Resisting System (SFRS) to resist the earthquake loads and their effects, and

b) load path (or paths) that will transfer the inertial forces generated by the earthquake to the foundations and supporting ground.

4) An unreinforced masonry SFRS shall not be permitted where

a) $IE$ is greater than 1.0, or

b) the height above grade is greater than or equal to 30 m.

5) The height above grade of SFRS designed in accordance with CSA S136, “North American Specification for the Design of Cold-Formed Steel Structural Members,” shall be less than 15 m.

6) Earthquake forces shall be assumed to act horizontally and independently about any two orthogonal axes.

7) The minimum lateral earthquake design force, $V_s$, at the base of the structure in the direction under consideration shall be calculated as follows:

$$V_s = F_s S_a(T_s) I_e W_t / R_s$$

where

- $S_a(T_s)$ = value of $S_a$ at $T_s$ determined by linear interpolation between the value of $S_a$ at 0.2 s, 0.5 s, and 1.0 s, and
- $W_t$ = sum of $W_i$ over the height of the building, where $W_i$ is defined in Article 4.1.8.2., and
- $R_s$ = 1.5, except $R_s = 1.0$ for structures where the storey strength is less than that in the storey above and for an unreinforced masonry SFRS,

where

- $T_s$ = fundamental lateral period of vibration of the building, as defined in Article 4.1.8.2.,
- $= 0.085(h_n)^{0.3}$ for steel moment frames,
- $= 0.075(h_n)^{0.3}$ for concrete moment frames,
- $= 0.1 N$ for other moment frames,
- $= 0.025 h_n$ for braced frames, and
- $= 0.05(h_n)^{0.3}$ for shear walls and other structures,

where

- $h_n$ = height above the base, in m, as defined in Article 4.1.8.2.,

except that $V_s$ shall not be less than $F_s S_a(1.0) I_e W_t / R_s$ and, in cases where $R_s = 1.5$, $V_s$ need not be greater than $F_s S_a(0.5) I_e W_t / R_s$.

8) The total lateral earthquake design force, $V_s$, shall be distributed over the height of the building in accordance with the following formula:

$$F_x = V_s W_x h_x / \left( \sum_{i=1}^{n} W_i h_i \right)$$

where

- $F_x$ = force applied through the centre of mass at level $x$,

- $W_x, W_i$ = portion of $W$ that is located at or is assigned to level $x$ or $i$ respectively, and

- $h_x, h_i$ = height, in m, above the base of level $x$ and level $i$ as per Article 4.1.8.2.

9) Accidental torsional effects applied concurrently with $F_x$ shall be considered by applying torsional moments about the vertical axis at each level for each of the following cases considered separately:

a) $+0.1D h F_x$, and
b) $-0.1D_n F_x$.

10) Deflections obtained from a linear analysis shall include the effects of torsion and be multiplied by $R_s/I_E$ to get realistic values of expected deflections.

11) The deflections referred to in Sentence (10) shall be used to calculate the largest interstorey deflection, which shall not exceed
   a) $0.01h_s$ for post-disaster buildings,
   b) $0.02h_s$ for High Importance Category buildings, and
   c) $0.025h_s$ for all other buildings,
where $h_s$ is the interstorey height as defined in Article 4.1.8.2.

12) When earthquake forces are calculated using $R_s = 1.5$, the following elements in the SFRS shall have their design forces due to earthquake effects increased by 33%:
   a) diaphragms and their chords, connections, struts and collectors,
   b) tie downs in wood or drywall shear walls,
   c) connections and anchor bolts in steel- and wood-braced frames,
   d) connections in precast concrete, and
   e) connections in steel moment frames.

13) Except as provided in Sentence (14), where cantilever parapet walls, other cantilever walls, exterior ornamentation and appendages, towers, chimneys or penthouses are connected to or form part of a building, they shall be designed, along with their connections, for a lateral force, $V_{sp}$, distributed according to the distribution of mass of the element and acting in the lateral direction that results in the most critical loading for design using the following equation:

$$V_{sp} = 0.1F_s I_E W_f$$

where $W_f$ = weight of a portion of a structure as defined in Article 4.1.8.2.

14) The value of $V_{sp}$ shall be doubled for unreinforced masonry elements.

15) Structures designed in accordance with this Article need not comply with the seismic requirements stated in the applicable design standard referenced in Section 4.3.

4.1.8.2. Notation

1) In this Subsection
   $A_r$ = response amplification factor to account for type of attachment of mechanical/electrical equipment, as defined in Sentence 4.1.8.18.(1),
   $A_x$ = amplification factor at level x to account for variation of response of mechanical/electrical equipment with elevation within the building, as defined in Sentence 4.1.8.18.(1),
   $B_e$ = ratio at level x used to determine torsional sensitivity, as defined in Sentence 4.1.8.11.(10),
   $B$ = maximum value of $B_e$, as defined in Sentence 4.1.8.11.(10),
   $C_p$ = seismic coefficient for mechanical/electrical equipment, as defined in Sentence 4.1.8.18.(1),
   $D_{nx}$ = plan dimension of the building at level x perpendicular to the direction of seismic loading being considered,
   $e_x$ = distance measured perpendicular to the direction of earthquake loading between centre of mass and centre of rigidity at the level being considered (See Note A-4.1.8.2.(1).),
   $F_s$ = site coefficient for application in Subsection 4.1.8., as defined in Sentence 4.1.8.4.(7),
   $F(PGA)$ = site coefficient for PGA, as defined in Sentence 4.1.8.4.(5),
   $F(PGV)$ = site coefficient for PGV, as defined in Sentence 4.1.8.4.(5),
   $F_s$ = site coefficient as defined in Sentence 4.1.8.1.2(2) for application in Article 4.1.8.1.,
   $F(T)$ = site coefficient for spectral acceleration, as defined in Sentence 4.1.8.4.(5),
   $F_t$ = portion of $V$ to be concentrated at the top of the structure, as defined in Sentence 4.1.8.11.(7),
   $F_v$ = site coefficient for application in Subsection 4.1.8., as defined in Sentence 4.1.8.4.(7),
   $F_x$ = lateral force applied to level x, as defined in Sentence 4.1.8.11.(7),
hi, hn, hx = the height above the base (i = 0) to level i, n, or x respectively, where the base of the structure is the level at which horizontal earthquake motions are considered to be imparted to the structure,

hs = interstorey height (hi - hi-1),

IE = earthquake importance factor of the structure, as described in Sentence 4.1.8.5.(1),

J = numerical reduction coefficient for base overturning moment, as defined in Sentence 4.1.8.11.(6),

Jx = numerical reduction coefficient for overturning moment at level x, as defined in Sentence 4.1.8.11.(8),

Level i = any level in the building, i = 1 for first level above the base,

Level n = level that is uppermost in the main portion of the structure,

Level x = level that is under design consideration,

Mv = factor to account for higher mode effect on base shear, as defined in Sentence 4.1.8.11.(6),

Mx = overturning moment at level x, as defined in Sentence 4.1.8.11.(8),

N = total number of storeys above exterior grade to level n,

N60 = Average Standard Penetration Resistance for the top 30 m, corrected to a rod energy efficiency of 60% of the theoretical maximum,

PGA = Peak Ground Acceleration expressed as a ratio to gravitational acceleration, as defined in Sentence 4.1.8.4.(1),

PGAref = reference PGA for determining F(T), F(PGA) and F(PGV), as defined in Sentence 4.1.8.4.(4),

PGV = Peak Ground Velocity, in m/s, as defined in Sentence 4.1.8.4.(1),

PI = plasticity index for clays,

Rd = ductility-related force modification factor reflecting the capability of a structure to dissipate energy through reversed cyclic inelastic behaviour, as given in Article 4.1.8.9.,

Ro = overstrength-related force modification factor accounting for the dependable portion of reserve strength in a structure designed according to these provisions, as defined in Article 4.1.8.9.,

Rs = combined overstrength and ductility-related modification factor, as defined in Sentence 4.1.8.1.(7), for application in Article 4.1.8.1.,

Sr = horizontal force factor for part or portion of a building and its anchorage, as given in Sentence 4.1.8.18.(1),

S(T) = design spectral response acceleration, expressed as a ratio to gravitational acceleration, for a period of T, as defined in Sentence 4.1.8.4.(9),

Sd(T) = 5% damped spectral response acceleration, expressed as a ratio to gravitational acceleration, for a period of T, as defined in Sentence 4.1.8.4.(1),

SFRS = Seismic Force Resisting System(s) is that part of the structural system that has been considered in the design to provide the required resistance to the earthquake forces and effects defined in Subsection 4.1.8.,

su = average undrained shear strength in the top 30 m of soil,

T = period in seconds,

Ta = fundamental lateral period of vibration of the building or structure, in s, in the direction under consideration, as defined in Sentence 4.1.8.11.(3),

Ts = fundamental lateral period of vibration of the building or structure, in s, in the direction under consideration, as defined in Sentence 4.1.8.1.(7),

Tx = floor torque at level x, as defined in Sentence 4.1.8.11.(11),

TDD = Total Design Displacement of any point in a seismically isolated structure, within or above the isolation system, obtained by calculating the mean + (IE × the standard deviation) of the peak horizontal displacements from all sets of ground motion histories analyzed, but not less than √IE ×
the mean, where the peak horizontal displacement is based on the vector sum of the two orthogonal horizontal displacements considered for each time step,

- $V\bar{V}$ = lateral earthquake design force at the base of the structure, as determined by Article 4.1.8.11.,
- $V_d$ = lateral earthquake design force at the base of the structure, as determined by Article 4.1.8.12.,
- $V_e$ = lateral earthquake elastic force at the base of the structure, as determined by Article 4.1.8.12.,
- $V_{ed}$ = lateral earthquake design elastic force at the base of the structure, as determined by Article 4.1.8.12.,
- $V_p$ = lateral force on a part of the structure, as determined by Article 4.1.8.18.,
- $Vs$ = lateral earthquake design force at the base of the structure, as determined by Sentence 4.1.8.1.(7), for application in Article 4.1.8.1.,
- $V_{s30}$ = average shear wave velocity in the top 30 m of soil or rock,
- $W$ = dead load, as defined in Article 4.1.4.1., except that the minimum partition load as defined in Sentence 4.1.4.1.(3) need not exceed 0.5 kPa, plus 25% of the design snow load specified in Subsection 4.1.6., plus 60% of the storage load for areas used for storage, except that storage garages need not be considered storage areas, and the full contents of any tanks (See Note A-4.1.8.2.(1).),
- $W_i, W_x$ = portion of $W$ that is located at or is assigned to level $i$ or $x$ respectively,
- $W_o$ = weight of a part or portion of a structure, e.g., cladding, partitions and appendages,
- $W_t$ = sum of $W_i$ over the height of the building, for application in Sentence 4.1.8.1.(7),
- $\delta_{ave}$ = average displacement of the structure at level $x$, as defined in Sentence 4.1.8.11.(10), and
- $\delta_{max}$ = maximum displacement of the structure at level $x$, as defined in Sentence 4.1.8.11.(10).

4.1.8.3. General Requirements

1) The building shall be designed to meet the requirements of this Subsection and of the design standards referenced in Section 4.3.
2) Structures shall be designed with a clearly defined load path, or paths, that will transfer the inertial forces generated in an earthquake to the supporting ground.
3) The structure shall have a clearly defined Seismic Force Resisting System(s) (SFRS), as defined in Article 4.1.8.2.
4) The SFRS shall be designed to resist 100% of the earthquake loads and their effects. (See Note A-4.1.8.3.(4).)
5) All structural framing elements not considered to be part of the SFRS must be investigated and shown to behave elastically or to have sufficient non-linear capacity to support their gravity loads while undergoing earthquake-induced deformations calculated from the deflections determined in Article 4.1.8.13.
6) Stiff elements that are not considered part of the SFRS, such as concrete, masonry, brick or precast walls or panels, shall be
   a) separated from all structural elements of the building such that no interaction takes place as the building undergoes deflections due to earthquake effects as calculated in this Subsection, or
   b) made part of the SFRS and satisfy the requirements of this Subsection.
(See Note A-4.1.8.3.(6).)
7) Stiffness imparted to the structure from elements not part of the SFRS, other than those described in Sentence (6), shall not be used to resist earthquake deflections but shall be accounted for
   a) in calculating the period of the structure for determining forces if the added stiffness decreases the fundamental lateral period by more than 15%,
   b) in determining the irregularity of the structure, except the additional stiffness shall not be used to make an irregular SFRS regular or to reduce the effects of torsion (See Note A-4.1.8.3.(7)(b) and (c).), and
c) in designing the SFRS if inclusion of the elements not part of the SFRS in the analysis has an adverse effect on the SFRS (See Note A-4.1.8.3.(7)(b) and (c)).

8) Structural modelling shall be representative of the magnitude and spatial distribution of the mass of the building and of the stiffness of all elements of the SFRS, including stiff elements that are not separated in accordance with Sentence 4.1.8.3.(6), and shall account for
   a) the effect of cracked sections in reinforced concrete and reinforced masonry elements,
   b) the effect of the finite size of members and joints,
   c) sway effects arising from the interaction of gravity loads with the displaced configuration of the structure, and
   d) other effects that influence the lateral stiffness of the building.
(See Note A-4.1.8.3.(8)).

4.1.8.4. Site Properties
1) The peak ground acceleration (PGA), peak ground velocity (PGV), and the 5% damped spectral response acceleration values, $S_h(T)$, for the reference ground conditions (Site Class C in Table 4.1.8.4.-A) for periods $T$ of 0.2 s, 0.5 s, 1.0 s, 2.0 s, 5.0 s and 10.0 s shall be determined in accordance with Subsection 1.1.3. and are based on a 2% probability of exceedance in 50 years.

</table>

Notes to Table 4.1.8.4.-A:
(1) Site Classes A and B, hard rock and rock, are not to be used if there is more than 3 m of softer materials between the rock and the underside of footing or mat foundations. The appropriate Site Class for such cases is determined on the basis of the average properties of the total thickness of the softer materials (See Note A-4.1.8.4.(3) and Table 4.1.8.4.-A).
(2) Where $\overline{V}_{s30}$ has been measured in-situ, the $F(T)$ values for Site Class A derived from Tables 4.1.8.4.-B to 4.1.8.4.-G are permitted to be multiplied by the factor $0.04 + (1500/\overline{V}_{s30})^{0.5}$.
(3) Other soils include:
   a) liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils, and other soils susceptible to failure or collapse under seismic loading,
   b) peat and/or highly organic clays greater than 3 m in thickness,
c) highly plastic clays (PI > 75) more than 8 m thick, and
d) soft to medium stiff clays more than 30 m thick.

2) Site classifications for ground shall conform to Table 4.1.8.4.-A and shall be determined using $\bar{V}_{s30}$, or where $\bar{V}_{s30}$ is not known, using Sentence (3).

3) If average shear wave velocity, $\bar{V}_{s30}$, is not known, Site Class shall be determined from energy-corrected Average Standard Penetration Resistance, $N_{60}$, or from soil average undrained shear strength, $s_u$, as noted in Table 4.1.8.4.-A, $N_{60}$ and $s_u$ being calculated based on rational analysis. (See Note A-4.1.8.4.(3) and Table 4.1.8.4.-A.)

4) For the purpose of determining the values of $F(T)$ to be used in the calculation of design spectral acceleration, $S(T)$, in Sentence (9), and the values of $F(PGA)$ and $F(PGV)$, the value of $PGA_{ref}$ to be used with Tables 4.1.8.4.-B to 4.1.8.4.-I shall be taken as
   a) 0.8 PGA, where the ratio $S_a(0.2)/PGA < 2.0$, and
   b) PGA, otherwise.

5) The values of the site coefficient for design spectral acceleration at period $T$, $F(T)$, and of similar coefficients $F(PGA)$ and $F(PGV)$ shall conform to Tables 4.1.8.4.-B to 4.1.8.4.-I using linear interpolation for intermediate values of $PGA_{ref}$.

6) Site-specific evaluation is required to determine $F(T)$, $F(PGA)$ and $F(PGV)$ for Site Class F. (See Note A-4.1.8.4.(3) and Table 4.1.8.4.-A.)

7) For all applications in Subsection 4.1.8., $F_a = F(0.2)$ and $F_v = F(1.0)$.

8) For structures with a fundamental period of vibration equal to or less than 0.5 s that are built on liquefiable soils, Site Class and the corresponding values of $F(T)$ may be determined as described in Tables 4.1.8.4.-A, 4.1.8.4.-B, and 4.1.8.4.-C by assuming that the soils are not liquefiable. (See Note A-4.1.8.4.(3) and Table 4.1.8.4.-A.)

9) The design spectral acceleration values of $S(T)$ shall be determined as follows, using linear interpolation for intermediate values of $T$:
   \[
   S(T) = \begin{cases} 
   F(0.2)S_a(0.2) & \text{or} \ F(0.5)S_a(0.5), \\
   & \text{whichever is larger, for } T \leq 0.2 \text{ s} \\
   F(0.5)S_a(0.5) & \text{for } T = 0.5 \text{ s} \\
   F(1.0)S_a(1.0) & \text{for } T = 1.0 \text{ s} \\
   F(2.0)S_a(2.0) & \text{for } T = 2.0 \text{ s} \\
   F(5.0)S_a(5.0) & \text{for } T = 5.0 \text{ s} \\
   F(10.0)S_a(10.0) & \text{for } T \geq 10.0 \text{ s} 
   \end{cases}
   \]

<td></td>
</tr>
</tbody>
</table>

**Notes to Table 4.1.8.6.**:<br>(1) One-storey penthouses with a weight of less than 10% of the level below need not be considered in the application of this Table.<br>(2) See Article 4.1.8.7.<br>(3) See Article 4.1.8.10.<br>(4) See Note A-Table 4.1.8.6.<br>(5) See Article 4.1.8.15.<br>(6) See Sentences 4.1.8.11.(10), (11) and 4.1.8.12.(4).<br>(7) See Article 4.1.8.8.

### 4.1.8.7. Methods of Analysis
1) Analysis for design earthquake actions shall be carried out in accordance with the Dynamic Analysis Procedure described in Article 4.1.8.12. (See Note A-4.1.8.7.(1).), except that the Equivalent Static Force Procedure described in Article 4.1.8.11. may be used for structures that meet any of the following criteria:<br>a) in cases where $I_E F_{eSa}(0.2)$ is less than 0.35,<br>b) regular structures that are less than 60 m in height and have a fundamental lateral period, $T_a$, less than 2 s in each of two orthogonal directions as defined in Article 4.1.8.8., or<br>c) structures with structural irregularity, of Type 1, 2, 3, 4, 5, 6 or 8 as defined in Table 4.1.8.6., that are less than 20 m in height and have a fundamental lateral period, $T_a$, less than 0.5 s in each of two orthogonal directions as defined in Article 4.1.8.8.

### 4.1.8.8. Direction of Loading
1) Earthquake forces shall be assumed to act in any horizontal direction, except that the following shall be considered to provide adequate design force levels in the structure:<br>a) where components of the SFRS are oriented along a set of orthogonal axes, independent analyses about each of the principal axes of the structure shall be performed,<br>b) where the components of the SFRS are not oriented along a set of orthogonal axes and $I_E F_{eSa}(0.2)$ is less than 0.35, independent analyses about any two orthogonal axes is permitted, or<br>c) where the components of the SFRS are not oriented along a set of orthogonal axes and $I_E F_{eSa}(0.2)$ is equal to or greater than 0.35, analysis of the structure independently in any two orthogonal directions for 100% of the prescribed earthquake loads applied in one direction plus 30% of the prescribed earthquake loads in the perpendicular direction, with the combination requiring the greater element strength being used in the design.
### 4.1.8.9. SFRS Force Reduction Factors, System Overstrength Factors, and General Restrictions

1) Except as provided in Sentence 4.1.8.20.(7), the values of $R_d$ and $R_o$ and the corresponding system restrictions shall conform to Table 4.1.8.9. and the requirements of this Subsection.

2) When a particular value of $R_d$ is required by this Article, the corresponding $R_o$ shall be used.

3) For combinations of different types of SFRS acting in the same direction in the same storey, $R_d R_o$ shall be taken as the lowest value of $R_d R_o$ corresponding to these systems.

4) For vertical variations of $R_d R_o$, excluding rooftop structures not exceeding two storeys in height whose weight is less than the greater of 10% of $W$ and 30% of $W_i$ of the level below, the value of $R_d R_o$ used in the design of any storey shall be less than or equal to the lowest value of $R_d R_o$ used in the given direction for the storeys above, and the requirements of Sentence 4.1.8.15.(6) must be satisfied. (See Note A-4.1.8.9.(4).)

5) If it can be demonstrated through testing, research and analysis that the seismic performance of a structural system is at least equivalent to one of the types of SFRS mentioned in Table 4.1.8.9., then such a structural system will qualify for values of $R_d$ and $R_o$ corresponding to the equivalent type in that Table. (See Note A-4.1.8.9.(5).)

**Notes to Table 4.1.8.9.:**

1. See Article 4.1.8.10.
2. NP = system is not permitted.
   - NL = system is permitted and not limited in height as an SFRS.
   - Numbers in this Table are maximum height limits above grade, in m.
   - Height may be limited in other Parts of the By-law.
   - The most stringent requirement governs.
3. Higher design force levels are prescribed in CSA S16 for some heights of buildings.
4. See Note A-Table 4.1.8.9.
5. Frames limited to a maximum of 2 storeys.
6. Frames limited to a maximum of 3 storeys.

**4.1.8.10. Additional System Restrictions**

1. Except as required by Clause (2)(b), structures with a Type 6 irregularity, Discontinuity in Capacity – Weak Storey, as described in Table 4.1.8.6., are not permitted unless $I_{EF_{S_{a}}(0.2)}$ is less than 0.2 and the forces used for design of the SFRS are multiplied by $R_{d}R_{o}$. 
2) Post-disaster buildings shall
   a) not have any irregularities conforming to Types 1, 3, 4, 5, 7 and 9 as described in Table 4.1.8.6.,
      in cases where \( I_{EF_a S_a(0.2)} \) is equal to or greater than 0.35,
   b) not have a Type 6 irregularity as described in Table 4.1.8.6.,
   c) have an SFRS with an \( R_o \) of 2.0 or greater, and
   d) have no storey with a lateral stiffness that is less than that of the storey above it.
3) For buildings having fundamental lateral periods, \( T_a \), of 1.0 s or greater, and where \( I_{EF_v S_v(1.0)} \) is greater than 0.25, shear walls that are other than wood-based and form part of the SFRS shall be continuous from their top to the foundation and shall not have irregularities of Type 4 or 5 as described in Table 4.1.8.6.
4) For buildings constructed with more than 4 storeys of continuous wood construction and where \( I_{EF_a S_a(0.2)} \) is equal to or greater than 0.35, timber SFRS consisting of shear walls with wood-based panels or of braced or moment-resisting frames as defined in Table 4.1.8.9. within the continuous wood construction shall not have Type 4 or Type 5 irregularities as described in Table 4.1.8.6. (See Note A-4.1.8.10.(4).)
5) The ratio, \( \alpha \), for a Type 9 irregularity as described in Table 4.1.8.6. shall be determined independently for each orthogonal direction using the following equation:

   \[
   x = \frac{Q_G}{Q_y}
   \]

where

\( Q_G \) = gravity-induced lateral demand on the SFRS at the critical level of the yielding system, and
\( Q_y \) = the resistance of the yielding mechanism required to resist the minimum earthquake loads, which need not be taken as less than \( R_o \) multiplied by the minimum lateral earthquake force as determined in Article 4.1.8.11. or 4.1.8.12., as appropriate.
(See Note A-4.1.8.10.(5).)
6) For buildings with a Type 9 irregularity as described in Table 4.1.8.6. and where \( I_{EF_a S_a(0.2)} \) is equal to or greater than 0.5, deflections determined in accordance with Article 4.1.8.13. shall be multiplied by 1.2.
7) Structures where the value of \( \alpha \), as determined in accordance with Sentence (5), exceeds twice the limits specified in Table 4.1.8.6. for a Type 9 irregularity, and where \( I_{EF_a S_a(0.2)} \) is equal to or greater than 0.5 are not permitted unless determined to be acceptable based on non-linear dynamic analysis studies. (See Note A-4.1.8.10.(7).)

4.1.8.11. Equivalent Static Force Procedure for Structures Satisfying the Conditions of Article 4.1.8.7.
1) The static loading due to earthquake motion shall be determined according to the procedures given in this Article.
2) Except as provided in Sentence (12), the minimum lateral earthquake force, \( V \), shall be calculated using the following formula:

\[
V = S(T_a)M_xI_E W/(R_dR_o)
\]

except
   a) for walls, coupled walls and wall-frame systems, \( V \) shall not be less than \( S(4.0)M_xI_E W/(R_dR_o) \)
   b) for moment-resisting frames, braced frames, and other systems, \( V \) shall not be less than \( S(2.0)M_xI_E W/(R_dR_o) \)
   c) for buildings located on a site other than Class F and having an SFRS with an \( R_o \) equal to or greater than 1.5, \( V \) need not be greater than the larger of

\[
\frac{2}{3} S(0.2)I_E W/(R_dR_o) \quad \text{and} \quad S(0.5)I_E W/(R_dR_o)
\]
3) Except as provided in Sentence (4), the fundamental lateral period, $T_a$, in the direction under consideration in Sentence (2), shall be determined as:
   a) for moment-resisting frames that resist 100% of the required lateral forces and where the frame is not enclosed by or adjoined by more rigid elements that would tend to prevent the frame from resisting lateral forces, and where $h_n$ is in metres:
      i) $0.085 \times (h_n)^{3/4}$ for steel moment frames,
      ii) $0.075 \times (h_n)^{3/4}$ for concrete moment frames, or
      iii) $0.1 N$ for other moment frames,
   b) $0.025\times h_n$ for braced frames where $h_n$ is in metres,
   c) $0.05 \times (h_n)^{3/4}$ for shear wall and other structures where $h_n$ is in metres, or
   d) other established methods of mechanics using a structural model that complies with the requirements of Sentence 4.1.8.3.(8), except that
      i) for moment-resisting frames, $T_a$ shall not be taken greater than 1.5 times that determined in Clause (a),
      ii) for braced frames, $T_a$ shall not be taken greater than 2.0 times that determined in Clause (b),
      iii) for shear wall structures, $T_a$ shall not be taken greater than 2.0 times that determined in Clause (c),
      iv) for other structures, $T_a$ shall not be taken greater than that determined in Clause (c), and
      v) for the purpose of calculating the deflections, the period without the upper limit specified in Subclauses (d)(i) to (d)(iv) may be used, except that, for walls, coupled walls and wall-frame systems, $T_a$ shall not exceed 4.0 s, and for moment-resisting frames, braced frames, and other systems, $T_a$ shall not exceed 2.0 s.

(See Note A-4.1.8.11.(3).)

4) For single-storey buildings with steel deck or wood roof diaphragms, the fundamental lateral period, $T_a$, in the direction under consideration is permitted to be taken as
   a) $0.05 \times (h_n)^{3/4} + 0.004 L$ for shear walls,
   b) $0.035 \times h_n + 0.004 L$ for steel moment frames and steel braced frames, or
   c) the value obtained from methods of mechanics using a structural model that complies with the requirements of Sentence 4.1.8.3.(8), except that $T_a$ shall not be greater than 1.5 times the value determined in Clause (a) or (b), as applicable,

where $L$ is the shortest length of the diaphragm, in m, between adjacent vertical elements of the SFRS in the direction perpendicular to the direction under consideration.

5) The weight, $W$, of the building shall be calculated using the following formula:

$$W = \sum_{i=1}^{n} w_i$$

6) The higher mode factor, $M_v$, and its associated base overturning moment reduction factor, $J$, shall conform to Table 4.1.8.11.

7) The total lateral seismic force, $V$, shall be distributed such that a portion, $F_t$, shall be assumed to be concentrated at the top of the building, where $F_t$ is equal to $0.07 \times T_a \times V$ but need not exceed 0.25 $V$ and may be considered as zero where the fundamental lateral period, $T_a$, does not exceed 0.7 s; the remainder, $V - F_t$, shall be distributed along the height of the building, including the top level, in accordance with the following formula:

$$F_x = \frac{(V - F_t)W_x h_2}{\left(\sum_{i=1}^{n} W_i h_i\right)}$$
Table 4.1.8.11.
Higher Mode Factor, \( M_v \), and Base Overturning Reduction Factor, \( J \)

</table>

Notes to Table 4.1.8.11.:
(1) For intermediate values of the spectral ratio S(0.2)/S(5.0), \( M_v \) and \( J \) shall be obtained by linear interpolation.
(2) For intermediate values of the fundamental lateral period, \( T_a \), \( S(T_a)M_v \) shall be obtained by linear interpolation using the values of \( M_v \) obtained in...
accordance with Note (1).

(3) For intermediate values of the fundamental lateral period, $T_a$, $J$ shall be obtained by linear interpolation using the values of $J$ obtained in accordance with Note (1).

(4) For a combination of different seismic force resisting systems (SFRS) not given in Table 4.1.8.11. that are in the same direction under consideration, use the highest $M_v$ factor of all the SFRS and the corresponding value of $J$.

(5) For fundamental lateral periods, $T_a$, greater than 2.0 s, use the 2.0 s values obtained in accordance with Note (1). See Clause 4.1.8.11.(2)(b).

(6) A “coupled” wall is a wall system with coupling beams, where at least 66% of the base overturning moment resisted by the wall system is carried by the axial tension and compression forces resulting from shear in the coupling beams.

(7) For fundamental lateral periods, $T_a$, greater than 4.0 s, use the 4.0 s values of $S(T_a)M_v$ obtained by interpolation between 2.0 s and 5.0 s using the value of $M_v$ obtained in accordance with Note (1). See Clause 4.1.8.11.(2)(a).

(8) For fundamental lateral periods, $T_a$, greater than 4.0 s, use the 4.0 s values of $J$ obtained by interpolation between 2.0 s and 5.0 s using the value of $J$ obtained in accordance with Note (1). See Clause 4.1.8.11.(2)(a).

8) The structure shall be designed to resist overturning effects caused by the earthquake forces determined in Sentence (7) and the overturning moment at level $x$, $M_x$, shall be determined using the following equation:

$$M_x = J \sum_{i=x}^{n} F_i (h_i - h_x)$$

where

$$J_x = \begin{cases} 1.0 & \text{for } h_x \geq 0.6h_n, \text{and} \\ J + (1 - J)(h_x / 0.6h_n) & \text{for } h_x < 0.6h_n \end{cases}$$

where

$J$ = base overturning moment reduction factor conforming to Table 4.1.8.11.

9) Torsional effects that are concurrent with the effects of the forces mentioned in Sentence (7) and are caused by the simultaneous actions of the following torsional moments shall be considered in the design of the structure according to Sentence (11):

a) torsional moments introduced by eccentricity between the centres of mass and resistance and their dynamic amplification, and

b) torsional moments due to accidental eccentricities.

10) Torsional sensitivity shall be determined by calculating the ratio $B_x$ for each level $x$ according to the following equation for each orthogonal direction determined independently:

$$B_x = \frac{\delta_{\text{max}}}{\delta_{\text{ave}}}$$

where

$B$ = maximum of all values of $B_x$ in both orthogonal directions, except that the $B_x$ for one-storey penthouses with a weight less than 10% of the level below need not be considered,

$\delta_{\text{max}}$ = maximum storey displacement at the extreme points of the structure, at level $x$ in the direction of the earthquake induced by the equivalent static forces acting at distances $\pm 0.10 D_n$ from the centres of mass at each floor, and

$\delta_{\text{ave}}$ = average of the displacements at the extreme points of the structure at level $x$ produced by the above-mentioned forces.

11) Torsional effects shall be accounted for as follows:

a) for a building with $B \leq 1.7$ or where $I_{EF}a_S(0.2)$ is less than 0.35, by applying torsional moments about a vertical axis at each level throughout the building, derived for each of the following load cases considered separately:

i) $T_x = F_x (e_x + 0.10 D_n)$, and

ii) $T_x = F_x (e_x - 0.10 D_n)$

where $F_x$ is the lateral force at each level determined according to Sentence (7) and where each element of the building is designed for the most severe effect of the above load cases, or

b) for a building with $B > 1.7$, in cases where $I_{EF}a_S(0.2)$ is equal to or greater than 0.35, by a Dynamic Analysis Procedure as specified in Article 4.1.8.12.

12) Where the fundamental lateral period, $T_a$, is determined in accordance with Clause (3)(d) and the building is constructed with more than 4 storeys of continuous wood construction and has a timber SFRS
consisting of shear walls with wood-based panels or of braced or moment-resisting frames as defined in Table 4.1.8.9., the lateral earthquake force, V, as determined in accordance with Sentence (2) shall be multiplied by 1.2 but need not exceed the value determined by using Clause (2)(c). (See Note A-4.1.8.10.4.)

4.1.8.12. Dynamic Analysis Procedure

1) Except as provided in Articles 4.1.8.19. and 4.1.8.21., the Dynamic Analysis Procedure shall be in accordance with one of the following methods:
   a) Linear Dynamic Analysis by either the Modal Response Spectrum Method or the Numerical Integration Linear Time History Method using a structural model that complies with the requirements of Sentence 4.1.8.3.(8) (See Note A-4.1.8.12.(1)(a).), or
   b) Non-linear Dynamic Analysis, in which case a special study shall be performed. (See Note A-4.1.8.12.(1)(b).)

2) The spectral acceleration values used in the Modal Response Spectrum Method shall be the design spectral acceleration values, S(T), defined in Sentence 4.1.8.4.(9).

3) The ground motion histories used in the Numerical Integration Linear Time History Method shall be compatible with a response spectrum constructed from the design spectral acceleration values, S(T), defined in Sentence 4.1.8.4.(9). (See Note A-4.1.8.12.(3).)

4) The effects of accidental torsional moments acting concurrently with the lateral earthquake forces that cause them shall be accounted for by the following methods:
   a) the static effects of torsional moments due to (± 0.10 Dnx)Fx at each level x, where Fx is either determined from the elastic dynamic analysis or determined from Sentence 4.1.8.11.(7) multiplied by RDRd/IE, shall be combined with the effects determined by dynamic analysis (See Note A-4.1.8.12.(4)(a).), or
   b) if B, as defined in Sentence 4.1.8.11.(10), is less than 1.7, it is permitted to use a three-dimensional dynamic analysis with the centres of mass shifted by a distance of –0.05 Dnx and + 0.05 Dnx.

5) Except as provided in Sentence (6), the design elastic base shear, Ved, shall be equal to the elastic base shear, Vd, obtained from a Linear Dynamic Analysis.

6) For structures located on sites other than Class F that have an SFRS with Rd equal to or greater than 1.5, the elastic base shear obtained from a Linear Dynamic Analysis may be multiplied by the larger of the following factors to obtain the design elastic base shear, Ved:

\[
\frac{2S(0.2)}{3S(T_a)} \leq 1.0 \text{ and }
\]

\[
\frac{S(0.5)}{S(T_a)} \leq 1.0
\]

7) The design elastic base shear, Ved, shall be multiplied by the importance factor, IE, as determined in Article 4.1.8.5., and shall be divided by RdRo as determined in Article 4.1.8.9., to obtain the design base shear, Vd.

8) Except as required by Sentence (9) or (12), if the base shear, Vd, obtained in Sentence (7) is less than 80% of the lateral earthquake design force, V, of Article 4.1.8.11., Vd shall be taken as 0.8 V.

9) For irregular structures requiring dynamic analysis in accordance with Article 4.1.8.7., Vd shall be taken as the larger of the Vd determined in Sentence (7) and 100% of V.

10) Except as required by Sentence (11), the values of elastic storey shears, storey forces, member forces, and deflections obtained from the Linear Dynamic Analysis, including the effect of accidental torsion determined in Sentence (4), shall be multiplied by Vd/V to determine their design values, where Vd is the base shear.

11) For the purpose of calculating deflections, it is permitted to use a value for V based on the value for Ta determined in Clause 4.1.8.11.(3)(d) to obtain Vd in Sentences (8) and (9).

12) For buildings constructed with more than 4 storeys of continuous wood construction, having a timber SFRS consisting of shear walls with wood-based panels or braced or moment-resisting frames as defined in
Table 4.1.8.9., and whose fundamental lateral period, $T_a$, is determined in accordance with Clause 4.1.8.11.(3)(d), the design base shear, $V_d$, shall be taken as the larger value of $V_d$ determined in accordance with Sentence (7) and 100% of $V$. (See Note A-4.1.8.10.(4).)

4.1.8.13. Deflections and Drift Limits

1) Except as provided in Sentences (5) and (6), lateral deflections of a structure shall be calculated in accordance with the loads and requirements defined in this Subsection.

2) Lateral deflections obtained from a linear elastic analysis using the methods given in Articles 4.1.8.11. and 4.1.8.12. and incorporating the effects of torsion, including accidental torsional moments, shall be multiplied by $R_d R_o / I_E$ and increased as required in Sentences 4.1.8.10.(6) and 4.1.8.16.(1) to give realistic values of anticipated deflections.

3) Based on the lateral deflections calculated in Sentences (2), (5) and (6), the largest interstorey deflection at any level shall be limited to 0.01 $h_s$ for post-disaster buildings, 0.02 $h_s$ for High Importance Category buildings, and 0.025 $h_s$ for all other buildings.

4) The deflections calculated in Sentence (2) shall be used to account for sway effects as required by Sentence 4.1.3.2.(12). (See Note A-4.1.8.13.(4).)

5) The lateral deflections of a seismically isolated structure shall be calculated in accordance with Article 4.1.8.20.

6) The lateral deflections of a structure with supplemental energy dissipation shall be calculated in accordance with Article 4.1.8.22.

4.1.8.14. Structural Separation

1) Adjacent structures shall either be separated by the square root of the sum of the squares of their individual deflections calculated in Sentence 4.1.8.13.(2), or shall be connected to each other.

2) The method of connection required in Sentence (1) shall take into account the mass, stiffness, strength, ductility and anticipated motion of the connected buildings and the character of the connection.

3) Rigidly connected buildings shall be assumed to have the lowest $R_d R_o$ value of the buildings connected.

4) Buildings with non-rigid or energy-dissipating connections require special studies.

4.1.8.15. Design Provisions

1) Except as provided in Sentences (2) and (3), diaphragms, collectors, chords, struts and connections shall be designed so as not to yield, and the design shall account for the shape of the diaphragm, including openings, and for the forces generated in the diaphragm due to the following cases, whichever one governs (See Note A-4.1.8.15.(1)).:
   a) forces due to loads determined in Article 4.1.8.11. or 4.1.8.12. applied to the diaphragm are increased to reflect the lateral load capacity of the SFRS, plus forces in the diaphragm due to the transfer of forces between elements of the SFRS associated with the lateral load capacity of such elements and accounting for discontinuities and changes in stiffness in these elements, or
   b) a minimum force corresponding to the design-based shear divided by $N$ for the diaphragm at level $x$.

2) Steel deck roof diaphragms in buildings of less than 4 storeys or wood diaphragms that are designed and detailed according to the applicable referenced design standards to exhibit ductile behaviour shall meet the requirements of Sentence (1), except that they may yield and the forces shall be
   a) for wood diaphragms acting in combination with vertical wood shear walls, equal to the lateral earthquake design force,
   b) for wood diaphragms acting in combination with other SFRS, not less than the force corresponding to $R_d R_o = 2.0$, and
   c) for steel deck roof diaphragms, not less than the force corresponding to $R_d R_o = 2.0$.

3) Where diaphragms are designed in accordance with Sentence (2), the struts shall be designed in accordance with Clause 4.1.8.15.(1)(a) and the collectors, chords and connections between the diaphragms
Division B: Acceptable Solutions

Part 4 – Structural Design

and the vertical elements of the SFRS shall be designed for forces corresponding to the capacity of the diaphragms in accordance with the applicable CSA standards. (See Note A-4.1.8.15.(3).)

4) For single-storey buildings with steel deck or wood roof diaphragms designed with a value of $R_d$ greater than 1.5 and where the calculated maximum relative deflection, $\Delta_{D}$, of the diaphragm under lateral loads exceeds 50% of the average storey drift, $\Delta_{B}$, of the adjoining vertical elements of the SFRS, dynamic magnification of the inelastic response due to the in-plane diaphragm deformations shall be accounted for in the design as follows:

a) the vertical elements of the SFRS shall be designed and detailed to any one of the following:
   i) to accommodate the anticipated magnified lateral deformations taken as $R_d R_o (\Delta_B + \Delta_D) - R_d \Delta_D$,
   ii) to resist the forces magnified by $R_d (1 + \Delta_D/\Delta_B) / (R_d + \Delta_D/\Delta_B)$, or
   iii) by a special study, and

b) the roof diaphragm and chords shall be designed for in-plane shears and moments determined while taking into consideration the inelastic higher mode response of the structure.

(See Note A-4.1.8.15.(4).)

5) In cases where $I^2 F_a S_a(0.2)$ is equal to or greater than 0.35, the elements supporting any discontinuous wall, column or braced frame shall be designed for the lateral load capacity of the components of the SFRS they support. (See Note A-4.1.8.15.(5).)

6) Where structures have vertical variations of $R_d R_o$ satisfying Sentence 4.1.8.9.(4), the elements of the SFRS below the level where the change in $R_d R_o$ occurs shall be designed for the forces associated with the lateral load capacity of the SFRS above that level. (See Note A-4.1.8.15.(6).)

7) Where earthquake effects can produce forces in a column or wall due to lateral loading along both orthogonal axes, account shall be taken of the effects of potential concurrent yielding of other elements framing into the column or wall from all directions at the level under consideration and as appropriate at other levels. (See Note A-4.1.8.15.(7).)

8) The design forces associated with the lateral capacity of the SFRS need not exceed the forces determined in accordance with Sentence 4.1.8.7.(1) with $R_d R_o$ taken as 1.0, unless otherwise provided by the applicable referenced design standards for elements, in which case the design forces associated with the lateral capacity of the SFRS need not exceed the forces determined in accordance with Sentence 4.1.8.7.(1) with $R_d R_o$ taken as less than or equal to 1.3. (See Note A-4.1.8.15.(8).)

9) Foundations need not be designed to resist the lateral load overturning capacity of the SFRS, provided the design and the $R_d$ and $R_o$ for the type of SFRS used conform to Table 4.1.8.9. and that the foundation is designed in accordance with Sentence 4.1.8.16.(4).

10) Foundation displacements and rotations shall be considered as required by Sentence 4.1.8.16.(1).

4.1.8.16. Foundation Provisions

1) The increased displacements of the structure resulting from foundation movement shall be shown to be within acceptable limits for both the SFRS and the structural framing elements not considered to be part of the SFRS. (See Note A-4.1.8.16.(1).)

2) Except as provided in Sentences (3) and (4), foundations shall be designed to have factored shear and overturning resistances greater than the lateral load capacity of the SFRS. (See Note A-4.1.8.16.(2).)

3) The shear and overturning resistances of the foundation determined using a bearing stress equal to 1.5 times the factored bearing strength of the soil or rock and all other resistances equal to 1.3 times the factored resistances need not exceed the design forces determined in Sentence 4.1.8.7.(1) using $R_d R_o = 1.0$, except that the factor of 1.3 shall not apply to the portion of the resistance to uplift or overturning resulting from gravity loads.

4) A foundation is permitted to have a factored overturning resistance less than the lateral load overturning capacity of the supported SFRS, provided the following requirements are met:

a) neither the foundation nor the supported SFRS are constrained against rotation, and

b) the design overturning moment of the foundation is

   i) not less than 75% of the overturning capacity of the supported SFRS, and
Division B: Acceptable Solutions

Part 4 – Structural Design

Vancouver Building Bylaw 2019

Division B: Acceptable Solutions

ii) not less than that determined in Sentence 4.1.8.7.(1) using \( R_R = 2.0 \).

(See Note A-4.1.8.16.(4).)

5) The design of foundations shall be such that they are capable of transferring earthquake loads and effects between the building and the ground without exceeding the capacities of the soil and rock.

6) In cases where \( I_F S_a(0.2) \) is equal to or greater than 0.35, the following requirements shall be satisfied:
   a) piles or pile caps, drilled piers, and caissons shall be interconnected by continuous ties in not less than two directions (See Note A-4.1.8.16.(6)(a)),
   b) piles, drilled piers, and caissons shall be embedded a minimum of 100 mm into the pile cap or structure, and
   c) piles, drilled piers, and caissons, other than wood piles, shall be connected to the pile cap or structure for a minimum tension force equal to 0.15 times the factored compression load on the pile.

7) At sites where \( I_F S_a(0.2) \) is equal to or greater than 0.35, basement walls shall be designed to resist earthquake lateral pressures from backfill or natural ground. (See Note A-4.1.8.16.(7).)

8) At sites where \( I_F S_a(0.2) \) is greater than 0.75, the following requirements shall be satisfied:
   a) piles, drilled piers, or caissons shall be designed and detailed to accommodate cyclic inelastic behaviour when the design moment in the element due to earthquake effects is greater than 75% of its moment capacity (See Note A-4.1.8.16.(8)(a)), and
   b) spread footings founded on soil defined as Site Class E or F shall be interconnected by continuous ties in not less than two directions.

9) Each segment of a tie between elements that is required by Clauses (6)(a) or (8)(b) shall be designed to carry by tension or compression a horizontal force at least equal to the greatest factored pile cap or column vertical load in the elements it connects, multiplied by a factor of 0.10 \( I_F S_a(0.2) \), unless it can be demonstrated that equivalent restraints can be provided by other means. (See Note A-4.1.8.16.(9).)

10) The potential for liquefaction of the soil and its consequences, such as significant ground displacement and loss of soil strength and stiffness, shall be evaluated based on the ground motion parameters referenced in Subsection 1.1.3., as modified by Article 4.1.8.4., and shall be taken into account in the design of the structure and its foundations. (See Note A-4.1.8.16.(10).)

4.1.8.17. Site Stability

1) The potential for slope instability and its consequences, such as slope displacement, shall be evaluated based on site-specific material properties and ground motion parameters referenced in Subsection 1.1.3., as modified by Article 4.1.8.4., and shall be taken into account in the design of the structure and its foundations. (See Note A-4.1.8.17.(1).)

4.1.8.18. Elements of Structures, Non-structural Components and Equipment

(See Note A-4.1.8.18.)

1) Except as provided in Sentences (2), (7) and (16), elements and components of buildings described in Table 4.1.8.18. and their connections to the structure shall be designed to accommodate the building deflections calculated in accordance with Article 4.1.8.13. and the element or component deflections calculated in accordance with Sentence (9), and shall be designed for a lateral force, \( V_p \), distributed according to the distribution of mass:

\[
V_p = 0.3 F_a S_a(0.2) I_E S_p W_p
\]

where

- \( F_a \) = as defined in Sentence 4.1.8.4.(7),
- \( S_a(0.2) \) = spectral response acceleration value at 0.2 s, as defined in Sentence 4.1.8.4.(1),
- \( I_E \) = importance factor for the building, as defined in Article 4.1.8.5.,
- \( S_p \) = \( C_p A_v A_v / R_p \) (the maximum value of \( S_p \) shall be taken as 4.0 and the minimum value of \( S_p \) shall be taken as 0.7), where
- \( C_p \) = element or component factor from Table 4.1.8.18.,
- \( A_v \) = element or component force amplification factor from Table 4.1.8.18.,
\[ A_x = \text{height factor } (1 + 2 \frac{h_x}{h_n}), \]
\[ R_p = \text{element or component response modification factor from Table 4.1.8.18.}, \]
\[ W_p = \text{weight of the component or element}. \]

</table>

Notes to Table 4.1.8.18.:

1) See Note A-Table 4.1.8.18..
2) See Sentence (8).
3) See also the Elevating Devices Safety Regulation
4) See Sentence (13) and Note A-Table 4.1.8.18.

2) For buildings other than post-disaster buildings, seismically isolated buildings, and buildings with supplemental energy dissipation systems, where \( I_F S_d(0.2) \) is less than 0.35, the requirements of Sentence (1) need not apply to Categories 6 through 22 of Table 4.1.8.18.
3) For the purpose of applying Sentence (1) for Categories 11 and 12 of Table 4.1.8.18., elements or components shall be assumed to be flexible or flexibly connected unless it can be shown that the fundamental period of the element or component and its connection is less than or equal to 0.06 s, in which case the element or component is classified as being rigid or rigidly connected.
4) The weight of access floors shall include the dead load of the access floor and the weight of permanent equipment, which shall not be taken as less than 25% of the floor live load.
5) When the mass of a tank plus its contents or the mass of a flexible or flexibly connected piece of machinery, fixture or equipment is greater than 10% of the mass of the supporting floor, the lateral forces shall be determined by rational analysis.
6) Forces shall be applied in the horizontal direction that results in the most critical loading for design, except for Category 6 of Table 4.1.8.18., where the forces shall be applied up and down vertically.
7) Connections to the structure of elements and components listed in Table 4.1.8.18. shall be designed to support the component or element for gravity loads, shall conform to the requirements of Sentence (1), and shall also satisfy these additional requirements:
   a) friction due to gravity loads shall not be considered to provide resistance to seismic forces,
   b) \( R_p \) for non-ductile connections, such as adhesives or power-actuated fasteners, shall be taken as 1.0,
   c) \( R_p \) for anchorage using shallow expansion, chemical, epoxy or cast-in-place anchors shall be 1.5, where shallow anchors are those with a ratio of embedment length to diameter of less than 8,
   d) power-actuated fasteners and drop-in anchors shall not be used for tension loads,
   e) connections for non-structural elements or components of Category 1, 2 or 3 of Table 4.1.8.18. attached to the side of a building and above the first level above grade shall satisfy the following requirements:
      i) for connections where the body of the connection is ductile, the body shall be designed for values of \( C_p \), \( A_p \) and \( R_p \) given in Table 4.1.8.18., and all of the other parts of the connection, such as anchors, welds, bolts and inserts, shall be capable of developing 2.0 times the nominal yield resistance of the body of the connection, and
ii) connections where the body of the connection is not ductile shall be designed for values of $C_p = 2.0$, $R_p = 1.0$ and $A_r$ given in Table 4.1.8.18., and
f) a ductile connection is one where the body of the connection is capable of dissipating energy through cyclic inelastic behaviour.

8) Floors and roofs acting as diaphragms shall satisfy the requirements for diaphragms stated in Article 4.1.8.15.

9) Lateral deflections of elements or components shall be based on the loads defined in Sentence (1) and lateral deflections obtained from an elastic analysis shall be multiplied by $R_p/I_E$ to give realistic values of the anticipated deflections.

10) The elements or components shall be designed so as not to transfer to the structure any forces unaccounted for in the design, and rigid elements such as walls or panels shall satisfy the requirements of Sentence 4.1.8.3.(6).

11) Seismic restraint for suspended equipment, pipes, ducts, electrical cable trays, etc. shall be designed to meet the force and displacement requirements of this Article and be constructed in a manner that will not subject hanger rods to bending.

12) Isolated suspended equipment and components, such as pendent lights, may be designed as a pendulum system provided that adequate chains or cables capable of supporting 2.0 times the weight of the suspended component are provided and the deflection requirements of Sentence (10) are satisfied.

13) Free-standing steel pallet storage racks are permitted to be designed to resist earthquake effects using rational analysis, provided the design achieves the minimum performance level required by Subsection 4.1.8. (See Note A-4.1.8.18.(14).)

14) Except as provided in Sentence (15), the relative displacement of glass in glazing systems, $D_{fallout}$, shall be equal to the greater of

\[ a) \quad D_{fallout} \geq 1.25 I_E D_p \]

\[ b) \quad 13 \text{ mm} \]

(See Note A-4.1.8.18.(15) and (16)(c).)

15) Glass need not comply with Sentence (14), provided at least one of the following conditions is met:

\[ a) \quad I_E F_e S_a(0.2) < 0.35, \]

\[ b) \quad \text{the glass has sufficient clearance from its frame such that } D_{clear} \geq 1.25 D_p \text{ calculated as follows:} \]

\[ D_{clear} = 2 C_1 \left( 1 + h_p C_2 / (b_p C_2) \right) \]

Where

\[ D_{clear} = \text{relative horizontal displacement measured over the height of the glass panel, which causes initial glass-to-frame contact,} \]

\[ C_1 = \text{average of the clearances on both sides between the vertical glass edges and the frame,} \]

\[ h_p = \text{height of the rectangular glass panel,} \]

\[ C_2 = \text{averages of the top and bottom clearances between the horizontal glass edges and the frame, and} \]

\[ b_p = \text{width of the rectangular glass panel,} \]

\[ \text{c) the glass is fully tempered, monolithic, installed in a non-post-disaster building, and no part of the glass is located more than 3 m above a walking surface (See Note A-4.1.8.18.(15) and (16)(c).), or} \]

\[ \text{d) the glass is annealed or heat-strengthened laminated glass in a single thickness with an interlayer no less than 0.76 mm and captured mechanically in a wall system glazing pocket with the perimeter secured to the frame by a wet, glazed, gunable, curing, elastomeric sealant perimeter bead of 13 mm minimum glass contact width.} \]
16) For structures with supplemental energy dissipation, the following criteria shall apply:
   a) the value of $S_a(0.2)$ used in Sentence (1) shall be determined from the mean 5% damped floor
      spectral acceleration values at 0.2 s by averaging the individual 5% damped floor spectra at the
      base of the structure determined using Non-Linear Dynamic Analysis, and
   b) the value of $F_a$ used in Sentence (1) shall be 1.

4.1.8.19. Seismic Isolation

1) For the purposes of this Article and Article 4.1.8.20., the following terms shall have the meanings stated
   herein:
   a) “seismic isolation” is an alternative seismic design concept that consists of installing an isolation
      system with low horizontal stiffness, thereby substantially increasing the fundamental period of the
      structure;
   b) “isolation system” is a collection of structural elements at the level of the isolation interface that
      includes all individual isolator units, all structural elements that transfer force between elements of
      the isolation system, all connections to other structural elements, and may also include a wind-
      restraint system, energy-dissipation devices, and a displacement restraint system;
   c) “seismically isolated structure” includes the upper portion of the structure above the isolation
      system, the isolation system, and the portion of the structure below the isolation system;
   d) “isolator unit” is a structural element of the isolation system that permits large lateral
      deformations under lateral earthquake design forces and is characterized by vertical-load-carrying
      capability combined with increased horizontal flexibility and high vertical stiffness, energy
      dissipation (hysteretic or viscous), self-centering capability, and lateral restraint (sufficient elastic
      stiffness) under non-seismic service lateral loads;
   e) “isolation interface” is the boundary between the isolated upper portion of the structure above
      the isolation system and the lower portion of the structure below the isolation system; and
   f) “wind-restraint system” is the collection of structural elements of the isolation system that
      provides restraint of the seismically isolated structure for wind loads and is permitted to be either
      an integral part of the isolator units or a separate device.

2) Every seismically isolated structure and every portion thereof shall be analyzed and designed in
   accordance with
   a) the loads and requirements prescribed in this Article and Article 4.1.8.20.,
   b) other applicable requirements of this Subsection, and
   c) appropriate engineering principles and current engineering practice.
   (See Note A-4.1.8.19.(2).)

3) For the analysis and modeling of the seismically isolated structure, the following criteria shall apply:
   a) a three-dimensional Non-linear Dynamic Analysis of the structure shall be performed in
      accordance with Article 4.1.8.12. (See Note A-4.1.8.19.(3)(a).),
   b) unless verified from rational analysis, the inherent equivalent viscous damping – excluding the
      hysteretic damping provided by the isolation system or supplemental energy dissipation devices –
      used in the analysis shall not be taken as more than 2.5% of the critical damping at the significant
      modes of vibration,
   c) all individual isolator units shall be modeled with sufficient detail to account for their non-linear
      force-deformation characteristics, including effects of the relevant loads, and with consideration of
      variations in material properties over the design life of the structure, and
   d) except for elements of the isolation system, other components of the seismically isolated
      structure shall be modeled using elastic material properties in accordance with Sentence
      4.1.8.3.(8).

4) The ground motion histories used in Sentence (3) shall be
   a) appropriately selected and scaled following good engineering practice,
   b) compatible with
Division B: Acceptable Solutions

Part 4 – Structural Design

1) The period of the isolated structure, determined using the post-yield stiffness of the isolation system in the horizontal direction under consideration, shall be greater than three times the period of the structure above the isolation interface calculated as a fixed base.

2) The isolation system shall be configured to produce a restoring force such that the lateral force at the TDD at the centre of mass of the isolated structure above the isolation interface is at least 0.025W, greater than the lateral force at 50% of the TDD at the same location, in each horizontal direction, where W is the portion of W above the isolation interface.

3) The values of storey shears, storey forces, member forces, and deflections used in the design of all structural framing elements and components of the isolation system shall be obtained from analysis conforming to Sentence 4.1.8.19.(3) using one of the following values, whichever produces the most critical effect:
   a) mean plus lE times the standard deviation of results of all Non-linear Dynamic Analyses, or
   b) √lE times the mean of the results of all Non-linear Dynamic Analyses.

4) The force-deformation and damping characteristics of the isolation system used in the analysis and design of the seismically isolated structures shall be validated by testing at least two full-size specimens of each predominant type and size of isolator unit of the isolation system, which shall include
   a) the individual isolator units,
   b) separate supplemental damping devices, if used, and
   c) separate sacrificial wind-restraint systems, if used.

5) The force-deformation characteristics and damping value of a representative sample of the isolator units installed in the building shall be validated by tests prior to their installation.

6) A diaphragm or horizontal structural elements shall provide continuity immediately above the isolation interface to transmit forces due to non-uniform ground motions from one part of the structure to another.

7) All structural framing elements shall be designed for the forces described in Sentence (3) with RdRo = 1.0, except
   a) for structures with lE < 1.5, all SFRS shall be detailed in accordance with the requirements for Rd ≥ 1.5 and the applicable referenced design standards, and
   b) for structures with lE = 1.5, all SFRS shall be detailed in accordance with the requirements for Rd ≥ 2.0 and the applicable referenced design standards.

8) The height restrictions noted in Table 4.1.8.9. need not apply to seismically isolated structures.

9) All isolator units shall be
   a) designed for the forces described in Sentence (3), and
   b) able to accommodate the TDD determined at the specific location of each isolator unit.

10) The isolation system, including a separate wind-restraint system if used, shall limit lateral displacement due to wind loads across the isolation interface to a value equal to that required for the least storey height in accordance with Sentence 4.1.3.5.(3).

4.1.8.21. Supplemental Energy Dissipation

1) For the purposes of this Article and Article 4.1.8.22., the following terms shall have the meanings stated herein:
a) “supplemental energy dissipation device” is a dedicated structural element of the supplemental energy dissipation system that dissipates energy due to relative motion of each of its ends or by alternative means, and includes all pins, bolts, gusset plates, brace extensions and other components required to connect it to the other elements of the structure; a device may be classified as either displacement-dependent or velocity-dependent, or a combination thereof, and may be configured to act in either a linear or non-linear manner, and
b) “supplemental energy dissipation system” is a collection of energy dissipation devices installed in a structure that supplement the energy dissipation of the SFRS.

2) Every structure with a supplemental energy dissipation system and every portion thereof shall be designed and constructed in accordance with

   a) the loads and requirements prescribed in this Article and Article 4.1.8.22.,
   b) other applicable requirements of this Subsection, and
   c) appropriate engineering principles and current engineering practice.

   (See Note A-4.1.8.21.(2).)

3) Where supplemental energy dissipation devices are used across the isolation interface of a seismically isolated structure, displacements, velocities, and accelerations shall be determined in accordance with Article 4.1.8.20.

4) For the analysis and modeling of structures with supplemental energy dissipation devices, the following criteria shall apply:

   a) a three-dimensional Non-linear Dynamic Analysis of the structure shall be performed in accordance with Article 4.1.8.12. (See Note A-4.1.8.21.(4)(a).),
   b) for SFRS with $R_d > 1.0$, the non-linear hysteretic behaviour of the SFRS shall be explicitly – with sufficient detail – accounted for in the modeling and analysis of the structure,
   c) unless verified from rational analysis, the inherent equivalent viscous damping – excluding the damping provided by the supplemental energy dissipation devices – used in the analysis shall not be taken as more than 2.5% of the critical damping at the significant modes of vibration,
   d) all supplemental energy dissipation devices shall be modeled with sufficient detail to account for their non-linear force deformation characteristics, including effects of the relevant loads, and with consideration of variations in their properties over the design life of the structure, and
   e) except for the SFRS and elements of the supplemental energy dissipation system, other components of the structure shall be modeled using elastic material properties in accordance with Sentence 4.1.8.3.(8).

5) The ground motion histories used in Sentence (4) shall be

   a) appropriately selected and scaled following good engineering practice,
   b) compatible with a 5% damped response spectrum derived from the design spectral acceleration values, $S(T)$, defined in Sentence 4.1.8.4.(9), and
   c) amplitude-scaled in an appropriate manner over the period range of $0.2 \ T_1$ to $1.5 \ T_1$, where $T_1$ is the fundamental lateral period of the structure with the supplemental energy dissipation system.

   (See Note A-4.1.8.21.(5).)

4.1.8.22. Supplemental Energy Dissipation Design Considerations

1) The values of storey shears, storey forces, member forces, and deflections for the design of all structural framing elements and all supplemental energy dissipation devices shall be obtained from analysis conforming to Sentence 4.1.8.21.(4) using one of the following values, whichever produces the most critical effect:

   a) mean plus $1\sigma$ times the standard deviation of the results of all Non-linear Dynamic Analyses, or
   b) $\sqrt{n} \ \sigma$ times the mean of the results of all Non-linear Dynamic Analyses.

2) The largest interstorey deflection at any level of the structure as determined in accordance with Sentence (1) shall conform to the limits stated in Sentence 4.1.8.13.(3).

3) The force-deformation and force-velocity characteristics of the supplemental energy dissipation devices used in the analysis and design of structures with supplemental energy dissipation systems shall be
validated by testing at least two full-size specimens of each type of supplementary energy dissipation device.

4) The force-deformation and force-velocity characteristics and damping values of a representative sample of the supplemental energy dissipation devices installed in the building shall be validated by tests prior to their installation.

5) Elements of the supplemental energy dissipation system, except the supplemental energy dissipation devices themselves, shall be designed to remain elastic for the design loads.

6) All structural framing elements shall be designed
   a) for an SFRS with $R_d = 1.0$, using the forces referred to in Sentence (1) with $R_d R_o = 1.0$, except that the SFRS shall be detailed in accordance with the requirements for $R_d \geq 1.5$ and the applicable referenced design standards, or
   b) for an SFRS with $R_d > 1.0$, using the forces referred to in Sentence (1) with $R_d R_o = 1.0$, except that the SFRS shall be detailed in accordance with the requirements for the selected $R_d$ and the applicable referenced design standards.

7) Supplemental energy dissipation devices and other components of the supplemental energy dissipation system shall be designed in accordance with Sentence (1) with consideration of the following:
   a) low-cycle, large-displacement degradation due to seismic loads,
   b) high-cycle, small-displacement degradation due to wind, thermal, or other cyclic loads,
   c) forces or displacements due to gravity loads,
   d) adhesion of device parts due to corrosion or abrasion, biodegradation, moisture, or chemical exposure,
   e) exposure to environmental conditions, including, but not limited to, temperature, humidity, moisture, radiation (e.g., ultraviolet light), and reactive or corrosive substances (e.g., salt water),
   f) devices subject to failure due to low-cycle fatigue must resist wind forces without slip, movement, or inelastic cycling,
   g) the range of thermal conditions, device wear, manufacturing tolerances, and other effects that cause device properties to vary during the design life of the device, and
   h) connection points of devices must provide sufficient articulation to accommodate simultaneous longitudinal, lateral, and vertical displacements of the supplemental energy dissipation system.

8) Means of access for inspection and removal for replacement of all supplemental energy dissipation devices shall be provided.

Section 4.2. Foundations

4.2. General

4.2.1. Application

1) This Section applies to excavations and foundation systems for buildings.

4.2.2. Subsurface Investigations, Drawings and Reviews

4.2.2.1. Subsurface Investigation

1) A subsurface investigation, including groundwater conditions, shall be carried out by or under the direction of a professional engineer having knowledge and experience in planning and executing such investigations to a degree appropriate for the building and its use, the ground and the surrounding site conditions. (See Note A-4.2.2.1.(1).)

4.2.2.2. Drawings

1) Drawings associated with foundations and excavations shall conform to the appropriate requirements of Section 2.2. of Division C. (See Article 2.2.4.6. of Division C.)
4.2.2.3. Field Review

1) A field review shall be carried out by the designer or by another suitably qualified person to ascertain that the subsurface conditions are consistent with the design and that construction is carried out in accordance with the design and good engineering practice. (See Note A-4.2.2.3.(1).)

2) The review required by Sentence (1) shall be carried out
   a) on a continuous basis
      i) during the construction of all deep foundation units with all pertinent information recorded for each foundation unit,
      ii) during the installation and removal of retaining structures and related backfilling operations, and
      iii) during the placement of engineered fills that are to be used to support the foundation units, and
   b) as required, unless otherwise directed by the Chief Building Official,
      i) in the construction of all shallow foundation units, and
      ii) in excavating, dewatering and other related works.

4.2.2.4. Altered Subsurface Condition

1) If, during construction, the soil, rock or groundwater is found not to be of the type or in the condition used in design and as indicated on the drawings, the design shall be reassessed by the designer.

2) If, during construction, climatic or any other conditions change the properties of the soil, rock or groundwater, the design shall be reassessed by the designer.

4.2.3. Materials Used in Foundations

4.2.3.1. Wood

1) Wood used in foundations or in support of soil or rock shall conform with the appropriate requirements of Subsection 4.3.1.

4.2.3.2. Preservation Treatment of Wood

1) Wood exposed to soil or air above the lowest anticipated groundwater table shall be treated with preservative in conformance with CAN/CSA-O80 Series, “Wood Preservation,” and the requirements of the appropriate commodity standard as follows:
   a) CAN/CSA-O80.2, “Processing and Treatment,”
   b) CAN/CSA-O80.3, “Preservative Formulations,” or
   c) CSA O80.15, “Preservative Treatment of Wood for Building Foundation Systems, Basements, and Crawl Spaces by Pressure Processes.”

2) Where timber has been treated as required in Sentence (1), it shall be cared for as provided in AWPA M4, “Care of Preservative-Treated Wood Products,” as revised by Clause 6 of CAN/CSA-O80 Series, “Wood Preservation.”

4.2.3.3. Plain and Reinforced Masonry

1) Plain or reinforced masonry used in foundations or in support of soil or rock shall conform with the requirements of Subsection 4.3.2.

4.2.3.4. Prevention of Deterioration of Masonry

1) Where plain or reinforced masonry in foundations or in structures supporting soil or rock may be subject to conditions conducive to deterioration, protection shall be provided to prevent such deterioration.
4.2.3.5. Concrete
1) Plain, reinforced or pre-stressed concrete used in foundations or in support of soil or rock shall conform with the requirements of Subsection 4.3.3.

4.2.3.6. Protection Against Chemical Attack
1) Where concrete in foundations may be subject to chemical attack, it shall be treated in conformance with the requirements in CSA A23.1, “Concrete Materials and Methods of Concrete Construction.”

4.2.3.7. Steel
1) Steel used in foundations or in support of soil or rock shall conform with the appropriate requirements of Subsection 4.3.3. or 4.3.4., unless otherwise specified in this Section.

4.2.3.8. Steel Piles
1) Where steel piles are used in deep foundations and act as permanent load-carrying members, the steel shall conform with one of the following standards:
   a) ASTM A 252, “Welded and Seamless Steel Pipe Piles,”
   b) ASTM A 283/A 283M, “Low and Intermediate Tensile Strength Carbon Steel Plates,”
   c) ASTM A 1008/A 1008M, “Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable,”
   d) ASTM A 1011/A 1011M, “Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength,” or
   e) CSA G40.21, “Structural Quality Steel.”

4.2.3.9. High Strength Steel Tendons
1) Where high strength steel is used for tendons in anchor systems used for the permanent support of a foundation or in the erection of temporary support of soil or rock adjacent to an excavation, it shall conform with the requirements of CSA A23.1, “Concrete Materials and Methods of Concrete Construction.”

4.2.3.10. Corrosion of Steel
1) Where conditions are corrosive to steel, adequate protection of exposed steel shall be provided. (See Article 1.2.1.1. of Division A for use of other materials.)

4.2.4. Design Requirements

4.2.4.1. Design Basis
1) The design of foundations, excavations and soil- and rock-retaining structures shall be based on a subsurface investigation carried out in conformance with the requirements of this Section, and on any of the following, as appropriate:
   a) application of generally accepted geotechnical and civil engineering principles by a professional engineer especially qualified in this field of work, as provided in this Section and other Sections of Part 4,
   b) established local practice, where such practice includes successful experience both with soils and rocks of similar type and condition and with a foundation or excavation of similar type, construction method, size and depth, or
   c) in situ testing of foundation units, such as the load testing of piles, anchors or footings, carried out by a person competent in this field of work.

(See Note A-4.2.4.1.(1).)
2) The foundations of a building shall be capable of resisting all the loads stipulated in Section 4.1., in accordance with limit states design in Subsection 4.1.3.
3) For the purpose of the application of the load combinations given in Table 4.1.3.2.-A, the geotechnical components of loads and the factored geotechnical resistances at ULS shall be determined by a suitably qualified and experienced professional engineer. (See Note A-4.2.4.1.(3).)

4) Geotechnical components of service loads and geotechnical reactions for SLS shall be determined by a suitably qualified and experienced professional engineer.

5) The foundation of a building shall be designed to satisfy SLS requirements within the limits that the building is designed to accommodate, including total settlement and differential settlement, heave, lateral movement, tilt or rotation. (See Note A-4.2.4.1.(5).)

6) Communication, interaction and coordination between the designer and the professional engineer responsible for the geotechnical aspects of the project shall take place to a degree commensurate with the complexity and requirements of the project.

4.2.4.2. Subsurface Investigation

1) A subsurface investigation shall be carried out to the depth and extent to which the building or excavation will significantly change the stress in the soil or rock, or to such a depth and extent as to provide all the necessary information for the design and construction of the excavation or the foundations.

4.2.4.3. Identification

1) The identification and classification of soil, rock and groundwater and descriptions of their engineering and physical properties shall be in accordance with a widely accepted system.

4.2.4.4. Depth of Foundations

1) Except as permitted in Sentence (2), the bearing surface of a foundation shall be below the level of potential damage, including damage resulting from frost action, and the foundation shall be designed to prevent damage resulting from adfreezeing and frost jacking. (See Note A-4.2.4.4.(1).)

2) The bearing surface of a foundation need not be below the level of potential damage from frost where the foundation
   a) is designed against frost action, or
   b) overlies material not susceptible to frost action.

4.2.4.5. Sloping Ground

1) Where a foundation is to rest on, in or near sloping ground, this particular condition shall be provided for in the design.

4.2.4.6. Eccentric and Inclined Loads

1) Where there is eccentricity or inclination of loading in foundation units, this effect shall be fully investigated and provided for in the design.

4.2.4.7. Dynamic Loading

1) Where dynamic loading conditions apply, the effects shall be assessed by a special investigation of these conditions and provided for in the design.

4.2.4.8. Hydrostatic Uplift

1) Where a foundation or any part of a building is subject to hydrostatic uplift, the effects shall be provided for in the design.

4.2.4.9. Groundwater Level Change

1) Where proposed construction will result in a temporary or permanent change in the groundwater level, the effects of this change on adjacent buildings shall be fully investigated and provided for in the design.

4.2.4.10. Permafrost
1) Where conditions of permafrost are encountered or proven to exist, the design of the foundation shall be based upon analysis of these conditions by a person especially qualified in that field of work.

4.2.4.11. Swelling and Shrinking Soils
1) Where swelling or shrinking soils, in which movements resulting from moisture content changes may be sufficient to cause damage to a structure, are encountered or known to exist, such a condition shall be fully investigated and provided for in the design.

4.2.4.12. Expanding and Deteriorating Rock
1) Where rock that expands or deteriorates when subjected to unfavourable environmental conditions or to stress release is known to exist, this condition shall be fully investigated and provided for in the design.

4.2.4.13. Construction on Fill
1) Buildings may be placed on fill if it can be shown by subsurface investigation that
   a) the fill is or can be made capable of safely supporting the building,
   b) detrimental movement of the building or of services leading to the building will not occur, and
   c) explosive gases can be controlled or do not exist.

4.2.4.14. Structural Design
1) The structural design of the foundation of a building, the procedures and construction practices shall conform with the appropriate Sections of this By-law unless otherwise specified in this Section.

4.2.5. Excavations

4.2.5.1. Design of Excavations
1) The design of excavations and of supports for the sides of excavations shall conform with Subsection 4.2.4. and with this Subsection. (See Note A-4.2.5.1.(1).)

4.2.5.2. Excavation Construction
1) Every excavation shall be undertaken in such a manner as to
   a) prevent movement that would cause damage to adjacent buildings at all phases of construction, and
   b) comply with the appropriate requirements of Part 8.
2) Material shall not be placed nor shall equipment be operated or placed in or adjacent to an excavation in a manner that may endanger the integrity of the excavation or its supports.

4.2.5.3. Supported Excavations
1) The sides of an excavation in soil or rock shall be supported by a retaining structure conforming with the requirements of Articles 4.2.5.1. and 4.2.5.2., except as permitted in Article 4.2.5.4.

4.2.5.4. Unsupported Excavations
1) The sides of an excavation in soil or rock may be unsupported where a design is prepared in conformance with the requirements of Articles 4.2.5.1. and 4.2.5.2.

4.2.5.5. Control of Water around Excavations
1) Surface water, all groundwater, perched groundwater and in particular artesian groundwater shall be kept under control at all phases of excavation and construction.

4.2.5.6. Loss of Ground
1) At all phases of excavation and construction, loss of ground due to water or any other cause shall be prevented.
4.2.5.7. Protection and Maintenance at Excavations
1) All sides of an excavation, supported and unsupported, shall be continuously maintained and protected from possible deterioration by construction activity or by the action of frost, rain and wind.

4.2.5.8. Backfilling
1) Where an excavation is backfilled, the backfill shall be placed so as to
   a) provide lateral support to the soil adjacent to the excavation, and
   b) prevent detrimental movements.
2) The material used as backfill or fill supporting a footing, foundation or a floor on grade shall be of a type that is not subject to detrimental volume change with changes in moisture content and temperature.

4.2.6. Shallow Foundations

4.2.6.1. Design of Shallow Foundations
1) The design of shallow foundations shall be in conformance with Subsection 4.2.4. and the requirements of this Subsection. (See Note A-4.2.6.1.(1).)

4.2.6.2. Support of Shallow Foundations
1) Where a shallow foundation is to be placed on soil or rock, the soil or rock shall be cleaned of loose and unsound material and shall be adequate to support the design load taking into account temperature, precipitation, construction activities and other factors that may lead to changes in the properties of soil or rock.

4.2.6.3. Incorrect Placement of Shallow Foundations
1) Where a shallow foundation unit has not been placed or located as indicated on the drawings,
   a) the error shall be corrected, or
   b) the design of the foundation unit shall be recalculated for the altered conditions by the designer and action taken as required in Article 2.2.4.7. of Division C.

4.2.6.4. Damaged Shallow Foundations
1) If a shallow foundation unit is damaged,
   a) it shall be repaired, or
   b) the design of the foundation unit shall be recalculated for the damaged condition by the designer and action taken as required in Article 2.2.4.7. of Division C.

4.2.7. Deep Foundations

4.2.7.1. General
1) A deep foundation shall provide support for a building by transferring loads by end-bearing to a competent stratum at considerable depth below the structure, or by mobilizing resistance by adhesion or friction, or both, in the soil or rock in which it is placed. (See Note A-4.2.7.1.(1).)

4.2.7.2. Design of Deep Foundations
1) Deep foundations shall be designed in conformance with Subsection 4.2.4. and this Subsection. (See Note A-4.2.7.2.(1).)
2) Where deep foundation units are load tested, as required in Clause 4.2.4.1.(1)(c), the determination of the number and type of load test and the interpretation of the results shall be carried out by a professional engineer especially qualified in this field of work. (See Note A-4.2.7.2.(2).)
3) The design of deep foundations shall be determined on the basis of geotechnical considerations taking into account...
a) the method of installation,
b) the degree of inspection,
c) the spacing of foundation units and group effects,
d) other requirements in this Subsection, and
e) the appropriate structural requirements in Section 4.1. and Subsections 4.3.1., 4.3.3. and 4.3.4.

4) The portion of a deep foundation unit permanently in contact with soil or rock shall be structurally designed as a laterally supported compression member.

5) The portion of a deep foundation unit that is not permanently in contact with soil or rock shall be structurally designed as a laterally unsupported compression member.

6) The structural design of prefabricated deep foundation units shall allow for all stresses resulting from driving, handling and testing.

4.2.7.3. Tolerance in Alignment and Location
1) Permissible deviations from the design alignment and the location of the top of deep foundation units shall be determined by design analysis and shall be indicated on the drawings.

4.2.7.4. Incorrect Alignment and Location
1) Where a deep foundation unit has not been placed within the permissible deviations referred to in Article 4.2.7.3., the condition of the foundation shall be assessed by the designer, any necessary changes made and action taken as required in Article 2.2.4.7. of Division C.

4.2.7.5. Installation of Deep Foundations
1) Deep foundation units shall be installed in such a manner as not to impair
a) the strength of the deep foundation units and the properties of the soil or rock on or in which they are placed beyond the calculated or anticipated limits,
b) the integrity of previously installed deep foundation units, or
c) the integrity of neighbouring buildings.

4.2.7.6. Damaged Deep Foundation Units
1) Where inspection shows that a deep foundation unit is damaged or not consistent with design or good engineering practice,
   a) such a unit shall be reassessed by the designer,
   b) any necessary changes shall be made, and
   c) action shall be taken as required in Article 2.2.4.7. of Division C.

4.2.8. Special Foundations

4.2.8.1. General
1) Where special foundation systems are used, such systems shall conform to Subsection 4.2.4., Sentence 4.1.1.5.(2) and Article 1.2.1.1. of Division A.

4.2.8.2. Use of Existing Foundations
1) Existing foundations may be used to support new or altered buildings provided they comply with all pertinent requirements of this Section.

Section 4.3. Design Requirements for Structural Materials

4.3.1. Wood

4.3.1.1. Design Basis for Wood
1) *Buildings* and their structural members made of wood shall conform to CSA O86, “Engineering Design in Wood.”
(See note A-4.3.1.1.)

4.3.1.2. Glued-Laminated Members
1) Glued-laminated members shall be fabricated in plants conforming to CSA O177, “Qualification Code for Manufacturers of Structural Glued-Laminated Timber.”

4.3.1.3. Termites
1) In areas known to be infested by termites, the requirements in Articles 9.3.2.9., 9.12.1.1. and 9.15.5.1. shall apply.

4.3.2. Plain and Reinforced Masonry

4.3.2.1. Design Basis for Plain and Reinforced Masonry
1) *Buildings* and their structural members made of plain and reinforced masonry shall conform to CSA S304, "Design of Masonry Structures."

4.3.3. Plain, Reinforced and Pre-stressed Concrete

4.3.3.1. Design Basis for Plain, Reinforced and Pre-stressed Concrete
1) *Buildings* and their structural members made of plain, reinforced and pre-stressed concrete shall conform to CSA A23.3, “Design of Concrete Structures.” (See Note A-4.3.3.1.(1).)

4.3.4. Steel

4.3.4.1. Design Basis for Structural Steel
1) *Buildings* and their structural members made of structural steel shall conform to CSA S16, “Design of Steel Structures.” (See Note A-4.3.4.1.(1).)

4.3.4.2. Design Basis for Cold-Formed Steel
1) *Buildings* and their structural members made of cold-formed steel shall conform to CSA S136, “North American Specification for the Design of Cold-Formed Steel Structural Members.” (See Note A-4.3.4.2.(1).)

4.3.4.3. Steel Building Systems
1) Steel building systems shall be manufactured by companies certified in accordance with the requirements of CSA A660, “Certification of Manufacturers of Steel Building Systems.”

4.3.5. Aluminum

4.3.5.1. Design Basis for Aluminum
1) *Buildings* and their structural members made of aluminum shall conform to CAN/CSA-S157/S157.1, “Strength Design in Aluminum/Commentary on CSA S157-05, Strength Design in Aluminum,” using the loads stipulated in Section 4.1., in accordance with limit states design in Subsection 4.1.3.

4.3.6. Glass

4.3.6.1. Design Basis for Glass
1) Glass used in buildings shall be designed in conformance with a) CAN/CGSB-12.20-M, “Structural Design of Glass for Buildings,” using an adjustment factor on the wind load, W, of not less than 0.75, or
b) ASTM E 1300, “Standard Practice for Determining Load Resistance of Glass in Buildings,” using an adjustment factor on the wind load, W, of not less than 1.0. (See Note A-4.3.6.1.(1).)

Section 4.4. Design Requirements for Special Structures

4.4.1. Air-Supported Structures

4.4.1.1. Design Basis for Air-Supported Structures

1) The structural design of air-supported structures shall conform to CSA S367, “Air-, Cable-, and Frame-Supported Membrane Structures,” using the loads stipulated in Section 4.1., in accordance with limit states design in Subsection 4.1.3.

4.4.2. Parking Structures

4.4.2.1. Design Basis for Parking Structures and Repair Garages

1) Parking structures and repair garages shall be designed in conformance with CSA S413, “Parking Structures.” (See Note A-4.4.2.1.(1).)

Section 4.5. Objectives and Functional Statements

4.5.1. Objectives and Functional Statements

4.5.1.1. Attributions to Acceptable Solutions

1) For the purpose of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 4.5.1.1. (See Note A-1.1.2.1.(1).)

Table 4.5.1.1.

---

**Notes to Table 4.5.1.1.:**  
See Parts 2 and 3 of Division A.
Notes to Part 4
Structural Design

A-4.1.1.3.(1) Structural Integrity. The requirements of Part 4, including the CSA design standards, generally provide a satisfactory level of structural integrity. Additional considerations may, however, be required for building systems made of components of different materials, whose interconnection is not covered by existing CSA design standards, buildings outside the scope of existing CSA design standards, and buildings exposed to severe accidental loads such as vehicle impact or explosion. Further guidance can be found in the Commentary entitled Structural Integrity in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.1.3.(2) Serviceability. Information on serviceability can be found in the Commentary entitled Deflection and Vibration Criteria for Serviceability and Fatigue Limit States in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.1.5.(2) Structural Equivalents. Sentence 4.1.1.5.(2) provides for the use of design methods not specified in Part 4, including full-scale testing and model analogues. This provision is usually used to permit the acceptance of new and innovative structures or to permit the acceptance of model tests such as those used to determine structural behaviour, or snow or wind loads. Sentence 4.1.1.5.(2) specifically requires that the level of safety and performance be at least equivalent to that provided by design to Part 4 and requires that loads and designs conform to Section 4.1.

Sentence 4.1.1.5.(2) and the provision for alternative solutions stated in Clause 1.2.1.1.(1)(b) of Division A are not intended to allow structural design using design standards other than those listed in Part 4. The acceptance of structures that have been designed to other design standards would require the designer to prove to the appropriate authority that the structure provides the level of safety and performance required by Clause 1.2.1.1.(1)(b) of Division A. The equivalence of safety and performance can only be established by analyzing the structure for the loads and load factors set out in Section 4.1. and by demonstrating that the structure at least meets the requirements of the design standards listed in Sections 4.3. and 4.4.

A-4.1.2.1. Loads and Effects. Information on the definitions can be found in the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.2.1.(1) Temperature Changes. Information on effects due to temperature changes can be found in the Commentary entitled Effects of Deformations in Building Components in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.2.1.(3) Major Occupancies. In a building containing more than one major occupancy and classified in more than one Importance Category, the classification of each independent structural system shall be the same as for any part of the building that is dependent on that structural system and for the highest usage group according to Table 4.1.2.1.

A-Table 4.1.2.1. Importance Categories for Buildings.

<table>
<thead>
<tr>
<th>Low Importance Category Buildings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low human-occupancy farm buildings are defined in the National Farm Building Code of Canada 1995 as having an occupant load of 1 person or less per 40 m² of floor area. Minor storage buildings include only those storage buildings that represent a low direct or indirect hazard to human life in the event of structural</td>
</tr>
</tbody>
</table>
failure, either because people are unlikely to be affected by structural failure, or because structural failure causing damage to materials or equipment does not present a direct threat to human life.

Buildings Containing Hazardous Materials
The following buildings contain sufficient quantities of toxic, explosive or other hazardous substances to be classified in the High Importance Category of use and occupancy:
- petrochemical facilities,
- fuel storage facilities (other than those required for post-disaster use), and
- manufacturing or storage facilities for dangerous goods.

The following types of buildings may be classified in the Normal Importance Category: buildings that are equipped with secondary containment of toxic, explosive or other hazardous substances, including but not limited to, double-wall tanks, dikes of sufficient size to contain a spill, or other means to contain a spill or a blast within the property boundary of the facility and prevent the release of harmful quantities of contaminants to the air, soil, groundwater, surface water or atmosphere, as the case may be.

A-4.1.3. Limit States Design. Information on limit states design can be found in the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.3.2.(2) Load Combinations.

Load Combination Equations
The load combinations in Tables 4.1.3.2.-A and 4.1.3.2.-B apply to most situations for loadbearing building structures. Guidance on special situations such as load combinations for fire resistance and building envelopes is given in the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

Load Cases and Crane Load Effects
The load combinations in Table 4.1.3.2.-A are to be evaluated for structures with crane load effects for the scenario where the crane loads are zero, and for structures without crane loads. The load combinations in Table 4.1.3.2.-B are to be evaluated for structures with crane loads for the scenario where the crane load effects are other than zero.

Crane Loads
Crane-supporting structures that have cranes in multiple parallel bays should be designed for the maximum vertical crane load with the cranes positioned for the most critical effect in conjunction with a lateral load with each crane in turn positioned for the most critical effect. For load combinations that include crane loads, additional guidance can be found in CISC/ICCA 2013, “Crane-Supporting Steel Structures: Design Guide.”

A-4.1.3.2.(4) Effects of Lateral Earth Pressure, H, Pre-stress, P, and Imposed Deformation, T, in Design Calculations.

Effects of Lateral Earth Pressure, H, in Design Calculations
For common building structures below ground level, such as walls, columns and frames, 1.5 H is added to load combinations 2 to 4. For cantilever retaining wall structures, see the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

Effects of Pre-stress, P, and Imposed Deformation, T, in Design Calculations
For structures and building envelopes designed in accordance with the requirements specified in the standards listed in Section 4.3., with the exception of Clauses 8 and 18 of CSA A23.3, “Design of Concrete Structures,” P and T need not be included in the load combinations of Table 4.1.3.2.-A. For structures not
within the scope of the standards listed in Section 4.3., including building envelopes, P and T must be taken into account in the design calculations. For recommended load combinations including T, see the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.3.2.(5) Overturning, Uplift or Sliding. Information on overturning, uplift and sliding can be found in the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.3.3.(1) Failure due to Fatigue. Failure due to fatigue of building structures referred to in Section 4.3. and designed for serviceability in accordance with Article 4.1.3.6. is, in general, unlikely except for girders supporting heavily used cranes, on which Article 4.1.5.11. provides guidance.

A-4.1.3.3.(2) Vibration Effects. Guidance on vibration effects can be found in the Commentary entitled Deflection and Vibration Criteria for Serviceability and Fatigue Limit States in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.3.4.(1) Loads and Load Combinations for Serviceability. The loads and load combinations for serviceability depend on the serviceability limit states and on the properties of the structural materials. Information on loads and load combinations for the serviceability limit states, other than those controlled by deflection, can be found in the Commentary entitled Deflection and Vibration Criteria for Serviceability and Fatigue Limit States in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).” Information on deflections can be found in the Commentary entitled Deflection and Vibration Criteria for Serviceability and Fatigue Limit States in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).” Information on loads and load combinations for calculating deflection can be found in the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.3.5.(1) Deflections. Serviceability criteria for deflections that cause damage to non-structural building components can be found in the standards listed in Section 4.3. Information on deflections can be found in the Commentary entitled Deflection and Vibration Criteria for Serviceability and Fatigue Limit States in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).” Information on loads and load combinations for calculating deflection can be found in the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.3.5.(3) Lateral Deflection of Buildings. The limitation of 1/500 drift per storey may be exceeded if it can be established that the drift as calculated will not result in damage to non-structural elements. Information on lateral deflection can be found in the Commentary entitled Wind Load and Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.3.6.(1) Floor Vibration. Information on floor vibration can be found in the Commentary entitled Deflection and Vibration Criteria for Serviceability and Fatigue Limit States in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).” Information on loads and load combinations for the calculation of vibration can be found in the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.3.6.(2) Dynamic Analyses of Floor Vibrations. Information on a dynamic analysis of floor vibrations from rhythmic activities can be found in the Commentary entitled Deflection and Vibration Criteria for Serviceability and Fatigue Limit States in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.3.6.(3) Lateral Vibration Under Wind Load. Information on lateral vibrations and accelerations under dynamic wind loads can be found in the Commentary entitled Wind Load and Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”
A-4.1.4.1.(6) Counteracting Dead Load Due to Soil. Examples of structures that traditionally employ the dead load of soil to resist loadings are pylon signs, tower structures, retaining walls, and deadmen, which resist wind uplift and overturning in light structures.

A-4.1.5.1.(1) Loads Due to Use of Floors and Roofs. In many areas of buildings, such as equipment areas, service rooms, factories, storage areas, warehouses, museums, and office filing areas, live loads due to their intended use may exceed the minimum specified loads listed in Table 4.1.5.3. In these instances, the probable live load shall be calculated and used as the specified live load for the design of that particular area.

A-Table 4.1.5.3. Considerations for Live Loads.

Arenas, Grandstands and Stadia
The designer should give special consideration to the effects of vibration.

Attics – Limited Accessibility
Attic live loading is not required when the ceiling below the attic consists of removable panels that permit access to the ceiling space without loading the ceiling supporting members. Attic live loading is not required in any area of the attic where the least dimension of the attic space is less than 500 mm.

Corridors, Aisles and Rows of Seats
The spaces between rows of seats are typically designed for the loads of the occupancy they serve. Rows of seats typically discharge into aisles that are designed for the loads used for the rows of seats. Corridors have a minimum width of 1 100 mm and may serve as collectors for aisles; they are therefore part of the exit system and are required to be designed for a minimum live load of 4.8 kPa.

Floor Areas That Could Be Used As Viewing Areas
Some interior balconies, mezzanines, corridors, lobbies and aisles that are not intended to be used by an assembly of people as viewing areas are sometimes used as such; consequently, they are subject to loadings much higher than those for the occupancies they serve. Floor areas that may be subject to such higher loads must, therefore, be designed for a loading of 4.8 kPa.

Lecture Halls and Classrooms
For the purposes of applying the requirements of Table 4.1.5.3., lecture halls with fixed seats are similar to theatres in configuration (the seats may have a writing tablet affixed to one arm). Classrooms are typically furnished with full-sized desks having separate or integrated seats.

Minimum Roof Live Load
Articles 4.1.5.3. and 4.1.5.9. stipulate a minimum uniform roof live load of 1.0 kPa and a minimum concentrated live load of 1.3 kN. These live loads are “use and occupancy loads” intended to provide for maintenance loadings: they are not reduced as a function of area or as a function of the roof slope due to their variability in distribution and location.

Vehicle Loads
A special study should be undertaken to determine the distributed loads to be used for the design of floors and areas used by vehicles exceeding 9 000 kg gross weight and of driveways and sidewalks over areaways and basements. Where appropriate, the designer should refer to CSA S6, “Canadian Highway Bridge Design Code.”

A-4.1.5.5. Loads on Exterior Areas. In Article 4.1.5.5., “accessible” refers to the lack of a physical barrier that prevents or restricts access by vehicles or persons to the site in the context of the specific use.
A-4.1.5.8. **Tributary Area.** Information on tributary area can be found in the Commentary entitled Live Loads in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-Table 4.1.5.9. **Loads Due to Concentrations.** Special study is required to determine concentrated loads for the design of floors and areas used by vehicles exceeding 9 000 kg gross weight, and of driveways and sidewalks over areaways and basements. Where appropriate the designer should refer to CSA S6, “Canadian Highway Bridge Design Code.”

A-4.1.5.11. **Crane-Supporting Structures.** Guidance on crane-supporting structures can be found in CSA S16, “Design of Steel Structures.”

A-4.1.5.14. and 4.1.5.15.(1) **Design of Guards.** In the design of guards, due consideration should be given to the durability of the members and their connections.

A-4.1.5.17. **Loads on Firewalls.** Information on loads on firewalls can be found in the Commentary entitled Structural Integrity of Firewalls in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.6.2. **Coefficients for Snow Loads on Roofs.** Information on coefficients for snow loads on roofs can be found in the Commentary entitled Snow Loads in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.6.2.(2) **Basic Roof Snow Load Factor.** Figure A-4.1.6.2.(2) shows the basic roof snow load factor, $C_{b}$, plotted against $I_{C_{w}}$.

![Figure A-4.1.6.2.(2) Basic roof snow load factor, $C_{b}$](image)

A-4.1.6.3.(2) **Full and Partial Loading under Snow Loads.** Information on full and partial snow loading on roofs can be found in the Commentary entitled Snow Loads in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.6.4.(1) **Rain Loads.** Information on rain loads can be found in the Commentary entitled Rain Loads in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”
A-4.1.6.4.(3) Flow Control Drains. Book II (Plumbing Services) of this By-law contains requirements regarding the use of flow control roof drains. The designer must ensure that the building complies with both Book I and Book II of the Building By-law.

A-4.1.6.7.(1) Roof Projections. Elevator, air-conditioning and fan housings, small penthouses and wide chimneys are examples of roof projections.

---

**Figure A-4.1.6.7.(1)**

Roof projections

---

A-4.1.6.7.(2) Values of $C_s$ for Small Roof Projections. Calculating $C_s$ in accordance with Article 4.1.6.5. rather than Sentence 4.1.6.7.(1) results in lower values for small projections.

Figure A-4.1.6.9.
Load cases for gable roofs

Notes to Figure A-4.1.6.9.:
(1) Case II loading does not apply to gable roofs with slopes of 15° or less, to single-sloped (shed) roofs, or to flat roofs.
(2) The value of $C_w$ for load case I is as prescribed in Sentences 4.1.6.2.(3) and (4).
(3) Varies as a function of slope, $\alpha$, as defined in Sentences 4.1.6.2.(5) and (6).

**A-4.1.7.1.(6) Computational Fluid Dynamics (CFD).** It is not currently possible to verify the reliability and accuracy of CFD and no standards address it; as such, this method is not permitted to be used to determine specified wind loads.

**A-4.1.7.2.(1) and (2) Natural Frequency.** Information on calculating the natural frequency of a building can be found in the Commentary entitled Wind Load and Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

**A-4.1.7.3.(5)(c) Procedure for Calculating Intermediate $C_e$.** Information on calculating intermediate values of $C_e$ between two exposures can be found in the Commentary entitled Wind Load and Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

**A-4.1.7.3.(10) Internal Gust Effect Factor, $C_{gi}$.** The effect of building envelope flexibility can be included in the calculation of $C_{gi}$. See the Commentary entitled Wind Load and Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

**A-4.1.7.5.(2) and (3) Pressure Coefficients for Main Structural System on Rectangular Buildings.**
Figure A-4.1.7.5.(2) and (3)
Values of $C_p$ for main structural system on rectangular buildings

A-4.1.7.5.(4) Pressure coefficients for roof and wall claddings and secondary structural supports of cladding on rectangular buildings.

Notes to Figure A-4.1.7.5.(4):
(1) The larger of $W$ or $D$ is to be used.
(2) Where vertical ribs deeper than 1 m are present on the walls, the dimensions $0.1D$ and $0.1W$ must be changed to $0.2D$ and $0.2W$ and the negative value of $C_p$ must be changed from -1.2 to -1.4.

A-4.1.7.8.(2) and (3) Exposure Factor for Dynamic Procedure.

Exposure factor, $C_e$, for dynamic procedure
Notes to Figure A-4.1.7.8.(2) and (3):
(1) Curve A represents $C_n$ for open terrain, as defined in Clause 4.1.7.3.(5)(a).
(2) Curve B represents $C_n$ for rough terrain, as defined in Clause 4.1.7.3.(5)(b).

A-4.1.7.8.(4) Peak Factor, Size Reduction Factor and Gust Energy Ratio.

\[ g_p = \sqrt{2 \ln(vT)} + \frac{0.577}{\sqrt{2 \ln(vT)}} \]
\[ T = 3600 \text{ s} \]
A-4.1.7.9.(1) Full and Partial Wind Loading. Information on full and partial loading under wind loads can be found in the Commentary entitled Wind Load and Effects in the “User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”
A-4.1.7.11. **Exterior Ornamentations, Equipment and Appendages.** Appendages may increase the overall forces in the design of the building structure and need to be accounted for.

**A-4.1.8.2.(1) Notation.**

**Definition of ε**
Information on the calculation of torsional moments can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

**Definition of W**
Information on the definition of dead load, W, can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

**A-4.1.8.3.(4) General Design of the SFRS.** Information on the general design requirements for the SFRS can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

**A-4.1.8.3.(6) General Design of Stiff Elements.** Information on the general design requirements for stiff elements can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

**A-4.1.8.3.(7)(b) and (c) Stiffness Imparted to the Structure from Elements Not Part of the SFRS.** Information on stiffness imparted to the structure from elements not part of the SFRS can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

**A-4.1.8.3.(8) Structural Modelling.** Information on structural modelling can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”
A-4.1.8.4.(3) and Table 4.1.8.4.-A  Site Class. Information on Site Class can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-Table 4.1.8.5.  Serviceability Limit States for Earthquake. Information on serviceability limit states for earthquake can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-Table 4.1.8.6.  Structural Irregularities.

Structural Irregularities
Information on structural irregularities can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

Gravity-Induced Lateral Demand – Type 9 Irregularity
Uncoupled concrete and masonry shear walls where a large fraction of the overturning resistance is provided by axial compression, rather than through yielding of the longitudinal reinforcement, are less susceptible to amplified displacements due to gravity-induced lateral demands because the axial loads have a self-centering effect on the shear walls. Walls that are stronger than the foundation and other systems such as coupled walls, braced frames, and moment frames are more susceptible to amplified displacements due to gravity-induced lateral demands. A lower limit on $\alpha$ is thus specified for such systems. Further information on the impacts of gravity-induced lateral demands on the seismic response of buildings can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.7.(1)  Dynamic Analysis Procedures. Information on dynamic analysis procedures can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-Table 4.1.8.9.  Industrial-Type Steel Structures. Guidance on the height limits, system restrictions and additional analysis and design requirements for steel SFRSs in industrial-type structures, intended essentially to support equipment, tanks or an industrial process, can be found in Annex M, Seismic Design of Industrial Steel Structures, of CSA S16, “Design of Steel Structures.”

A-4.1.8.9.(4)  Vertical Variations in $R_dR_o$. Information on vertical variations in $R_dR_o$ can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.9.(5)  $R_dR_o$ and Equivalent Systems. Information on the $R_dR_o$ of equivalent systems can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.10.(4)  Mid-rise Timber SFRS. Information on structural irregularities in mid-rise wood construction and on how to determine the number of storeys for application in Sentence 4.1.8.10.(4) can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.10.(5)  Gravity-Induced Lateral Demand – Type 9 Irregularity. Structural systems that include components such as inclined columns or horizontal floor cantilevers can induce lateral force demands on the SFRS under gravity loads. Buildings with such gravity-induced lateral demands on the SFRS are more likely to experience severe damage during strong ground shaking due to their tendency to drift only in one direction, leading to large residual displacements or instability. To determine if a building is susceptible to amplification of displacements due to...
gravity-induced lateral demands, the lateral resistance of the yielding mechanism to resist earthquake forces alone, $Q_y$, must be compared with the gravity-induced lateral demand, $Q_G$, at the same location. The force component selected for this comparison depends on the yielding mechanism for the SFRS. For example, for a coupled wall, the overturning moment resistance at the level of the expected plastic hinges should be compared with the overturning moment demand (at the same level) due to gravity loads alone, whereas for a steel-braced frame, the storey shear at the critical level of the yielding system should be compared with the storey shear demand (at the same level) due to the gravity loads alone. If the gravity-induced lateral demands exceed the limits prescribed in Sentence 4.1.8.10.(7), amplifications in seismic displacements due to gravity-induced lateral demands can only be identified through non-linear dynamic analyses using models that adequately represent the hysteretic behaviour of the SFRS. Further information on the impacts of gravity-induced lateral demands on the seismic response of buildings can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.10.(7) Gravity-Induced Lateral Demand – Non-Linear Dynamic Analysis. Information on non-linear dynamic analysis can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.11.(3) Determination of the Fundamental Period, $T_a$. Information on the determination of the fundamental period, $T_a$, can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.12.(1)(a) Linear Dynamic Analysis. Information on Linear Dynamic Analysis can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.12.(1)(b) Non-linear Dynamic Analysis. Information on Non-linear Dynamic Analysis can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.12.(3) Ground Motion Histories. Information on ground motion histories can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.12.(4)(a) Accidental Torsional Moments. Information on accidental torsional moments can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.13.(4) Deflections and Sway Effects. Information on deflections and sway effects can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.15.(1) Diaphragms and their Connections. Information on diaphragms and their connections can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.15.(3) Ductile Diaphragms. Information on the design of struts, collectors, chords and connections for ductile diaphragms can be found in the Commentary entitled Design for Seismic Effects in the "User's Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.15.(4) Influence of Dynamic Diaphragm In-plane Response.
Clause 4.1.8.15.(4)(a)

In lieu of carrying out a special study as stated in Subclause 4.1.8.15.(4)(a)(iii), the anticipated total deformation demand on the vertical elements of the SFRS, including inelastic deformations, may be taken as equal to \( R_d R_o (\Delta_b + \Delta_d) - R_o \Delta_d \), i.e., the difference between the total storey drift including inelastic deformation effects and diaphragm deformations, \( R_d R_o (\Delta_b + \Delta_d) \), and the diaphragm deformation under \( R_o \) times the seismic load, where \( R_d \) may be replaced by the actual overstrength of the SFRS vertical elements. The design engineer must verify that the SFRS vertical elements have sufficient deformation capacity to accommodate the computed deformation demand. If the vertical elements of the SFRS do not have sufficient deformation capacity, the design forces for the vertical elements of the SFRS must be magnified by \( R_d (1 + \Delta_d/\Delta_b)/(R_d + \Delta_d/\Delta_b) \). The calculation of the magnified design forces is iterative as the \( \Delta_d/\Delta_b \) ratio may change when using higher design forces for the vertical elements of the SFRS. Reducing the \( \Delta_d/\Delta_b \) ratio by increasing the stiffness of the roof diaphragm relative to that of the vertical elements of the SFRS may be considered to reduce the deformation demand on the vertical elements of the SFRS. Additional information can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

Clause 4.1.8.15.(4)(b)

The dynamic response of the diaphragm with the vertical elements of the SFRS under seismic excitation involves several modes of vibration that affect both the amplitude and distribution of in-plane shears and bending moments in the roof diaphragm. The shape of the fundamental mode of vibration resembles the deflected shape of the diaphragm/vertical SFRS elements under a distributed lateral load while higher modes involve increasing numbers of zero crossings of the deflected shapes along the length of the diaphragm, similar to the modes of a simply supported beam with distributed mass. Shears and bending moments therefore deviate from the values obtained from the equivalent static force procedure essentially due to higher mode response. Modal contributions to shears and bending moments in the diaphragms can be obtained from a Linear Dynamic Analysis. The contribution from the higher modes is generally more pronounced when the \( \Delta_d/\Delta_b \) ratio, the period in the first mode, or the ratio \( S_a(0.2)/S_a(2.0) \) is increased. It also increases when the SFRS is designed with a higher \( R_d \) factor as inelastic deformations of the vertical elements of the SFRS attenuate the first mode response. Methods to take into account the inelastic higher mode effects on in-plane diaphragm shears and moments are discussed in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.15.(5) Discontinuities. Information on elements supporting discontinuities can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.15.(6) Vertical Variations in \( R_d R_o \). Information on elements of the SFRS below the variation in \( R_d R_o \) can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.15.(7) Concurrent Yielding. Information on the effects of concurrent yielding of elements can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.15.(8) Design Force in Elements. Information on the design force in elements can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.16.(1) Foundation Movement. The bearing stress distribution in soil or rock that is used to determine the factored overturning resistance of the foundation influences the rotation of the foundation, which occurs due to the forces applied by the SFRS. Generally, all foundations will rotate on soil or rock. In particular, footings (a type of
foundation unit) often undergo uplift at one end, and if the factored bearing stress at the other end is only over a short length, then the uplift and rotation of the footing can be significant. CSA A23.3, "Design of Concrete Structures," contains design requirements for footings that rotate and uplift; see also the Commentary entitled Design for Seismic Effects in the "User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)" for guidance and methods to account for foundation movement.

A-4.1.8.16.(2) Actual Lateral Load Capacity of the SFRS. The actual lateral load capacity of the SFRS includes the effects of member overstrengths similar to those used to determine the $R_o$ factors. The applicable CSA design standards include requirements on calculating the overstrengths and capacities, which may be based on the members’ nominal or probable resistance. The actual capacities are larger than the factored loads and factored resistances and, in many cases, can be significantly larger. Note that the foundations designed to develop the capacity of the SFRS will undergo movements and Sentence 4.1.8.16.(1) still applies.

A-4.1.8.16.(4) Overturning Resistance of the Foundation. For the special case where the foundation is a footing, and where it and the attached SFRS are not constrained against rotation, it is permitted, with certain limitations, to size the footing to have a factored overturning resistance less than the overturning capacity of the supported SFRS. This approach results in a smaller footing, increased footing rotations, increased drifts in the structure, and increased soil stresses, all of which are over and above those associated with footings sized to have a factored overturning resistance equal to or greater than the overturning capacity of the SFRS. The footing itself must have a factored resistance capable of developing the required soil or rock reactions. An example of a footing and SFRS that are not constrained against rotation is an SFRS on a footing near the ground surface such that it can rotate freely and is attached to a gravity-load-resisting system (non-SFRS) that is laterally flexible and provides little lateral resistance. For this case, the SFRS is usually analyzed on its own and the resulting displacements are imposed on the non-SFRS elements in order to assess the effects on them. Cases where the footing and SFRS are attached to a system that has significant lateral stiffness require careful analysis and engineering judgement, or the footing can be capacity-designed.

Limiting the overturning moment on the foundation and the $R_oR_d$ value provides some control on the increase in lateral displacement, drift and stress in the soil or rock. Cases that exceed these limits require special study. For the common case where the SFRS and/or the footing are constrained in some way against rotation, the footing’s factored resistance must be equal to or greater than the capacity of the supported SFRS. An example of an SFRS constrained against freely rotating with the footing is an SFRS attached to adjacent foundation walls by below-grade diaphragms. Examples of footings constrained against free rotation are footings that use soil anchors to resist overturning, footings on piles, and raft foundations. Note that Sentence 4.1.8.16.(1) still applies.

A-4.1.8.16.(6)(a) Interconnection of Foundation Elements. Information on the interconnection of piles or pile caps, drilled piers, and caissons can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.16.(7) Earthquake Lateral Pressures from Backfill or Natural Ground. Information on methods of computing the seismic lateral pressures from backfill or natural ground can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.16.(8)(a) Cyclic Inelastic Behaviour of Foundation Elements. Information on the cyclic inelastic behaviour of piles or pile caps, drilled piers, and caissons can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”
A-4.1.8.16.(9) **Alternative Foundation Ties.** Alternative methods of tying foundations together, such as a properly reinforced floor slab capable of resisting the required tension and compression forces, may be used. Passive soil pressure against buried pile caps may not be used to resist these forces.

A-4.1.8.16.(10) **Liquefaction.** Information on liquefaction can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.17.(1) **Slope Stability.** Information on slope instability can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.18. **Elements of Structures, Non-structural Components and Equipment.** Information on the requirements of Article 4.1.8.18. can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-Table 4.1.8.18. **Non-structural Components and Equipment.** The failure or detachment of non-structural components and equipment during an earthquake can present a major threat to life safety. The design requirements presented in Article 4.1.8.18. are intended to ensure that such components and their connections to the building will retain their integrity during strong ground shaking. Guidelines for the seismic risk reduction of such components are given in CAN/CSA-S832, “Seismic Risk Reduction of Operational and Functional Components (OFCs) of Buildings.”

A-4.1.8.18.(14) **Storage Racks.** Free-standing steel pallet storage racks contain only materials typically loaded by forklift. They are designed to store loaded pallets, however in some cases, the stored material does not sit on a pallet. There is no occupancy within the racks. Information on racks can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.18.(15) and (16)(c) **Glass Fallout and Failure.** Information on glass fallout and testing for glass fallout can be found in AAMA 501.6, “Recommended Dynamic Test Method For Determining The Seismic Drift Causing Glass Fallout From A Wall System.” Every surface other than inaccessible areas or areas where occupancy is prevented or access is prevented should be considered a “walking surface.” Additional information can be found in ASCE/SEI 7, “Minimum Design Loads for Buildings and Other Structures,” in FEMA P-750, “NEHRP Recommended Seismic Provisions for New Buildings and Other Structures,” and FEMA 450-1, “NEHRP Recommended Provisions for Seismic Regulations for New Buildings and Other Structures,” and related commentaries, and in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.19.(2) **Design Review.** It is strongly recommended that a design review of the seismically isolated structure and its isolation system be carried out by an independent team of professional engineers and geoscientists experienced in seismic analysis methods and the theory and application of seismic isolation. The design review should include, but not be limited to, the following:

a) site-specific spectra,
b) ground motion time histories,
c) modeling and analyses,
d) testing program and results, and
e) final design of all structural framing elements and isolation system components.

A-4.1.8.19.(3)(a) **Non-Linear Dynamic Analysis.** Three-dimensional Non-Linear Dynamic Analysis is a complex process requiring special expertise. Guidance on Non-linear Dynamic Analysis can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.1.8.19.(4) **Ground Motion Time Histories.** Ground motion time histories and their horizontal and vertical components must be appropriately selected and scaled according to accepted practice. Further information on
ground motion time histories can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.1.8.21.(2) Design Review. It is strongly recommended that a design review of the structure and the supplementary energy dissipation system be carried out by an independent team of professional engineers and geoscientists experienced in seismic analysis methods and the theory and application of supplementary energy dissipation. The design review should include, but not be limited to, the following:
   a) ground motion time histories,
   b) modeling and analyses,
   c) testing program and results, and
   d) final design of all structural framing elements and supplemental energy dissipation system components.

A-4.1.8.21.(5) Ground Motion Time Histories. Ground motion time histories and their horizontal and vertical components must be appropriately selected and scaled according to accepted practice. Further information on ground motion time histories can be found in the Commentary entitled Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.2.2.1.(1) Subsurface Investigation. Where acceptable information on subsurface conditions already exists, the investigation may not require further physical subsurface exploration or testing.

A-4.2.2.3.(1) Responsibilities of the Designer as Defined in Part 4. In certain situations, such as when the design is highly technical, it may be necessary for the “other suitably qualified person” to be someone responsible to the designer. In such cases the Chief Building Official may wish to order that the review be done by the designer.

A-4.2.4.1.(1) Innovative Designs. It is important that innovative approaches to foundation design be carried out by a person especially qualified in the specific method applied and that the design provide a level of safety and performance at least equivalent to that provided for or implicit in the design carried out by the methods referred to in Part 4. Provision must be made for monitoring the subsequent performance of such structures so that the long-term sufficiency of the design can be evaluated.

A-4.2.4.1.(3) Ultimate Limit States for Foundations. Information on ultimate limit states for foundations, including terminology and resistance factors, can be found in the Commentary entitled Foundations in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.2.4.1.(5) Design of Foundations for Differential Movements. Information on the design of foundations for differential movements can be found in the Commentary entitled Foundations in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."

A-4.2.4.4.(1) Depth of Foundations. When adfreezing has occurred and subsequent freezing results in soil expansion beneath this area, the resulting uplift effect is sometimes referred to as frost jacking.

A heated building that is insulated to prevent heat loss through the foundation walls should be considered as an unheated structure unless the effect of the insulation is taken into account in determining the maximum depth of frost penetration.

A-4.2.5.1.(1) Excavations. Information on excavations can be found in the Commentary entitled Foundations in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)."
A-4.2.6.1.(1)  **Shallow Foundations.** Information on shallow foundations can be found in the Commentary entitled Foundations in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.2.7.1.(1)  **Deep Foundation Units.** A deep foundation unit can be pre-manufactured or cast-in-place; it can be driven, jacked, jetted, screwed, bored or excavated; it can be of wood, concrete or steel or a combination thereof.

A-4.2.7.2.(1)  **Deep Foundations.** Information on deep foundations can be found in the Commentary entitled Foundations in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

A-4.2.7.2.(2)  **Load Testing of Piles.** ASTM D 1143/D 1143M, “Deep Foundations Under Static Axial Compressive Load,” defines routine load test procedures that have been extensively used.

A-4.3.1.1. **Wood**  The design criteria for wood, CAN/CSA 086 “Engineering Design in Wood”, makes assumptions that the wood products being used are in a condition as intended by their grading. This includes the limits of moisture content as specified by the grade. However, conditions such as transportation, site storage, and construction conditions can impact the original design assumptions.

Design considerations should include and be specific to shrinkage that may occur due to changes in moisture content of the wood. This is of particular concern where the building height can be up to 6 storeys, such as being built under Article 3.2.2.45. The potential building movement due to shrinkage should be indicated to other design professionals for their considerations such as cladding systems, mechanical systems, hold-down devices for structural walls and connections to non-shrinking elements including firewalls and elevator shafts.

Many wood designs now incorporate mass timber elements as part of the primary structural elements or seismic force resistance systems. Such products may include glue or mechanically laminated wood elements such as Glulam, Cross and Dowel Laminated Timbers, or other proprietary products or systems which may not exhibit the properties assumed by the by-law or its referenced standards. Where such elements are used, compliance with CAN/CSA-O86 may not be sufficient to demonstrate compliance with the objective of the By-law. In such cases, where in the opinion of the Chief Building Official the potential consequence of failure is considered to be significant, they may require that such designs be supported by the third party review of the structural design under the most credible fire impaired or unimpaired scenarios. This will include the assessment of the performance of the specified materials, fire-protective features, and expected behavior of the structure under each of these scenarios.

A-4.3.3.1.(1)  **Precast Concrete.** CSA A23.3, “Design of Concrete Structures,” requires precast concrete members to conform to CSA A23.4, “Precast Concrete – Materials and Construction.”

A-4.3.4.1.(1)  **Welded Construction.** Qualification for fabricators and erectors of welded construction is found in Clause 24.3 of CSA S16, “Design of Steel Structures.”

A-4.3.4.2.(1)  **Cold-Formed Stainless Steel Members.** There is currently no Canadian standard for the design of cold-formed stainless steel structural members. As an interim measure, design may be carried out using the limit states design provisions of ASCE/SEI 8, “Design of Cold-Formed Stainless Steel Structural Members,” except that load factors, load combinations and load combination factors shall be in accordance with Subsection 4.1.3.

A-4.3.6.1.(1)  **Design Basis for Glass.** The load factors in Tables 4.1.3.2.-A and 4.1.3.2.-B must be applied to the adjusted wind load before designing in accordance with the referenced standard. Additional information is given in the Commentary entitled Wind Load and Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”
A-4.4.2.1.(1) Design Basis for Parking Structures and Repair Garages. See the Commentary entitled Live Loads in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”
Part 5
Environmental Separation

Section 5.1. General

5.1. Scope

5.1.1. Scope

1) This Part is concerned with
   a) the control of condensation
      i) in building components and assemblies, and
      ii) on building materials, components and assemblies, and
   b) the transfer of heat, air, moisture and sound through
      i) building materials, components and assemblies, and
      ii) interfaces between building materials, components and assemblies.
   (See Note A-5.1.1.1.(1).)

5.1.1.2. Maritime Climate

1) This Part includes special provisions to deal with the potentially damaging effects of Vancouver’s maritime climate, including the possibility of rapid decay in structural members. (See Note A-5.1.1.2.)

5.1.2. Application

5.1.2.1. Exposure to Exterior Space or the Ground and Separation of Dissimilar Environments

1) Except as provided in Sentence (2), this Part applies, as described in Subsection 1.3.3. of Division A, to
   a) building materials, components and assemblies exposed to exterior space or the ground, including those separating interior space from exterior space or separating interior space from the ground,
   b) building materials, components and assemblies separating environmentally dissimilar interior spaces (See Note A-5.8.), and
   c) site materials, components, assemblies and grading that may affect environmental loads on building materials, components and assemblies exposed to exterior space or the ground.
   (See Note A-5.1.2.1.(1).)

2) Buildings or portions of buildings not required to provide environmental separation, not exposed to exterior environmental loads or intended only for summer seasonal use need not conform to this Part where it can be shown, to the satisfaction of the Chief Building Official that the health or safety of building users, the intended use of the building and the operation of building services will not be adversely affected. (See Note A-5.1.2.1.(2).)

5.1.2.2. Building Envelope Professional Requirements

1) The Building Envelope Professional shall conduct reviews, and provide letters as required in Sentences (2) and (3), on buildings or portions of buildings with a cladding system over wood framing or light steel framing and on all residential buildings within the scope of Part 5 with respect to Section 5.4., 5.5. and 5.6. (See Note A-5.1.2.2.(1).)

2) The Building Envelope Professional shall, prior to issuance of a building permit, provide the Chief Building Official with a completed, signed and sealed commitment letter in the form attached as Schedule D-1 at the end of this part.
3) The Building Envelope Professional shall, prior to issuance of an occupancy permit, provide the Chief Building Official with a completed, signed and sealed completion letter in the form attached as Schedule D-2 at the end of this Part.

5.1.3. Definitions

5.1.3.1. Defined Words

1) Words that appear in italics are defined in Article 1.4.1.2. of Division A.

5.1.4. Resistance to Loads and Deterioration

5.1.4.1. Structural and Environmental Loads

(See Note A-5.1.4.1.)

1) Building materials, components and assemblies that separate dissimilar environments or are exposed to the exterior shall have sufficient capacity and integrity to resist or accommodate

a) all environmental loads, and effects of those loads, that may reasonably be expected having regard to

i) the intended use of the building, and

ii) the environment to which the materials, components and assemblies are subject, and

b) all structural loads, and effects of those loads, that may reasonably be expected.

2) Where building materials, components or assemblies perform more than one function, they shall satisfy the requirements of all of those functions. (See Note A-5.1.4.1.(2).)

3) Compliance with Clause (1)(a) shall be demonstrated by design complying with Subsection 5.2.1. and construction conforming to that design.

4) Compliance with Clause (1)(b) shall be demonstrated by design complying with Subsection 5.2.2., and construction conforming to that design, with regard to

a) materials, components and assemblies, and associated loads, that are identified in Part 4,

b) air pressure loads imposed on air barrier systems,

c) wind up-lift imposed on roofing, and

d) hydrostatic pressure imposed on the means of protection from moisture in the ground.

5) For materials, components, assemblies and loads to which Sentence (4) does not apply, compliance with Clause (1)(b) shall be demonstrated

a) by design complying with Subsection 5.2.2. for individual applicable loads and construction conforming to that design, or

b) in the case of common materials, components and assemblies, and their installation, by proven past performance over a period of several years for individual applicable loads.

(See Note A-5.1.4.1.(5).)

6) Materials, components and assemblies separating dissimilar environments and assemblies exposed to the exterior, including their connections, that are subject to structural loads as defined in Article 5.2.2.1., shall

a) transfer such loads to the building structure without adverse effects on the performance of other materials, components or assemblies,

b) not deflect to a degree that adversely affects the performance of other materials, components or assemblies (See Note A-5.1.4.1.(6)(b) and (c).), and

c) be designed, and constructed according to that design, to accommodate (See Note A-5.1.4.1.(6)(b) and (c).)

i) the maximum relative structural movement that may reasonably be expected, and

ii) construction tolerances that may be reasonably expected.

(See Article 4.1.3.5., Sentence 4.1.3.3.(2) and Subsection 4.1.8. for information on different types of structural movements.) (See Note A-5.1.4.1.)
5.1.4.2. Resistance to Deterioration
(See Note A-5.1.4.2.)
1) Except as provided in Sentence (2), materials used in building components and assemblies that separate dissimilar environments, or in assemblies exposed to the exterior, shall be
   a) compatible with adjoining materials, and
   b) resistant to any mechanisms of deterioration that may reasonably be expected, given
      i) the nature and function of the materials, and
      ii) the exposure and climatic conditions in which they will be installed.
2) Material compatibility and deterioration resistance are not required where it can be shown that incompatibility or uncontrolled deterioration will not adversely affect any of
   a) the health or safety of building users,
   b) the intended use of the building, or
   c) the operation of building services.
3) Design and construction of building components and assemblies described in Article 5.1.2.1. shall be in accordance with good practice as described in CSA S478, “Guideline on Durability in Buildings”.

5.1.5. Other Requirements
5.1.5.1. Requirements in Other Parts of the By-law
1) Energy utilization, structural and fire safety requirements of other Parts of this By-law shall apply.

Section 5.2. Loads and Procedures

5.2.1. Environmental Loads and Design Procedures

5.2.1.1. Exterior Environmental Loads
1) Above ground climatic loads shall be determined according to Subsection 1.1.3.
2) Except as provided in Sentence (3), below ground exterior environmental loads not described in Subsection 1.1.3. shall be determined from existing geological and hydrological data or from site tests.
3) Where local design and construction practice has shown soil temperature analysis to be unnecessary, soil temperatures need not be determined. (See Note A-5.2.1.1.(3).)

5.2.1.2. Interior Environmental Loads
1) Interior environmental loads shall be determined in accordance with good practice as described in Sentence 6.2.1.1.(1) based on the intended use of the space. (See Note A-5.2.1.2.(1).)

5.2.1.3. Environmental Load and Transfer Calculations
1) Calculations related to the transfer of heat, air and moisture and the transmission of sound shall conform to good practice such as that described in the ASHRAE Handbooks.
2) For the purposes of any analysis conducted to indicate conformance to the thermal resistance levels required in Article 5.3.1.2., soil temperatures shall be determined based on annual average soil temperature, seasonal amplitude of variation and attenuation of variation with depth.
3) Wind load calculations shall conform to Subsection 4.1.7.

5.2.2. Structural Loads and Design Procedures

5.2.2.1. Determination of Structural Loads and Effects
1) Where materials, components or assemblies that separate dissimilar environments or are exposed to the exterior, or their connections, are required to be designed to withstand structural loads, these loads shall be determined in accordance with Part 4. (See also Subsection 2.2.5. of Division C.)
2) Except as provided in Article 4.1.8.18., the structural loads referred to in Sentence (1) and their related effects shall include
   a) *dead loads* transferred from structural elements,
   b) wind, snow, rain, hydrostatic and earth pressures,
   c) earthquake effects for *post-disaster buildings*, depending on their intended function (See Note A-5.2.2.1.(2)(c)),
   d) *live loads* due to use and *occupancy*, and
   e) loads due to thermal or moisture-related expansion and contraction, deflection, deformation, creep, shrinkage, settlement, and differential movement.

3) Where materials, components or assemblies that separate dissimilar environments or are exposed to the exterior, or their connections, can be expected to be subject to loads or other effects not described in this Subsection or in Part 4, such loads or effects shall be taken into account in the design based on the most current and applicable information available.

5.2.2.2. Determination of Wind Load
   (See Note A-5.2.2.2.)
   1) This Article applies to the determination of wind load to be used in the design of materials, components and assemblies, including their connections, that separate dissimilar environments or are exposed to the exterior, where these are
      a) subject to wind load, and
      b) required to be designed to resist wind load.
   2) Except as provided in Sentence (3), the wind load referred to in Sentence (1) shall be 100% of the specified wind load determined in accordance with Article 4.1.7.1.
   3) Where it can be shown by test or analysis that a material, component, assembly or connection referred to in Sentence (1) will be subject to less than 100% of the specified wind load, the wind load referred to in Sentence (1) shall be not less than the load determined by test or analysis.
   4) Except as provided in Sentence (5), the wind uplift resistance of membrane roofing assemblies shall be determined in accordance with the requirements of CAN/CSA-A123.21, “Dynamic Wind Uplift Resistance of Membrane-Roofing Systems.” (See Note A-5.2.2.2.(4).)
   5) Membrane roofing assemblies with proven past performance for the anticipated wind loads need not comply with Sentence (4). (See Note A-5.1.4.1.(5).)

5.2.2.3. Design Procedures
   1) Structural design shall be carried out in accordance with Subsection 4.1.3. and other applicable requirements in Part 4.

Section 5.3. Heat Transfer
   (See Note A-5.3.)

5.3.1. Thermal Resistance of Assemblies

5.3.1.1. Required Resistance to Heat Transfer
   (See Note A-5.3.1.1.)
   1) Where a *building* component or assembly will be subjected to an intended temperature differential, the component or assembly shall include materials to resist heat transfer or a means to dissipate transferred heat in accordance with the remainder of this Subsection, and Part 10 of Division B.
   2) Deleted.

5.3.1.2. Properties to Resist Heat Transfer or Dissipate Heat
   (See Note A-5.3.1.2.)
1) Taking into account the conditions on either side of the environmental separator, materials and components installed to provide the required resistance to heat transfer or the means implemented to dissipate heat shall provide sufficient resistance or dissipation,
   a) to minimize surface condensation on the warm side of the component or assembly,
   b) in conjunction with other materials and components in the assembly, to minimize condensation within the component or assembly,
   c) in conjunction with systems installed for space conditioning, to meet the interior design thermal conditions for the intended occupancy, and
   d) to minimize ice damming on sloped roofs.
(See Note A-5.3.1.2.(1).)

5.3.1.3. Location and Installation of Materials Providing Thermal Resistance
1) Where a material required by Article 5.3.1.1. is intersected by a building assembly, penetrated by a high conductance component or interrupted by expansion, control or construction joints, and where condensation is likely to occur at these intersections, penetrations or interruptions, sufficient thermal resistance shall be provided so as to minimize condensation at these locations.
2) Materials providing required thermal resistance shall have sufficient inherent resistance to airflow or be positioned in the assembly so as to prevent convective airflow through and around the material. (See Note A-5.3.1.3.(2).)

Section 5.4. Air Leakage

5.4.1. Air Barrier Systems

5.4.1.1. Required Resistance to Air Leakage
(See Note A-5.4.1.1.)
1) Where a building component or assembly separates interior conditioned space from exterior space, interior space from the ground, or environmentally dissimilar interior spaces, the properties and position of the materials and components in those components or assemblies shall be such that they control air leakage or permit venting to the exterior so as to
   a) provide acceptable conditions for the building occupants,
   b) maintain appropriate conditions for the intended use of the building,
   c) minimize the accumulation of condensation in and the penetration of precipitation into the building component or assembly,
   d) control heat transfer to roofs where ice damming can occur,
   e) minimize the ingress of airborne radon from the ground with an aim to controlling the indoor radon concentration to an acceptable level, and
   f) not compromise the operation of building services.
2) An air barrier system shall be installed to provide the principal resistance to air leakage.
3) Deleted.

5.4.1.2. Air Barrier System Properties
1) Materials intended to provide the principal resistance to air leakage shall
   a) have an air leakage characteristic not greater than 0.02 L/(s·m²) measured at an air pressure difference of 75 Pa, when tested in accordance to ASTM E 2178, “Air Permeance of Building Materials,” or
   b) conform to CAN/ULC-S741, “Air Barrier Materials – Specification.”
(See Note A-5.4.1.2.(1).)
2) Deleted.
3) The air barrier system shall be continuous
Division B: Acceptable Solutions

Part 5 – Environmental Separation

Section 5.5. Vapour Diffusion

5.5.1. Vapour Barriers

5.5.1.1. Required Resistance to Vapour Diffusion
(See Note A-5.5.1.1.)

1) Where a building component or assembly is subjected to differentials in temperature and water vapour pressure, the properties and position of the materials and components in those components or assemblies shall be such that they control vapour diffusion or permit venting to the exterior so as to minimize the accumulation of condensation in the building component or assembly.

2) A vapour barrier shall be installed to provide the principal resistance to water vapour diffusion.

3) Deleted.

5.5.1.2. Vapour Barrier Properties and Installation
(See Note A-5.3.1.2.)

1) The vapour barrier shall have sufficiently low permeance and shall be positioned in the building component or assembly so as to
   a) minimize moisture transfer by diffusion, to surfaces within the assembly that would be cold enough to cause condensation at the design temperature and humidity conditions, or
   b) reduce moisture transfer by diffusion, to surfaces within the assembly that would be cold enough to cause condensation at the design temperature and humidity conditions, to a rate that will not allow sufficient accumulation of moisture to cause deterioration or otherwise adversely affect any of
      i) the health or safety of building users,
      ii) the intended use of the building, or
      iii) the operation of building services.
(See Note A-5.5.1.2.(1.).)

2) Coatings applied to gypsum board to provide required resistance to vapour diffusion shall conform to the requirements of Sentence (1) when tested in accordance with CAN/CGSB-1.501-M, “Method for Permeance of Coated Wallboard.”

3) Coatings applied to materials other than gypsum board to provide required resistance to vapour diffusion shall conform to the requirements of Sentence (1) when tested in accordance with ASTM E 96/E 96M, “Water Vapor Transmission of Materials,” by the desiccant method (dry cup).

Section 5.6. Precipitation

5.6.1. Protection from Precipitation

5.6.1.1. Required Protection from Precipitation
(See Note A-5.6.1.1.)

1) Where a building component or assembly is exposed to precipitation, the component or assembly shall
   a) minimize ingress of precipitation into the component or assembly, and
   b) prevent ingress of precipitation into interior space.

2) Deleted.
5.6.1.2. Installation of Protective Materials
(See Note A-5.6.1.2.)

1) Where protective materials are applied to assemblies to provide the required protection from precipitation, they shall be installed so as to shed precipitation or otherwise minimize its entry into the assembly and prevent its penetration through the assembly. (See Note A-5.6.1.2.(1), (See also Clause 5.3.1.2.(1)(d).)

2) Where protective materials applied to assemblies to provide the required protection from precipitation are part of a vegetated roofing system, they shall be resistant to root and rhizome penetration when tested in accordance with ANSI/GRHC/SPRI VR-1, “Investigating Resistance to Root Penetration on Vegetative Roofs.” (See Note A-5.6.1.2.(2).)

3) Flashings, drips, or overhangs shall be incorporated to deflect accumulated water from the building face where there are changes in planes of walls and roofs, changes in cladding material, or window or door heads or sills. (See Note A-5.6.1.2.(3).)

5.6.2. Drainage, Accumulation and Disposal

5.6.2.1. Drainage
(See Note A-5.6.2.1.)

1) Materials, components, assemblies, joints in materials, junctions between components and junctions between assemblies exposed to precipitation shall be
   a) designed to shed precipitation, and
   b) drained to direct precipitation to the exterior.

2) Deleted.

5.6.2.2. Accumulation and Disposal

1) Where water, snow or ice can accumulate on a building, provision shall be made to minimize the likelihood of hazardous conditions arising from such accumulation.

2) Where precipitation can accumulate on sloped or horizontal assemblies, provision shall be made for drainage conforming with Article 2.4.10.4. of Division B of Book II (Plumbing Systems) of this By-law.

3) Where downspouts are provided and are not connected to a sewer, provisions shall be made to
   a) divert the water from the building, and
   b) prevent soil erosion.

4) Junctions between vertical assemblies, and sloped or horizontal assemblies, shall be designed and constructed to minimize the flow of water from the sloped or horizontal assembly onto the vertical assembly.

5) Where a roof or balcony is entirely enclosed by parapet walls, there shall be a sufficient number of overflow outlets installed in the parapet walls in order to properly drain the roof or balcony in the event that any rainwater conductors become obstructed. (See Note A-5.6.2.2.(5).)

Section 5.7. Surface and Ground Water
(See Note A-5.7.)

5.7.1. Site Factors

5.7.1.1. Application

1) This Subsection applies to the location of buildings, the grading of building sites, the directing of water away from building assemblies, and the provision of means for drainage.

5.7.1.2. Required Protection
1) The building shall be located, the building site shall be graded, or water shall be directed away from building assemblies so as to prevent or accommodate the accumulation of surface water against the building or adjacent buildings.

2) Drainage shall be provided to direct water away from assemblies separating interior space from the ground, except
   a) where the assembly is designed in accordance with Subsection 5.7.2. to withstand continuous hydrostatic pressure.
   b) Deleted.

(See Note A-5.7.1.2.(2).)

5.7.2. Protection against Hydrostatic Pressure

5.7.2.1. Application
1) This Subsection applies to waterproofing materials, components, assemblies and systems applied to building assemblies that separate dissimilar environments and are subjected to hydrostatic pressure.

5.7.2.2. Design of Building Elements Under Hydrostatic Loads
1) Waterproofing materials, components, assemblies and systems described in Article 5.7.2.1. shall be designed in accordance with Subsection 5.1.4.
2) Hydrostatic design loads shall be determined in accordance with Subsection 5.2.2.

5.7.2.3. Required Protection
1) Waterproofing materials, components, assemblies and systems described in Article 5.7.2.1. shall comply with Article 5.7.3.2.

5.7.3. Protection against Ground Water

5.7.3.1. Application
1) This Subsection applies to the protection of building assemblies that separate interior space from the ground.

5.7.3.2. Required Protection
1) Except as provided in Article 5.7.3.4., building assemblies described in Article 5.7.3.1. shall be protected by waterproofing in accordance with Article 5.7.3.3. so as to prevent the ingress of water into the building or the accumulation of water against the building.
2) Deleted.

5.7.3.3. Waterproofing
1) Waterproofing materials, components, assemblies, or systems installed to provide the required protection shall form a continuous and impervious barrier to the ingress of water and be capable of accommodating
   a) imperfections, construction joints, control joints and expansion joints, (See Note A-5.7.3.3.(1)(a).),
   b) junctions between different building assemblies, and
   c) elements penetrating building assemblies.

5.7.3.4. Where Dampproofing is Permitted
1) Vertical building assemblies that separate interior space from the ground are permitted to be dampproofed where
   a) such assemblies are not subjected to hydrostatic pressure,
   b) the substrate is cast-in-place concrete, and
   c) a drainage layer is installed between the building assembly and the soil.
Section 5.8. Sound Transmission
(See Note A-5.8.)

5.8.1. Protection from Airborne Noise

5.8.1.1. Required Protection
1) Except as provided in Sentence (2), a dwelling unit shall be separated from every other space in a building in which noise may be generated by
   a) a separating assembly and adjoining constructions, which, together, provide an apparent sound transmission class (ASTC) rating not less than 47, or
   b) a separating assembly that provides a sound transmission class (STC) rating of not less than 50 and adjoining constructions that conform to Article 9.11.1.4.
2) Assemblies and adjoining constructions separating a dwelling unit from an elevator shaft or a refuse chute shall have an STC rating not less than 55.

5.8.1.2. Determination of Sound Transmission Ratings
(See Note A-5.8.1.2.)
1) The STC ratings of separating assemblies shall be determined in accordance with ASTM E 413, “Classification for Rating Sound Insulation,” using the results from measurements carried out in accordance with ASTM E 90, “Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements.”
2) The ASTC ratings of separating assemblies and adjoining constructions shall be
   a) determined in accordance with ASTM E 413, “Classification for Rating Sound Insulation,” using the results from measurements carried out in accordance with ASTM E 336, “Measurement of Airborne Sound Attenuation between Rooms in Buildings,” or
   b) calculated in accordance with
      i) the detailed method described in Article 5.8.1.4., or
      ii) the simplified method described in Article 5.8.1.5.

5.8.1.3. Compliance with Required Ratings
1) Compliance with the required STC ratings shall be demonstrated through
   a) measurements carried out in accordance with Sentence 5.8.1.2.(1), or
   b) the construction of separating assemblies conforming to those presented in Table 9.10.3.1.-A or 9.10.3.1.-B, as applicable.
2) Compliance with the required ASTC ratings shall be demonstrated through
   a) measurements or calculations carried out in accordance with Sentence 5.8.1.2.(2), or
   b) the construction of separating assemblies conforming to those presented in Table 9.10.3.1.-A or 9.10.3.1.-B, as applicable, that have an STC rating of not less than 50 in conjunction with flanking assemblies constructed in accordance with Article 9.11.1.4.

5.8.1.4. Detailed Method for Calculating ASTC
(See Note A-5.8.1.4.)
Division B: Acceptable Solutions

Part 5 – Environmental Separation

2) The vibration reduction index for the junctions between separating assemblies shall be
   a) determined using the equations presented in Annex E of ISO 15712-1, “Building Acoustics –
      Estimation of Acoustic Performance of Buildings From the Performance of Elements – Part 1:
      Airborne Sound Insulation Between Rooms,” or
   b) measured in accordance with Parts 1 to 4 of ISO 10848, “Acoustics – Laboratory Measurement
      of the Flanking Transmission of Airborne and Impact Sound Between Adjoining Rooms.”

3) The normalized flanking level difference shall be measured in accordance with Parts 1 to 4 of ISO 10848,
   “Acoustics – Laboratory Measurement of the Flanking Transmission of Airborne and Impact Sound Between
   Adjoining Rooms.”

4) The direct sound reduction index for the separating assembly in situ shall be determined using Clause (a)
   or (b), depending on the type of construction:
   a) for a lightweight separating wall or floor assembly with wood or steel framing, the index shall be
      taken as equal to the sound transmission loss, without correction;
   b) for a heavyweight separating wall or floor assembly of concrete or masonry, the index shall be
      determined in accordance with the detailed method for structure-borne transmission presented in
      Performance of Elements – Part 1: Airborne Sound Insulation Between Rooms.”

5) The flanking sound reduction index for each flanking path at each edge of the separating assembly shall
   be determined using Clause (a), (b) or (c), depending on the type of construction:
   a) for a lightweight separating wall or floor assembly with wood or steel framing and connected
      lightweight flanking assemblies with wood or steel framing, the index shall be taken as equal to the
      normalized flanking level difference re-normalized for the ASTC field situation in accordance with
      From the Performance of Elements – Part 1: Airborne Sound Insulation Between Rooms”;
   b) for a heavyweight separating wall or floor assembly of concrete or masonry and connected
      flanking assemblies of concrete or masonry, the index shall be determined in accordance with the
      Estimation of Acoustic Performance of Buildings From the Performance of Elements – Part 1:
      Airborne Sound Insulation Between Rooms”;
   c) for a mixture of lightweight framed assemblies and heavyweight concrete or masonry
      assemblies, the index shall be determined in accordance with Clause (a) or (b).

6) Once the pertinent indices and measurements referred to in Sentences (1) to (5) have been determined
   based on the type of construction, the apparent sound reduction index shall then be determined in
   the Performance of Elements – Part 1: Airborne Sound Insulation Between Rooms.”

7) The ASTC shall be calculated in accordance with ASTM E 413, “Classification for Rating Sound
   Insulation,” using the apparent sound reduction index determined in Sentence (6), which shall be treated as
   equivalent to the values of apparent sound transmission loss measured in accordance with ASTM E 336,
   “Measurement of Airborne Sound Attenuation between Rooms in Buildings.”

5.8.1.5. Simplified Method for Calculating ASTC
   (See Note A-5.8.1.4.)
1) The STC rating shall be used in lieu of the weighted sound reduction index required in ISO 15712-1,
   Part 1: Airborne Sound Insulation Between Rooms.”
2) The vibration reduction index for the junctions between separating assemblies shall be
   a) determined using the equations presented in Annex E of ISO 15712-1, “Building Acoustics –
      Estimation of Acoustic Performance of Buildings From the Performance of Elements – Part 1:
      Airborne Sound Insulation Between Rooms,” or
   b) measured in accordance with Parts 1 to 4 of ISO 10848, “Acoustics – Laboratory Measurement
      of the Flanking Transmission of Airborne and Impact Sound Between Adjoining Rooms.”
3) The weighted normalized flanking level difference shall be determined in accordance with ASTM E 413, “Classification for Rating Sound Insulation,” using the results from measurements carried out in accordance with Parts 1 to 4 of ISO 10848, “Acoustics – Laboratory Measurement of the Flanking Transmission of Airborne and Impact Sound Between Adjoining Rooms.”

4) The direct weighted sound reduction index for the separating assembly shall be taken as equal to the STC, without correction.

5) The weighted flanking sound reduction index for each flanking path at each edge of the separating assembly shall be determined using Clause (a) or (b), depending on the type of construction:
   a) for a lightweight separating wall or floor assembly with wood or steel framing and connected lightweight flanking assemblies with wood or steel framing, the index shall be taken as equal to the weighted normalized flanking level difference re-normalized for the ASTC field situation in accordance with Annex F of ISO 15712-1, “Building Acoustics – Estimation of Acoustic Performance of Buildings From the Performance of Elements – Part 1: Airborne Sound Insulation Between Rooms”;
   b) for a heavyweight separating wall or floor assembly of concrete or masonry and connected flanking assemblies of concrete or masonry, the index shall be determined in accordance with the simplified method for structure-borne transmission presented in ISO 15712-1, “Building Acoustics – Estimation of Acoustic Performance of Buildings From the Performance of Elements – Part 1: Airborne Sound Insulation Between Rooms.”

6) Once the pertinent indices and measurements referred to in Sentences (1) to (5) have been determined based on the type of construction, the ASTC shall then be calculated in accordance with ISO 15712-1, “Building Acoustics – Estimation of Acoustic Performance of Buildings From the Performance of Elements – Part 1: Airborne Sound Insulation Between Rooms.”

Section 5.9. Standards

5.9.1. Applicable Standards

5.9.1.1. Compliance with Applicable Standards

1) Except as provided in Sentence (2) and elsewhere in this Part, materials and components, and their installation, shall conform to the requirements of the applicable standards in Table 5.9.1.1. where those materials or components are
   a) incorporated into environmental separators or assemblies exposed to the exterior, and
   b) installed to fulfill the requirements of this Part.

(See Note A-5.9.1.1.(1).)

2) The requirements for flame-spread ratings contained in thermal insulation standards shall be applied only as required in Part 3.

### Notes to Table 5.9.1.1:

1. See Note A-Table 5.9.1.1.
2. The flame-spread rating of gypsum board shall be determined in accordance with CAN/ULC-S102 in lieu of ASTM E 84 as indicated in ASTM C 1396/C 1396M.
3. The flame-spread rating of glass mat gypsum panels shall be determined in accordance with CAN/ULC-S102 in lieu of ASTM E 84 as indicated in ASTM C 1658/C 1658M.
4. For the purpose of compliance with Part 5, ASTM D 3019 shall only apply to the non-fibered and non-asbestos-fibered types of asphalt roll roofing.

### 5.9.2. Windows, Doors, Skylights, and Other Glazed Products

#### 5.9.2.1. General

1. This Subsection applies to windows, doors, skylights, and other glazed products and their components, that separate
   a) interior space from exterior space, or
   b) environmentally dissimilar interior spaces.

2. For the purpose of this Subsection, the term “skylight” refers to unit skylights, roof windows and tubular daylighting devices.
3) Windows, doors, skylights, other glazed products and their components that are required to have a fire-protection rating need not conform to this subsection. (See Note A-5.9.2.1.(3).)

5.9.2.2. Design and Construction
(See Note A-5.9.2.2.)
1) Windows, doors, skylights, and their components shall be designed and constructed in accordance with
   a) Subsection 5.1.4., Section 5.3., Section 5.4. and Section 5.6., or
   b) the following standards
(See Note A-5.9.2.2.(1).)
2) Other glazed products and their components shall be designed and constructed in accordance with Subsection 5.1.4., Section 5.3., Section 5.4. and Section 5.6. (See Note A-5.9.2.2.(2).)
3) For the purposes of conformance with Subclause (1)(b)(ii), loads and procedures from Section 5.2 may be used instead of the loads and procedures set out in the standard. (See Note 5.9.2.2.(3).)

5.9.2.3. Reserved.

5.9.2.4. Heat Transfer
1) Windows, doors and skylights shall meet the heat transfer performance requirements stated in Section 5.3.
(See Note A-5.3.1.2.)
2) Except as provided in Sentence (3), all metal-framed glazed assemblies separating interior conditioned space from interior unconditioned space or exterior space shall incorporate a thermal break to minimize condensation.
3) Metal-framed glazed assemblies need not comply with Sentence (2) where these assemblies are
   a) storm windows or doors, or
   b) windows or doors that are required to have a fire-protection rating.
(See Note A-5.9.2.4.(3).)

5.9.3. Reserved.

5.9.4. Exterior Insulation Finish Systems

5.9.4.1. Structural Loads, Heat Transfer, Air Leakage, Vapour Diffusion and Water Penetration
1) Exterior insulation finish systems and their components shall comply with
   a) Subsection 5.1.4. and Sections 5.3. to 5.6., and
where covered in the scope of that standard.
(See Note A-5.9.4.1.(1).)

Section 5.10. Objectives and Functional Statements

5.10.1. Objectives and Functional Statements

5.10.1.1. Attributions to Acceptable Solutions
1) For the purpose of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 5.10.1.1. (See Note A-1.1.2.1.(1).)

**Table 5.10.1.1.**

Notes to Part 5
Environmental Separation

A-5 Environmental Separation. The requirements provided in Part 5 pertain to the separation of environmentally dissimilar spaces. Most obvious is the need to separate indoor conditioned spaces from unconditioned spaces, the outdoors or the ground. There are also cases where separation is needed between interior spaces which are intended to provide different environments. (See also Notes A-5.1.1.1.(1) and A-5.1.2.1.(1).)

A-5.1.1.1.(1) Scope. Part 5 provides explicit requirements related to the transfer of heat, air, moisture and sound in various forms. Control of the ingress of radon and other soil gases is addressed by the requirements related to air leakage.

A-5.1.1.2. Maritime Climate. The effects of Vancouver’s maritime climate are well documented. The City’s prolonged stretches of near continuous rainfall, combined with driving winds produce extended periods of wetting of building exteriors. This extended wetting combined with very mild year round temperatures means that there are limited periods in which the drying of an envelope assembly might occur. These factors create an environment where the possibility of moisture induced deterioration of materials is very high. The choice of appropriate materials and assemblies for building envelopes is therefore extremely important in Vancouver.

Consistent application of basic water management principles; deflection, drainage, drying and durability of materials throughout the design and construction process is critical for a successful building envelope assembly in Vancouver's climate. Although excess moisture in an envelope assembly can come from construction sources, exterior sources such as rainwater, or interior humidity sources, it has been shown that most performance problems in Vancouver have resulted from a failure to control exterior sources. In Vancouver, the first consideration in envelope design should be the deflection of incident rain with elements such as roof overhangs and the use of flashings with drip edges to direct water away from a building face. The ability to effectively drain water, which does penetrate through the cladding, should be the next consideration for successful envelope assemblies. Since many materials used in the construction of building envelope assemblies are susceptible to deterioration or decay if they remain wet, the ability of the assembly to allow for drying should be considered in the design. However, as the potential for drying in this climate is relatively limited, it should not be relied upon as the primary mechanism, and it should be ensured that materials placed in an exterior envelope assembly do not contain excess moisture before the assembly is enclosed. Lastly, where the probability exists that materials may be exposed to moisture sources, it is critical to choose materials which are durable enough to withstand the moisture until it is dissipated.

Selection and specification of performance criteria for components such as windows should ensure that the components are also capable of meeting the overall envelope performance requirements. In addition, the integration of components into the overall envelope assembly should be carefully considered in the drafting of design documents and throughout the construction process, particularly at the interfaces between components such as windows and the adjacent wall system. All envelope details should be clearly shown in the construction documents, using a progressive series of three dimensional details where correct layering and overlapping of materials needs to be clarified. For critical building envelope assembly details or new and unique assemblies, full-scale mock-ups and testing on site are extremely valuable in confirming the performance of an assembly and in establishing construction standards for the balance of the envelope construction.

The requirements in Part 5 outline a performance standard for the building envelopes, but good design practice should go beyond the requirements in these regulations. Issues such as the quality of detailing, the compatibility of materials used in assemblies, and a design that allows for the simplicity of on-going maintenance are concerns that a professional designer should take into account in the design of a successful building envelope assembly.
Guidance with respect to building science principles and envelope assembly performance for maritime climates is available from a variety of sources. The Canadian Building Digest series and many other publications from the National Research Council (NRC) and in particular from the Institute for Research in Construction (IRC) are valuable resources. Canada Mortgage and Housing Corporation (CMHC) has also published a wide variety of documents which are useful in understanding building science principles and the application of these principles to residential design and construction. Locally, courses in building envelope basics, offered as the educational component towards a Building Envelope Professional accreditation, are administered by the Architectural Institute of BC. Regular seminars on building envelope issues are also offered on an industry wide basis by the BC Building Envelope Council.

A-5.1.2.1.(1) Application. Subsection 1.3.3. of Division A specifies that Part 5 applies to all buildings except those within the scope of Part 9 or the scope of the National Farm Building Code of Canada. Because of their intended use, many buildings need only provide a limited degree of separation from the outdoor environment, the ground, or between interior spaces. The provisions in Part 5 are written to allow exemptions for these buildings. Part 5 applies to building elements that separate dissimilar environments and to site conditions that may affect environmental loading on the building envelope.

The provisions address:
- the design and construction, or selection, of building components, such as windows and doors,
- the design and construction of building assemblies, such as walls, floors and roofs,
- the design and construction of the interfaces between the above-mentioned elements, and
- the design or selection, and installation, of site materials, components and assemblies, such as backfill and drainage, and grading.

Part 5 applies not only to building elements that separate indoor space from outdoor space, but also to those elements that separate indoor space from the ground and that separate adjacent indoor spaces having significantly different environments.

Indoor spaces that require separation include interior conditioned spaces adjacent to indoor unconditioned spaces, and adjacent interior conditioned spaces that are intended to provide different environments. An extreme example of the last would be a wall that separates an indoor ice rink from a swimming pool.

Some building elements are exposed to exterior environmental loads but do not separate dissimilar environments. Solid guards on exterior walkways are one example. Such constructions are subject to the application of Part 5.

A-5.1.2.1.(2) Exemptions. This sentence is intended to allow for the exemption of the application of Part 5 to buildings or parts of buildings where it can be shown that due to the intended use of a building, the full provisions of Part 5 are not necessary. As an example, buildings such as open parking garages, stadia, and certain park buildings intended for summer use would only require a limited degree of separation from the exterior environment. Any proposed exemptions should be discussed with the City of Vancouver prior to implementation.

A-5.1.2.2.(1) Building Envelope Professional Reviews Scope of Application and Letters of Commitment and Completion. The specific areas of focus for which a Building Envelope Professional is required to perform reviews are Sections 5.4., 5.5. and 5.6. The duties are described as Building Envelope Professional design review and enhanced field review. The design review is required to be completed by a Building Envelope Professional. This review is intended to ascertain that the design for which they will be giving a commitment of responsibility for review in the field substantially complies with Part 5 with respect to Sections 5.4., 5.5. and 5.6.

The term enhanced field review is used to differentiate the level of review for which a Building Envelope Professional is responsible, from that which a registered professional signing for architectural items in Schedules B-1 and B-2.
would be responsible. The requirements in Part 5 outline a minimum performance standard, but these requirements cannot address the specific detail concerns which experience has shown are the primary source of problems which have resulted in the deterioration of building envelopes. Building Envelope Professional enhanced field review is intended to address this concern. It requires that the professional performs field reviews at a sufficient frequency and reviews a substantial number of the details, which could be potential problem sources, in order to ascertain that the performance requirements of Part 5 are satisfied. While a professional may not be able to see all of the details, the level of duty intended for this enhanced field review is to review as many details as possible rather than just a representative sampling.

An additional duty of the Building Envelope Professional involves the review of moisture content present in envelope assemblies prior to enclosure. Exterior walls, in buildings of structural light framing systems, should not be enclosed when there is sufficient moisture present to initiate deterioration. While wood may have been delivered to a construction site kiln dried, exposure to rain during construction may raise the moisture content to an unacceptable level (above 19 per cent). Water may also have collected in elements of wall assemblies, such as steel stud tracks, and may lead to deterioration if not dried out prior to the wall assembly being enclosed.

The Building Envelope Professional is required to assure that all wood framing, structural members, and sheathing do not exceed 19% moisture content, and all other materials are dry, prior to the wall assembly being enclosed.

The Articles in Section 5.4 do not define the air tightness limits of a completed assembly, but only that of the components in an assembly. Therefore, it is a critical responsibility of the Building Envelope Professional to conduct sufficient design and field review work in order to be able to ascertain that the continuity of the air barrier system meets the performance requirements of this Part.

The Building Envelope Professional is required to perform sufficient design and field review work to ascertain that the installed vapour barrier system meets the performance requirements of Part 5. The Building Envelope Professional is required to confirm adequate completeness of the system in order to ensure that vapour diffusion is retarded at an appropriate wall location and that all inappropriate barriers to diffusion are eliminated.

Preventing inappropriate barriers to diffusion requires careful attention to detail. While it is often unintended, envelope assemblies may end up with more than one functional vapour barrier. As it can never be ensured that an exterior envelope assembly will always be free of moisture, the drying mechanism must not be blocked, or the trapped moisture may lead to deterioration of moisture sensitive materials. Drying potential in the system requires that vapour, driven by a vapour pressure differential (i.e. from high interior vapour pressure to low exterior vapour pressure) be allowed to pass to a location in the assembly which is open to exterior air (such as a cavity) where drying may occur. Plywood sheathing for instance has sufficiently low permeance that care must be taken in the design of an assembly to ensure that vapour is allowed to pass the sheathing if it is not intended to act as a vapour barrier. Caution may also be needed with the over use of impermeable sheet membrane materials at details such as windows. If the application is too extensive, the potential for moisture diffusion out of the assembly may be locally impeded, with a resultant increase in the likelihood of deterioration.

The Building Envelope Professional is required to perform sufficient design and field review work to ascertain that the installed exterior cladding system meets the performance requirements of Part 5. The Building Envelope Professional is required to confirm that the cladding system will provide continuous precipitation protection, the drainage paths are complete and the flashings as installed over the complete exterior envelope will function properly.

A-5.1.4.1. Application of Structural Design to Other Building Elements. Part 4, as currently written, applies primarily to buildings as a whole and to structural members. Requirements defining structural loads and design to accommodate or resist those loads, however, apply not only to buildings as a whole and components that are traditionally recognized as structural members, but also apply to other elements of the building that are subject to structural loading. This is addressed to some extent in Part 4 by the requirements that pertain, for example, to wind
loads on cladding. A range of structural loads and effects, as defined in Subsection 4.1.2., may be imposed on non-loadbearing elements such as backing walls, roofing, interior partitions and their connections. These must generally be addressed using the same load determination and structural design procedures as used for structural members.

Responsibility for the structural design of buildings as a whole and their structural members is commonly assigned to the engineer of record. The application of Part 4 reflects this, and as such, “non-structural” elements are not explicitly identified in the Part 4 provisions. Rather the application of Part 4 to these elements is specified in cross-references from other Parts of the By-law, e.g. Part 5, which recognizes the fact that the structural design of these elements is often carried out by engineers other than the engineer of record.

Part 4 does not generally apply to the structural design of building services, such as heating, ventilating, air-conditioning, plumbing, electrical, electronic or fire safety systems, though these may be subject to structural loads. It does, however, apply to the design of the connections of building services to address earthquake loads (See Article 4.1.8.18.).

**A-5.1.4.1.(2) Materials, Components and Assemblies with Multiple Functions.** Where materials, components or assemblies are used to fulfill multiple functions, the designer may have to take into account their function with regard to structural loads, heat transfer, air leakage, vapour diffusion, and protection from precipitation, surface and ground water, and sound transmission. Materials should be selected taking into account the environmental loads to which they will be subjected, their physical and chemical characteristics, and their installation. Design and construction details should satisfy all intended functions and ensure continuity within and between assemblies, without adversely impacting adjacent materials, components or assemblies. The designer should also anticipate unintended consequences when materials that may fulfill multiple functions are used. For example, building membranes consisting of modified bitumen compounds, which are commonly used to control both water ingress and air leakage, also typically have low vapour transmission characteristics. Similarly, extruded polystyrene boards, which are used as thermal insulation, may also act as a component of an air barrier assembly, thus requiring wind loads to be considered.

An increasing number of manufactured systems are being used to serve more than one (and sometimes all) of the functions of an environmental separator: examples include pre-engineered building systems, exterior insulation finish systems, insulated metal panel systems, windows, other fenestration assemblies, and insulated precast concrete wall panels. These systems consist of combinations of pre-manufactured and/or site-built components, which are supposed to be assembled in a prescribed manner.

Ensuring compliance with one Section of Part 5 may impact compliance with other Sections of Part 5: for example, air barriers that are integral to some systems may also act as vapour barriers and impact condensation control. By extension, ensuring compliance with the requirements of Part 5 may impact compliance with other Parts of the By-law, for example, increasing the thickness of the insulation to improve an assembly’s thermal performance may impact its compliance with Part 3 with regard to fire resistance.

Compliance with a standard listed in Section 5.9. does not ensure that a system is appropriate for the intended application. The designer should consider all relevant criteria, beyond the standard tests, when selecting an appropriate product for a project.

**A-5.1.4.1.(5) Past Performance as Basis for Compliance with Respect to Structural Loads.** As discussed in Note A-5.1.4.1., a range of structural loads and effects can be imposed on materials, components and assemblies in environmental separators and assemblies exposed to the exterior. In many instances, compliance with Sentence 5.1.4.1.(1) for structural loads must be determined based on the loads and calculation methods described in Part 4 as specified in Sentence 5.1.4.1.(3) and the referenced Subsection 5.2.2., e.g. for cladding. In practice, compliance for some materials, components or assemblies of environmental separators and assemblies exposed to the exterior
is determined by relying on provisions governing the use of alternative solutions (such as Clause 1.2.1.1.(1)(b) of Division A).

For some very common building elements and installations, however, there is a very large body of evidence of proven performance over a long period of time. In these cases, imposing the degree of analysis, or documentation of performance, required by Part 4 or Section 2.3. of Division C would be unnecessary and onerous. Clause 5.1.4.1.(5)(b) is intended to address these particular cases. Because the constructions are so widely accepted throughout the industry and the body of evidence is so substantial (though not necessarily documented in an organized fashion), there should be no question that detailed analysis or documentation is unnecessary.

Whether compliance of a particular material, component or assembly may be determined based on past performance depends not only on the type of material, component or assembly, but also on its intended function, the particular loads to which it will be subject and the magnitude of those loads. Because the possible combinations and permutations are infinite, only guidelines can be provided as to when past performance is a reasonable basis for determining compliance.

In determining compliance based on past performance, the period of past performance considered should be a substantial number of years. For example, 30 years is often used to do life-cycle cost analysis of the viability of investments in building improvements. This period is more than long enough for most deficiencies to show up. There should be no question as to the structural adequacy of a material, component or assembly that has been successfully used in a given application for such a period.

The determination of compliance may be based on past performance only where the function of the material, component or assembly is identical to that of the materials, components or assemblies used as a reference, and where the expected loads do not exceed those imposed on the reference materials, components or assemblies. For example, the acceptance of gypsum board, and its fastening, to serve as part of the backing wall supporting cladding cannot be based on the performance of gypsum board that has served only as an interior finish.

The determination of compliance may be based on past performance only where the properties of the material, component or assembly are identical or superior to those of the materials, components or assemblies used as a reference. For example, where a component of a certain gauge of a particular metal has provided acceptable performance, the same component made of the same metal or a stronger one would be acceptable.

Compliance with respect to various loads may be determined individually. A particular material may have to be designed to Part 4 to establish acceptable resistance to wind or earthquake loads, for example, but past performance may be adequate to determine that the material and normal fastening will support the material’s dead load and will resist loads imposed by thermal and moisture-related expansion and contraction.

Past performance is a reasonable basis for determining compliance for lighter materials, components or assemblies not subject to wind load; for example, semi-rigid thermal insulation installed in wall assemblies where other materials, components or assemblies are installed to resist air pressure loads.

Past performance is an appropriate basis for determining compliance for some smaller elements that will be subject to wind loads but are continually supported or fastened behind elements that are designed for wind loads, for example, standard flashing over wall penetrations.

It should be noted that this particular approach to demonstrating compliance pertains only to the resistance or accommodation of structural loads described in Part 4. The resistance or accommodation of environmental loads, resistance to deterioration, and material compatibility must still be addressed in accordance with Part 5.
A-5.1.4.1.(6)(b) and (c) Accommodating Movement. It is well understood that the deflection of the backing assembly in a wall can have significant effects on the performance of the cladding. For example, CSA S304, “Design of Masonry Structures,” specifies the maximum deflection criteria for backing assemblies to masonry veneer. Clauses 5.1.4.1.(6)(b) and (c) are written in very general terms in recognition of the fact that not only can the deflection of cladding affect the performance of the backing assembly, but that the excessive deflection of any element has the potential to adversely affect the performance of any adjacent element. Similarly, inter-storey drift has the potential to adversely affect the performance of components and assemblies of environmental separators. CSA O86, “Engineering Design in Wood,” specifies a method for calculating building movement due to changes in moisture content. The effects of movement should be avoided or accommodated.

A-5.1.4.2. Deterioration. Environmental loads that must be considered include but are not limited to: sound, light and other types of radiation, temperature, moisture, air pressure, acids and alkalis.

Mechanisms of deterioration include:
- structural (impact, air pressure)
- hygrothermal (freeze-thaw, differential movement due to thermal expansion and contraction, ice lensing)
- electrochemical (oxidation, electrolytic action, galvanic action, solar deterioration)
- biochemical (biological attack, intrusion by insects and rodents).

Information on the effects of deformations in building elements can be found in the Commentary entitled Effects of Deformations in Building Components in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

Resistance to deterioration may be determined based on field performance, accelerated testing or compliance with guidelines provided by evaluation agencies recognized by the authority having jurisdiction. Guidance can be found in CSA S478, “Guideline on Durability in Buildings.”

Building components should be designed with some understanding of the length of time over which they will effectively perform their intended function. Actual service life will depend on the materials used and the environment to which they are exposed. The design should take into consideration these factors, the particular function of the component and the implications of premature failure, the ease of access for maintenance, repair or replacement, and the cost of repair or replacement.

Many buildings are designed such that access for maintenance, repair or replacement is not possible without damaging – or seriously risking damaging – other building elements. This can become a considerable deterrent to proper maintenance thus compromising the performance of the subject materials, components and assemblies, or other elements of the building. In cases where it is known or expected that maintenance, repair or replacement is likely to be required for certain elements before such time as the building undergoes a major retrofit, special consideration should be given to providing easy access to those elements. Anchorage points for maintenance personnel should be considered during the design of multi-storey buildings, including those of wood-frame construction, as adding them post-construction can be difficult.

Where the use of a building or space, or the services for a building or space, are changed significantly, an assessment of the impact of the changes on the environmental separators should be conducted to preclude premature failures that could create hazardous conditions.

A-5.2.1.1.(3) Soil Temperatures. In theory, soil temperatures are needed to determine the conformance of a design to the requirements related to heat transfer and vapour diffusion. In practice, standard construction in a particular area may have proven to perform quite adequately and detailed calculations of soil temperature are unnecessary. (See also Sentence 5.2.1.3.(2).)
A-5.2.1.2.(1) Interior Environmental Loads. The interior environmental conditions required depend on the intended use of the spaces in the building as defined in the building program. Spaces in different types of buildings and different spaces within a single building may impose different loads on the separators between interior and exterior spaces and between adjacent interior spaces. The separators must be designed to withstand the expected loads.

A-5.2.2.1.(2)(c) Determination of Structural Loads and Effects. As regards materials, components and assemblies and their interfaces that are installed in buildings to which Part 5 applies, the effects of earthquake loads on their ability to resist or accommodate environmental loads are generally only taken into account in the design of post-disaster buildings. For all other buildings, damage to building components during seismic events is anticipated and these buildings are not intended to be functional after the event. However, for post-disaster buildings, seismic effects must be taken into account in the design for environmental separation, as these buildings are required to have an adequate degree of functionality after the design event to meet their intended function (See Article 4.1.8.13. for deflections and drift limits for post-disaster buildings).

However, it is important to note that earthquake effects must be taken into account in the seismic design of all building materials, components and assemblies and their interfaces covered by Article 4.1.8.18. to address life safety and the structural protection of buildings.

A-5.2.2.2. Resistance to Wind and Other Air Pressure Loads. The wind load provisions apply to roofing and other materials subject to wind-uplift loads.

Note that, although Article 5.2.2.2. is specifically concerned with wind loads and directly references only one Article from Part 4, Sentence 5.2.2.1.(1) references all of Part 4 and would invoke Article 4.1.7.10. for example, which is concerned with air pressure loads on interior walls and partitions.

A-5.2.2.2.(4) Membrane Roofing Systems. Wind loads for membrane roofing systems must be calculated in accordance with Part 4. The tested uplift resistance and factored load should satisfy the requirements of the Commentary entitled Limit States Design in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

The test method described in CAN/CSA-A123.21, “Dynamic Wind Uplift Resistance of Membrane-Roofing Systems,” applies only to membrane roofing systems whose components’ resistance to wind uplift is achieved by fasteners or adhesives. It does not apply to roofing systems that use ballasts, such as gravel or pavers, to secure the membrane against wind uplift.

In the case of membrane roofing systems in which the waterproof membrane is attached to the structural deck using mechanical fasteners, the wind-induced forces and the roofing system’s response are time- and space-dependent and, thus, dynamic in nature. Further information on the design and evaluation of such systems can be found in “A Guide for the Wind Design of Mechanically Attached Flexible Membrane Roofs,” published by NRC.

The wind uplift resistance obtained from the test method in CAN/CSA-A123.21 is limited to configurations with specific fastener or adhesive patterns. To extrapolate the test data to non-tested configurations, refer to ANSI/SPRI WD-1, “Wind Design Standard Practice for Roofing Assemblies,” for a rational calculation procedure. However, in using this extrapolation procedure, wind loads should be calculated in accordance with the BCBC. NRC’s guide for wind design referenced above provides further guidance and examples of wind load calculations.

A-5.3. Heat Transfer. In addressing issues related to health and safety, Section 5.3. calls up levels of thermal resistance needed to minimize condensation on or within environmental separators, and to ensure thermal conditions appropriate for the building use. Energy regulations, where they exist, specify levels of thermal resistance required for energy efficiency or call up energy performance levels, which relate to levels of thermal resistance. Where Part 5 calls for levels of thermal resistance higher than those required by the energy regulations, the requirements of Part 5 take precedence.
A-5.3.1.1. Required Resistance to Heat Transfer. The control of heat flow is required wherever there is an intended temperature difference across the building assembly. The use of the term “intended” is important since, whenever interior space is separated from exterior space, temperature differences will occur.

The interior of an unheated warehouse, for example, will often be at a different temperature from the exterior due to solar radiation, radiation from the building to the night sky and the time lag in temperature change due to the thermal mass of the building and its contents. If this temperature difference is not “intended,” no special consideration need be given to the control of heat flow. If the warehouse is heated or cooled, thus making the temperature difference “intended,” some consideration would have to be given to the control of heat flow.

It should be noted, however, that in many cases, such as with adjacent interior spaces, there will be an intended temperature difference but the difference will not be great. In these cases, the provisions to control heat flow may be little or no more than would be provided by any standard interior separator. That is, materials typically used in the construction of partitions may provide the separation needed to meet the requirements of Section 5.3. without adding what are generally considered to be “insulating” materials.

A-5.3.1.2. Material and Component Properties and Condensation. Total prevention of condensation is generally unnecessary and its achievement is rarely a certainty at design conditions. Part 5, therefore, requires that condensation be minimized. The occurrence of condensation should be sufficiently rare, or the quantities accumulated should be sufficiently small and dry rapidly enough, to avoid material deterioration and the growth of mould and fungi.

The Harmonized North American Fenestration Standard, AAMA/WDMA/CSA 101/I.S.2/A440, “NAFS – North American Fenestration Standard/Specification for Windows, Doors, and Skylights,” identifies procedures to determine the condensation resistance and thermal transmittance of windows, doors and skylights though testing for condensation resistance is presented as optional in the standard. As such, a fenestration product that meets the standard’s requirements on air leakage, water penetration, uniform load and other performance requirements may not meet the condensation resistance performance level needed for a given application. Only the physical test procedure presented in CSA A440.2, “Fenestration Energy Performance,” can be used to establish the temperature index (I) value, which denotes condensation resistance performance evaluation criteria. It is recommended that designers specify I values for a given application to minimize the potential for condensation. Further guidance on the selection of the correct I value is provided in CSA A440.3, “User Guide to CSA A440.2-14, Fenestration Energy Performance.”

The scope of AAMA/WDMA/CSA 101/I.S.2/A440, which is referenced in Subsection 5.9.2., includes skylights and tubular daylighting devices (TDD). Where skylights and TDDs pass through unconditioned space, their wells and shafts may become the environmental separator and would therefore have to comply with the requirements of Part 5.

A-5.3.1.2.(1) Use of Thermal Insulation or Mechanical Systems for Environmental Control. The level of thermal resistance required to avoid condensation on the warm side of an assembly or within an assembly (at the vapour barrier), and to permit the maintenance of indoor conditions appropriate for the occupancy depends on
- the occupancy
- the exterior design air temperature
- the interior design air temperature and relative humidity
- the capacity of the heating system, and
- the means of delivering heat.

To control condensation on the interior surface of an exterior wall, for example, the interior surface must not fall below the dew point of the interior air. If, for instance, the interior air is 20°C and 35% RH, the dew point will be 4°C. If the interior air is 20°C and 55% RH, the dew point will be 11°C.
Where the exterior design temperature is mild, such as in south coastal British Columbia, the interior RH during the heating season may well be around 55%. With an exterior temperature of ~7°C, the materials in the environmental separator would have to provide a mere RSI 0.082 to avoid condensation on the interior surface. Depending on the specific properties of the material, this RSI might be provided by 10-mm plywood. Therefore, materials generally recognized as thermal insulation would not be required only to limit condensation on the warmer side of the building envelope.

In other areas of the Province, however, exterior design temperatures are much lower. In these cases, maintaining temperatures inboard of the vapour barrier above the dew point will require insulation or increased heat delivery to the environmental separator. Direct delivery of heat over the entire surface of the environmental separator is generally impractical. Indirect heat delivery may not be possible without raising the interior air temperatures above the comfort level. In any case, increased heat delivery would often entail excessive energy costs.

In addition to controlling condensation, interior surface temperatures must be warm enough to avoid occupant discomfort due to excessive heat loss by radiation. Depending on the occupancy of the subject spaces, this may require the installation of insulation even where it is not needed to control condensation.

**A-5.3.1.3.(2) Position of Materials Providing Thermal Resistance.** For a material providing thermal resistance to be effective, it must not be short-circuited by convective airflow through or around the material. The material must therefore be either
- the component of the air barrier system providing principal resistance to air leakage, or
- installed in full and continuous contact with a continuous low air permeance component.

**A-5.4.1.1. Resistance to Air Leakage.** An air barrier system in above-grade building components and assemblies separating conditioned space from the exterior will reduce the likelihood of condensation due to air leakage, discomfort from drafts, the infiltration of dust and other pollutants, and interference in the performance of building services, such as HVAC and plumbing. These problems can all lead to serious health or safety hazards.

Currently, the most obvious and significant problems are due to moisture-related material deterioration, such as rot and corrosion, which can lead to the failure of component connections. The infiltration of dust and other pollutants can lead to a wide range of health problems. Where the separator is subject to high moisture levels, the pollutants may include fungus spores. Interference with the performance of building services can lead to unhealthy conditions and potentially hazardous conditions during the heating season in many regions of the province.

There are few buildings intended for human occupancy where the interior space is conditioned but where an air barrier system is not required. Some industrial buildings, for example, may be exempt. This would depend, however, on the particular levels of interior conditioning provided, ventilation levels, protection provided for the workers, and the tolerance of the building’s construction to the accumulation of condensation and potential precipitation ingress.

Some industrial buildings are provided with only limited conditioning, for example radiant heating, and ventilation levels are sufficient to reduce relative humidity to a level at which condensation will not accumulate to a degree that is problematic. Conversely, some industrial buildings, due to the processes they contain, operate at very high temperatures and high ventilation levels. In these cases, the building envelope will be maintained at temperatures that will avoid condensation. In both examples above, either the ventilation rates or protective gear required in the work environment would protect the occupants from unacceptable levels of pollutants.

Where adjacent interior environments are sufficiently different, controlling airflow between those spaces is necessary to maintain conditions. Referring again to the industrial building examples above, assemblies separating office space from the work floor would likely require an air barrier system.
The word “minimize” is used in Clause 5.4.1.1.(1)(c) because not all moisture accumulation in an assembly need be of concern. Incidental condensation is normal but should be sufficiently rare and in sufficiently limited quantities and should dry rapidly enough to avoid material deterioration and the growth of mould or fungi.

An air barrier system is required in components and assemblies in contact with the ground to control the ingress of radon, and may be required to control the ingress of other soil gases such as methane.

In addition to an air barrier system, other measures may be required to reduce the radon concentration to a level below the guideline specified by Health Canada. Further information on protection from radon ingress can be found in:

- “Radon: A Guide for Canadian Homeowners” (CMHC/HC),
- “Guide for Radon Measurements in Public Buildings (Schools, Hospitals, Care Facilities, Detention Centres)” (HC), and
- EPA 625/R-92/016, “Radon Prevention in the Design and Construction of Schools and Other Large Buildings.”

A-5.4.1.2.(1) Air Leakage through the Air Barrier System.

The current requirements specify only a maximum air leakage rate for the material in the air barrier system that provides the principal resistance to air leakage.

Research and in-situ testing of installed air barrier systems have shown that the bulk of air leakage occurs through joints (between air barrier materials) and junctions (between air barrier components).

Ideally, a maximum air leakage rate for the complete air barrier system would be specified. The maximum acceptable rate will ultimately depend on warm and cold side temperatures and humidity conditions, and on the susceptibility of the environmental separator to moisture-related deterioration. Recommended maximum leakage rates for the air barrier system in an exterior envelope in most locations in Canada are shown in Table A-5.4.1.2.(1) and (2). These values are for air barrier systems in opaque, insulated portions of the building envelope. They are not for whole buildings, as windows, doors and other openings are not included. The Table is provided for guidance when testing air barrier systems as portions of an envelope.

</tbody>
</table>

Determining the leakage rate of a particular assembly, however, is problematic. There is little information available on the airtightness of the many air barrier systems used in building construction, and testing requires specialized equipment and expertise. Depending on the type of test,

- testing may not represent the performance of the complete installed system,
- the location of deficiencies may be difficult to identify, and
- rectification of deficiencies may not be feasible.
Despite the difficulties, when using a system whose performance is not known, it is recommended that tests be conducted. Testing options include:

- laboratory tests of small sections of the air barrier system, including the joints and intersections of different assemblies
- laboratory tests of large wall sections
- in-situ tests of characteristic envelope areas.

A-5.5.1.1. Required Resistance to Vapour Diffusion. Resistance to vapour diffusion is required to reduce the likelihood of condensation within building assemblies, and the consequent potential for material deterioration and fungal growth. Deterioration such as rot and corrosion can lead to the failure of building components and connections, and interfere with the performance of building services. Some fungi can have very serious effects on health.

In Canada, relatively few buildings that are subject to temperature and vapour pressure differences would be constructed or operated in such a manner that the control of vapour diffusion would not need to be addressed in their design. Assemblies enclosing certain industrial spaces, as described in Note A-5.4.1.1. for example, may be exempt.

For residential spaces, and most other spaces that are conditioned for human occupancy, a means of vapour diffusion control is generally agreed to be necessary, even in the milder climates of the province. The questions in those cases pertain to the degree of control needed.

The word “minimize” is used in Sentence 5.5.1.1.(1) because not all moisture accumulation in an assembly need be of concern. Incidental condensation is normal but should be sufficiently rare and in sufficiently limited quantities, and should dry rapidly enough, to avoid material deterioration and the growth of mould or fungi. Here are some references regarding the effects of fungi on health:

- “Fungal Contamination in Public Buildings: Health Effects and Investigation Methods,” Health Canada
- “Guidelines on Assessment and Remediation of Fungi in Indoor Environments,” New York City Department of Health and Mental Hygiene (NYCDH)

A-5.5.1.2.(1) Vapour Barrier Materials and Installation. In the summer, many buildings are subject to conditions where the interior temperature is lower than the exterior temperature. Vapour transfer during these periods is from the exterior to the interior. In general, in Canada, the duration of these periods is sufficiently short, the driving forces are sufficiently low, and assemblies are constructed such that any accumulated moisture will dissipate before deterioration will occur.

Buildings such as freezer plants, however, may operate for much of the year at temperatures that are below the ambient exterior temperature. In these cases, the “warm” side of the assembly would be the exterior and a detailed analysis on an annual basis is required.

Steady state heat transfer and vapour diffusion calculations may be used to determine acceptable permeance levels for the vapour barrier and to identify appropriate positions for the vapour barrier within the building assembly.

A-5.6.1.1. Required Protection from Precipitation. Windows, cast-in-place concrete walls, and metal and glass curtain wall systems are examples of components and assemblies that, when properly designed and constructed, are expected to prevent the ingress of precipitation into a building. Assemblies such as roofs and veneer walls consist of materials specifically intended to screen precipitation.

Components and assemblies separating interior conditioned space from the exterior are generally required to provide protection from the ingress of precipitation. Components and assemblies separating interior unconditioned space from the exterior may or may not be required to provide protection from the ingress of precipitation. Buildings such as stadia, parking garages and some seasonally occupied buildings, for example, may not require complete protection from the ingress of precipitation. The degree of protection will depend to a large extent on the materials selected for the building elements that will be exposed to precipitation.
The word “minimize” is used in Sentence 5.6.1.1.(1) because not all moisture ingress or accumulation in an assembly need be of concern. The penetration of wind-driven rain past the cladding may not affect the long-term performance of the assembly, provided the moisture dries out or is drained away before it initiates any deterioration of building materials. When the design service life of a material or component is longer than the design service life of the overall assembly, taking into account the expected exposure to moisture, initiating deterioration of the material should not be of concern. That is to say, provided the material or component continues to provide the necessary level of performance for its intended service life and does not adversely affect the service life of the assembly of which it is a part, the deterioration of the material or component is not an issue.

A-5.6.1.2. Protective Material

**Draining Moisture with Protective Materials**

The City of Vancouver’s past experience has shown that it is virtually impossible to make face sealed walls work in the Vancouver climate, in anything beyond a very low exposure condition. The intent of Section 5.6. is to illustrate to the designer that a rainscreen design is the minimum acceptable option for vertical exterior envelope assemblies in Part 5 buildings. Where there is a slope in any element of the envelope, it should be considered a roof and treated accordingly.

Where the system is a mass wall construction type, and does not include a cladding, all joints between panels (and junctions to other elements such as windows) are required to be two-stage or rainscreen joints with an appropriate means to drain any accumulated moisture to the exterior.

**Exterior Cladding over Structural Light Framing**

Exterior cladding shall be installed over a cavity with all the necessary through wall flashings designed to drain accumulated moisture to the exterior, where the wall system incorporates exterior cladding over structural light wood or steel framing systems,. This cavity, a water shedding plane on the interior side of the cavity and a complete air barrier system to achieve pressure moderation, constitute the primary elements of a required rainscreen design. Compartmentalization of the cavity, in particular at corners, is required to achieve effective pressure moderation. Where the cladding material is stiffer than the supporting light frame structure, such as in a stucco application, the compartmentalization should include though wall flashing at each floor. The design of the cavity should minimize the potential for water to bridge across this gap and maximize the free air space.

While there is agreement on the need for a cavity, current research is not conclusive on the optimal width of a cavity to maximize drying potential, however a conservative approach would suggest that the widest allowable cavity would be prudent in this environment, where drying is an issue. As other Sections of this By-law limit a cavity in a wall to 25 mm before requiring fire stopping, a 19 mm (3/4") cavity is the minimum width recommended which will satisfy this requirement, while still maximizing the drying potential for an assembly with insulation in the stud space. [See Clause 3.1.11.2.(2)(d)]

Where the envelope system employs a full membrane application on the outside of the sheathing and where all of the insulation is installed outboard, then the width of the cavity may be reduced, since the drying potential is not as critical in this configuration. Research has shown that a 10 mm gap is sufficient to prevent liquid water from bridging across a cavity. Therefore, a cavity width of 12 mm (1/2") is the minimum recommended for this configuration, provided that the application of the cladding and the insulation is constructed so that the Building Envelope Professional can assure that this 12 mm (1/2") gap can be maintained.

Exterior columns, beams, walkways, guardrails, or other elements, which do not form a direct continuation of the building enclosure, may not be required to be constructed as rainscreen assemblies. For this...
Division B: Acceptable Solutions

Part 5 – Environmental Separation

Approach to be acceptable, these elements must be totally constructed with pressure treated lumber and sheathing (field treated at cuts and bolt holes) or other durable materials, with corrosion resistant fasteners and be provided with proper ventilation.

Exterior Insulation Finish Systems
Subject to specific limitations, the required cavities in Exterior Insulation Finish Systems may be reduced in dimension provided they form part of a pressure moderated rainscreen system. This approach would not be acceptable where the application is over wood framing.

A-5.6.1.2.(1) Ice Damming. Water leakage through sloped roofs is often due to the formation of ice dams at the eaves, which can be limited by controlling the transfer of heat to the roof through a combination of insulation and venting to dissipate heat. See Clause 5.3.1.2.(1)(d).

A-5.6.1.2.(2) Vegetated Roofing Systems. The integrity of some assemblies installed to provide the required protection from the ingress of precipitation in vegetated roofing systems can be compromised due to an inadequate resistance to the penetration of plant roots and rhizomes. Additional information on vegetated roofing systems and the performance of protective materials can be found in the German Landscape Research, Development and Construction Society’s (FLL) “Guidelines for the Planning, Construction and Maintenance of Green Roofing” and in the National Roofing Contractors Association’s “Vegetative Roof Systems Manual.”

A-5.6.1.2.(3) Flashings, Drips or Overhangs As the first principle for water management in a building envelope is deflection, the appropriate use of flashings, drips or overhangs is a critical part of any precipitation protection system. The 1996 CMHC survey of envelope failures in B.C. found a striking inverse relationship between the length of overhang, and the percentage of walls which experienced water induced problems. Roof overhangs perform a more complex function than that as a simple ‘umbrella’ shielding the wall below. Studies have shown that a large proportion of the precipitation incident on any building face will be deposited on an overhang at the top of a wall due to wind movement and water deposition patterns. If the overhang includes a means to shed this water, a large portion of the precipitation can be deflected without it ever touching the rest of the building face. Proper detailing and lapping of flashings with other materials is also critical to prevent the ingress of precipitation where there are changes in planes of walls and roofs, changes in cladding material, or window or door heads and sills.

Information on the installation of flashing to drain water to the exterior of roof or wall assemblies may be found in a number of publications including, but not limited to:

- “Best Practice Guide: Flashings,” Canada Mortgage and Housing Corporation
- “Technical Notes,” Masonry Institute of British Columbia

A-5.6.2.1. Sealing and Drainage. Providing a surface-sealed, durable, watertight cover on the outside of a building is difficult. Where there is a likelihood of some penetration by precipitation into a component or assembly, drainage is generally required to direct the moisture to the exterior. The degree of protection against precipitation ingress needed in any particular case and the approach taken to provide that protection will depend on

- the exterior loads imposed on the assembly
- the materials selected for the backing assembly,
- the use of the enclosed space, and
- the level of maintenance that will be acceptable to the owners.
Where exterior loads are greater, it may be prudent to select a precipitation protection system whose small failures will not be as likely to have an immediate impact on the building or its occupants. For example, drained and vented wall and vented roof assemblies are typical for low-rise residential buildings. More robust drained and vented wall assemblies are recommended for mid- and high-rise buildings where the cost of maintenance and repair could be high.

Where materials with a greater resistance to moisture are used in the assembly, a less rugged precipitation protection system or a less rigorous maintenance schedule may be acceptable. This might be the case, for example, where the wall or backing wall is concrete or masonry.

For spaces that are not intended for ongoing human occupancy, some rainwater leakage may not be of particular concern. This may be the case for certain warehouse spaces for example, depending on how the spaces are used and conditioned.

Information on the installation of flashing to drain water to the exterior of roof and wall assemblies may be found in a number of publications including, but not limited to:

- Technical Notes, National Concrete Masonry Association
- Roofing Specifications, Canadian Roofing Contractors’ Association
- Technical Notes on Brick Construction, Brick Industry Association

Environmental separators installed in buildings of wood construction that exceed 4 storeys can be subjected to increased loading due to the height of the building. As such, certain design considerations may require different approaches from the common ones used by industry for buildings of 4 storeys or less. These considerations include, but are not limited to, the following:

- air barrier assemblies,
- fenestration selection,
- protection from precipitation,
- differential movement due to wood shrinkage,
- roofing selection and design, and
- risk of deterioration due to longer exposure of materials to the elements during construction.

Information on environmental separators and the loading to which they are subjected when installed in buildings of wood construction, as well as recommendations on dealing with differential movement, can be found in the following publications, among others:

- “Moisture and Wood-Frame Buildings,” Canadian Wood Council

A-5.6.2.2.(5) Overflow Outlets Where a roof or balcony is entirely enclosed by parapet walls there is a likelihood of drains becoming obstructed with materials such as leaves falling during heavy autumn rains. It is recommended that a secondary means of drainage such as scuppers be provided. Overflow outlets should be installed in the parapet walls in sufficient number and at an appropriate height to drain the roof or balcony, to avoid water backing up into moisture sensitive assemblies, and to prevent structural collapse from ponding.

A-5.7. Protection from Interior Sources of Water. Protection similar to that prescribed in Section 5.7. may be required where interior assemblies are in contact with water (such as site-built showers, steam rooms, swimming
pool areas) and where adjacent interior spaces need to be protected from the transfer of water through these assemblies.

**A-5.7.1.2.(2) Drainage.** Water should be directed away from the building and, ultimately, to a municipal drainage system, drainage ditch, swale, or other acceptable water management means. This can be accomplished by setting the building grade higher than the surrounding grades, by sloping the grade away from the building, by installing a surface water drainage system, or by a combination of these approaches. The chosen approach should follow generally accepted guidelines, such as the Rational Method of Stormwater Design by David B. Thompson, or other design methods acceptable to the Chief Building Official.

**A-5.7.3.3.(1)(a) Imperfections.** Examples of imperfections include shrinkage cracks, air holes, honeycombing, form-tie cone holes, and form joint ridges.

**A-5.7.3.4.(1) Dampproofing.** Dampproofing refers to the application of a material or materials to an environmental separation assembly to protect it and the interior space against the transfer of moisture due to the mechanisms of water vapour transmission, capillary action and pressure differences other than hydrostatic pressure. A dampproofed assembly should be designed such that it can provide short-term resistance to the ingress of water due to occasional hydrostatic pressure from ground water.

**A-5.8. Required Protection from Noise.** Section 5.8. applies to the separation of dwelling units from other dwelling units and from spaces where noise may be generated with regard to sound transmission irrespective of Clause 5.1.2.1.(1)(b), which deals with the separation of dissimilar environments. It is understood that, at any time, there is the potential for sound levels to be quite different in adjoining dwelling units.

**A-5.8.1.2. Using ASTC in lieu of STC.** A designer may choose to use an ASTC rating of equal or higher numerical value than the required STC to show compliance where STC ratings are required. An ASTC measurement or calculation will always yield a value equal to or lower than the STC for the same configuration, as the ASTC includes flanking transmission.

**A-5.8.1.4. Methods of Calculating ASTC.** The technical concepts, terminology, and calculation procedures relating to the detailed and simplified ASTC calculation methods are discussed in detail, with numerous worked examples, in the NRC publication entitled “Guide to Calculating Airborne Sound Transmission in Buildings.” This Guide includes references to readily-available sources of pertinent data.

For many common constructions, the calculations required by Article 5.8.1.4. can be performed using software tools, such as soundPATHS, which is available on NRC’s Web site. The simplified calculation method may not always identify the prominent flanking paths. Furthermore, it corresponds more closely with the results of the detailed calculation method where the separating assembly and the flanking constructions are both constructed according to the same method, i.e. either both are lightweight construction (steel or wood framing) or both are heavyweight construction (masonry or concrete).

**A-5.9.1.1.(1) Selection of Materials and Components and Compliance with Referenced Standards.** It is important to note that Sentence 5.9.1.1.(1) is stated in such a way that the selection of materials and components is not limited to those traditionally recognized as serving particular functions or those for which a standard is identified in Table 5.9.1.1. This approach permits more flexibility than is provided by similar requirements in Part 9. As long as the selected material meets the performance requirements stated elsewhere in Part 5, the material may be used to serve the required function. However, where the selected material or component, or its installation, falls within the scope of any of the standards listed in Table 5.9.1.1., the material, component or installation must comply with that standard. For example, if some resistance to heat transfer is required between two interior spaces and standard partition construction will provide the necessary resistance, the installation of one of the “thermal insulation” materials identified in the standard list is not
required. If, on the other hand, one decides to install glass fibre insulation, the material must conform to CAN/ULC-S702, “Mineral Fibre Thermal Insulation for Buildings.”

A-Table 5.9.1.1. Selection and Installation of Sealants. Analysis of many sealant joint failures indicates that the majority of failures can be attributed to improper joint preparation and deficient installation of the sealant and various joint components. The following ASTM guidelines describe several aspects that should be considered when applying sealants in unprotected environments to achieve a durable application:

- ASTM C 1193, “Use of Joint Sealants.”
- ASTM C 1299, “Selection of Liquid-Applied Sealants,” and
- ASTM C 1472, “Calculating Movement and Other Effects When Establishing Sealant Joint Width.”

The sealant manufacturer’s literature should always be consulted for recommended procedures and materials.

A-5.9.2.1.(3) Airtightness and Watertightness of Windows, Doors, Skylights, Other Glazed Products and their Components Required to have a Fire-Protection Rating. The airtightness and watertightness requirements are waived for these products when used in such an application, in recognition of the fact that the availability of assemblies that meet both the requirements of the applicable standards and the requirements for fire resistance may be limited. However, control of air and water leakage should not be ignored: measures should be taken to attempt to comply with applicable requirements.

A-5.9.2.2. Design and Construction of Windows, Doors and Skylights.

Design Values

Storm Doors and Windows
Where storm doors and storm windows are not incorporated in a rated window or door assembly, they should be designed and constructed to comply with the applicable requirements of Part 5 regarding such properties as appropriate air leakage and structural loads.

Forced Entry Test
Even though the performance label on rated windows, doors and skylights does not explicitly indicate that the product has passed the forced entry resistance test, products are required to pass this test in order to be rated.

Installation and Field Testing of Windows, Doors and Skylights
The installation details of windows, doors, skylights and their components must be appropriately designed and implemented for the building envelope assembly to perform acceptably overall. The proper design of the installation details provides the information necessary to integrate the structure and air, vapour and moisture barrier functions of windows, doors and skylights into the overall design of the building envelope assembly. Construction should be carried out in accordance with these details to achieve an appropriate level of long-term performance. Further guidance on installation detailing can be found in CAN/CSA-A440.4, “Window, Door, and Skylight Installation.”

It is recommended that the performance of installed windows, doors and skylights be field tested early in the envelope construction phase so that any discontinuities can be readily identified and corrected before construction of the building envelope assembly is completed. Additional field testing during subsequent construction phases to monitor installation consistency is also recommended. Field test procedures should be carried out in accordance with test standards such as ASTM E 783, “Field Measurement of Air Leakage.

A-5.9.2.2.(1) Two Compliance Paths. It is intended that any fenestration product that conforms to this Part may choose to comply with either Clause (a) or Clause (b) of Sentence 5.9.2.2.(1). Even if a product is in scope of the standards referenced via Clause (b) (NAFS and the Canadian Supplement to NAFS), the compliance path in Clause (a) may be used. However, it is not intended that the compliance path in Clause (b) be used where fenestration products are not within the scope of the referenced standards.

A-5.9.2.2.(2) Other Glazed Products. Glazed products such as curtain walls or sloped glazing that are not typically considered windows but are installed as part of a separation described in Sentence 5.9.2.1.(1) are not within the scope of the referenced standards and therefore must conform to Subsection 5.1.4. and Sections 5.3., 5.4. and 5.6. The following are considered to be “other glazed products”:

**Curtain Wall**
A curtain wall is considered to be a continuous wall cladding assembly (which may include fenestration and opaque portions) that is hung away from the edge of the primary floor structure. Curtain wall assemblies do not generally support vertical loads other than their own weight. Anchorage is typically provided by anchors that connect back to the floor structure. Curtain wall assemblies can be either “stick built,” meaning each main unit is assembled on-site, or a “unitized” system, meaning factory-assembled main units are installed and connected together on-site.

**Window Wall**
A window wall is considered to be a wall cladding assembly (which may include fenestration and opaque portions) that spans from the top of a primary floor structure to the underside of the next higher primary floor structure. Window wall assemblies do not generally support vertical loads other than their own weight. Primary provision for anchorage occurs at head and sill connections with the adjoining floor structure. Window wall assemblies may include separate or integral floor edge covers.

**Storefront**
A storefront is considered to be a non-residential assembly (which may include fenestration and opaque portions) consisting of one or more elements that could include doors, windows and curtain wall framing. Storefronts do not generally support vertical loads other than their own weight. Storefront profiles are typically narrow, rectilinear framing members that hold a combination of pocket glazing and applied glazing stops to securely retain the infills. Vertical framing members typically span the height of one floor or are retained within a structural punched opening.

Storefront assemblies are designed/selected to take into account the anticipated service and exposure conditions, which may be different than those for other portions of the building.

**Glazed Architectural Structures**
Glazed architectural structures are considered glazing assemblies that are supported in a non-traditional manner, such as corner-clamped, point-supported, linear-supported and edge-clamped glazing. Structural support systems can include, but are not limited to, tension cables, tension rods, steel and glass. Glazed architectural structures do not generally support vertical loads other than their own weight. These assemblies are designed/selected to take into account the anticipated service and exposure conditions, which may be different than those for other portions of the building.

Testing of Other Glazed Products

Although other glazed products are generally not within the scope of the standards referenced in Clause 5.9.2.2.(1)(b), they can be tested using other standards such as:

- AAMA 501, “Test for Exterior Walls,”
- AAMA 501.2, “Quality Assurance and Diagnostic Water Leakage Field Check of Installed Storefronts, Curtain Walls, and Sloped Glazing Systems,”
- AAMA 501.4, “Recommended Static Test Method for Evaluating Curtain Wall and Storefront Systems Subjected to Seismic and Wind Induced Interstory Drifts,”
- AAMA 501.5, “Thermal Cycling of Exterior Walls,” and
- AAMA 501.6, “Recommended Dynamic Test Method For Determining The Seismic Drift Causing Glass Fallout From A Wall System.”

- ASTM E 283, “Determining Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen.”
- ASTM E 547, “Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Cyclic Static Air Pressure Difference.”
- ASTM E 783, “Field Measurement of Air Leakage Through Installed Exterior Windows and Doors.”
- ASTM E 1105, “Field Determination of Water Penetration of Installed Exterior Windows, Skylights, Doors, and Curtain Walls, by Uniform or Cyclic Static Air Pressure Difference.”

Water Penetration

Notwithstanding that other glazed products are not covered under the testing scope of CSA A440S1, “Canadian Supplement to AAMA/WDMA/CSA 101/I.S.2/A440, NAFS – North American Fenestration Standard/Specification for Windows, Doors, and Skylights,” they may be tested at the driving rain wind pressure calculated in accordance with the procedure described therein.

Resistance to Condensation

Notwithstanding that other glazed products are not fully covered under the testing scope of CSA A440.2, “Fenestration Energy Performance,” the test method described therein can be used to evaluate their resistance to condensation, with technical modifications to accommodate differences in the size and configuration of the specimen. It is also common practice to use one cold cycle of AAMA 501.5, “Thermal Cycling of Exterior Walls,” to assess the potential for condensation. Both methods can be used for mock-ups in laboratory performance evaluations, however, only the test method in CSA A440.2 should be used if a Temperature Index is required. In most cases, the project specification documents establish the hygrothermal conditions (i.e., exterior temperature, interior temperature, interior relative humidity) for which the potential for condensation should be minimized. Under these conditions, the aforementioned test methods can be used to aid in the selection of the appropriate system performance to minimize the potential for interior surface condensation. In all cases, care should be taken in the construction and configuration of the specimen, as these parameters may have an impact on its thermal performance and resistance to condensation. These parameters may include, without limitation, interior wall construction and finishes, heating systems, ventilation systems, etc., to simulate the actual in-service conditions as closely as practicable.
Air Leakage Rate and Test Pressure
Air leakage rates and/or higher differential test pressure can be selected for specific applications of other glazed products where tight control of airflow is required to prevent interstitial condensation (e.g., in concealed spaces), improve thermal comfort (e.g., in hospitals, seniors’ residences), or prevent the migration of airborne contaminants (e.g., in food and drug research, manufacturing applications, biological laboratories). It is typical of other glazed products to be used as the sole building envelope component; where this is the case, a correspondingly higher degree of airtightness may be required.

In addition, higher test pressure differentials can be used to evaluate assemblies with low air leakage, such as non-operable or fixed fenestration systems whose air leakage rates are not easily measurable at the lower standard pressure differentials.

A-5.9.2.2.(3) Loads and Procedures. For windows within the scope of the “Canadian Supplement” referred to in Sentence 5.9.2.2.(1), structural and wind loads are included and may be calculated in accordance with that standard. As an alternative, structural and wind loads from Section 5.2. may be used to select fenestration products that are appropriate for the point of installation. Values derived from the referenced standard, which uses a simplified calculation method, are typically higher than those derived from calculations done in conformance with Section 5.2.

A-5.9.2.4.(3) Heat Transfer through Fire-Rated Glazed Assemblies. Thermal bridging through fire-rated glazed assemblies should not be ignored; measures should be taken to minimize condensation consistent with the intent of Sentence 5.9.2.4.(2).

A-5.9.4.1.(1) Exterior Insulation Finish Systems (EIFS). The reference to CAN/ULC-S716.1, “Exterior Insulation and Finish Systems (EIFS) – Materials and Systems,” in Clause 5.9.4.1.(1)(b) does not preclude the use of other component materials that may also meet the intent of the By-law. For example, using mineral-fibre insulation in lieu of other rigid insulation types, mechanical fastening methods for the insulation component in lieu of adhesive, or a type of water-resistive barrier other than a liquid-applied water-resistive barrier could be acceptable.

The following two companion standards facilitate the application of and conformance with CAN/ULC-S716.1:
Additional information on EIFS design and installation can be found in the EIFS Council of Canada’s “EIFS Practice Manual” and the manufacturer’s literature.

EIFS Selection
CAN/ULC-S716.1 provides minimum performance criteria for EIFS materials and systems that are tested under specific laboratory test protocols identified in the standard. However, compliance with this standard does not ensure that a system is appropriate for all projects. When selecting an EIFS product, designers should consider all relevant criteria – not only those covered by the tests in CAN/ULC-S716.1 – including, but not limited to,
• building exposure
• local climate characteristics (wind, precipitation, temperature variations, solar exposure)
• intended building use
• intended resistance to damage and deterioration
• construction tolerances
• constructability

Design and Construction of EIFS Drainage Cavity
The drainage capacity and thermal performance of the EIFS assembly can be affected by the dimensions and configuration of the EIFS drainage cavity.

EIFS are installed over other building materials such as sheathing and primary structural components, which have various construction installation tolerances. Designers should take into consideration the cumulative effects of construction tolerances and sequencing when specifying the drainage method and the cavity dimensions and configuration in order to ensure adequate drainage.

Designers should also take into account the impact of air movement, which varies depending on cavity size and the extent of venting, on the EIFS’ thermal performance when reviewing the overall thermal performance of the building envelope. ASTM C 1363, “Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus,” presents one method for assessing the thermal performance of assemblies.

Where an Exterior Insulation Finish System (EIFS) is used, design review and enhanced field review is required to be conducted by a Building Envelope Professional who has specialized training and experience with EIFS. The professional is required to review the project specific design, and confirm that the whole system including the required thermal expansion/contraction joints, joints around doors or windows, or any other penetrations of the finish will allow for drainage back to the exterior, without reliance on surface sealing. The professional is also responsible for reviewing the pressure moderating system including compartmentalization, vent location, sizing, and confirming the required stiffness of the substrate, using calculations based on the manufacturer’s data or by testing demonstrating that sufficient pressure equalization has been achieved as defined by the Institute for Research in Construction, Construction Technology Update No. 17; “Pressure Equalization in Rainscreen Wall Systems,” July 1998.

The quality provisions of the CCMC Technical Guide for “Exterior Insulation and Finish Systems (EIFS) Class PB Masterformat Section 07240”, Section 7.0 “Quality Assurance Program” must be adhered to. Buildings are required to be designed incorporating devices such as davit bases or other design elements, so that any required maintenance could be provided without causing undue damage to the EIFS.
Part 6
Heating, Ventilating and Air-conditioning

Section 6.1. General

6.1.1. Application

6.1.1.1. Scope
1) The scope of this Part shall be as described in Subsection 1.3.3. of Division A.

6.1.1.2. Application
1) This Part applies to systems and equipment for heating, ventilating and air-conditioning services.

6.1.2. Reserved

6.1.3. Plans and Specifications

6.1.3.1. Required Plans and Specifications
1) Plans, specifications and other information for heating, ventilating and air-conditioning systems shall conform to Subsection 2.2.6. of Division C.

Section 6.2. Planning
(See Part 10)

6.2.1. General

6.2.1.1. Good Engineering Practice
(See Note A-6.2.1.1.)
1) Heating, ventilating and air-conditioning systems, including mechanical refrigeration equipment, shall be designed, constructed and installed in conformance with good engineering practice such as that described in, but not limited to,
   a) the ASHRAE Handbooks and Standards,
   b) the HRAI Digest,
   c) the Hydronics Institute Manuals,
   d) the NFPA Standards,
   e) the SMACNA Manuals,
   f) the Industrial Ventilation Manual published by the ACGIH,
   g) CSA B214, “Installation Code for Hydronic Heating Systems,”
   h) CAN/CSA-Z317.2, “Special Requirements for Heating, Ventilation, and Air-Conditioning (HVAC) Systems in Health Care Facilities,” and
   i) EPA 625/R-92/016, “Radon Prevention in the Design and Construction of Schools and Other Large Buildings.”

6.2.1.2. Outdoor Design Conditions
1) The outdoor conditions to be used in designing heating, ventilating and air-conditioning systems shall be determined in conformance with Subsection 1.1.3.
2) Reserved.
3) Reserved.
6.2.1.3. Expansion, Contraction and System Pressure
1) Heating and cooling systems shall be designed to allow for expansion and contraction of the heat transfer fluid and to maintain the system pressure within the rated working pressure limits of all components of the system.

6.2.1.4. Structural Movement
(See Note A-6.2.1.4.)
1) Mechanical systems and equipment shall be designed and installed to accommodate the maximum relative structural movement provided for in the construction of the building.

6.2.1.5. Installation Standards
1) Except as provided in Articles 6.9.4.2. and 6.3.1.5., the installation of heating and air-conditioning equipment, including mechanical refrigeration equipment, and including provisions for mounting, clearances and air supply, shall conform to
   a) Reserved.
   b) the Safety Standards Act and the following of its regulations:
      i) the Gas Safety Regulation,
      ii) the Electrical Safety Regulation, and
      iii) the Power Engineers, Boiler, Pressure Vessel and Refrigeration Safety Regulation,
   c) CSA B139, “Installation Code for Oil-Burning Equipment,” and
   e) Reserved.
   f) Reserved.

6.2.1.6. Installation – General
1) Equipment requiring periodic maintenance and forming part of a heating, ventilating or air-conditioning system shall be installed with provision for access for inspection, maintenance, repair and cleaning.
(See Note A-6.2.1.6.(1.).)
2) Mechanical equipment shall be provided with guards so as to prevent injury.
3) Heating, ventilating or air-conditioning systems shall be protected from freezing if they may be adversely affected by freezing temperatures.

6.2.1.7. Asbestos
1) Asbestos shall not be used in HVAC systems and equipment.

6.2.2. Incinerators

6.2.2.1. Applicable Standard
1) The design, construction, installation and alteration of every indoor incinerator shall conform to NFPA82, “Incinerators and Waste and Linen Handling Systems and Equipment.”

6.2.3. Solid Fuel Storage

6.2.3.1. Solid Fuel Storage Bins
1) A storage bin for solid fuel shall not be located above a sewer opening or drain opening.
2) Storage bins for solid fuel shall be designed and constructed so that the air temperature in the bin or the surface temperature of any part of the floor or walls is below 50°C.
Section 6.3. Ventilation Systems

6.3.1. Ventilation

6.3.1.1. Required Ventilation
1) Except as provided in Sentence(3), all buildings shall be ventilated in accordance with this Part.
2) Except in storage garages covered by Article 6.3.1.4., the rates at which outdoor air is supplied in buildings by ventilation systems shall be not less than the rates required by ANSI/ASHRAE 62, “Ventilation for Acceptable Indoor Air Quality” (except Addendum n).
3) Self-contained heating-season mechanical ventilation systems serving only one dwelling unit shall comply with:
   a) this Part, or
   b) Subsection 9.32.3.
4) For suites in buildings conforming to Subsection 10.2.2.5., the outdoor air required by Sentence (2) shall be supplied directly to each suite by mechanical ventilation through ducting.

(See Note A-6.3.1.1.(4).)

6.3.1.2. Crawl Spaces and Attic or Roof Spaces
1) Unconditioned and unoccupied crawl spaces and unconditioned and unoccupied attic or roof spaces shall be ventilated by natural or mechanical means as required by Part 5. (See Note A-6.3.1.2.(1).)

6.3.1.3. Natural Ventilation
1) Except as permitted by Sentence(2) and except as required by Sentence 6.3.1.1.(4), the ventilation required by Article 6.3.1.1. shall be provided by mechanical ventilation, except that it can be provided by natural ventilation or a combination of natural and mechanical ventilation in:
   a) buildings of other than residential occupancy having an occupant load of not more than one person per 40m² during normal use,
   b) buildings of industrial occupancy where the nature of the processes contained therein permits or requires the use of large openings in the building envelope even during the winter, and
   c) seasonal buildings not intended to be occupied during the winter.
2) Where climatic conditions permit, buildings containing occupancies other than residential occupancies may be ventilated by natural ventilation methods in lieu of mechanical ventilation where engineering data demonstrates that such a method will provide the required ventilation for the type of occupancy.

6.3.1.4. Ventilation of Storage Garages
1) Except as provided in Sentences(4) and(6), an enclosed storage garage for five or more motor vehicles shall have a mechanical ventilation system designed to:
   a) limit the concentration of carbon monoxide to not more than 100 parts per million parts of air,
   b) limit the concentration of nitrogen dioxide to not more than 3 parts per million parts of air, where the majority of the vehicles stored are powered by diesel-fuelled engines, or
   c) provide, during operating hours, a continuous supply of outdoor air at a rate of not less than 3.9L/s for each square metre of floor area (See Article 3.3.1.20.).
(See also Sentence 3.3.5.4.(4).) (See Note A-6.3.1.4.(1).)
2) Mechanical ventilation systems provided in accordance with Clause(1)(a) shall be controlled by carbon monoxide monitoring devices, and systems provided in accordance with Clause(1)(b) shall be controlled by nitrogen dioxide or other acceptable monitoring devices. (See Note A-6.3.1.4.(2).)
3) Mechanical ventilation systems provided in accordance with Sentence(1) shall be designed such that the pressure in the storage garage is less than the pressure in adjoining buildings of other occupancy, or in adjacent portions of the same building having a different occupancy.
4) In storage garages subject to the requirements of Sentences(1) and(2), where motor vehicles are parked by mechanical means, the ventilation requirements may be reduced by one half.
5) Except as provided in Sentence(6), ticket and attendant booths of storage garages shall be pressurized with a supply of uncontaminated air.
6) The requirements of Sentences(1) to(5) shall not apply to open-air storeys in a storage garage.

6.3.1.5. Heat Recovery Ventilators
1) Heat recovery ventilators with rated capacities of not less than 25L/s and not more than 200L/s shall be installed in accordance with Subsection9.32.3.

6.3.1.6. Indoor Air Contaminants
(See NoteA-6.3.1.6.)
1) Air contaminants of concern that are released within buildings shall
   a) be removed insofar as is possible at their points of origin, and
   b) not be permitted to accumulate in concentrations greater than those permitted by applicable by-laws or regulatory enactments or, in the absence of such requirements, by good engineering practice such as that described in the publications listed in Sentence6.2.1.1.(1), measured using the methodology described therein.
2) Systems serving spaces that contain sources of contamination and systems serving other occupied parts of the building but located in or running through spaces that contain sources of contamination shall be designed in such a manner as to prevent the spread of such contamination to other occupied parts of the building.
3) Heating, ventilating and air-conditioning systems shall be designed to minimize the growth and spread of bio-contaminants.

6.3.1.7. Commercial Cooking Equipment
1) Except as provided in Sentences (2) and (3), Article 3.6.3.1. and Article3.6.3.5., systems for the ventilation of commercial cooking equipment shall be designed, constructed and installed to conform to NFPA96, “Ventilation Control and Fire Protection of Commercial Cooking Operations.”
2) The exhaust from a commercial cooking unit shall discharge through an ecology unit or acceptable equipment complying with Sentence (4), where the exterior wall termination of the exhaust is within 3 m of a lane, property line or street property line. (See Note A-6.31.7.(2).)
3) The exhaust from a commercial cooking unit which is discharged from an exterior wall termination shall not
   a) be discharged in a location or manner which causes a concentrated stream of air to fall directly onto pedestrians,
   b) be discharged in a location or manner which causes exhaust to accumulate in an area with outdoor seating, and
   c) generate a sound pressure level which exceeds noise levels permitted by the Noise Control By-law.
   (See Note A-6.3.1.7.(3).)
4) Equipment provided in compliance with Sentence (3) shall
   a) remove 99.97% of the grease entering the equipment,
   b) be of continuously welded 1.5 mm thick carbon steel or 1.1 mm stainless steel,
   c) prevent the leakage of flame, smoke, or grease from the equipment at normal or abnormal temperatures,
   d) limit the temperature rise of adjacent combustible materials to no more than 97°C above room temperature, and
   e) limit the temperature of exhaust air at the exhaust outlet to no more than 138°C.
   (See Note A-6.3.1.7.(4).)
6.3.2. Air Duct Systems

6.3.2.1. Application
1) This Subsection applies to the design, construction and installation of air duct distribution systems serving heating, ventilating and air-conditioning systems other than those in dwelling units covered by Part 9.

6.3.2.2. Drain Pans
1) Dehumidifying cooling coil assemblies and condensate-producing heat exchangers shall be equipped with drain pans beneath them that are
   a) designed in accordance with Section 5.11, Drain Pans, of ANSI/ASHRAE 62.1, “Ventilation for Acceptable Indoor Air Quality,”
   b) provided with an outlet that is piped to the outside of the airstream in a location where condensate can be eliminated, and
   c) installed so that water drains freely from the pan.

6.3.2.3. Materials in Air Duct Systems
1) All ducts, duct connectors, associated fittings and plenums used in air duct systems shall be constructed of materials as described in Article 3.6.5.1.
2) Ducts that are used in a location where they may be subjected to excessive moisture shall have no appreciable loss of strength when wet and shall be resistant to moisture-induced corrosion.
3) All ductwork and fittings shall be constructed and installed as recommended in SMACNA Manuals and ASHRAE Standards.
4) All duct materials shall be suitable for exposure to the temperature and humidity of the air being carried and shall be resistant to corrosion caused by contaminants in the air being conveyed in the duct.

6.3.2.4. Connections in Air Duct Systems
1) Air duct systems shall have tight-fitting connections throughout.

6.3.2.5. Duct Coverings and Linings
(See Note A-6.3.2.5.)
1) Coverings, linings and associated adhesives and insulation used in air ducts, plenums and other parts of air duct systems shall comply with Article 3.6.5.4.
2) Duct linings shall be installed so that they will not interfere with the operation of volume or balancing dampers or of fire dampers, fire stop flaps and other closures.

6.3.2.6. Clearance of Ducts and Plenums
1) The clearance of ducts and plenums from combustible materials shall comply with Article 3.6.5.6.

6.3.2.7. Interconnection of Systems
1) In a care or residential occupancy, air from one suite shall not be circulated to any other suite or to a public corridor.
2) Except as permitted by Sentences (3) and 6.3.2.10.(6), air duct systems serving storage garages shall not be directly interconnected with other parts of the building.
3) Exhaust ducts referred to in Sentence 6.3.2.10.(10) are permitted to exhaust through an enclosed storage garage prior to exhausting to the outdoors, provided
   a) the storage garage’s exhaust system runs continuously,
   b) the capacity of the storage garage’s exhaust system is equal to or exceeds the volume of the exhaust entering the garage, and
   c) a leakage rate 1 smoke/fire damper rated in accordance with CAN/ULC-S112.1, “Leakage Rated Dampers for Use in Smoke Control Systems,” is provided near the duct outlet location in the
storage garage to prevent air from the storage garage from entering the exhaust ductwork system in the event the building’s exhaust fan is shut down.

6.3.2.8. Makeup Air
(See NoteA-6.2.1.1.)
1) In ventilating systems that exhaust air to the outdoors, provision shall be made for the admission of a supply of makeup air in sufficient quantity so that the operation of the exhaust system and other exhaust equipment or combustion equipment is not adversely affected.
2) Makeup air facilities required by Sentence(1) shall be interlocked with the exhaust devices they serve so that both operate together.
3) Where makeup air facilities are intended to introduce air directly from the outdoors to occupied parts of the building in winter, they shall incorporate means of tempering that air to maintain the indoor design temperature.

6.3.2.9. Supply, Return, Intake and Exhaust Air Openings
1) Supply, return and exhaust air openings located less than 2m above the floor in rooms or spaces in buildings shall be protected by grilles having openings of a size that will not allow the passage of a 15mm diameter sphere.
2) Outdoor air intakes shall be located so that
   a) the quality of the air entering the building complies with Sentences 6.2.1.2.(2) and(3), and
   b) they are separated a minimum distance from sources of contaminants in accordance with Table 6.3.2.9.

Table 6.3.2.9.
Minimum Distances of Air Intakes from Sources of Contaminants

3) Outdoor air intakes shall be installed not less than 0.3m above roofs, landscape grades or other surfaces, taking into account anticipated snow accumulation levels.
4) Exterior openings for outdoor air intakes and exhaust outlets shall be shielded from the entry of snow and rain and shall be fitted with corrosion-resistant screens of mesh having openings not larger than 15mm,
Acceptable Solutions

Part 6 – Heating, Ventilation and Air conditioning

except where experience has shown that climatic conditions require larger openings to prevent the screen openings from icing over.

5) Screens required in Sentence(4) shall be accessible for maintenance.

6) Combustible grilles, diffusers and other devices covering supply, return, intake and exhaust openings shall comply with Article3.6.5.7.

6.3.2.10. Exhaust Ducts and Outlets

1) Except as provided in Sentence(2), exhaust ducts of non-mechanical ventilating systems serving separate rooms or spaces shall not be combined.

2) Exhaust ducts of non-mechanical ventilating systems serving similar occupancies may be combined immediately below the point of final delivery to the outdoors, such as at the base of a roof ventilator.

3) Exhaust ducts of ventilating systems shall have provision for the removal of condensation where this may be a problem.

4) Exhaust outlets shall be designed to prevent backdraft under wind conditions.

5) Except as permitted in Sentence(6), exhaust systems shall discharge directly to the outdoors. (See NoteA-6.3.2.10.(5) and (6).)

6) Exhaust systems are permitted to exhaust into a storage garage, provided
   a) they serve rooms that are accessible only from that storage garage,
   b) the exhaust contains no contaminants that would adversely affect the air quality in the storage garage (See NoteA-6.3.2.10.(6)(b).), and
   c) they are designed in accordance with Sentence6.3.2.7.(3).
   (See NoteA-6.3.2.10.(5) and (6).)

7) Exhaust ducts connected to laundry-drying equipment shall be
   a) independent of other exhaust ducts,
   b) accessible for inspection and cleaning, and
   c) constructed of a smooth corrosion-resistant material.
   (See NoteA-6.3.2.10.(7) and (8).)

8) Where collective venting of multiple installations of laundry-drying equipment is used, the ventilation system shall
   a) be connected to a common exhaust duct that is vented by one central exhaust fan and incorporates one central lint trap,
   b) include an interlock to activate the central exhaust fan when laundry-drying equipment is in use, and
   c) be provided with make-up air.
   (See NoteA-6.3.2.10.(7) and (8).)

9) Exhaust ducts or vents connected to laundry-drying equipment shall discharge directly to the outdoors.

10) Except as provided in Sentence(12) and except for self-contained systems serving individual dwelling units, exhaust ducts serving rooms containing water closets, urinals, basins, showers or slop sinks shall be independent of other exhaust ducts.

11) Except as provided in Sentence(12) and except for self-contained systems serving individual dwelling units, exhaust ducts serving rooms containing residential cooking equipment shall be independent of other exhaust ducts.

12) Two or more exhaust systems described in Sentences(10) and(11) may be interconnected or connected with exhaust ducts serving other areas of the building, provided
   a) the connections are made at the inlet of an exhaust fan, and all interconnected systems are equipped with suitable back pressure devices to prevent the passage of odours from one system to another when the fan is not in operation, or
   b) the exhaust ducts discharge to a shaft that is served by an exhaust fan having a capacity that is equal to or greater than the combined capacity of the exhaust fans discharging to the plenum multiplied by the operation diversity factor, provided that the exhaust fan serving the shaft operates continuously (See NoteA-6.3.2.10.(12)(b).).
13) Where *exhaust ducts* containing air from *conditioned spaces* pass through or are adjacent to unconditioned spaces, the ducts shall be constructed to prevent condensation from forming on the inside or outside of the ducts.

**6.3.2.11. Return-Air System**

1) Return-air systems shall comply with Article3.6.5.8.
2) Where a ceiling space is used as a *return-air plenum*, the requirements of Article3.6.4.3. shall apply.
3) A *public corridor* or *exit* shall not be used as a return-air *plenum*.

**6.3.2.12. Underground Ducts**

1) Underground ducts shall
   a) be constructed and installed to provide interior drainage from and access to all low points,
   b) not be connected directly to a sewer, and
   c) be installed and constructed of materials recommended by ASHRAE and SMACNA Standards and HRAI Manuals.
2) A clean-out or pump-out connection shall be provided in an underground duct system at every low point of the duct system.

**6.3.2.13. Filters**

1) Air filters for air duct systems shall conform to the requirements for Class2 air filter units as described in CAN/ULC-S111, “Fire Tests for Air Filter Units.”
2) When electrostatic-type filters are used, they shall be installed so as to ensure that the electric circuit is automatically de-energized when filter access doors are opened or, in *dwelling units*, when the *furnace* circulation fan is not operating.

**6.3.2.14. Reserved**

**6.3.2.15. Evaporative Cooling Towers, Evaporative Fluid Coolers and Evaporative Condensers**

1) Discharge from evaporative cooling towers to ventilation air intakes shall comply with
   a) Sentence6.3.2.9.(2), and
2) The distance between the air intakes of evaporative cooling towers, evaporative fluid coolers and evaporative condensers in relation to kitchen exhaust outlets, vegetation or other sources of organic matter shall be not less than 4.6m.
3) Deleted.
4) Water treatment equipment for biological growth control shall be provided in accordance with Sub-Section7.6.2. of ASHRAE Guideline12, “Minimizing the Risk of Legionellosis Associated with Building WaterSystems.”
5) Deleted.
6) Evaporative cooling towers, evaporative fluid coolers and evaporative condensers shall be provided with access ports, service platforms, fixed ladders and restraint connections to allow visual inspection, maintenance and testing.

**6.3.2.16. Evaporative Air Coolers, Misters, Atomizers, Air Washers and Humidifiers**

1) The filter and water evaporation medium of every air washer and evaporative air cooler enclosed within a *building* shall be made of *noncombustible* material.
2) Sumps for air washers and evaporative air coolers shall be constructed and installed so that they can be flushed and drained.
3) Evaporative air coolers, misters, atomizers, air washers and humidifiers shall be designed in accordance with Sections 8 and 9 of ASHRAE Guideline 12, “Minimizing the Risk of Legionellosis Associated with Building WaterSystems.”

6.3.2.17. Fans and Associated Air-Handling Equipment

1) Fans for heating, ventilating and air-conditioning systems shall be located and installed so that their operation
   a) does not adversely affect the draft required for proper operation of fuel-fired appliances, and
   b) does not allow the air in the duct system to be contaminated by air or gases from the boiler room or furnace room.

2) Fans and associated air-handling equipment, such as air washers, filters and heating and cooling units, when installed on the roof or elsewhere outside the building, shall be of a type designed for outdoor use.

6.3.2.18. Vibration Isolation Connectors

1) Vibration isolation connectors in air duct systems shall comply with Article 3.6.5.2.

6.3.2.19. Tape

1) Tape used for sealing joints in air ducts, plenums and other parts of air duct systems shall comply with Article 3.6.5.3.

6.3.3. Chimneys and Venting Equipment

6.3.3.1. Requirement for Venting

1) Except as provided in Articles 6.3.3.2. and 6.3.3.3., the products of combustion from oil-, gas- and solid-fuel-burning appliances shall be vented in conformance with the requirements in the applicable appliance installation standard listed in Article 6.2.1.5.

2) Except as provided in Article 6.2.1.5., vented products of combustion, other than those referred to in Sentence (1), shall be discharged away from the building, so as not to re-enter it, to a distance not less than
   a) 2.15m above sidewalks and driveways,
   b) 3m from outdoor air intakes,
   c) 3m horizontally or vertically from doors and operable windows, and
   d) 3m horizontally or vertically from occupiable outdoor spaces, excluding maintenance spaces.

   (See Note A-6.3.3.1.(2).)

6.3.3.2. Masonry or Concrete Chimneys

1) Rectangular masonry or concrete chimneys not more than 12m in height shall conform to Part 9 if they serve
   a) appliances with a combined total rated heat output of 120kW or less, or
   b) fireplaces.

2) Masonry or concrete chimneys other than those described in Sentence (1) shall be designed and installed in conformance with the appropriate requirements in NFPA 211, “Chimneys, Fireplaces, Vents, and Solid Fuel-Burning Appliances.”

6.3.3.3. Metal Smoke Stacks

1) Single wall metal smoke stacks shall be designed and installed in conformance with NFPA 211, “Chimneys, Fireplaces, Vents, and Solid Fuel-Burning Appliances.”

6.3.3.4. Access Ladders

1) Access ladders for chimneys, when provided, shall consist of steel or bronze rungs, built into the walls of the chimneys.

2) Rungs for external ladders shall begin at not less than 2.5m from ground level.
6.3.4. Ventilation for Laboratories

6.3.4.1. Application
1) This Subsection applies to laboratories where dangerous goods, including flammable liquids and combustible liquids, are used in normal laboratory operations in quantities or in a manner that creates a fire or explosion hazard.

6.3.4.2. General Ventilation
1) A laboratory shall be provided with continuous mechanical ventilation designed to ensure that dangerous goods vapours and particles
   a) do not accumulate in the laboratory,
   b) are prevented from migrating to other parts of the building,
   c) do not accumulate in the ventilation system,
   d) are exhausted to the outdoors, and
   e) are not returned to the building.
2) A ventilation system required by this Subsection shall be provided with monitoring devices to
   a) indicate that the ventilation system is in operation, and
   b) sound an alarm if the ventilation system is malfunctioning.
3) A ventilation system required by this Subsection shall be maintained in conformance with Article 5.5.4.1. of Division B of the Fire By-law.

6.3.4.3. Enclosure Exhaust Ventilation
1) The ventilation system for a power-ventilated enclosure required by Sentence 5.5.4.2.(1) of Division B of the Fire By-law shall
   a) conform to NFPA91, “Exhaust Systems for Air Conveying of Vapors, Gases, Mists, and Noncombustible Particulate Solids,”
   b) provide continuous exhaust ventilation at an air velocity sufficient to prevent the accumulation of combustible or reactive deposits in the power-ventilated enclosure and its exhaust duct system,
   c) confine dangerous goods vapours and particles to the area where they are generated and exhaust them to the outdoors,
   d) not return the exhausted air to the building, and
   e) be provided with well identified control switches that are
      i) located outside of the power-ventilated enclosure, and
      ii) readily accessible in case of an emergency.

6.3.4.4. Enclosure Construction
1) The power-ventilated enclosure required by Sentence 5.5.4.2.(1) of Division B of the Fire By-law and its exhaust duct system shall
   a) except as provided in Sentences (2) and (3), be constructed of noncombustible materials compatible with and chemically resistant to the dangerous goods vapours and particles being exhausted, and
   b) be provided with access doors to permit inspection and maintenance of the fan assembly and exhaust ducts.
2) Combustible materials are permitted in systems described in Clause (1)(a) if
   a) such materials are required by the corrosive or reactive properties of the dangerous goods being used, and
   b) their flame-spread rating is not more than 25.
3) The flame-spread rating required by Sentence (2) is permitted to be greater than 25 if an automatic fire suppression system is provided inside the power-ventilated enclosure and its exhaust duct system.
Section 6.4. Heating Systems

6.4.1. Heating Appliances, General

6.4.1.1. Location of Appliances
1) Except for appliances installed in dwelling units, fuel-fired heating appliances shall be located, enclosed or separated from the remainder of the building in conformance with Section 3.6. (See also Subsection 9.10.10.)

6.4.1.2. Appliances Installed Outside the Building
1) Fuel-fired appliances installed outside a building shall be designed and constructed for outdoor use.

6.4.2. Unit Heaters

6.4.2.1. Clearances
1) Every unit heater using either steam or hot water as the heating medium shall be installed such that the clearances between the appliance and adjacent combustible material conform to Table 6.7.1.2.

6.4.3. Radiators and Convecors

6.4.3.1. Lining or Backing
1) A noncombustible lining or backing shall be provided for every steam or hot water radiator and convector
   a) located in a recess or concealed space, or
   b) attached to the face of a wall of combustible construction.
2) Every steam or hot water radiator and convector shall be installed so as to conform to the clearance requirements of Table 6.7.1.2.

Section 6.5. Thermal Insulation Systems

6.5.1. Insulation

6.5.1.1. Insulation and Coverings
(See Note A-6.3.2.5.)
1) Insulation and coverings on pipes shall comply with Article 3.6.5.5.
2) Insulation and coverings on pipes shall be composed of material that will withstand deterioration from softening, melting, mildew and mould at the operating temperature of the system.
3) Exposed piping or equipment subject to human contact shall be insulated so that the temperature of the exposed surface does not exceed 70°C. (See Note A-6.5.1.1.(3).)

Section 6.6. Refrigeration and Cooling Systems

6.6.1. Refrigerating Systems and Equipment for Air-conditioning

6.6.1.1. Cooling Units
1) Where a cooling unit is combined with a fuel-fired furnace in the same duct system, the cooling unit shall be installed
   a) in parallel with the heating furnace,
   b) upstream of the furnace provided the furnace is designed for such application, or
   c) downstream of the furnace provided the cooling unit is designed to prevent excessive temperature or pressure in the refrigeration system.
Section 6.7. Piping Systems

6.7.1. Piping for Heating and Cooling Systems

6.7.1.1. Piping Materials and Installation
1) Piping shall be made from materials designed to withstand the effects of temperatures and pressures that may occur in the system. (See Articles 3.1.5.19., 3.1.9.1., 9.10.9.6. and 9.10.9.7. for fire safety requirements.)
2) Every pipe used in a heating or air-conditioning system shall be installed to allow for expansion and contraction due to temperature changes.
3) Supports and anchors for piping in a heating or air-conditioning system shall be designed and installed to ensure that undue stress is not placed on the supporting structure.

6.7.1.2. Clearances
1) Clearances between combustible material and bare pipes carrying steam or hot water shall conform to Table 6.7.1.2.

Table 6.7.1.2.
Clearance Between Steam or Hot Water Pipes and Combustible Material
Forming Part of Articles 6.4.2.1. and 6.7.1.2., and Sentence 6.4.3.1.(2)

</tr>
</tbody>
</table>

6.7.1.3. Surface Temperature
1) The exposed surface temperature of a steam or hot water radiator shall not exceed 70°C unless precautions are taken to prevent human contact. (See Note A-6.5.1.1.(3).)

6.7.1.4. Protection
1) Where a pipe carrying steam or hot water at a temperature above 120°C passes through a combustible floor, ceiling or wall, the construction shall be protected by a sleeve of metal or other noncombustible material not less than 50mm larger in diameter than the pipe.

6.7.1.5. Piping in Shafts
1) Where piping for heating or air-conditioning systems is enclosed in a shaft, the requirements of Article 3.6.3.1. for shafts shall apply.

6.7.2. Storage Bins

6.7.2.1. Storage Bins
1) Service pipes passing through a storage bin for solid fuel shall be protected or so located as to avoid damage to the pipes.
2) Except for fuel-thawing pipes, every pipe designed to operate at a temperature of 50°C or above shall be located where solid fuel cannot be stored in contact with it.

Section 6.8. Equipment Access
6.8.1. Openings

6.8.1.1. Access Openings
1) Any covering of an access opening through which a person could enter shall be openable from the inside without the use of keys where there is a possibility of the opening being accidentally closed while the system or equipment is being serviced.

6.8.1.2. Openings in Air Duct Systems
1) Air duct systems shall have no openings other than those required for the proper operation and maintenance of the system.
2) Access openings shall be provided in duct systems to allow the removal of material that may accumulate in plenums and ducts.

6.8.1.3. Odour Removal Equipment
1) When odour removal equipment of the adsorption type is used, it shall be
   a) installed to allow access so that adsorption material can be reactivated or renewed, and
   b) protected from dust accumulation by air filters installed on the inlet side.
2) Facilities for flushing and drainage shall be provided where filters are designed to be washed in place.

Section 6.9. Fire Safety Systems

6.9.1. General

6.9.1.1. Fire Safety Requirements
1) The fire safety characteristics of heating, ventilating and air-conditioning systems shall comply with Subsection3.6.5.
2) Characteristics referred to in Sentence(1) include but are not limited to
   a) use of combustible materials in duct systems,
   b) flame-spread ratings and smoke-developed ratings of duct and pipe materials and coverings,
   c) installation of equipment relative to property lines, and
   d) requirements for fire dampers and fire stop flaps.

6.9.1.2. Hazardous Gases, Dusts or Liquids
1) Except as provided in Subsection6.3.4., systems serving spaces that contain hazardous gases, dusts or liquids shall be designed, constructed and installed to conform to the requirements of the Fire By-law and all applicable by-laws or regulatory enactments or, in the absence of such requirements, to good engineering practice such as that described in the publications of the National Fire Protection Association. (SeeNoteA-6.9.1.2.(1).)
2) When indoor piping for ClassI flammable liquids is installed in a trench, the trench shall be
   a) provided with positive ventilation to the outdoors, or
   b) designed to prevent the accumulation of flammable vapours.

6.9.1.3. Commercial Cooking Equipment
1) Fire protection systems for commercial cooking equipment referred to in Sentence6.3.1.7.(1) using vegetable oil or animal fat shall conform to
   a) ANSI/UL 300, "Fire Testing of Fire Extinguishing Systems for Protection of Commercial Cooking Equipment," or
   b) ULC/ORD-C1254.6, "Fire Testing of Restaurant Cooking Area Fire Extinguishing System Units."
6.9.2. Dampers and Ductwork

6.9.2.1. Fire Dampers
   1) Fire dampers shall conform to Article 3.1.8.10.

6.9.2.2. Smoke Detectors
   1) Air handling systems shall incorporate smoke detectors where and as required by Article 3.2.4.12.

6.9.2.3. Exhaust Ducts and Outlets
   1) Where an exhaust duct system is used for smoke removal in a high building, the requirements of Article 3.2.6.6. shall apply.
   2) Where exhaust duct systems from more than one fire compartment are connected to an exhaust duct in a vertical service space, the requirements of Article 3.6.3.4. shall apply.

6.9.2.4. Ducts in Exits
   1) Where ducts penetrate fire separations separating exits from the remainder of the building, they shall be in accordance with Article 3.4.4.4.

6.9.3. Carbon Monoxide Alarms

6.9.3.1. Carbon Monoxide Alarms
   1) This Article applies to every building that contains a residential occupancy, a care occupancy with individual suites, or a care occupancy containing sleeping rooms not within a suite, and that also contains
      a) a fuel-burning appliance, or
      b) a storage garage.
   2) Carbon monoxide (CO) alarms required by this Article shall
      a) conform to CAN/CSA-6.19, “Residential Carbon Monoxide Alarming Devices,”
      b) be equipped with an integral alarm that satisfies the audibility requirements of CAN/CSA-6.19, “Residential Carbon Monoxide Alarming Devices,”
      c) have no disconnect switch between the overcurrent device and the CO alarm, where the CO alarm is powered by the electrical system serving the suite (See Note A-6.9.3.1.(2)(c).), and
      d) be mechanically fixed at a height above the floor as recommended by the manufacturer.
   3) Where a fuel-burning appliance is installed in a suite of residential occupancy or in a suite of care occupancy, a CO alarm shall be installed
      a) inside each bedroom, or
      b) outside each bedroom, within 5m of each bedroom door, measured following corridors and doorways.
   4) Where a fuel-burning appliance is installed in a service room that is not in a suite of residential occupancy nor in a suite of care occupancy, a CO alarm shall be installed
      a) either inside each bedroom, or if outside, within 5m of each bedroom door, measured following corridors and doorways, in every suite of residential occupancy or suite of care occupancy that shares a wall or floor/ceiling assembly with the service room, and
      b) in the service room.
   5) For each suite of residential occupancy or suite of care occupancy that shares a wall or floor/ceiling assembly with a storage garage or that is adjacent to an attic or crawl space to which the storage garage is also adjacent, a CO alarm shall be installed
      a) inside each bedroom, or
      b) outside each bedroom, within 5m of each bedroom door, measured following corridors and doorways.

6.9.4. Ash Storage
6.9.4.1. Ash Storage Bins
1) Every ash storage bin shall be constructed of noncombustible material.
2) Every opening in an ash storage bin shall be protected by a tight-fitting metal door with metal frame securely fastened to the bin.

6.9.4.2. Fireplaces
1) Fireplaces shall conform to the requirements of Section 9.22.

Section 6.10. Objectives and Functional Statements

6.10.1. Objectives and Functional Statements

6.10.1.1. Attributes to Acceptable Solutions
1) For the purpose of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 6.10.1.1. (See Note A-1.1.2.1.(1).)

Notes to Table 6.10.1.1.:
See Parts 2 and 3 of Division A.
Notes to Part 6
Heating, Ventilating and Air-conditioning

A-6.2.1.1. Good Engineering Practice.

Building Pressurization
New buildings tend to be considerably more airtight than older ones. Consequently, these buildings may have a reduced pressurization requirement compared to the normal requirement in order to limit drafts and provide a reasonable level of comfort.

The humidification and relative pressurization of buildings and individual spaces in buildings can be significant factors in compromising the ongoing performance of the building envelope and other environmental separators.

In new construction, HVAC designers should take this issue into consideration and confer with those responsible for the design of the environmental separators so as to limit unintended effects on the environmental separators. In existing buildings, the ability of the environmental separators to resist or accommodate increases in pressure differential or moisture loading should be considered before changes are made to the HVAC system.

Radon Control
Measures may be necessary to reduce the radon concentration to a level below the guideline specified by Health Canada.

Further information on reducing the indoor concentration of radon can be found in the following Health Canada publications:
- “Guide for Radon Measurements in Public Buildings (Schools, Hospitals, Care Facilities, Detention Centres),” and

A-6.2.1.2.(2) Outdoor Design Conditions. In the past, the practice of ventilating buildings with outdoor air assumed that the outdoor air was of better quality than the indoor air. It has become evident that the outdoor air in some areas of Canada may not be of an acceptable quality for ventilating buildings unless certain particles and gases are first removed or reduced. For particulate matter, the maximum acceptable level is the 98th percentile of the average 24-hour values; for ozone, the maximum acceptable level is the average of the average 8-hour values. A recent estimate suggests that many Canadians are exposed to contaminated outdoor air via buildings’ ventilation systems, which may lead to health problems such as cardiovascular and cerebral vascular diseases, respiratory irritation and illnesses, asthma, allergies, cancer, mucus membrane disorders and possibly death.

In order to manage the air quality of a building’s indoor environment, thus reducing the potential for adverse effects on occupants’ health, the quality of outdoor air for building ventilation purposes must be addressed. The air pollutants for which standards have been developed are particulate matter and ground-level ozone. Sentence 6.2.1.2.(2) sets limits on the maximum acceptable levels of these particles and gas that a building’s ventilation system should introduce directly to the indoor environment. These limits form part of the Canada-wide Standards for Particulate Matter (PM) and Ozone, which were established pursuant to the 1998 Canada-wide Accord on Environmental Harmonization of the Canadian Council of Ministers of the Environment (CCME) and its Canada-wide Environmental Standards Sub-Agreement. Information on related regulations is available from Environment Canada and the provincial/territorial ministries of the environment. A database of particle measurements for certain Canadian locations is available from the National Air Pollution Surveillance Network (NAPS), which is run by Environment
Division B: Acceptable Solutions

Part 6 – Heating, Ventilation and Air conditioning

Canada in conjunction with the provinces and territories. (See Subsection 1.3.2. for contact information for CCME, Environment Canada and NAPS.)

A-6.2.1.4. Structural Movement. This Article is intended to remind designers and installers of mechanical systems of one aspect of the “good engineering practice” referred to in Article 6.2.1.1. In determining how to accommodate structural movement, there are two important principles to bear in mind:

- The prime concern of the Building By-law is the safety of people in and around the building, as opposed to protection of the mechanical systems and equipment.
- The nature of the accommodation will vary with the type of movement being considered, taking into account particularly how often the movement is likely to be encountered over the life of the building.

For example, a gas line supported on columns that also support a crane must be installed in such a way that the movement of the columns, which occurs many times daily, does not cause the lines to break, thus creating a hazard. Even if the gas line installation could somehow be designed to break in a non-hazardous manner, it would hardly be recognized as good engineering practice if movement that occurs so frequently could disrupt the operation of the mechanical system.

On the other hand, earthquakes occur far less frequently and it would not be surprising to have a non-critical mechanical system fail as a result of an earthquake. However, even in this situation, the failure must occur in a manner that does not create a hazard to building occupants. For example, heavy mechanical equipment should be properly anchored so that it does not topple on building occupants during an earthquake. The design of the anchors should take into account accelerations consistent with the seismic data given in Appendix C for the location of the building. Part 4 provides guidance on the calculation of the loads such equipment would exert on the building structure during an earthquake; these same loads can be used in designing the anchors.

Some mechanical equipment can be an important component of post-disaster life safety systems. In these cases, the measures needed to accommodate the movements caused by an earthquake become even more critical since failure of the equipment would not be acceptable.

Clearly, complying with this requirement will, in most cases, necessitate close coordination between the mechanical designer and the structural designer.

For additional information on the types of structural movement that may be encountered, see Article 4.1.3.5., Sentence 4.1.3.3.(2) and Subsection 4.1.8.

A-6.2.1.6.(1) Installation – General. Ducts or pipes without dampers or valves are generally not considered to constitute “equipment” and are therefore not subject to this requirement.

A-6.3.1.1.(4) Ventilation Air Supplied to Suites. The indirect supply of required outdoor ventilation air to normally occupied spaces through corridor pressurization or other indirect systems is not permitted.

A-6.3.1.2.(1) Ventilation and Venting of Crawl Spaces and Attic or Roof Spaces. The cross-reference to Part 5 pertains to unconditioned and unoccupied crawl spaces, and attic or roof spaces, which are effectively within the building envelope. That is, unconditioned and unoccupied attic or roof spaces are located between the roof deck and roofing above, and the insulation, air barrier system and vapour barrier below. Unconditioned and unoccupied crawl spaces are located between the ground cover below and the insulation, air barrier system and vapour barrier above. Venting of these spaces has implications for the performance of the building envelope rather than having direct effects on indoor conditions. The ventilation of conditioned or occupied crawl spaces and attic or roof spaces must comply with Part 6.

The requirements in Part 5 are stated in terms of loads that must be resisted rather than in terms of building elements. Thus, the By-law user will not find explicit references in Part 5 to crawl spaces, or attic or roof spaces. Part 5 makes reference to the need for venting environmental separators, i.e., the dissipation of heat or moisture.
Sentence 6.3.1.2.(1) requires that crawl spaces be ventilated either by natural (above-grade only) or mechanical means. High moisture levels within the crawl space can lead to problems such as the formation of mould, lifting of flooring or long-term damage to structural components.

Crawl space ventilation cannot be expected to correct moisture-related problems caused by other factors like inadequate surface drainage from the foundation walls or improper protection against moisture from the ground. These conditions must be properly addressed so that crawl space ventilation can meet its intended objectives.

Several factors favour the use of mechanical ventilation rather than reliance on natural drafts. Local conditions, such as areas with high water tables, may dictate the need for mechanical ventilation to remove excessive moisture. Crawl spaces should be maintained at a negative pressure relative to the conditioned area above to prevent the migration of moisture into occupied areas. This can be achieved through the use of an exhaust fan and relying on air transfer through floor penetrations, such as pipes.

A-6.3.1.4.(1) Storage Garages. Car dealership showrooms are not considered as storage garages.

A-6.3.1.4.(2) Ventilation of Storage Garages. Storage garages are ventilated to protect occupants from exposure to carbon monoxide and other vehicular exhaust fumes. In certain cases, such as small two- or three-bay storage garages that are used for occasional vehicle storage, and where occupants are not present, carbon monoxide or nitrogen dioxide monitoring devices may be omitted if the ventilation system is interlocked with a local light switch or other controls to ensure continuous system operation whenever the area is occupied. In any event, the ventilation system capacity must be designed to limit the concentrations of carbon monoxide or nitrogen dioxide at or below the prescribed values.

A-6.3.1.6. Indoor Air Contaminants.

Contaminants of Concern
Indoor air can contain complex mixtures of contaminants of concern such as formaldehyde, legionella, mould and emissions from building materials. While some contaminants may be knowingly introduced – as in the case of processing and manufacturing environments – others may be unintentionally released into indoor environments. “Industrial Ventilation: A Manual of Recommended Practice for Design,” published by the ACGIH, and the “Exposure Guidelines for Residential Indoor Air Quality,” published by Health Canada, are useful references on the control of contaminants in industrial workplace environments and residential settings, respectively. These and other guidelines and manuals should be interpreted while keeping in mind the settings and purposes for which they were developed compared to those to which they will be applied. Note that such documents do not necessarily consider the interactions between various contaminants.

Minimizing the Growth and Spread of Bio-contaminants
Bio-contaminants, such as bacteria, mould, mildew, fungi, viruses, and pollen, can thrive or be spread by sources like drain pans, spray-water air-washers, contaminated filters, poorly maintained cooling coils, water incursion into ductwork, cafeteria dishwasher drainage leaks, high humidity and stagnant water, potentially causing a wide range of adverse health effects including respiratory allergic reactions, asthma, and infectious diseases ranging from influenza to legionnaires’ disease.

Some of the control measures are as follows:

a) Air-handling equipment should be accessible for the maintenance of filters, cooling coils and condensate drain pans located below the cooling coils. Access doors should be large and easy to open to facilitate thorough and regular maintenance.

b) If moisture is added to building ventilation air to maintain humidity levels in a designated range, humidifiers that inject steam or water vapour into central air-handling units or main supply ducts are
normally used. Injection nozzles should not be located in air-handling unit plenums or ductwork that is insulated with internal fibrous lining. If the lining becomes wet, conditions conducive to the growth and spread of bio-contaminants will result.

The above only addresses built-in features of an HVAC system that can help to minimize the growth and spread of bio-contaminants. Even more important than the built-in features is a program of regular maintenance and cleaning of those portions of the system where such growth is likely to occur.

**A-6.3.1.7.(2) Commercial Cooking Equipment** Refer to the City of Vancouver’s Kitchen Ventilation Guidelines for further information. Included is information on Design Considerations for Development Permit, Vancouver Coastal Health policy, checklists for inspections, and requirements for maintenance. This guideline is available on the City of Vancouver website.

**A-6.3.1.7.(3) Commercial Cooking Equipment** The termination is also to be designed to the satisfaction of the Director of Planning. Where there is a canopy or awning, the discharge should be located above the canopy or awning. The exhaust and make-up air locations should be determined respectful of existing discharge, make-up air, operable window, and door locations of neighbouring properties.

In some cases, the Director of Planning may not approve exhaust or make-up air wall terminations on street frontages. Wall terminations should be located where they have the least impact on nearby properties, suites, amenity areas, the public realm, windows, and building design. Generally, roof terminations are preferred and wall terminations should be located in the lane.

**A-6.3.1.7.(4) Ecologizers and Alternative Technologies** It is not the intention of the Article 6.3.1.7.(2) to prohibit technologies other than ecologizers. Other technologies that are capable of demonstrating an equivalent or better level of performance to devices listed to ULC-S647, “Standard for Exhaust Cleaning and Recirculation Assemblies for Commercial and Institutional Kitchen Exhaust Systems,” may be permitted at the discretion of the Chief Building Official provided that an acceptable technical demonstration of performance has been provided as part of a building permit submission. Such devices must also comply with all applicable metro Vancouver regulations related to air emissions, odour, and low level ozone.

**A-6.3.2.5. Duct Coverings and Linings.** The TIAC “Mechanical Insulation Best Practices Guide” is a comprehensive source of information on the selection, installation and proper use of thermal insulation materials. (Note that Section 4 of this Guide is not included in the scope of this Note as it contains information on proprietary products, which are not within the mandate of the By-law.)

**A-6.3.2.10.(5) and (6) Exhausting to Garages.** A frequent practice in the design of ventilation systems serving buildings which have associated parking garages is to discharge exhaust air from the building to the garage in order to reduce the cost of heating the garage or reduce the length of the exhaust ducts. However, this practice entails a certain amount of risk since, when the exhaust system is not running, stack effect may turn the exhaust outlets into intakes and exhaust fumes (including carbon monoxide) can be drawn from the garage into the building. Incorporating a backdraft damper at the exhaust outlet provides some additional protection but backdraft dampers are generally not regarded as being very reliable. Therefore this practice is only permitted in very limited circumstances.

**A-6.3.2.10.(6)(b) Air Contaminants.** For the purpose of Clause 6.3.2.10.(6)(b), washroom exhaust air is not considered to contain contaminants that would adversely affect the air quality in the storage garage.

**A-6.3.2.10.(7) and (8) Exhaust Ducts Connected to Laundry-Drying Equipment.** Clothes dryers are a major cause of fires in buildings often due to a build-up of lint in the system, which then ignites or obstructs the venting or ventilation. Proper cleaning and regular maintenance of lint traps is directly proportional to the ease of access to the
lint traps. It is therefore important to ensure that lint traps in multiple installations of laundry-drying equipment are installed in such a way as to allow easy access for inspection, maintenance, repair and cleaning.

A-6.3.2.10.(12)(b) Operation Diversity Factor. The operation diversity factor has to be assessed for each specific application. Good engineering practice (See Article 6.2.1.1.) design guidelines can provide information on the subject. Figure A-6.3.2.10.(12)(b), which originates from ASHRAE handbooks, provides an example of factors that can be used for general applications.

![Figure A-6.3.2.10.(12)(b)](image)

Operation diversity factor

A-6.3.3.1.(2) Requirement for Venting. Sentence 6.3.3.1.(2) requires that vented products of combustion from appliances be discharged a minimum distance away from certain outdoor spaces and building components in cases where the vented products could contaminate the air of occupiable spaces. These minimum distances may need to be increased due to local conditions such as prevailing winds, adjacent structures, special processes being carried out, specific contaminants or effluent discharges, all of which would require further analysis.

“Occupiable outdoor spaces” refers to areas that could be occupied for a duration of more than fifteen minutes at any time, but does not include maintenance spaces. Occupiable outdoor spaces are located adjacent to an indoor space and are considered to be an extension of this indoor space: e.g. main entries, balconies, patios, decks, green roofs and other public assembly areas. Although sidewalks and driveways are mentioned in the provision, these areas are not considered as occupiable outdoor spaces since they are used as transport routes to and from the building, and people are not expected to remain there for extended periods of time.

The requirements of Sentence 6.3.3.1.(2) are not meant to override similar requirements found in the installation standards referenced in Article 6.2.1.5. that address identical situations.

A-6.5.1.1.(3) Temperature of Exposed Piping. Normally piping carrying steam or high-temperature hot water at pressures above atmospheric (corresponding temperature 100°C or above) will be insulated to reduce heat losses as an economy measure. Abovea temperature of approximately 70°C, however, a bare pipe can cause a burn to human flesh coming in contact with the pipe. If pipes above this temperature are normally out of reach of all persons other than maintenance personnel or are properly guarded, it would be expected that no insulation would be needed for public safety.
A-6.9.1.2.(1) NFPA Publications Pertaining to the Heating, Ventilating and Air-Conditioning of Spaces Containing Hazardous Gases, Dusts or Liquids.
NFPA 30, “Flammable and Combustible Liquids Code”
NFPA 30A, “Motor Fuel Dispensing Facilities and Repair Garages”
NFPA 32, “Drycleaning Plants”
NFPA 33, “Spray Application Using Flammable or Combustible Materials”
NFPA 34, “Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids”
NFPA 36, “Solvent Extraction Plants”
NFPA 40, “Storage and Handling of Cellulose Nitrate Film”
NFPA 51A, “Acetylene Cylinder Charging Plants”
NFPA 61, “Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities”
NFPA 68, “Explosion Protection by Deflagration Venting”
NFPA 69, “Explosion Prevention Systems”
NFPA 86, “Ovens and Furnaces”
NFPA 88A, “Parking Structures”
NFPA 91, “Exhaust Systems for Air Conveying of Vapors, Gases, Mists, and Noncombustible Particulate Solids”
NFPA 204, “Smoke and Heat Venting”
NFPA 303, “Marinas and Boatyards”
NFPA 409, “Aircraft Hangars”
NFPA 415, “Airport Terminal Buildings, Fueling Ramp Drainage, and Loading Walkways”
NFPA 484, “Combustible Metals”
NFPA 654, “Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids”
NFPA 655, “Prevention of Sulfur Fires and Explosions”
NFPA 664, “Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities”

A-6.9.3.1.(2)(c) Carbon Monoxide Alarms. Battery-powered carbon monoxide alarms are acceptable provided that they are mechanically fastened in place.
Part 7
Plumbing Services

Section 7.1. General

7.1.1. Scope

7.1.1.1. Scope
1) The scope of this Part shall be as described in Subsection 1.3.3. of Division A.

7.1.1.2. Application
1) This Part applies to the design, construction, extension, alteration, renewal or repair of plumbing systems.

7.1.2. Design and Installation

7.1.2.1. Conformance
1) Every plumbing system shall be designed and installed in conformance with Book II (Plumbing Systems) of this By-law.

7.1.3. Required Facilities

7.1.3.1. All Buildings Except Dwelling Units
1) Buildings shall be equipped with plumbing facilities as required in Subsection 3.7.2. and Article 3.8.2.8.

7.1.3.2. Dwelling Units
1) Dwelling units shall be equipped with plumbing facilities as required in Section 9.31.

7.1.4. Definitions

7.1.4.1. Defined Terms
1) Words that appear in italics are defined in Article 1.4.1.2. of Division A.

Section 7.2. Objectives and Functional Statements

7.2.1. Objectives and Functional Statements

7.2.1.1. Attributions to Acceptable Solutions
1) For the purpose of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 7.2.1.1. (See Note A-1.1.2.1.(1).)

Part 8
Safety Measures at Construction and Demolition Sites

Section 8.1. General

8.1.1. Scope

8.1.1.1. Scope
1) The scope of this Part shall be as described in Subsection 1.3.3. of Division A.
2) This Part applies to fire safety and the protection of the public during the construction, alteration or demolition of every building, including any incompletely or abandoned building.
3) Fire safety at construction and demolition sites shall conform to CAN/CSA S350-M, “Code of Practice for Safety in Demolition of Structures,” the Fire By-law and Subsection 8.2.6 of this By-law.

8.1.1.2. Reserved

8.1.1.3. Deconstruction and Demolition Procedures
1) Measures shall be taken during demolition to protect the public in conformance with Section 5.6. of Division B.

8.1.2. Application

8.1.2.1. Application
1) Where a building is undergoing construction, construction and fire safety, measures shall be taken at the building site in conformance with this Code. (See Note A-8.1.2.1.(1).)

8.1.2.2. Protection from Risk
1) Precautions shall be taken to ensure that no person is exposed to undue risk.

8.1.3. Construction Safety Program

8.1.3.1. Requirements for Construction Safety Program
1) Unless otherwise provided in Article 8.1.3.2., before the commencement of any construction a Construction Safety Program shall be submitted to the Chief Building Official.
2) A Construction Safety Program shall include
   a) the names and emergency phone numbers of the constructor, the coordinating registered professional and the Construction Safety Officer,
   b) details of the construction procedures relating to site access, traffic control, scaffolding and swing stages, protection at excavations, hoisting equipment (including its location and scheduling), fire protection facilities, material storage, waste material disposal, control of dust and debris, protection at the perimeters of all floor levels, barricades, covered walkways and any other details required by the City Engineer, the Chief Building Official or any other city official having jurisdiction, and
   c) a construction site plan showing the location on the site of the equipment, facilities and safety measures detailed in the Construction Safety Program in accordance with Clause (b).
3) The Construction Safety Program shall be amended from time to time to reflect the current stage of construction.
8.1.3.2. Exemptions

1) A Construction Safety Program is not required for minor interior alterations contained within a suite or for minor alterations or additions to a building contain only one dwelling unit and its contained ancillary residential suites, except that the Chief Building Official may require a Construction Safety Program if, in the opinion of the Chief Building Official, the work may cause a hazard for persons occupying the building, construction workers or the public.

8.1.3.3. Posting Requirements

1) No construction shall commence until a copy of the Construction Safety Program which complies with this subsection is posted on the project site in accordance with Sentence (2).
2) The copy of the Construction Safety Program required by Sentence (1) shall be
   a) posted on a plywood board measuring no less than 600 mm by 600 mm, which is staked into the ground, protected from the weather and visible from the street, or
   b) posted on the exterior of the principal construction site shelter.
3) Notwithstanding the exceptions of 8.1.4.1.(1), a copy of the Construction Safety Program shall be posted on the project site at all times during construction.

8.1.4. Construction Safety Officer

8.1.4.1. Requirement for Construction Safety Officer

1) Except for a building containing only 2 primary dwelling units and their contained ancillary residential units, where construction of a building includes the services of a Coordinating Registered Professional, a full-time Construction Safety Officer shall be present on the project site at all times during construction.

8.1.4.2. Requirement for Site Reviews

1) During construction, the Construction Safety Officer shall carry out site reviews at least twice daily to ensure that work is proceeding safely and in conformance with the Construction Safety Program.
2) After each site review, the Construction Safety Officer shall post a copy of the site review in a location adjacent to the posted copy of the Construction Safety Program.

8.1.4.3. Site Safety Meetings Required

1) The Construction Safety Officer shall hold regular construction site safety meetings at least monthly with the constructor and a representative of each trade.

8.1.4.4. Safety Meeting Minutes

1) The Construction Safety Officer shall keep minutes of the construction site safety meetings held in accordance with Article 8.1.4.3. and copies of those minutes shall be provided to the coordinating registered professional and shall be available at the construction site for inspection by the Chief Building Official.

8.1.4.5. Violation of Construction Safety Program

1) If the Construction Safety Officer observes that a procedure set out in the Construction Safety Program is not being followed, the Construction Safety Officer shall immediately inform the appropriate trades safety coordinator or, if that person is unavailable at the site, the supervisor of the appropriate sub-contractor.
2) If corrective measures are not taken immediately by the person informed in accordance with Sentence (1), the Construction Safety Officer shall promptly inform the constructor or an agent of the constructor.
Section 8.2. Protection of the Public

8.2.1. Walkways, Fencing, Boarding and Barricades

8.2.1.1. Covered Walkways
1) If construction of a building may cause a hazard for persons using the adjacent sidewalk, work shall not commence until a covered walkway has been provided on the sidewalk in accordance with Article 8.2.1.2.
2) Despite the provisions of Sentence (1) a covered walkway is not required on a sidewalk if:
   a) the work is carried out entirely behind fencing, boarding or barricades which separate the construction site from the sidewalk, or
   b) the building is located no less than 2 m from a sidewalk used by pedestrians, except that the Chief Building Official may require a covered walkway for a site which contains a project located more than 2 m from a sidewalk if, in the opinion of the Chief Building Official, site conditions so warrant.

8.2.1.2. Covered Walkway Construction
1) A covered way shall
   a) have a clear height of not less than 2.5 m,
   b) have a clear width of not less than 1.5 m or the width of the sidewalk, whichever is the lesser,
   c) be designed and constructed to support safely all loads that may be reasonably expected to be applied to it, but in no case less than 2.4 kPa on the roof,
   d) have a weathertight roof sloped towards the site or, if flat, be equipped with a splash board not less than 300 mm high on the street side,
   e) be totally enclosed,
      i) on the construction site side with a structure having a reasonably smooth surface facing the public way,
      ii) on the construction site side of the sidewalk, and
      iii) walls with a smooth surface facing the sidewalk,
   f) have a railing 1070 mm high measured from the walking surface and located on the street side of the sidewalk if the covered way is supported by posts on the street side of the sidewalk, and
   g) constructed with sufficient lighting to enable the public to walk safely through any walkway which
   h) is constructed on a sidewalk which is illuminated by overhead street lighting at night.

8.2.1.3. Fencing, Boarding or Barricades
1) If construction which may cause a hazard to the public is located 2 m or more from a street, fencing, boarding or barricades not less than 1.8 m high shall be erected between the construction site and the street.
2) Fencing, boarding, and barricades erected in accordance with Sentence (1) shall have a smooth surface facing the street and shall be without openings, except those required for access to the construction site.
3) Access openings through fencing, boarding or barricades erected in accordance with Sentence (1) shall be equipped with gates that shall be
   a) kept closed and locked when the construction site is unattended, and
   b) maintained in place until construction is completed.

8.2.1.4. Special Hazards
1) If an unusual hazard exists on a construction site, security guards shall be posted 24 hours a day and 7 days a week, to prevent public access to the area where the unusual hazard is located.

8.2.1.5. Work Shutdown
1) All hazardous areas on a project site shall be secured against unauthorized entry at all times.
2) If workers are not present on a construction site during normal working hours,
a) all windows, doors and other openings located within 3 m of the ground shall be secured with barricades, or  
b) a fencing, boarding or barricades shall be constructed around the entire site in accordance with Article 8.2.1.3.

8.2.2. Excavation

8.2.2.1. Water Removal
   1) Excavations shall be kept reasonably clear of water.

8.2.2.2. Protection of Adjoining Property
   (See Note A-8.2.2.2.)
   1) If the stability of adjoining buildings may be endangered by the work of excavating, adequate underpinning, shoring and bracing shall be provided to prevent  
      a) damage to, or movement of, any part of the adjoining building, and  
      b) the creation of a hazard to the public.

8.2.3. Use of Streets or Public Property

8.2.3.1. Safe Passage Past Site
   1) Except as provided in Article 8.2.3.2., provisions shall be made at all times for the safe passage of pedestrian and vehicular traffic past the project site.  
   2) Material or equipment shall not be placed on any public way except as authorized by the City Engineer, the General Manager, Real Estate and Facilities Management, or the General Manager, Park Board, as the case may be.  
   3) Except as provided in Sentence (4), where a sidewalk exists adjacent to the construction site it shall be kept clear of obstructions at all times.  
   4) Where construction operations necessitate the obstruction of a sidewalk, a temporary sidewalk shall be provided and it shall be kept clear of obstruction at all times.  
   5) If construction necessitates the movement of material or equipment on or across a public way a person shall be posted to supervise the movement of the material or equipment and shall take all steps necessary to ensure the safety of pedestrians and vehicular traffic on the public way.

8.2.3.2. Overhead Construction Activities
   1) Overhead operations which may create a hazard to pedestrian or vehicular traffic shall only be carried out if the public way is closed to pedestrian and vehicular traffic.  
   2) For the purposes of Sentence (1), closure of a street, other than momentary interruptions in public use, shall only be permitted by the City Engineer if the City Engineer is satisfied that no other reasonable alternative exists to minimize the hazard to pedestrians and vehicular traffic.  
   3) For the purposes of Sentence (1), closure of a public way other than a street or park shall only be permitted by the General Manager, Real Estate and Facilities Management if the General Manager, Real Estate and Facilities Management is satisfied that no other reasonable alternative exists to minimize the hazard to pedestrians and vehicular traffic.  
   4) For the purposes of Sentence (1), closure of a park shall only be permitted by the General Manager, Park Board if the General Manager, Park Board is satisfied that no other reasonable alternative exists to minimize the hazard to pedestrians and vehicular traffic.  
   5) Permission to close a street, park or other public way as required in Sentences (2),(3), and (4) shall be applied for and obtained before the street, park or other public way is closed.

8.2.3.3. Barriers
   1) An excavation in a street or other public way or adjacent to a traffic lane where there is no sidewalk or
Division B: Acceptable Solutions

Part 8 – Safety Measures at Construction and Demolition Sites

curb, shall be protected by barriers.
2) Barriers provided for in Sentence (1) shall be constructed of concrete interlocking barriers or plastic water filled interlocking barriers sufficient to prevent pedestrian or vehicular traffic from entering the excavation.
3) Barriers provided for in Sentence (1) shall be marked with retro reflective tape, paint or delineators sufficient to make the barriers visible from dusk until dawn.”

8.2.3.4. Restoration and Repair of Streets or City Property
1) All streets, parks or other public property that have been damaged shall be restored to the satisfaction of the City Engineer, the General Manager, Real Estate and Facilities Management, or the General Manager, Park Board, as the case may be.
2) All obstructions on streets, park or other public property shall be removed as soon as the need for such obstructions is ended.

8.2.3.5. Warning Lights
1) Warning lights shall be placed and shall be in operation from dusk until dawn at all obstructions on streets or other public ways.

8.2.3.6. Maintenance of Public Ways
1) Public ways adjacent to projects shall be cleaned and maintained to the satisfaction of the City Engineer., the General Manager, Real Estate and Facilities Management, or the General Manager, Park Board, as the case may be.
2) No person shall place, park or leave construction vehicles on public ways or City property.
3) No person shall place or leave construction materials, overspills, debris, excavated materials or mud on public ways or City property.
4) No person shall dump or discharge waste water from construction activities or vehicle wash water from concrete trucks or dump trucks on public ways or City property.

8.2.4. Traffic Control

8.2.4.1. Protection of the Public on Public Ways
1) If work on a project site creates a traffic hazard on or adjacent to a public way, traffic control measures for the duration of the hazard shall include
   a) persons to direct construction workers,
   b) persons to direct traffic,
   c) appropriate warning signs indicating the presence of construction work and flagpersons.
   d) warning signs indicating any lane closures,
   e) if there is a lane closure of a vehicle travel lane, retro reflective lane control devices set up in a gradual taper to close the vehicle travel lane,
   f) if there is a lane closure of a vehicle travel lane at night, yellow flashing lights mounted on retro reflective barricades at the closure point of the vehicle travel lane,
   g) retro reflective lane control devices surrounding the closed portion of any public way, and
   h) at night, retro reflective barricades with yellow flashing lights in front of any construction material or equipment which is not marked with retro reflective sheeting.
2) If work on a construction site creates a hazard to bicycle traffic on a bikeway for more than 15 minutes, traffic control measures for the duration of the hazard must include
   a) a safe delineated continuous path for bicycle traffic or a safe alternative delineated path for pedestrian traffic,
   b) persons to supervise and direct bicycle traffic past the hazard, and
   c) if a safe alternative pedestrian path is provided, a bicycle dismount sign at either end of the path.
8.2.4.2. Traffic Control and Hazard Signs

1) Traffic control and traffic hazard signs shall be
   a) at least 75 cm by 75 cm,
   b) backed with retro reflective sheeting,
   c) marked with black text or symbols on an fluorescent orange background for hazard signs, and
   d) marked with black text or symbols on a white background for traffic control signs.

8.2.4.3. Lane Control Devices

1) A lane control device shall be
   a) a fluorescent red or orange plastic tubular marker 100 cm in diameter marked with two 8cm retro reflective bands,
   b) a fluorescent red or orange plastic cone 45 cm or 70 cm in diameter at the base with a 15 cm retro reflective band, or
   c) a fluorescent red or orange plastic flexible drum with two 10 inch retro reflective bands.

8.2.4.4. Traffic Control Person

1) A person directing traffic on a public way shall
   a) carry written proof of completion of a traffic control course approved under the authority of the Workers’ Compensation Act of British Columbia or the British Columbia Safety Council,
   b) wear personal protective equipment approved under the authority of the Workers’ Compensation Act of British Columbia including a safety vest, hard hat, reflective wrist straps, and safety footwear approved under the authority of the Canadian Standards Association,
   c) use a traffic control paddle consisting of a “STOP” sign marked with white letters on a retro reflective red background and a “SLOW” sign marked with black letters on a retro reflective yellow background, and
   d) use a flashlight that includes a red signaling hood for night traffic conditions.

8.2.4.5. Construction Vehicle Traffic Hazard

1) If the location or use of a vehicle related to a construction site creates a traffic hazard on a public way adjacent to a construction site, the vehicle shall display
   a) a 360 degree yellow flashing light,
   b) four way flashers, and
   c) a flashing arrow board.

8.2.5. Waste Material

8.2.5.1. Control of Waste Material

1) Waste material or other material shall not be permitted to fall freely from one storey to another.

8.2.5.2. Removal of Waste Material

1) Waste material shall be removed as quickly as possible by means of
   a) appropriate containers,
   b) an enclosed shaft or chute conforming to Sentence 8.2.5.4.(1), or
   c) a hoisting apparatus if large pieces or objects are involved.

8.2.5.3. Enclosures for Waste Material

1) Waste material removed in accordance with Sentence 8.2.5.2.(1) shall be deposited in a container which is
   a) designed to ensure that waste material cannot escape from the container, and
   b) secure and inaccessible to the public.
8.2.5.4. Chutes for Waste Material
1) The chute described in Clause 8.2.5.2.(1)(b) shall be closed if it is inclined more than 45° to the horizontal.

8.2.5.5. Disposal of Waste Material
1) Except as provided in Sentence (2), all waste material on a construction site shall be sorted, diverted and disposed of in a manner satisfactory to the Chief Building Official. (See Note A-8.2.5.5.(1).)
2) Sentence (1) does not apply to
   a) proposed work of a value of $50,000 or less, and
   b) corrective measures or immediate measures carried out by the Chief Building Official in accordance with Articles 1.5.3.4. and 1.5.3.5.

8.2.6. Fire Safety Measures

8.2.6.1. Application
(See Note A-8.2.6.1.)
1) This Subsection applies to fire safety for projects undergoing construction and adjacent projects.

8.2.6.2. Protection of Adjacent Buildings
(See Note A-8.2.6.2.)
1) Protection shall be provided for adjacent buildings that could be exposed to fire originating from buildings undergoing construction.

8.2.6.3. Fire Safety Plan
1) Before the commencement of construction, a fire safety plan for the project site shall be submitted to and accepted by the Chief Building Official.
2) Unless otherwise required by Sentence (3), a fire safety plan shall conform with the requirements of the Fire By-law and shall include
   a) measures to reduce fire hazards in and around the building (See Note A-8.2.6.3.(2)(a).), and
   b) a maintenance program for firefighting measures required by the Fire By-law.
3) Where construction occurs in an existing building that is required to have a fire safety plan conforming to the Fire By-law, the existing fire safety plan shall be modified to incorporate the alterations to the existing building.

8.2.6.4. Access for Firefighting
1) Unobstructed access to fire hydrants, portable extinguishers and fire department connections for standpipe and sprinkler systems shall be maintained on all construction sites.
2) Firefighters shall be provided with unobstructed access to all levels of the building.
3) Firefighters shall be provided with unobstructed access to all elevators, hoists or lifts in the building.
4) Firefighters shall be provided with unobstructed access to access routes for firefighting vehicles.
5) Where a project site is enclosed by fencing, boarding or barricades, firefighters shall be provided with 24 hour emergency access for fire department equipment and personnel.

8.2.6.5. Portable Extinguishers
1) Portable extinguishers shall be provided in unobstructed locations in all areas where
   a) hot work operations are carried out,
   b) combustibles are stored,
   c) internal combustion engines are located,
   d) flammable liquids and combustible liquids or gases are stored or handled, and temporary fuel-fired equipment is used.
2) Portable extinguishers required by Sentence (1) shall have a minimum rating of:
   a) 2-A:10-B:C on moveable equipment, and
   b) 4-A:40-B:C in all other locations.

8.2.6.6. Standpipe Systems
(See Note A-8.2.6.6.)
1) Where a standpipe system is installed in a building under construction, the standpipe system shall be installed progressively, in conformance with Subsection 3.2.5. of Division B of this By-law, in occupied portions of a building.
2) Where a standpipe system is to be installed progressively in unoccupied portions of a building under construction, a permanent or temporary standpipe system is permitted, and the standpipe system shall have:
   a) conspicuously marked and readily accessible fire department connections on the outside of the building at street level
   b) at least one hose outlet at each floor,
   c) pipe size, hose valves and water supply conforming to Subsection 3.2.5. of Division B of this By-law,
   d) as a minimum, secure supports and restraints on alternate floors,
   e) at least one hose valve for attaching fire department hose at each intermediate landing or floor level in the exit stairway, and
   f) valves which are kept closed and protected from mechanical damage at all times.
3) A standpipe system installed in accordance with Sentence (2) shall be progressively installed so that it is no more than one floor below the highest forms, staging, and similar combustible construction materials at all times.
4) A temporary standpipe system shall remain in service until the installation of the permanent standpipe system is complete.
5) If a building equipped with a standpipe system is being deconstructed or demolished floor by floor, the standpipe system, together with all fire department connections and valves, shall be maintained in operable condition at all times on all storeys, except for the storey located immediately below the storey being deconstructed or demolished.

8.2.6.7. Hot Surface Applications
1) Roofing operations and other surface applications that involve heat sources and hot processes shall be considered hot works and shall conform to the requirements in the Fire By-law.
2) Bitumen kettles shall not be located on roofs, and shall be:
   a) provided with a close-fitting cover constructed of steel with a minimum thickness of No. 14 sheet metal gauge,
   b) under constant supervision when in operation, and
   c) maintained free of excessive residue.
3) Mops used to spread bitumen shall be stored in a safe location at a safe distance away from buildings, when not in use.

8.2.6.8. Ignition Sources
(See Note A-8.2.6.8.)
1) Internal combustion engines, temporary heating equipment and other equipment capable of causing ignition shall be kept at a safe distance away from combustible materials.
2) The clearance between combustible materials and temporary heating equipment, including flues, shall be in conformance with Part 6 or in conformance with the minimum clearances shown on certified heating equipment.

8.2.6.9. Utility Services to Buildings under Construction
1) Except as required in Sentence (3) and except for water supplies for firefighting, utility services shall be...
Division B: Acceptable Solutions  
Part 8 – Safety Measures at Construction and Demolition Sites

8.2.6.10. Fuel Supply Installation
1) Fuel supplies for heating equipment and internal combustion engines shall conform to
   a) CAN/CSA-B139-M, “Installation Code for Oil-Burning Equipment,” or
   b) the British Columbia Gas Safety Regulation.

8.2.6.11. Safety of Fuel Tanks and Piping at Construction Sites
1) Fuel tanks and piping at a deconstruction or demolition site which contain or may have contained
   flammable or combustible liquids or vapours shall be decommissioned in conformance with the Fire By-law.
2) Fuel tanks and piping at a deconstruction or demolition site which contain or may have contained
   flammable or combustible liquids or vapours shall be drained or vented and removed prior to the
   deconstruction or demolition of a building, except as permitted by Sentence (3).
3) Where it is impracticable to remove fuel tanks or piping from the construction site prior to deconstruction
   or demolition of a building, such equipment shall be tagged for identification and removed as soon as
   conditions permit.
4) Fuel tanks and piping referred to in Sentences (1), (2) and (3) shall be purged with inert materials prior to
   deconstruction or demolition of a building. (See Note A-8.2.6.11.(4).)

8.2.6.12. Fire Separations in Partly Occupied Buildings
1) Where part of a building under construction is occupied, the occupied part of the building shall be
   separated from the part of the building under construction by a fire separation having a fire-resistance rating
   of no less than 1 h.

8.2.6.13. Protection During Fire Protection System Shutdown
1) Except as permitted in Sentence (2), where a fire protection system is provided, it shall remain operational
   throughout the entire building during construction.
2) If any portion of a fire protection system is temporarily shut down during construction, protection of the
   building shall comply with the Fire By-law.

8.2.6.14. Requirement for Fire Watch
1) If a building is partly occupied and part of the building is undergoing deconstruction or demolition, a fire watch shall be maintained at all times, unless the building is provided with an active fire alarm system.
2) A fire watch as required by Sentence (1) shall include:
   a) a complete tour of inspection of the project at least once every hour,
   b) facilities to provide a fire warning to occupants, to the satisfaction of the Chief Building Official, and
   c) facilities to communicate with the fire department in the event of fire, to the satisfaction of the Chief Building Official.

8.2.6.15. Smoking Restrictions on Construction Sites
1) Smoking shall only be permitted on construction sites in accordance with the Fire By-law.
8.2.6.16. Egress from Buildings under Construction
1) In buildings under construction, there shall be at least one exit which is accessible and usable at all times.
2) In buildings under construction, there shall be at least one stairway maintained in usable condition at all times.

8.2.6.17. Fire Warning in Buildings under Construction
1) Facilities shall be provided to alert persons on a project to the presence of a fire and such facilities shall be audible throughout the building.

8.2.6.18. Storage and Use of Dangerous Goods on Construction Sites
1) Combustible liquids and flammable liquids shall be stored and used in conformance with the Fire By-law.
2) Dangerous goods and materials shall be stored and used in conformance with the Fire By-law.
3) Dangerous goods and materials shall be stored and used in conformance with the British Columbia Gas Safety Regulations.

8.2.6.19. Temporary Enclosures on Construction Sites
1) Fabrics and films used to temporarily enclose buildings shall be securely fastened to prevent contact with heaters or other ignition sources.

8.2.6.20. Storage of Combustible Refuse
1) Combustible refuse shall be stored a safe distance away from buildings, and at a safe location. (See also Subsection 8.2.5.)

8.2.6.21. Shut-off of Utility Services at Excavation Sites
1) Except as provided in Article 8.2.6.22., before excavation begins, utility services shall be shut off, and terminated outside the limits of the excavation and the terminations shall be labeled so as to be easily identifiable. (See also Sentence 8.2.6.9. (1).)
2) A utility service provider whose service connections will be affected by construction shall be notified before any service connections are terminated in accordance with Sentence (1).
3) If it is necessary to maintain any utility service, during excavation, the utility service shall be
   a) relocated as necessary, and
   b) protected from damage.

8.2.6.22. Maintaining Existing Utility Services
1) Existing utility services may be left within the area of the excavation if
   a) the service company consents to the location of the services before the excavation begins,
   b) a method of excavation is adopted which ensures that the services are not damaged, and the services are provided with temporary support.

Section 8.3. Objectives and Functional Statements

8.3.1. Objectives and Functional Statements

8.3.1.1. Attributions to Acceptable Solutions
1) For the purpose of compliance with this Code as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 8.3.1.1. (See Note A-1.1.2.1.(1).)

**Notes to Table 8.3.1.1.:**

(1) See Parts 2 and 3 of Division A.
Notes to Part 8
Safety Measures at Construction and Demolition Sites

A-8.1.2.1.(1) Application. The use of streets or public property and vehicular traffic during construction or demolition is normally controlled by regulations of authorities other than the building department (e.g., police department).

A-8.2.2.2. Protection of Adjacent Properties The requirements of 8.2.2.2. apply to projects of all sizes where there exists the potential for unintended movement of bearing surfaces as a consequence of proposed or prior, soil disturbance or excavation. Designers should take care that appropriate assessments of the existing conditions have been carried out before relying upon shallow foundation design principles, as this may lead to concerns over soil movement, slope stability and the impact on adjacent properties and City infrastructure. Owners considering deeper basements, or work in areas containing peat, liquefiable, or potentially unstable soils (such as adjacent to site where the amount of native untouched fill is unknown), should obtain assistance from qualified professionals before undertaking such work. Guidance for geotechnical and foundation design work for one and two family homes is provided in the “Housing Foundations and Geotechnical Challenges – Best Practices for Residential Builders in BC” publication.

A-8.2.5.5.(1) Disposal of Waste Material Certain waste materials are banned or prohibited from disposal at a garbage or landfill site. The Greater Vancouver Sewerage and Drainage District Act and its regulations, and the City of Vancouver Solid Waste By-law No. 8417 lists materials that are restricted or prohibited from disposal at a garbage or landfill sites. Sorted material means the separation of waste materials into like type materials at the construction site prior to disposal. Diverted material means the reuse, recycle or recovery of sorted waste material to avoid disposal at a garbage, landfill or incinerator facility.

A-8.2.6.1. Application The degree of application should be determined in advance in conjunction with the Chief building Official. Each operation should be determined in advance, as part of the fire safety plan for the operation, taking into consideration such issues as the size of the operation, exposure of adjacent buildings or facilities to hazards and the site conditions. Operations can range from large multi-storey buildings to small single-storey residences and may include additions or alterations to existing buildings. Where the work does not pose an exposure hazard to other buildings or to occupants, the application of Subsection 8.2.6. may be minimal.

A-8.2.6.2. Protection of Adjacent Buildings Methods and materials used to protect adjacent buildings and facilities can range from active to passive systems such as spatial separation, installing water curtains, using construction methods and materials that include gypsum sheathing or erecting a temporary fire barrier such as a fire tarpaulin.

A-8.2.6.3.(2)(a) Fire Safety Plan The control of fire hazards in and around buildings under construction, renovation or demolition includes fire protection for combustible material construction and combustible refuse on the site. The size of material and refuse piles and the location of these piles in relation to adjacent buildings are factors that should be taken into consideration in determining which fire protection measures to implement. The selection of fire protection measures for demolition operations will also depend on the demolition procedure being used, the specific conditions existing on the site and the firefighting capabilities of the responding fire department. It is the intent of this By-law that the Outdoor Storage requirements of the Fire By-law are in compliance on all construction and demolition sites.
A-8.2.6.6. **Standpipe Systems** Not all aspects of Subsection 3.2.5. of Division B of the Building By-law are applicable to unoccupied areas of buildings, parts of buildings, facilities and associated areas undergoing construction, alteration or demolition operations. When the temperature causes freezing conditions, the standpipe should be drained to prevent damage to the equipment. It is not expected that hoses and nozzles be made available in the building undergoing construction, alteration or demolition operations, as they will be brought to the relevant floor by the responding fire department.

A-8.2.6.8. **Ignition Sources** Minimum clearances shown on certified heating equipment or as described in Part 6 of Division B of the Building By-law should be provided between combustible materials and temporary heating equipment, including flues such as exhaust discharges from internal combustion engines.

A-8.2.6.11.(4) **Safety of Fuel Tanks and Piping at Construction Sites** Guidance on methods of rendering inert tanks, piping and machinery reservoirs is available in NFPA 326, “Standard for the Safeguarding of Tanks and Containers for Entry, Cleaning, or Repair.”
Part 9  
Housing and Small Buildings

Section 9.1.  General

9.1.1.  Application

9.1.1.1.  General Application
1) The application of this Part shall be as described in Subsection 1.3.3. of Division A. (See Note A-9.1.1.1.(1) regarding application to seasonally and intermittently occupied buildings.)
2) When an existing building is altered and the alteration triggers upgrading as determined in Division B Section 11.2., the alternative acceptable solutions provided in Division B, Sections 11.3., 11.4., 11.5. and 11.6. may apply in lieu of the requirements of this Part. (See Article 1.1.1.2. of Division A.)

9.1.2.  Reserved

Section 9.2.  Definitions

9.2.1.  General

9.2.1.1.  Defined Words
1) Words in italics are defined in Article 1.4.1.2. of Division A.

Section 9.3.  Materials, Systems and Equipment

9.3.1.  Concrete

9.3.1.1.  General
1) Except as provided in Sentence (2) and Articles 9.3.1.6. and 9.3.1.7., unreinforced and nominally reinforced concrete shall be designed, mixed, placed, cured and tested in accordance with the requirements for “R” class concrete stated in Section 9 of CSA A23.1, “Concrete Materials and Methods of Concrete Construction.”
2) Unreinforced and nominally reinforced site-batched concrete shall be designed, mixed, placed and cured in accordance with Articles 9.3.1.2. to 9.3.1.9.
3) Except as provided in Sentence (4), reinforced concrete shall be designed to conform to the requirements of Part 4.
4) For flat insulating concrete form walls not exceeding 2 storeys in building height and having a maximum floor to floor height of 3 m, in buildings of light-frame construction containing only a single dwelling unit, the concrete and reinforcing shall comply with Part 4 or
   a) the concrete shall conform to CSA A23.1, “Concrete Materials and Methods of Concrete Construction,” with a maximum aggregate size of 19 mm, and
   b) the reinforcing shall
      i) conform to CSA G30.18, “Carbon Steel Bars for Concrete Reinforcement,”
      ii) have a minimum specified yield strength of 400 MPa, and
      iii) be lapped a minimum of 450 mm for 10M bars and 650 mm for 15M bars (See also Articles 9.15.4.5. and 9.20.17.2. to 9.20.17.4.).

9.3.1.2.  Cement
1) Cement shall meet the requirements of CSA A3001, “Cementitious Materials for Use in Concrete.”

9.3.1.3. Concrete in Contact with Sulphate Soil
1) Concrete in contact with sulphate soil, which is deleterious to normal cement, shall conform to the requirements in Clause 4.1.1.6 of CSA A23.1, “Concrete Materials and Methods of Concrete Construction.”

9.3.1.4. Aggregates
1) Aggregates shall
   a) consist of sand, gravel, crushed rock, crushed air-cooled blast furnace slag, expanded shale or expanded clay conforming to CSA A23.1, “Concrete Materials and Methods of Concrete Construction,” and
   b) be clean, well-graded and free of injurious amounts of organic and other deleterious material.

9.3.1.5. Water
1) Water shall be clean and free of injurious amounts of oil, organic matter, sediment or any other deleterious material.

9.3.1.6. Compressive Strength
(See also Article 9.12.4.1., Sentence 9.15.4.2.(1) and Article 9.18.6.1.)
1) Except as provided elsewhere in this Part, the compressive strength of unreinforced concrete after 28 days shall be not less than
   a) 15 MPa for walls, columns, fireplaces and chimneys, footings, foundation walls, grade beams and piers,
   b) 20 MPa for floors other than those in garages and carports, and
   c) for garage and carport floors, and the exterior steps,
      i) 32 MPa, or
      ii) 30 MPa where indigenous aggregates do not achieve 32 MPa with a 0.45 water to cementing material ratio.
2) Site-batched concrete used for garage and carport floors and exterior steps shall have air entrainment of 5 to 8%.

9.3.1.7. Concrete Mixes
(See Note A-9.3.1.7.)
1) For pre-mixed concrete and for the site-batched concrete mixes described in Table 9.3.1.7., the maximum ratio of water to cementing materials measured by weight shall not exceed
   a) 0.70 for walls, columns, fireplaces and chimneys, footings, foundation walls, grade beams and piers,
   b) 0.65 for floors other than those in garages and carports, and
   c) 0.45 for garage and carport floors, and exterior steps.

Site-Batched Concrete Mixes
Forming Part of Sentence 9.3.1.7.(1)
Notes to Table 9.3.1.7.:
(1) 1 part cementing material = 1 × 40 kg bag

2) The size of aggregate in unreinforced site-batched concrete mixes referred to in Sentence (1) shall not exceed
   a) 1/5 the distance between the sides of vertical forms, or
   b) 1/3 the thickness of flatwork.

9.3.1.8. Admixtures
1) Admixtures shall conform to ASTM C 260, “Air-Entraining Admixtures for Concrete,” or
   ASTM C 494/C 494M, “Chemical Admixtures for Concrete,” as applicable.

9.3.1.9. Cold Weather Requirements
1) When the air temperature is below 5°C, concrete shall be
   a) kept at a temperature of not less than 10°C or more than 25°C while being mixed and placed,
   b) maintained at a temperature of not less than 10°C for 72 h after placing.
2) No frozen material or ice shall be used in concrete described in Sentence (1).

9.3.2. Lumber and Wood Products

9.3.2.1. Grade Marking
1) Lumber for joists, rafters, trusses and beams and for the uses listed in Table 9.3.2.1. shall be identified by
   a grade stamp to indicate its grade as determined by NLGA 2014, “Standard Grading Rules for Canadian
   Lumber.” (See Note A-9.3.2.1.(1).)

**Notes to Table 9.3.2.1:**

1. See Note A-Table 9.3.2.1.

#### 9.3.2.2. Lumber Grades

1) Except for joists, rafters, trusses and beams, visually graded lumber shall conform to the grades in Table 9.3.2.1. (See Article 9.23.4.2. for joists, rafters and beams and Article 9.23.14.11. for trusses.)

#### 9.3.2.3. Machine Stress Rated Lumber

1) Machine stress rated lumber shall conform to the requirements of Subsection 4.3.1.

#### 9.3.2.4. OSB, Waferboard and Plywood Marking

1) OSB, waferboard and plywood used for roof sheathing, wall sheathing and subflooring shall be legibly identified on the face of the material indicating
   a) the manufacturer of the material,
   b) the standard to which it is produced, and
   c) that the material is of an exterior type.

#### 9.3.2.5. Moisture Content

1) Moisture content of lumber shall be not more than 19% at the time of installation.

#### 9.3.2.6. Lumber Dimensions

1) Lumber dimensions referred to in this Part are actual dimensions determined in conformance with CSA O141, “Softwood Lumber.”

#### 9.3.2.7. Panel Thickness Tolerances

1) The thicknesses specified in this Part for plywood, hardboard, particleboard, OSB and waferboard shall be subject to the tolerances permitted in the standards referenced for these products unless specifically indicated herein.

#### 9.3.2.8. Undersized Lumber
1) Joist, rafter, lintel and beam members up to 5% less than the actual Canadian standard sizes are permitted to be used provided the allowable spans for the grade and species of lumber under consideration are reduced 5% from those shown in the Span Tables for full size members. (See Note A-9.3.2.8.(1).)

9.3.2.9. Termite and Decay Protection

1) In localities where termites are known to occur,
   a) clearance between structural wood elements and the finished ground level directly below them shall be not less than 450 mm and, except as provided in Sentence (2), all sides of the supporting elements shall be visible to permit inspection, or
   b) structural wood elements, supported by elements in contact with the ground or exposed over bare soil, shall be pressure-treated with a chemical that is toxic to termites.

   (See Note A-9.3.2.9.(1).)

2) In localities where termites are known to occur and foundations are insulated or otherwise finished in a manner that could conceal a termite infestation,
   a) a metal or plastic barrier shall be installed through the insulation and any other separation or finish materials above finished ground level to control the passage of termites behind or through the insulation, separation or finish materials, and
   b) all sides of the finished supporting assembly shall be visible to permit inspection.

3) Structural wood elements shall be pressure-treated with a preservative to resist decay,
   a) where the vertical clearance between structural wood elements and the finished ground level is less than 150 mm (See also Articles 9.23.2.2. and 9.23.2.3.), or
   b) where
      i) the wood elements are not protected from exposure to precipitation,
      ii) the configuration is conducive to moisture accumulation, and
      iii) the moisture index is greater than 1.00.

   (See Note A-9.3.2.9.(3).)

4) Structural wood elements used in retaining walls and cribbing shall be pressure-treated with a preservative to resist decay, where
   a) the retaining wall or cribbing supports ground that is critical to the stability of building foundations, or
   b) the retaining wall or cribbing is greater than 1.2 m in height.

   (See Note A-9.3.2.9.(4).)

5) Where wood is required by this Article to be treated to resist termites or decay, such treatment shall be in accordance with Table 2, Use Categories for Specific Products, Uses, and Exposures, of CAN/CSA-O80.1, “Specification of Treated Wood,” as follows:
   a) Use Category 1 (UC1), where the wood member is used in
      i) interior construction,
      ii) above-ground applications, and
      iii) applications where the wood member remains dry,
   b) Use Category 2 (UC2), where the wood member is used in
      i) interior construction,
      ii) above-ground applications, and
      iii) applications where the wood member may be subjected to occasional sources of moisture,
   c) Use Category 3.2 (UC3.2), where the wood member is used in
      i) exterior construction,
      ii) above-ground applications, and
      iii) applications where the wood member is uncoated or is used in a configuration conducive to moisture accumulation,
   d) Use Category 4.1 (UC4.1), where
      i) the wood member is in contact with the ground,
ii) the wood member is in contact with fresh water, or
iii) the vertical clearance between the wood element and the finished ground level is less than 150 mm and the wood elements are not separated from permeable supporting materials by a moisture barrier, or
e) Use Category 4.2 (UC4.2), where the wood member is used in critical structural components, including permanent wood foundations.

6) Where wood is protected in accordance with UC1 or UC2 using an inorganic boron preservative, the wood shall be
a) protected from direct exposure to water during and after the completion of construction, and
b) separated from permeable supporting materials by a moisture barrier that is resistant to all expected mechanisms of deterioration in the service environment if the vertical clearance to the ground is less than 150 mm.

7) Wood that is required by this Article to be treated to resist termites or decay shall be identified by a mark to indicate the type of preservative used and conformance to the relevant required Use Category.

9.3.3. Metal

9.3.3.1. Sheet Metal Thickness
1) Minimum thicknesses for sheet metal material that are stated in this Part refer to the actual minimum base metal thicknesses measured at any point of the material and, in the case of galvanized steel described in Sentence 9.3.3.2.(1), include the thickness of the galvanizing coating unless otherwise indicated.

9.3.3.2. Galvanized Sheet Steel
1) Where sheet steel is required to be galvanized, it shall be metallic-coated with zinc or an alloy of 55% aluminum-zinc meeting the requirements of
   a) ASTM A 653/A 653M, “Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process,” or
   b) ASTM A 792/A 792M, “Steel Sheet, 55% Aluminum-Zinc Alloy-Coated by the Hot-Dip Process.”
2) Where galvanized sheet steel is intended for use in locations exposed to the weather or as a flashing material, it shall have a zinc coating not less than the G90 [Z275] coating designation or an aluminum-zinc alloy coating not less than the AZM150 coating designation, as referred to in Sentence (1).

Section 9.4. Structural Requirements

9.4.1. Structural Design Requirements and Application Limitations

9.4.1.1. General
(See Note A-9.4.1.1.)
1) Subject to the application limitations defined elsewhere in this Part, structural members and their connections shall
   a) conform to requirements provided elsewhere in this Part,
   b) be designed according to good engineering practice such as that provided in CWC 2014, “Engineering Guide for Wood Frame Construction,” or
   c) be designed according to Part 4 using the loads and deflection and vibration limits specified in
      i) Part 9, or
2) Where floor framing is designed in accordance with Clause (1)(b) or (c), and where supporting wall framing and fastenings, or footings, are designed according to Clause (1)(a), the maximum specified live load on the floor according to Table 4.1.5.3. shall not exceed 2.4 kPa.
3) Location-specific information for structural design, including snow and wind loads and seismic spectral response accelerations, shall be determined according to Subsection 1.1.3.

4) A registered professional who undertakes design work and field review for the structural design of a building of residential occupancy containing not more than two principal dwelling units shall provide a note on the structural drawings which provides assurance that the design of the structure has been reviewed for resistance to the structural requirements of Division B Section 9.4.

9.4.2. Specified Loads

9.4.2.1. Application
1) This Subsection applies to light-frame constructions whose wall, floor and roof planes are generally comprised of frames of small repetitive structural members, and where
   a) the roof and wall planes are clad, sheathed or braced on at least one side,
   b) the small repetitive structural members are spaced not more than 600 mm o.c.,
   c) the clear span of any structural member does not exceed 12.2 m,
   d) the maximum deflection of the structural roof members conforms to Article 9.4.3.1.,
   e) the maximum total roof area, notwithstanding any separation of adjoining buildings by firewalls, is 4 550 m², and
   f) for flat roofs, there are no significant obstructions on the roof, such as parapet walls, spaced closer than the distance calculated by
      \[ D_o = 10(H_o - 0.8S_s/\gamma) \]
      where
      \[ D_o \] = minimum distance between obstructions, m,
      \[ H_o \] = height of the obstruction above the roof, m,
      \[ S_s \] = ground snow load, kPa, and
      \[ \gamma \] = specific weight of snow, kN/m³.
(See Note A-9.4.2.1.(1).)

9.4.2.2. Specified Snow Loads
(See Note A-9.4.2.2.)
1) Except as provided in Sentences (2) and (3), specified snow loads shall be not less than those calculated using the following formula:
   \[ S = C_b S_s + S_r \]
   where
   \[ S \] = specified snow load,
   \[ C_b \] = basic snow load roof factor, which is 0.45 where the entire width of the roof does not exceed 4.3 m and 0.55 for all other roofs,
   \[ S_s \] = 1-in-50-year ground snow load in kPa, determined according to Subsection 1.1.3., and
   \[ S_r \] = associated 1-in-50-year rain load in kPa, determined according to Subsection 1.1.3.
2) In no case shall the specified snow load be less than 1 kPa.
3) Bow string, arch or semi-circular roof trusses having an unsupported span greater than 6 m shall be designed in conformance with the snow load requirements in Subsection 4.1.6.

9.4.2.3. Platforms Subject to Snow and Occupancy Loads
1) Balconies, decks and other accessible exterior platforms intended for an occupancy and subject to snow loads shall be designed to carry the specified roof snow load or 1.9 kPa, whichever is greater, where the platform, or each segregated area of the platform, serves a single dwelling unit. (See Note A-9.4.2.3.(1).)

9.4.2.4. Attics and Roof Spaces
1) The ceiling joists or truss bottom chords in residential attic or roof spaces having limited accessibility that precludes the storage of equipment or material shall be designed for a total specified load of not less than
0.35 kPa, where the total specified load is the sum of the specified dead load plus the specified live load of the ceiling. (See Note A-9.4.2.4.(1).)

9.4.3. Deflections

9.4.3.1. Deflections

1) The maximum deflection of structural members shall conform to Table 9.4.3.1.
2) Dead loads need not be considered in computing deflections referred to in Sentence (1).

9.4.4. Foundation Conditions

9.4.4.1. Allowable Bearing Pressures

1) Footing sizes for shallow foundations shall be
   a) determined in accordance with Section 9.15., or
   b) designed in accordance with Section 4.2. using
      i) the maximum allowable bearing pressures in Table 9.4.4.1., or
      ii) allowable bearing pressures determined from subsurface investigation.

</tbody>
</table>

**Notes to Table 9.4.4.1.:**

1. See Note A-Table 9.4.4.1.

#### 9.4.4.2. Foundation Capacity in Weaker Soil and Rock

1. Where a soil or rock within a distance equal to twice the footing width below the bearing surface has a lower allowable bearing pressure than that at the bearing surface as shown in Article 9.4.4.1., the design capacity of the foundation shall not be greater than would cause the weakest soil or rock to be stressed beyond its allowable bearing pressure.

2. In calculating subsurface pressures referred to in Sentence (1), the loads from the footings shall be assumed to be distributed uniformly over a horizontal plane within a frustum extending downward from the footing at an angle of 60° to the horizontal.

#### 9.4.4.3. High Water Table

1. Where a foundation bears on gravel, sand or silt, and the water table is within a distance below the bearing surface equal to the width of the foundation, the allowable bearing pressure shall be 50% of that determined in Article 9.4.4.1.

#### 9.4.4.4. Soil Movement

1. Where a foundation is located in an area where soil movement caused by changes in soil moisture content, freezing, or chemical-microbiological oxidation is known to occur to the extent that it will damage a building, measures shall be taken to preclude such movement or to reduce its effects on the building so that the building's stability and the performance of assemblies will not be adversely affected. (See Note A-9.4.4.4.(1).)

2. The potential for slope instability and its consequences, such as slope displacement, shall be evaluated based on site-specific material properties and ground motion parameters referenced in Subsection 1.1.3. and shall be taken into account in the design of the structure and its foundations.

#### 9.4.4.5. Retaining Walls

1. Walls shall be designed to resist the lateral pressure of the retained material.

#### 9.4.4.6. Walls Supporting Drained Earth

(See Note A-9.4.4.6. and Article 9.15.1.1.)

1. Except where constructed in accordance with Section 9.15., walls supporting drained earth shall be designed for a pressure equivalent to that exerted by a fluid that has a density of not less than 480 kg/m³ and a depth equal to a) that of the retained earth, or

2. in accordance with Section 4.2. so as to be able to resist the loads and effects described in Article 4.1.2.1.

2. Walls supporting other than drained earth shall be designed...
a) for the pressure described in Clause (1)(a) plus the fluid pressure of the surcharge, or
b) in accordance with Section 4.2. so as to be able to resist the loads and effects described in
Article 4.1.2.1.

Section 9.5. Design of Areas and Spaces

9.5.1. General

9.5.1.1. Method of Measurement
1) Unless otherwise indicated herein, dimensions of rooms or spaces shall be measured between finished
wall surfaces and between finished floor and ceiling surfaces.

9.5.1.2. Combination Rooms
(See Note A-9.5.1.2.)
1) Two or more areas may be considered as a combination room if the opening between the areas occupies
the larger of 3 m² or 40% or more of the area of the wall measured on the side of the dependent area.
2) Where the dependent area is a bedroom, direct passage shall be provided between the two areas.

9.5.2. Access for Persons with Disabilities

9.5.2.1. General
1) Except as provided in Article 3.8.2.1., every building shall be designed in conformance with Section 3.8.

9.5.2.2. Protection on Accessible Floor Areas
1) Where access is required on any floor area, the requirements in Article 3.3.1.7. shall apply.

9.5.2.3. Reserved

9.5.3. Ceiling Heights

9.5.3.1. Ceiling Heights of Rooms or Spaces
1) The ceiling heights and clear heights in rooms or spaces in residential occupancies shall conform to Table
9.5.3.1.
2) Reserved.
3) Reserved.
4) Areas in rooms or spaces over which ceiling height and clear height are not less than the minimum
specified in Table 9.5.3.1. shall be contiguous with the entry or entries to those rooms or spaces

<table>

<td></td>
</tr>
</tbody>
</table>

**Notes to Table 9.5.3.1.:**
(1) Area of the space shall be measured at floor level.

### 9.5.3.2. Mezzanines
1) The ceiling height above and below a mezzanine floor assembly in occupancies other than residential occupancies shall be not less than 2.1 m.

### 9.5.3.3. Storage Garages
1) The clear height in a storage garage shall be not less than 2 m.

### 9.5.4. Hallways

#### 9.5.4.1. Hallway Width
1) The unobstructed width of a hallway within a dwelling unit shall be not less than 860 mm, except that the hallway width is permitted to be 710 mm where:
   a) there are only bedrooms and bathrooms at the end of the hallway furthest from the living area, and
   b) a second exit is provided
      i) in the hallway near the end farthest from the living area, or
      ii) in each bedroom served by the hallway.

### 9.5.5. Doorway Sizes

#### 9.5.5.1. Doorway Opening Sizes
1) Except as provided in Articles 9.5.5.3., 9.9.6.2. and 9.9.6.3., doorway openings within dwelling units shall be designed to accommodate at least the door sizes given in Table 9.5.5.1. for swing-type and folding doors.
2) Reserved.

</tbody>
</table>

Notes to Table 9.5.5.1.:
(1) See Article 9.5.5.3.

9.5.5.2. Doorways to Public Water-Closet Rooms
1) Doorways to public water-closet rooms shall be not less than 810 mm wide and 2 030 mm high.

9.5.5.3. Doorways to Rooms with a Bathtub, Shower or Water Closet
(See Note A-9.5.5.3.)
1) This Article applies where a hallway of not less than 860 mm wide serves one or more rooms containing a bathtub, shower or water closet.
2) At least one doorway in a hallway described in Sentence (1) shall be constructed
   a) so that access is provided to not less than 1 of each type of fixture described in Sentence (1), and
   b) to accommodate a door not less than 760 mm wide.

9.5.6. Automatic Overhead Garage Doors

9.5.6.1. Automatic Overhead Garage Doors
1) Automatic overhead garage doors equipped with openers shall be designed in accordance with Articles 3.3.7.6. and 3.3.7.7.

Section 9.6. Glass

9.6.1. General
9.6.1.1. Application

1) This Section applies to glass, and the protection of glass, in
   a) doors, including closet doors and sidelights for doors,
   b) windows,
   c) skylights as defined in Sentence 9.7.1.1.(2),
   d) shower or bathtub enclosures,
   e) glazed panels and partitions, and
   f) glass guards.
(See Note A-9.6.1.1.)

9.6.1.2. Material Standards for Glass

1) Glass shall conform to
   a) CAN/CGSB-12.1-M, “Tempered or Laminated Safety Glass,”
   b) CAN/CGSB-12.2-M, “Flat, Clear Sheet Glass,”
   c) CAN/CGSB-12.3-M, “Flat, Clear Float Glass,”
   d) CAN/CGSB-12.4-M, “Heat Absorbing Glass,”
   e) CAN/CGSB-12.8, “Insulating Glass Units,”
   f) CAN/CGSB-12.10-M, “Glass, Light and Heat Reflecting,”
   g) CAN/CGSB-12.11-M, “Wired Safety Glass,” or
   h) ASTM E 2190, “Insulating Glass Unit Performance and Evaluation.”

2) Mirrored glass doors are only permitted to be used at the entrance to clothes closets and shall conform to
   the requirements of CAN/CGSB-82.6-M, “Doors, Mirrored Glass, Sliding or Folding, Wardrobe.” (See Note
   A-9.6.1.2.(2).)

9.6.1.3. Structural Sufficiency of Glass

1) Except as provided in Sentence (3), glass shall be designed in conformance with
   a) CAN/CGSB-12.20-M, “Structural Design of Glass for Buildings,” or
   also Article 4.3.6.1.).

2) Reserved.

3) Deleted.

**Notes to Table 9.6.1.3.:**

(1) See Note A-Table 9.6.1.3.

(2) Not generally available.

### 9.6.1.4. Types of Glass and Protection of Glass

1) Glass sidelights and windows located within 915 mm of doors and greater than 500 mm wide that could be mistaken for doors, glass in storm doors and glass in sliding doors within or at every entrance to a **dwelling unit** and in public areas shall be
   a) safety glass of the tempered or laminated type conforming to CAN/CGSB-12.1-M, “Tempered or Laminated Safety Glass,” or
   b) wired glass conforming to CAN/CGSB-12.11-M, “Wired Safety Glass.”

2) Except as provided in Sentence (4), glass in entrance doors to **dwelling units** and in public areas, other than the entrance doors described in Sentence (1), shall be safety glass or wired glass of the type described in Sentence (1).

3) Except as provided in Sentence (4), transparent panels that could be mistaken as a **means of egress** shall be protected by barriers or railings.

4) Sliding glass **partitions** that separate a **public corridor** from an adjacent **occupancy** and that are open during normal working hours need not conform to Sentences (2), (3) and (5), except that such **partitions** shall be suitably marked to indicate their existence and position.

5) Except as provided in Sentence (4), every glass or transparent door accessible to the public shall be equipped with hardware, bars or other permanent fixtures designed so that the existence and position of such doors is readily apparent.

6) Glass other than safety glass shall not be used for a shower or bathtub enclosure.

7) All skylights shall be glazed with wired glass, laminated safety glass or **combustible** glazing, which is anchored to the skylight frame and to the **building** structure. (See Note A-3.1.14.3.)

### Section 9.7. Windows, Doors and Skylights

(See Note A-9.7. and Note A-9.7.4.)

#### 9.7.1. General

#### 9.7.1.1. Application

1) This Section applies to
   a) windows, doors and skylights separating **conditioned space** from unconditioned space or the exterior, and
   b) entrance doors to **dwelling units**.

2) For the purpose of this Section, the term "skylight" refers to unit skylights, roof windows and tubular daylighting devices.

3) For the purpose of this Section, the term "doors" includes glazing in doors and sidelights for doors but does not include vehicular access doors.

#### 9.7.2. Required Windows, Doors and Skylights

#### 9.7.2.1. Entrance Doors

1) A door shall be provided at each entrance to a **dwelling unit**.

2) Main entrance doors to **dwelling units** shall be provided with
   a) a door viewer or transparent glazing in the door, or
b) a sidelight.

9.7.2.2. Reserved

9.7.3. Performance of Windows, Doors and Skylights

9.7.3.1. General
1) Skylights and their components shall be designed, constructed and installed so that they resist snow loads.
2) Reserved.
3) Reserved.
4) Reserved.
5) Reserved.

9.7.3.2. Heat Transfer Performance
1) Windows, doors and skylights and their components described in Sentence 9.7.1.1.(1) shall be designed, constructed and installed to
   a) minimize surface condensation on the warm side of the component (See Note A-9.7.3.2.(1)(a)), and
   b) ensure comfortable conditions for occupants.
2) Compliance with the heat transfer performance requirements described in Sentence (1) shall be demonstrated by
   a) complying with the requirements in Article 9.7.3.3., or
   b) design and construction conforming to Part 5.
3) Windows, doors and skylights shall conform to the energy efficiency requirements of Part 10

9.7.3.3. Thermal Characteristics of Windows, Doors and Skylights
1) Except as permitted in Sentence (2), metal frames and sash of windows, doors and skylights shall incorporate a thermal break.
2) Windows and doors described in Sentence (1) do not require a thermal break where they
   a) reserved,
   b) are installed as storm windows and doors, or
   c) are required to have a fire-protection rating.
3) Reserved.
4) Windows, doors and skylights with or without storm doors or sash that are installed in portions of buildings where the intended use of the interior space will result in high moisture generation shall be designed in conformance with Section 5.3. (See Note A-9.25.5.2.)

9.7.4. Design and Construction

9.7.4.1. General
1) Except as provided by Sentence (2), windows, doors, skylights and their components shall be designed and constructed in accordance with
   a) Article 9.7.4.2., or
   b) Part 5.
2) Windows, doors, skylights and their components that are required to have a fire-protection rating need not conform to this Subsection.

9.7.4.2. Standards
1) Except as permitted by Sentence (2) and Article 9.7.4.3., windows, doors and skylights and their components shall conform to
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

9.7.4.2. Acceptable Solutions

(See Note A-9.7.4.2.(1).)

2) A door designated as a “Limited Water” door in accordance with the standard referenced in Clause (1)(a) shall not be used unless the door

a) separates a dwelling unit from an unconditioned storage garage or a carport,

b) conforms to Clauses 3.3.1.13.(1)(a), (b) and (c) and Sentences 3.3.1.13.(5) and (10), or

c) is not required by Sentence 9.27.3.8.(3) to have flashing installed.

9.7.4.3. Performance Requirements

1) For the purposes of compliance with the standard referenced in Clause 9.7.4.2.(1)(b), windows, doors and their components in a building of no more than 10 m in height, measured from grade, may conform to the design pressure, performance grade and water resistance values in Table C-5 of Appendix C instead of the values calculated in the CSA A440S1, “Canadian Supplement to AAMA/WDMA/CSA 101/I.S.2/A440, NAFS – North American Fenestration Standard/Specification for Windows, Doors, and Skylights,”

2) For buildings described in Sentence 1.3.3.3.(1) of Division A, where design pressure, performance grade and water resistance values are calculated in accordance with the standard referenced in Clause 9.7.4.2.(1)(b), the driving rain wind pressure (DRWP) values in Table A.1 of CSA A440S1, “Canadian Supplement to AAMA/WDMA/CSA 101/I.S.2/A440, NAFS – North American Fenestration Standard/Specification for Windows, Doors, and Skylights,” shall be used.

(See Note A-9.7.4.3.(2).)

3) Reserved.

4) Reserved.

9.7.5. Resistance to Forced Entry

9.7.5.1. Resistance to Forced Entry for Sliding Doors

1) This Article applies to sliding doors serving dwelling units, other than exterior doors to garages and to other ancillary spaces.

2) Sliding doors shall not permit the removal of the sliding panel when in the locked position.

3) Exterior doors shall

a) have a pin type locking mechanism, with a minimum 9 mm throw into the frame, or an equivalent locking mechanism, operable from the interior without the use of keys, special devices or specialized knowledge of the locking mechanism, or

9.7.5.2. Resistance to Forced Entry for Swinging Doors

1) Except for exterior doors to ancillary spaces other than garages, this Article applies to

a) swinging entrance doors to dwelling units,

b) swinging doors between dwelling units and attached garages or other ancillary spaces,

c) swinging doors that provide access directly or indirectly from a storage garage to a dwelling unit, and

d) swinging entrance doors to detached storage garages.

(See Note A-9.7.5.2.(1).)

2) Doors, frames and hardware that conform to AAMA 1304, “Voluntary Specification for Forced Entry Resistance of Side-Hinged Door Systems,” are not required to conform to Sentences (3) to (7).

(See Note A-9.7.5.2.(2).)

3) Where doors as described in Sentence (1) are constructed of wood, they shall
a) be solid core or stile-and-rail type,
b) be not less than 45 mm thick, and
c) if of the stile-and-rail type, have a panel thickness of not less than 19 mm, with a total panel area
not more than half of the door area.

4) Doors described in Sentence (1) shall be provided with
a) a deadbolt lock with a cylinder having no fewer than 5 pins, and
b) a bolt throw not less than 25 mm long, protected with a solid or hardened free-turning ring or
beveled cylinder housing.
(See Article 9.9.6.7.)

5) An inactive leaf in double doors used in locations specified in
Sentence (1) shall be provided with heavy-duty bolts top and bottom having an engagement of not less than
15 mm.

6) Hinges for doors described in Sentence (1) shall be fastened
a) to wood doors with wood screws not less than 25 mm long and to wood frames with wood
screws so that at least 2 screws per hinge penetrate not less than 30 mm into solid wood, or
b) to metal doors and metal frames with machine screws not smaller than No. 10 and not less than
10 mm long.
(See Note A-9.7.5.2.(6).)

7) Strikeplates for deadbolts described in Sentence (4) shall be fastened
a) to wood frames with wood screws that penetrate not less than 30 mm into solid wood, or
b) to metal frames with machine screws not smaller than No. 8 and not less than 10 mm long.
(See Note A-9.7.5.2.(6))

8) Except for storm or screen doors, doors described in Sentence (1) that swing outward shall be provided
with hinges or pins so that the doors cannot be removed when they are in the closed position.
(See Note A-9.7.5.2.(8).)

9) Solid blocking shall be provided on both sides at the lock height between the jambs for doors described in
Sentence (1) and the structural framing so that the jambs will resist spreading by force.

10) Except as permitted by Sentences (11) and (12), a door frame reinforcement plate shall be installed
between the jack stud and door frame, and shall be:
   a) constructed of minimum 18 gauge steel plate;
   b) provided with an integral metal tongue that is:
      i) at right angles to the plate located and designed so as to resist the inwards movement
      of the door when the deadbolt is engaged, and
      ii) inset into the door frame to a minimum 15.9 mm depth; and
   c) screwed into the door frame or adjacent jack stud with wood screws that are:
      i) are not smaller than No. 10,
      ii) penetrate at least 50 mm into wood studs,
      iii) have at least two points of attachment on each side of the deadbolt, and
      iv) are located at least 38 mm away from the deadbolt throw.
(See Notes A-9.7.5.2.(10) and (11).)

11) Except as permitted by Sentence (12), strikeplates required by Clause 9.7.5.2.(7)(a) and installed in a
wood door frame without the reinforcement plate of Sentence (10), shall be:
   a) constructed from minimum 18 gauge steel plate;
   b) provided with an integral door reinforcement by means of a minimum 13 mm long metal tongue
   inset into the frame at right angles to the strike plate and arranged so as to resist forced entry when
   the deadbolt is engaged; and
   c) attached to the door frame by means of wood screws penetrating at least 30 mm into the wood
   at least two points of attachment on each side of the deadbolt, at least 38 mm away from the
deadbolt throw.
(See Note A-9.7.5.2.(10) and (11).)

12) A door provided with a multi-point locking system is not required to comply with Sentences (10) or (11).
9.7.5.3. Resistance to Forced Entry for Windows
1) In dwelling units, windows, any part of which is located within 2 m of adjacent ground level, shall conform to the requirements for resistance to forced entry as described in Clause 5.3.5 of AAMA/WDMA/CSA 101/I.S.2/A440, “NAFS – North American Fenestration Standard/Specification for Windows, Doors, and Skylights.” (See Note A-9.7.5.3.(1).)

9.7.5.4. Resistance to Forced Entry for Skylights
1) All openable skylights shall be designed to prevent opening from the outside when in the closed and locked position.
2) All exterior skylight fasteners shall be tamperproof.

9.7.6. Installation
9.7.6.1. Installation of Windows, Doors and Skylights
1) Except as provided by Sentence (2), the installation of manufactured and pre-assembled windows, doors and skylights and the field assembly of manufactured window and door combination units shall conform to the instructions, if any, provided by the manufacturer.
2) In case of conflict between the provisions of this By-law and instructions referred to in Sentence (1), the provisions of this By-law shall govern.
3) Windows, doors and skylights shall be sealed to air barriers.

9.7.6.2. Sealants, Trim and Flashing
1) The sealing compound used to seal the glass component of an insulating glazing unit to the sash component shall be compatible with the sealing compound used to edge seal the glass component.
2) Flashing used to protect openings shall conform to Articles 9.27.3.7. and 9.27.3.8.
3) Sealants shall be applied between window frames or trim and the exterior cladding or masonry in conformance with Subsection 9.27.4.
4) All unfinished portions of the frame and other components of aluminum windows, doors or skylights in contact with the edges of masonry, concrete, stucco or plaster shall be protected with an alkali-resistant coating.

Section 9.8. Stairs, Ramps, Handrails and Guards
9.8.1. Application
9.8.1.1. General
1) This Section applies to the design and construction of interior and exterior stairs, steps, ramps, handrails and guards.

9.8.1.2. Stairs, Ramps, Landings, Handrails and Guards in Garages
1) Where stairs, ramps, landings, handrails or guards are installed in garages that serve a single dwelling unit, the garage shall be considered to be part of the dwelling unit and the requirements for stairs, ramps, landings, handrails and guards within dwelling units shall apply.

9.8.1.3. Exit Stairs, Ramps and Landings
1) Where a stair, ramp or landing forms part of an exit, the appropriate requirements in Sections 9.9. and 9.10. shall also apply.
9.8.1.4. Escalators and Moving Walkways
1) Escalators and moving walkways shall conform to the appropriate requirements in Part 3.

9.8.2. Stair Dimensions

9.8.2.1. Stair Width
1) Except as provided in Sentence (2), required exit stairs and public stairs serving buildings of residential occupancy shall have a width of not less than 900 mm.
2) Exit stairs serving a single dwelling unit shall have a width of not less than 860 mm.
3) Required exit stairs and public stairs serving buildings of other than residential occupancy shall have a width of not less than the greater of
   a) 900 mm, or
   b) 8 mm per person based on the occupant load limits specified in Table 3.1.17.1.
4) At least one stair between each floor level within a dwelling unit, and exterior stairs serving a single dwelling unit except required exit stairs, shall have a width of not less than 860 mm.

9.8.2.2. Height over Stairs
1) The clear height over stairs shall be measured vertically, over the clear width of the stair, from a straight line tangent to the tread and landing nosings to the lowest point above. (See Note A-3.4.3.4.)
2) Except as provided in Sentence (3), the clear height over stairs shall not be less than 2 050 mm.
3) The clear height over stairs serving a single dwelling unit shall not be less than 1 950 mm.

9.8.3. Stair Configurations

9.8.3.1. Permitted Configurations
(See Note A-9.8.4.)
1) Except as provided by Sentence (2), stairs in buildings shall consist of
   a) straight flights, or
   b) except as provided in Sentence (4), curved flights,
2) Stairs within dwelling units shall consist of
   a) straight flights,
   b) except as provided in Sentence (4), curved flights,
   c) reserved,
   d) except as provided in Sentence (3), flights with rectangular treads and winders, or
   e) reserved.
3) Only one set of winders described in Article 9.8.4.6. shall be permitted between floor levels.
4) Curved flights in exits shall comply with Sentence 3.4.6.9.(2).
5) All tapered treads within a flight shall turn in the same direction.

9.8.3.2. Minimum Number of Risers
1) Except for stairs within a dwelling unit, at least 3 risers shall be provided in interior flights.

9.8.3.3. Maximum Height of Stairs
1) The vertical height of any flight of stairs shall not exceed 3.7 m.

9.8.4. Step Dimensions
(See Note A-9.8.4.)

9.8.4.1. Dimensions for Risers
(See Note A-9.8.4.)
1) Except for stairs serving areas only used as service rooms or service spaces, the rise, which is measured as the vertical nosing-to-nosing distance, shall comply with Table 9.8.4.1.

**Table 9.8.4.1.**
Rise for Rectangular Treads and Tapered Treads (Including Winders)
Forming Part of Sentence 9.8.4.1.(1)

<table>
<thead>
<tr>
<th>Stair Type</th>
<th>Rectangular Treads and Tapered Treads (Including Winders)</th>
<th>Rise, mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Max.</td>
</tr>
<tr>
<td>Private(1)</td>
<td></td>
<td>200</td>
</tr>
<tr>
<td>Public(2)</td>
<td></td>
<td>180</td>
</tr>
</tbody>
</table>

Notes to Table 9.8.4.1.:
(1) Private stairs are exterior and interior stairs that serve single dwelling units or that serve garages that serve single dwelling units.
(2) Public stairs are all stairs not described as service stairs or private stairs.

9.8.4.2. Dimensions for Rectangular Treads
(See Note A-9.8.4.)
1) Except for stairs serving areas only used as service rooms or service spaces, the run shall comply with Table 9.8.4.2.

**Table 9.8.4.2.**
Run for Rectangular Treads
Forming Part of Sentence 9.8.4.2.(1)

<table>
<thead>
<tr>
<th>Stair Type</th>
<th>Rectangular Treads</th>
<th>Run, mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Max.</td>
</tr>
<tr>
<td>Private(1)</td>
<td></td>
<td>355</td>
</tr>
<tr>
<td>Public(2)</td>
<td></td>
<td>No limit</td>
</tr>
</tbody>
</table>

Notes to Table 9.8.4.2.:
(1) Private stairs are exterior and interior stairs that serve single dwelling units or that serve garages that serve single dwelling units.
(2) Public stairs are all stairs not described as service stairs or private stairs.

2) The depth of a rectangular tread shall be not less than its run and not more than its run plus 25 mm.

9.8.4.3. Dimensions of Tapered Treads
(See Note A-9.8.4.)
1) Except as provided in Sentence (3) and Article 9.8.4.6., tapered treads shall have a run that
   a) is not less than 150 mm at the narrow end of the tread, and
   b) complies with the dimensions stated in Table 9.8.4.2. when measured at a point 300 mm from the centre line of the handrail at the narrow end of the tread.
2) Tapered treads in required exit stairs shall conform to the requirements in Article 3.4.6.9.
3) The depth of a tapered tread shall be not less than its run at any point and not more than its run at any point plus 25 mm.

9.8.4.4. Uniformity and Tolerances for Risers, Runs and Treads

1) Except as provided in Sentence (2), risers shall be of uniform height in any one flight, with a maximum tolerance of
   a) 5 mm between adjacent treads or landings, and
   b) 10 mm between the tallest and shortest risers in a flight.

2) Except for required exit stairs, where the top or bottom riser in a stair adjoins a sloping finished walking surface, such as a garage floor, driveway or sidewalk, the height of the riser across the stair shall vary by not more than 1 in 12.

3) Rectangular treads shall have a uniform run with a maximum tolerance of
   a) 5 mm between adjacent treads, and
   b) 10 mm between the deepest and shallowest treads in a flight.

4) Tapered treads in a flight shall have a uniform run in accordance with the construction tolerances stipulated in Sentence (3) when measured at a point 300 mm from the centre line of the handrail as described in Sentence 9.8.7.1.(5).

5) The slope of treads shall not exceed 1 in 50.

9.8.4.5. Reserved

9.8.4.6. Winders

(See Note A-9.8.4.6.)

1) Individual treads in winders shall turn through an angle of
   a) 30° with no deviation above or below 30°, or
   b) 45° with no deviation above or below 45°.

2) Where winders are incorporated into a stair, each set shall not turn through more than 90°.

3) Treads in winders shall have a run, measured at a point 200 mm from the narrow end of the tread, conforming to the minimum run requirements for a private stair in Table 9.8.4.2.

9.8.4.7. Reserved

9.8.4.8. Tread Nosings

See Notes A-9.8.4.8. and A-9.8.4.)

1) Except as permitted by Sentence (2), the top of the nosings of stair treads shall have a rounded or beveled edge extending not less than 6 mm and not more than 14 mm measured horizontally from the front of the nosing.

2) If resilient material is used to cover the nosing of a stair tread, the minimum extension of the rounded or beveled edge required by Sentence (1) is permitted to be reduced to 3 mm.

9.8.5. Ramps

9.8.5.1. Application

1) This Subsection applies to pedestrian ramps, except ramps in an accessible path of travel.

2) Ramps in an accessible path of travel shall conform to the requirements in Section 3.8.

9.8.5.2. Ramp Width

(See also Article 9.9.3.2.)

1) Except as provided in Sentence (2), ramps shall be not less than 1 100 mm wide.

2) Ramps serving a single dwelling unit shall be not less than 860 mm wide.
9.8.5.3. Height over Ramps
   1) The clear height over ramps shall be not less than 2 050 mm.

9.8.5.4. Ramp Slope
   1) The slope of ramps shall be not more than
      a) 1 in 10 for exterior ramps,
      b) 1 in 10 for interior ramps serving residential occupancies,
      c) 1 in 6 for industrial occupancies, and
      d) 1 in 8 for all other occupancies.

9.8.5.5. Maximum Rise
   1) Where the slope of the ramp is greater than 1 in 12, the maximum rise between floors or landings shall be
      1 500 mm.

9.8.6. Landings

9.8.6.1. Application
   1) This Subsection applies to landings, except landings for ramps in an accessible path of travel.
   2) Landings for ramps in an accessible path of travel shall conform to the requirements in Section 3.8.
   3) Finished floors, and ground surfaces with a slope not exceeding 1 in 50, at the top and bottom of stairs or
      ramps shall be considered as landings.

9.8.6.2. Required Landings
   1) Except as provided in Sentences (2) to (4) and Sentence 9.9.6.6.(2), a landing shall be provided
      a) at the top and bottom of each flight of interior and exterior stairs, including stairs in garages,
      b) at the top and bottom of every ramp with a slope greater than 1 in 50,
      c) where a doorway opens onto a stair or ramp,
      d) where a ramp opens onto a stair, and
      e) where a stair opens onto a ramp.
   2) Where a door at the top of a stair within a dwelling unit swings away from the stair, no landing is required
      between the doorway and the stair.
   3) A landing may be omitted at the top of an exterior flight serving a secondary entrance to a single dwelling unit, provided
      a) the stair does not contain more than 3 risers,
      b) the principal door is a sliding door or swings away from the stair, and
      c) only a storm or screen door, if any, swings over the stair and is equipped with hardware to hold it open.
   4) A landing may be omitted at the bottom of an exterior stair or ramp provided there is no obstruction, such
      as a gate or door, within the lesser of the width of the stair or ramp or
      a) 900 mm for stairs or ramps serving a single dwelling unit, and
      b) 1 100 mm for stairs or ramps not serving a single dwelling unit.

9.8.6.3. Dimensions of Landings
   (See Note A-3.4.6.4.) (See also Articles 9.9.6.1. and 9.9.6.6. regarding landings in exits.)
   1) Except as provided in Sentences (2) to (7), landings shall be at least as wide and as long as the width of
      the stair or ramp in which they occur.
   2) Where the landing in a stairway or ramp does not turn or turns less than 90°, the length of the landing
      need not be more than the lesser of
      a) the required width of the stair or ramp, or
      b) 1 100 mm.
3) The length of a landing shall be measured perpendicular to the nosings of adjacent steps or to the end of the ramp, at a distance equal to half the length required in Sentence (2) from the narrow edge of the landing.

4) Where stair flights or ramps of different widths adjoin a single landing, the minimum width of the landing shall be
   a) where one or more of the stair or ramp widths do not exceed their respective required widths, not less than the greater required stair or ramp width, or
   b) where all of the widths of the stairs or ramps exceed their respective required widths, not less than the lesser actual stair or ramp width.

5) Where a door swings toward a stair, the full arc of the swing shall be over the landing.

6) The slope of landings shall not exceed 1 in 50.

7) Where a doorway or stairway opens onto the side of a ramp, the landing shall extend for a distance of not less than 300 mm on either side of the doorway or stairway, except on a side abutting an end wall.

9.8.6.4. Height over Landings
   1) Except as permitted by Sentence (2), the clear height over landings shall be not less than 2,050 mm.
   2) The clear height over landings serving a single dwelling unit shall be not less than 1,950 mm.

9.8.6.5. Tactile Warning
   1) Landings required at the top of a flight of stairs shall be provided with tactile walking surface indicators conforming to Subsection 3.8.3., unless the stairs are
      a) stairs within dwelling units or serving not more than two dwelling units,
      b) exit stairs not normally used for access purposes, and
      c) fire escape stairs.

9.8.7. Handrails

9.8.7.1. Required Handrails
   1) Except as provided in Sentences (2) to (4), handrails shall be installed on stairs and ramps in accordance with Table 9.8.7.1.

<table>
<thead>
<tr>
<th>Location of Stair or Ramp</th>
<th>Handrails Serving Stairs</th>
<th>Handrails Serving Ramps</th>
</tr>

<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

Notes to Table 9.8.7.1.:
(1) See Sentences 9.8.7.1.(2), (3) and (4) for exceptions.
2) Except where a stair or ramp serves not more than two dwelling units, at least one handrail shall be located not more than 750 mm from the natural path of travel on the stair or ramp. (See Note A-9.8.7.1.(2).)

3) Handrails are not required for stairs and ramps serving a single dwelling unit, where
   a) interior stairs have not more than 2 risers,
   b) exterior stairs have not more than 3 risers, or
   c) ramps rise not more than 400 mm.

4) Only one handrail is required on exterior stairs having more than 3 risers provided such stairs serve not more than one dwelling unit.

5) Except for stairs with winders, where a flight of stairs within a dwelling unit consists of tapered treads, one handrail shall be installed along the narrow end of the treads.

### 9.8.7.2. Continuity of Handrails

(See Note A-9.8.7.2.)

1) Except as provided in Sentence (3), required handrails shall be continuously graspable throughout the length of
   a) ramps, and
   b) flights of stairs, from the bottom riser to the top riser.

2) Except for stairs or ramps serving a single dwelling unit, at least one required handrail shall be continuous throughout the length of the stair or ramp, including at the landing except where interrupted by doorways. (See Note A-3.4.6.5.(10).)

3) For stairs or ramps serving a single dwelling unit or a house with a secondary suite including their common spaces, a handrail is permitted to start from a newel post or volute installed on the bottom tread.

### 9.8.7.3. Termination of Handrails

1) Handrails shall be terminated in a manner that will not obstruct pedestrian travel or create a hazard. (See Note A-9.8.7.3.(1).)

2) Except for stairs and ramps serving only one dwelling unit at least one handrail at the sides of a stair or ramp shall extend horizontally not less than 300 mm beyond the top and bottom of each flight or ramp. (See Note A-9.8.7.3.(2).)

### 9.8.7.4. Height of Handrails

(See Note A-9.8.7.4.)

1) The height of handrails on stairs and ramps shall be measured vertically from the top of the handrail to
   a) a straight line drawn tangent to the tread nosings of the stair served by the handrail, or
   b) the surface of the ramp, floor or landing served by the handrail.

2) Except as provided in Sentence (3) and Clause 3.8.3.5.(1)(e), required handrails shall be 865 mm to 1070 mm high.

3) Handrails installed in addition to required handrails need not comply with Sentence (2).

### 9.8.7.5. Ergonomic Design

1) The clearance between a handrail and the surface behind it shall be not less than
   a) 50 mm, or
   b) where said surface is rough or abrasive, 60 mm.

2) All handrails shall be constructed so as to be continually graspable along their entire length with no obstruction on or above them to break a handhold. (See Note A-9.8.7.5.(2).)

### 9.8.7.6. Projections into Stairs and Ramps

1) Handrails and constructions below handrails, including handrail supports and stair stringers, shall not project more than 100 mm into the required width of a stair or ramp. (See Note A-9.8.7.6.(1).) (See also Articles 9.8.2.1. and 9.8.5.2.)
9.8.7.7. Design and Attachment of Handrails
(See Note A-9.8.7.7.)
1) Handrails and their supports shall be designed and constructed to withstand the following loads, which need not be considered to act simultaneously:
   a) a concentrated load of not less than 0.9 kN applied at any point and in any direction for all handrails, and
   b) for handrails other than those serving a single dwelling unit, a uniform load of not less than 0.7 kN/m.
2) Where exterior or interior handrails serving a single dwelling unit are attached to wood studs or blocking, the attachment shall be deemed to comply with Sentence (1), where
   a) the attachment points are spaced not more than 1.2 m apart measured on the horizontal plane,
   b) the first attachment point at either end is located no more than 300 mm from the end of the handrail, and
   c) the fasteners consist of not less than 2 No. 8 wood screws at each point, penetrating not less than 32 mm into solid wood.

9.8.8. Guards

9.8.8.1. Required Guards
(See Note A-9.8.8.1.)
1) Except as provided in Sentence (2), every surface to which access is provided, including but not limited to flights of steps and ramps, exterior landings, porches, balconies, mezzanines, galleries and raised walkways, shall be protected by a guard on each side that is not protected by a wall for the length where
   a) there is a difference in elevation of more than 600 mm between the walking surface and the adjacent surface,
   b) the adjacent surface within 1.2 m of the walking surface has a slope of more than 1 in 2,
   c) an interior stair has more than 2 risers, and
   d) an interior ramp rises more than 400 mm
2) Guards are not required
   a) at loading docks,
   b) at floor pits in repair garages, or
   c) where access is provided for maintenance purposes only.
3) Doors in buildings of residential occupancy, where the finished floor on one side of the door is more than 600 mm above the floor or other constructed surface or ground level on the other side of the door, shall be protected by
   a) a guard, or
   b) a mechanism capable of controlling the free swinging or sliding of the door so as to limit any clear unobstructed opening to not more than 100 mm.
4) Except as provided in Sentence (5), openable windows in buildings of residential occupancy shall be protected by
   a) a guard, or
   b) a mechanism capable of controlling the free swinging or sliding of the openable part of the window so as to limit any clear unobstructed opening to not more than 100 mm measured either vertically or horizontally where the other dimension is greater than 380 mm.
(See Note A-9.8.8.1.(4).)
5) Windows need not be protected in accordance with Sentence (4), where
   a) reserved,
   b) reserved,
   c) the only opening greater than 100 mm by 380 mm is a horizontal opening at the top of the window, and
      i) construction below the opening does not facilitate climbing, and
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

9.8.8.2. Loads on Guards

(See Note A-9.8.8.2.)

1) Except as provided in Sentences (2) and (4), guards shall be designed to resist the specified loads prescribed in Table 9.8.8.2.

Table 9.8.8.2.
Specified Loads for Guards
Forming Part of Sentence 9.8.8.2.(1)

<table>
<thead>
<tr>
<th>Location of Guard</th>
<th>Minimum Specified Loads</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Horizontal Load Applied Inward or Outward at any Point at the Minimum Required Height of the Guard</td>
</tr>
<tr>
<td>Guards within dwelling units</td>
<td>0.5 kN/m OR concentrated</td>
</tr>
</tbody>
</table>
and exterior guards serving not more than 2 dwelling units  & load of 1.0 kN applied at any point\(^{(1)}\) & maximum width of 300 mm and a height of 300 mm\(^{(2)}\)  &  \\
Guards serving access ways to equipment platforms and similar areas where the gathering of many people is improbable & Concentrated load of 1.0 kN applied at any point & Concentrated load of 0.5 kN applied over an area of 100 mm by 100 mm located at any point on the element or elements so as to produce the most critical effect & 1.5 kN/m  \\
All other guards & 0.75 kN/m OR concentrated load of 1.0 kN applied at any point\(^{(1)}\) & Concentrated load of 0.5 kN applied over an area of 100 mm by 100 mm located at any point on the element or elements so as to produce the most critical effect & 1.5 kN/m  \\

Notes to Table 9.8.8.2.:  
\(^{(1)}\) The load that creates the most critical condition shall apply.  
\(^{(2)}\) See Sentence (2).

2) For guards within dwelling units and for exterior guards serving not more than 2 dwelling units, where the width and spacing of balusters are such that 3 balusters can be engaged by a load imposed over a 300 mm width, the load shall be imposed so as to engage 3 balusters.

3) None of the loads specified in Table 9.8.8.2. need be considered to act simultaneously.

4) For guards within dwelling units and for exterior guards serving not more than 2 dwelling units, Table 9.8.8.2. need not apply where the guard construction used has been demonstrated to provide effective performance.

9.8.8.3. Height of Guards
(See Note A-9.8.8.3.)
1) Except as provided in Sentences (2) to (4), all guards shall be not less than 1 070 mm high.
2) All guards within dwelling units shall be not less than 900 mm high.
3) Exterior guards serving not more than one dwelling unit shall be not less than 900 mm high where the walking surface served by the guard is not more than 1 800 mm above the finished ground level.
4) Guards for flights of steps, except in required exit stairs, shall be not less than 900 mm high.
5) The height of guards for flights of steps shall be measured vertically from the top of the guard to a line drawn through the tread nosing served by the guard.

9.8.8.4. Guards for Floors and Ramps in Garages
1) Except for floors of garages referred to in Section 9.35., where garage floors or ramps are 600 mm or more above the adjacent ground or floor level, every opening through a garage floor and the perimeter of floors and ramps that have no exterior walls shall be provided with
   a) a continuous curb not less than 140 mm in height, and
   b) a guard not less than 1 070 mm above the floor level.
2) Vehicle guardrails shall be designed and constructed to withstand the loading values stipulated in Sentence 4.1.5.15.(1). (See Note A-4.1.5.14. and 4.1.5.15.(1).)

9.8.8.5. Openings in Guards
1) Except as permitted in Sentences (2) and (3), openings through guards shall be of a size that prevents the passage of a spherical object having a diameter of 100 mm. (See Note A-9.8.8.5.(1) and (2).)
2) Except where they serve storage garages, guards in industrial occupancies are permitted to consist of
   a) a top railing, and
   b) one or more horizontal intermediate rails spaced such that the size of the openings through the
guard prevents the passage of a spherical object having a diameter of 535 mm.
   (See Note A-9.8.8.5.(1) and (2).)
3) Openings through any guard that is not required by Article 9.8.8.1. and that serves an occupancy other
   than an industrial occupancy shall be of a size that
   a) prevents the passage of a spherical object having a diameter of 100 mm, or
   b) permits the passage of a spherical object having a diameter of 200 mm.
   (See Note A-9.8.8.5.(3).)

9.8.8.6. Design of Guards to Not Facilitate Climbing
   1) Except for guards in industrial occupancies, guards required by Article 9.8.8.1. that protect a level located
   more than 4.2 m above the adjacent level shall be designed so that no member, attachment or opening
   located between 140 mm and 900 mm above the level protected by the guard facilitates climbing. (See Note
   A-9.8.8.6.(1).)

9.8.8.7. Glass in Guards
   1) Glass in guards shall be
      a) safety glass of the laminated or tempered type conforming to CAN/CGSB-12.1-M, “Tempered or
         Laminated Safety Glass,” or
      b) wired glass conforming to CAN/CGSB-12.11-M, “Wired Safety Glass.”

9.8.8.8. Glass Guards
   1) All glass guards shall have a top rail capable of transferring the guard loads to adjacent glass panels or,
      in the event of the failure of a glass panel, to the structural component of the building.

9.8.9. Construction

9.8.9.1. Loads on Stairs and Ramps
   1) Except as specified in Articles 9.8.9.4. and 9.8.9.5., stairs and ramps shall be designed for strength and
      rigidity under uniform loading criteria to support specified loads of
      a) 1.9 kPa for stairs and ramps serving not more than one dwelling unit, and
      b) 4.8 kPa for other stairs and ramps.

9.8.9.2. Exterior Concrete Stairs
   1) Exterior concrete stairs with more than 2 risers and 2 treads shall be
      a) supported on unit masonry or concrete walls or piers not less than 150 mm in cross section, or
      b) cantilevered from the main foundation wall.
   2) Stairs described in Sentence (1), when cantilevered from the foundation wall, shall be constructed and
      installed in conformance with Subsection 9.8.10.
   3) The depth below ground level for foundations for exterior steps shall conform to the requirements in
      Section 9.12.

9.8.9.3. Exterior Wood Steps
   1) Exterior wood steps shall not be in direct contact with the ground unless suitably treated with a wood
      preservative.

9.8.9.4. Wooden Stair Stringers
   1) Wooden stair stringers shall
a) have a minimum effective depth of 90 mm, measured perpendicularly to the bottom of the stringer at the point of minimum cross-section, and an overall depth of not less than 235 mm, 
b) be supported and secured top and bottom, 
c) be not less than 25 mm actual thickness if supported along their length and 38 mm actual thickness if unsupported along their length, and
d) except as permitted in Sentence (2), be spaced not more than 900 mm o.c. in stairs serving not more than one dwelling unit and 600 mm o.c. in other stairs.

2) For stairs serving not more than one dwelling unit, where risers support the front portion of the tread, the space between stringers shall be not more than 1 200 mm.

9.8.9.5. Treads
1) Stair treads of lumber, plywood or O-2 grade OSB within dwelling units shall be not less than 25 mm actual thickness, except that if open risers are used and the distance between stringers exceeds 750 mm, the treads shall be not less than 38 mm actual thickness.
2) Stair treads of plywood or OSB that are not continuously supported by the riser shall have their face grain or direction of face orientation at right angles to the stringers.

9.8.9.6. Finish for Treads and Landings
1) The finish for treads and landings of interior stairs in dwelling units, other than stairs to unfinished basements, shall consist of hardwood, vertical grain softwood, resilient flooring or other material providing equivalent performance.
2) Treads and landings of interior and exterior stairs and ramps, other than those within dwelling units shall have a slip-resistant finish or be provided with slip-resistant strips that extend not more than 1 mm above the surface.

9.8.10. Cantilevered Precast Concrete Steps

9.8.10.1. Design
1) Exterior concrete steps and their anchorage system that are cantilevered from a foundation wall shall be designed and installed to support the loads to which they may be subjected.

9.8.10.2. Anchorage
1) Cantilevered concrete steps referred to in Article 9.8.10.1. shall be anchored to concrete foundation walls not less than 200 mm thick.

9.8.10.3. Prevention of Damage Due to Frost
1) Suitable precautions shall be taken during backfilling and grading operations to ensure that subsequent freezing of the soil will not cause uplift forces on the underside of cantilevered concrete steps to the extent that the steps or the walls to which they are attached will be damaged.

Section 9.9. Means of Egress

9.9.1. General

9.9.1.1. Application
1) Stairways, handrails and guards in a means of egress shall conform to the requirements in Section 9.8. as well as to the requirements in this Section.

9.9.1.2. Fire Protection
1) In addition to the fire protection requirements provided in Subsection 9.9.4., flame-spread ratings, fire-resistance ratings and fire-protection ratings for means of egress shall conform to Section 9.10.

9.9.1.3. Occupant Load
1) Except for dwelling units, the occupant load of a floor area or part of a floor area shall be the number of persons for which such areas are designed, but not fewer than that determined from Table 3.1.17.1., unless it can be shown that the area will be occupied by fewer persons.
2) The occupant load for dwelling units shall be based on 2 persons per bedroom or sleeping area.

9.9.2. Types and Purpose of Exits

9.9.2.1. Types of Exits
1) Except as otherwise provided in this Section, an exit from any floor area shall be one of the following used singly or in combination:
   a) an exterior doorway,
   b) an exterior passageway,
   c) an exterior ramp,
   d) an exterior stairway,
   e) a fire escape,
   f) a horizontal exit,
   g) an interior passageway,
   h) an interior ramp, or
   i) an interior stairway.
2) Fire escapes shall only be used as exits on existing buildings and shall be designed and installed in conformance with Subsection 3.4.7.
3) Where a horizontal exit is used, it shall conform to Sentence 3.4.1.6.(1) and Article 3.4.6.10.

9.9.2.2. Purpose of Exits
1) An exit shall be designed for no purpose other than for exiting except that an exit may also serve as an access to a floor area.

9.9.2.3. Elevators, Slide Escapes and Windows as Means of Egress
1) Elevators, slide escapes and windows shall not be considered as part of a required means of egress.

9.9.2.4. Principal Entrances
1) Except for doors serving a single dwelling unit, at least one door at every principal entrance to a building providing access from the exterior at ground level shall be designed in accordance with the requirements for exits.

9.9.3. Dimensions of Means of Egress

9.9.3.1. Application
1) This Subsection applies to every means of egress except
   a) exits that serve not more than one dwelling unit, and
   b) access to exits within dwelling units.

9.9.3.2. Exit Width
1) Except for doors and corridors, the width of every exit facility shall be not less than 900 mm. (See Article 9.9.6.3. for doors, Article 9.8.2.1. for stairs, and Article 9.8.5.2. for ramps.)

9.9.3.3. Width of Corridors
1) The width of every public corridor, corridor used by the public, and exit corridor shall be not less than 1100 mm. (See also Subsection 9.9.5. for obstructions in corridors.)

9.9.3.4. Clear Height
1) Except for stairways, doorways and storage garages, the minimum clear height in exits and access to exits shall be 2.1 m. (See Article 9.8.2.2. for stairs, Article 9.8.5.3. for ramps, Article 9.8.6.4. for landings and Article 9.9.6.2. for doorways.)
2) The clear height in exits and access to exits in storage garages shall be not less than 2 m.

9.9.4. Fire Protection of Exits

9.9.4.1. Application
1) Except as provided in Articles 9.9.4.4. and 9.9.4.6., this Subsection applies to the fire protection of all exits except exits serving not more than one dwelling unit.

9.9.4.2. Fire Separations for Exits
1) Except as provided in Sentences (2) and (5) and Article 9.9.8.5., every exit other than an exterior doorway shall be separated from each adjacent floor area or from another exit:
   a) where there is a floor assembly above the floor area, by a fire separation having a fire-resistance rating not less than that required for the floor assembly above the floor area (See Article 9.10.9.10.), and
   b) where there is no floor assembly above the floor area, by a fire separation having a fire-resistance rating not less than the greater of
      i) that required by Subsection 9.10.8. for the floor assembly below, or
      ii) 45 min.
2) Reserved.
3) A fire separation common to 2 exits shall be smoke-tight and not be pierced by doorways, duct work, piping or any other opening that may affect the continuity of the separation.
4) A fire separation that separates an exit from the remainder of the building shall have no openings except those for electrical wiring, noncombustible conduit and noncombustible piping that serve only the exit, and for standpipes, sprinkler piping, exit doorways and wired glass and glass block permitted in Article 9.9.4.3.
5) The requirements in Sentence (1) do not apply to an exterior exit passageway provided the passageway has not less than 50% of its exterior sides open to the outdoors and is served by an exit stair at each end of the passageway.

9.9.4.3. Wired Glass or Glass Block
(See Note A-3.1.8.19.(1.).)
1) This Article applies to wired glass in doors, and wired glass or glass block in sidelights, where these are installed in fire separations between exit enclosures and floor areas.
2) Except as provided in Sentence (3), the combined area of glazing in doors and sidelights shall not exceed 0.8 m².
3) Where an exit enclosure connects with a floor area through an enclosed vestibule or corridor separated from the floor area by fire separations having not less than a 45 min fire-resistance rating, the glazed areas described in Sentence (1) need not be limited as required in Sentence (2).

9.9.4.4. Openings Near Unenclosed Exterior Exit Stairs and Ramps
1) Unprotected openings in exterior walls of the building shall be protected with wired glass in fixed steel frames, glass block conforming to Articles 9.10.13.5. and 9.10.13.7., or protection complying with the requirements of Sentence 3.2.3.13.(5.), where
   a) an unenclosed exterior exit stair or ramp provides the only means of egress from a suite and is exposed to fire from unprotected openings in the exterior walls of
9.9.4.5. Openings in Exterior Walls of Exits

1) Either openings in exterior walls of an exit or openings in adjacent exterior walls of the building the exit serves shall be protected with wired glass in fixed steel frames or glass block installed in accordance with Articles 9.10.13.5. and 9.10.13.7., where
   a) the exit enclosure has exterior walls that intersect the exterior walls of the building at an angle of less than 135° measured on the outside of the building, and
   b) the openings in the exterior walls of the building are within 3 m horizontally and less than 2 m above the openings in the exterior walls of the exit.

(See Note A-9.9.4.5.(1.).)

2) The opening protection referred to in Sentence (1) may conform to Sentence 3.2.3.13.(4).

9.9.4.6. Openings Near Exit Doors

1) Where an exterior exit door in one fire compartment is within 3 m horizontally of an unprotected opening in another fire compartment and the exterior walls of these fire compartments intersect at an exterior angle of less than 135°, the opening shall be protected with
   a) wired glass in fixed steel frames conforming to Article 9.10.13.5.,
   b) glass block conforming to Article 9.10.13.7., or
   c) protection complying with the requirements of Sentence 3.2.3.13.(5).

2) The opening protection referred to in Sentence (1) may conform to Sentence 3.2.3.13.(4).

9.9.4.7. Stairways in 2 Storey, Group D or E Buildings

1) Where a suite of Group D or E occupancy is located partly on the first storey and partly on the second storey, stairways serving the second storey of that suite need not be constructed as exit stairs provided,
   a) the building is not greater than 2 storeys in building height,
   b) the suite is separated from other occupancies by at least a 45 min fire separation,
   c) the area occupied by the suite is not greater than 100 m² per storey,
   d) the maximum travel distance from any point in the suite to an exterior exit is not greater than 25 m,
   e) the floor assemblies have a fire-resistance rating of not less than 45 min or are of noncombustible construction, and
   f) the basement and first storey are separated by a fire separation having a fire-resistance rating of not less than 45 min.

9.9.5. Obstructions and Hazards in Means of Egress

9.9.5.1. Application

1) This Subsection applies to obstructions and hazards in every means of egress except those within a dwelling unit or serving not more than one dwelling unit.

9.9.5.2. Occupancies in Corridors

1) Where a corridor contains an occupancy, the occupancy shall not reduce the unobstructed width of the corridor to less than the required width of the corridor.

9.9.5.3. Obstructions in Public Corridors
1) Except as permitted in Sentence (2), obstructions located within 1 980 mm of the floor shall not project horizontally more than 100 mm into exit passageways, corridors used by the public or public corridors in a manner that would create a hazard for visually impaired persons travelling adjacent to walls.
2) The horizontal projection of an obstruction referred to in Sentence (1) is permitted to exceed 100 mm where the obstruction extends to less than 680 mm above the floor. (See Note A-3.3.1.9.(4).)

9.9.5.4. Obstructions in Exits
1) Except as permitted in Subsection 9.9.6. and Article 9.8.7.6., no fixture, turnstile or construction shall project within the required width of an exit.

9.9.5.5. Obstructions in Means of Egress
1) No obstructions such as posts or turnstiles shall be placed so as to restrict the width of a required means of egress from a floor area or part of a floor area to less than 750 mm unless an alternate unobstructed means of egress is provided adjacent to and plainly visible from the restricted egress.
2) Except as provided in Sentence (3), no obstructions, such as counter gates, that do not meet the requirements for exit doors, shall be placed in a required means of egress from a floor area or part of a floor area unless an alternate unobstructed means of egress is provided adjacent to and plainly visible from the restricted egress.
3) Obstructions, such as counter gates, that do not satisfy Sentence (2), are permitted to be placed in a required means of egress from a part of a floor area in mercantile occupancies and business and personal services occupancies, provided that the part of the floor area served by the obstructed means of egress is not generally accessible to the public.

9.9.5.6. Mirrors or Draperies
1) No mirror shall be placed in or adjacent to any exit so as to confuse the direction of exit, and no mirror or draperies shall be placed on or over exit doors.

9.9.5.7. Fuel-Fired Appliances
1) Fuel-fired appliances shall not be installed in an exit or corridor serving as an access to exit.

9.9.5.8. Service Rooms
1) Service rooms containing equipment subject to possible explosion, such as boilers designed to operate at a pressure in excess of 100 kPa, and certain types of refrigerating and transformer equipment, shall not be located under required exits.

9.9.5.9. Ancillary Rooms
1) Ancillary rooms such as storage rooms, washrooms, toilet rooms, laundry rooms and service rooms shall not open directly into an exit.

9.9.6. Doors in a Means of Egress

9.9.6.1. Obstructions by Doors
1) Except as provided in Sentence (4), obstructions created by doors shall be limited in accordance with Sentences (2) and (3)
   a) at exit doors,
   b) at doors that open into or are located within a public corridor, and
   c) at doors that open into or are located within another facility that provides access to exit from a suite.
2) When fully open, doors described in Sentence (1) shall not decrease the required exit width by more than
   a) 100 mm in exit corridors, and
   b) 50 mm for other exit facilities.
3) The swing of doors described in Sentence (1) shall not reduce the width of the path of travel to less than
   a) the required exit width in exit corridors and passageways, and
   b) 750 mm on exit stairs or landings.
4) Doors serving a single dwelling unit need not comply with Sentences (2) and (3).

9.9.6.2. Clear Opening Height at Doorways
1) Except as provided in Sentences (2) and (3), the clear opening height of doorways shall be not less than
   2 030 mm high at
      a) exit doors,
      b) doors that open into or are located within a public corridor, and
      c) doors that open into or are located within another facility that provides access to exit from a suite.
2) The clear opening height under door closers and other devices in doorways described in Sentence (1)
   shall be not less than 1 980 mm.
3) Doorways serving a single dwelling unit need not comply with Sentences (1) and (2). (See also Article 9.5.5.1.)

9.9.6.3. Clear Opening Width at Doorways
1) Except as provided in Sentence (4), the clear opening width of doorways shall comply with Sentence (2)
   at
      a) exit doors, and
      b) doors that open into or are located within a public corridor or other facility that provides access to exit from a suite.
2) Doorways described in Sentence (1) shall be
      a) not less than 800 mm wide where there is only one door leaf,
      b) not less than 800 mm wide where multiple-leaf doors are installed with only one active leaf
         having a latching mechanism described in Article 9.9.6.7., and
      c) not less than 1 210 mm wide where multiple-leaf doors are installed with two active leaves.
3) In doorways described in Sentence (1) that have multiple-leaf doors installed,
      a) no active leaf shall be less than 810 mm wide where only one leaf is active, and
      b) no single leaf shall be less than 610 mm wide where two leaves are active.
4) Doorways serving a single dwelling unit need not comply with Sentence (2). (See also Article 9.5.5.1.)

9.9.6.4. Door Action
1) Except as provided in Sentences (4) and (5), required exit doors and doors in required means of egress,
   except doors in means of egress within dwelling units, shall swing on the vertical axis.
2) Except as provided in Sentence (5), breakaway sliding doors, installed as required exit doors or required
   doors in means of egress, shall be identified as swinging doors by means of a label or decal affixed to the door.
3) Revolving doors shall comply with Article 3.4.6.15.
4) Movable partitions used to separate a public corridor from an adjacent business and personal services
   occupancy or a mercantile occupancy need not conform to Sentence (1), provided the partitions are not
   located in the only means of egress. (See Note A-3.3.1.12.(3).)
5) Exit doors need not conform to Sentences (1) or (2), where
      a) the doors serve accessory buildings where life safety is not adversely affected,
      b) the doors serve storage garages or other accessory buildings serving not more than one
         dwelling unit, or
      c) the doors
         i) serve storage suites of not more than 20 m² in gross area that are in warehousing buildings of not more than one storey, and
         ii) open directly to the exterior at ground level.
9.9.6.5. Direction of Door Swing
1) Except for doors serving a single dwelling unit, exit doors that are required to swing shall swing in the direction of exit travel.
2) Doors that open onto a corridor or other facility that provides access to exit from a room or suite having an occupant load of more than 60 persons shall swing on the vertical axis in the direction of exit travel.
3) Doors that divide a corridor that is not wholly contained within a suite shall swing in the direction of exit travel.
4) Where a pair of doors is installed in a corridor that provides access to exit in both directions, the doors shall
   a) swing in opposite directions, with the door on the right-hand side swinging in the direction of exit travel, or
   b) swing in both directions.
5) Principal entrance doors opening to an acceptable open space at ground level are not required to swing in the direction of exit travel provided
   a) the room or suite is located at ground level, and
   b) the occupant load is not more than 60 persons.

9.9.6.6. Nearness of Doors to Stairs
1) Except as provided in Sentence (2), the distance between a stair riser and the leading edge of a door during its swing, except for doors serving a single dwelling unit, shall be not less than 300 mm.
2) Where there is a danger of blockage from ice or snow, an exit door, including doors serving a single dwelling unit, may open onto not more than one step, provided the riser of such a step does not exceed 150 mm.

9.9.6.7. Door Latching, Locking and Opening Mechanisms
1) Principal entrance doors, exit doors and doors to suites, including exterior doors of dwelling units, and other doors in an access to exit shall
   a) be openable from the inside or in travelling to an exit without requiring keys, special devices or specialized knowledge of the door-opening mechanism, or
   b) be controlled by electromagnetic locking mechanisms in accordance with Sentence 3.4.6.16.(4).
2) Except for doors serving a single dwelling unit, and doors to accessory buildings and to garages serving a single dwelling unit, door release hardware on doors in a means of egress shall be operable with one hand and the door shall be openable with not more than one releasing operation. (See also Sentence 3.8.3.6.(4) and Note A-3.3.4.5.(1).)
3) Door release hardware on doors in a means of egress shall be installed not more than 1 200 mm above the finished floor.
4) Except for hotels and motels, a door opening onto a public corridor that provides access to exit from suites shall be designed not to lock automatically if it is equipped with an automatic self-closing device. (See Note A-3.3.4.5.(1).)

9.9.6.8. Effort Required to Open
1) Every exit door, except doors serving a single dwelling unit, shall be designed and installed so that when the latch is released the door will open in the direction of exit travel under a force of not more than 90 N applied to the door release hardware. (See Sentence 3.8.3.6.(8) for door opening forces in an accessible path of travel.)

9.9.7. Access to Exits

9.9.7.1. Egress from Roof Area, Podiums, Terraces, Platforms and Contained Open Spaces
1) An access to exit shall be provided from every roof intended for occupancy and from every podium, terrace, platform or contained open space.<br>2) Where a roof is intended for an occupant load of more than 60 persons, at least 2 separate means of egress shall be provided from the roof to stairs designed in conformance with the requirements for exit stairs and located remote from each other.<br>3) Where a podium, terrace, platform or contained open space is provided, egress requirements shall conform to the appropriate requirements for rooms or suites in Article 9.9.7.4.

9.9.7.2. Means of Egress from Suites<br>1) Except as required in Sentence 9.9.9.3.(1), each suite in a floor area occupied by more than one suite shall have<br>   a) an exterior exit doorway,<br   b) a doorway to a public corridor, or<br   c) a doorway to an exterior passageway.<br>2) Except as provided in Sentences 9.9.7.3.(1) and 9.9.8.2.(2), from the point where a doorway described in Clause (1)(b) or (c) enters the public corridor or exterior passageway, it shall be possible to go in opposite directions to each of 2 separate exits.

9.9.7.3. Dead-End Corridors<br>1) Except for a dead-end corridor that is entirely within a suite and except as permitted in Sentence 9.9.9.2.(1), a dead-end corridor is permitted provided it is not more than 6 m long.

9.9.7.4. Number and Spacing of Egress Doors<br>1) Except for dwelling units, at least 2 egress doors shall be provided when the area of a room or suite, or the distance measured from any point within the room or suite to the nearest egress door, exceeds the values in Table 9.9.7.4.<br>2) Doors required in Sentence (1) shall be spaced so that in the event that one door is made inaccessible by a fire within such room or suite, the other door will provide safe egress.<br>3) The travel distance required in Sentence (1) may be increased to 25 m for sprinklered buildings.

9.9.7.5. Independent Access to Exit<br>1) Required access to exit from suites shall not be through any other dwelling unit, service room or other occupancy.

9.9.7.6. Travel Distance within Rooms and Suites
1) Except for *dwelling units*, the travel distance from any point within the room or *suite* to the nearest egress door shall not exceed the maximum travel distance in Article 9.9.8.2.

### 9.9.8. Exits from Floor Areas

#### 9.9.8.1. Measurement of Travel Distance

1) Except as provided in Sentences (2) and (3), for the purposes of this Subsection, travel distance means the distance from any point in the *floor area* to an *exit* measured along the path of *exit* travel.

2) Where a *room* or *suite* is separated from the remainder of the *floor area* by a *fire separation* having a *fire-resistance rating* of at least 45 min or, in a *sprinklered building*, by a *fire separation* which is not required to have a *fire-resistance rating*, the travel distance may be measured from an egress door of the room or *suite* to the nearest *exit*.

3) Where a *public corridor* is not less than 9 m wide and conforms to Subclauses 3.4.2.5.(1)(d)(i) to (d)(iv), the travel distance may be determined in accordance with those Subclauses.

#### 9.9.8.2. Number of Required Exits

1) Except as provided in Sentence (2) and Subsection 9.9.9., at least 2 *exits* shall be provided from every *floor area*, spaced so that the travel distance to the nearest *exit* is not more than

   a) 40 m in the case of *business and personal services occupancies*,

   b) 45 m for all *occupancies* where the *floor area* is *sprinklered*, and

   c) 30 m for all other *occupancies*.

2) Except as provided in Subsection 9.9.9., a single *exit* is permitted from each *storey* in *buildings* of 1 and 2 *storeys* in *building height* provided the *floor area* and travel distance requirements conform to those required in Article 9.9.7.4. and the total *occupant load* served by an *exit* facility does not exceed 60 persons.

#### 9.9.8.3. Contribution of Each Exit

1) Where more than one *exit* is required from a *floor area*, each *exit* shall be considered as contributing not more than half the required *exit* width.

#### 9.9.8.4. Location of Exits

1) Where more than one *exit* is required from a *floor area*, at least 2 *exits* shall be independent of each other and be placed remote from each other along the path of travel between them. (See Note A-9.9.8.4.(1).)

#### 9.9.8.5. Exiting through a Lobby

1) Not more than one *exit* from a *floor area* above or below the *first storey* is permitted to lead through a lobby.

2) The lobby referred to in Sentence (1) shall be not more than 4.5 m above *grade*, and the path of travel through the lobby to the outdoors shall not exceed 15 m.

3) The lobby referred to in Sentence (1) shall conform in all respects to the requirements for *exits*, except that rooms other than *service rooms*, storage rooms and rooms of *residential or industrial occupancy* are permitted to open directly onto such lobby.

4) Where the lobby referred to in Sentence (1) and adjacent *occupancies* that are permitted to open into the lobby are *sprinklered*, the *fire separation* between such *occupancies* and the lobby need not have a *fire-resistance rating*. (See Note A-3.4.4.2.(2)(e).)

5) Passenger elevators are permitted to open onto the lobby referred to in Sentence (1) provided the elevator doors are designed to remain closed except while loading and unloading passengers.

#### 9.9.8.6. Mezzanine Means of Egress

1) Except as permitted by Sentences (2) and (3), the space above a *mezzanine* shall be served by *means of egress* leading to *exits* accessible at the *mezzanine* level, on the same basis as *floor areas*.

2) The *means of egress* from a *mezzanine* need not conform to Sentence (1), provided
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

a) the mezzanine is not required to terminate at a vertical fire separation, as permitted by Sentence 9.10.12.1.(2),

b) the occupant load of the mezzanine is not more than 60,

c) the area of the mezzanine does not exceed the area limits stated in Table 9.9.7.4., and

d) the distance limits stated in Table 9.9.7.4., measured along the path of travel, are not exceeded from any point on the mezzanine to
   i) an egress door serving the space that the mezzanine overlooks if the space is served by a single egress door, or
   ii) an egress stairway leading to an access to exit in the space below if that space is required to be served by 2 or more egress doorways in conformance with Sentence 9.9.7.4.(1).

3) Notwithstanding the limitations of Sentence (2), one means of egress from a mezzanine complying with Sentence 9.10.12.1.(2), need not terminate at a fire separation, and is permitted to lead through the room in which the mezzanine is located, provided all other means of egress from that mezzanine lead to exits accessible at the mezzanine level.

4) Except as provided in Sentence (2), the maximum travel distance from any point on a mezzanine to the nearest exit shall be not more than
   a) 40 m in a business and personal services occupancy,
   b) 45 m in a floor area that is sprinklered throughout, provided it does not contain a high-hazard industrial occupancy, or
   c) 30 m in any floor area not referred to in Clauses (a) or (b).

9.9.9. Egress from Dwelling Units

9.9.9.1. Travel Limit to Exits or Egress Doors

1) Except as provided in Sentences (2) and (3), every dwelling unit containing more than 1 storey shall have exits or egress doors located so that it shall not be necessary to travel up or down more than 1 storey in a building, or more than 2 storeys in a sprinklered building, to reach a level served by
   a) an egress door to a public corridor, enclosed exit stair or exterior passageway, or
   b) an exit doorway located within 1 storey of ground level.

2) Where a dwelling unit is not located above or below another suite, the travel limit from a floor level in the dwelling unit to an exit or egress door may exceed 1 storey where that floor level is served by an openable window
   a) providing an unobstructed opening of not less than 1 m in height and 0.55 m in width, and
   b) located so that the sill is not more than
      i) 1 m above the floor, and
      ii) 7 m above adjacent ground level.

3) The travel limit from a floor level in a dwelling unit to an exit or egress door may exceed 1 storey where that floor level has direct access to a balcony.

9.9.9.2. Two Separate Exits

1) Except as provided in Sentence 9.9.7.3.(1), where an egress door from a dwelling unit opens onto a public corridor or exterior passageway it shall be possible from the location where the egress door opens onto the corridor or exterior passageway to go in opposite directions to 2 separate exits unless the dwelling unit has a second and separate means of egress.

9.9.9.3. Shared Egress Facilities

1) A dwelling unit shall be provided with a second and separate means of egress where an egress door from the dwelling unit opens onto
   a) an exit stairway serving more than one suite,
   b) a public corridor
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

Division B:

Acceptable Solutions

Part 9 – Housing and Small Buildings

9.9.10. Egress from Bedrooms

9.9.10.1. Egress Windows or Doors for Bedrooms

1) Except where the suite is sprinklered, each bedroom or combination bedroom shall have at least one outside window or exterior door openable from the inside without the use of keys, tools or special knowledge and without the removal of sashes or hardware. (See Article 9.5.1.2. and Note A-9.9.10.1.(1).)

2) The window referred to in Sentence (1) shall
   a) provide an unobstructed opening of not less than 0.35 m² in area with no dimension less than 380 mm, and
   b) maintain the required opening during an emergency without the need for additional support. (See Note A-9.9.10.1.(2).)

3) Where a window required in Sentence (1) opens into a window well, a clearance of not less than 760 mm shall be provided in front of the window. (See Note A-9.9.10.1.(3).)

4) Where the sash of a window referred to in Sentence (3) swings towards the window well, the operation of the sash shall not reduce the clearance in a manner that would restrict escape in an emergency.

5) Where a protective enclosure is installed over the window well referred to in Sentence (3), the enclosure shall be openable from the inside without the use of keys, tools or special knowledge of the opening mechanism.

9.9.11. Signs

9.9.11.1. Application

1) This Subsection applies to all exits except those serving not more than one dwelling unit.

9.9.11.2. Visibility of Exits

1) Exits shall be located so as to be clearly visible or their locations shall be clearly indicated.

2) Where an exit door leading directly to the outside is subject to being obstructed by parked vehicles or storage because of its location, a visible sign or a physical barrier prohibiting such obstructions shall be installed on the exterior side of the door.

9.9.11.3. Exit Signs

1) Every exit door shall have an exit sign placed over it or adjacent to it if the exit serves
   a) a building that is 3 storeys in building height,
   b) a building having an occupant load of more than 150, or
   c) a room or floor area that has a fire escape as part of a required means of egress.

2) Every exit sign shall
   a) be visible on approach to the exit,
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

b) consist of a green and white or lightly tinted graphical symbol meeting the colour specifications referred to in ISO 3864-1, “Graphical symbols – Safety colours and safety signs – Part 1: Design principles for safety signs and safety markings,” and
c) conform to ISO 7010, “Graphical symbols – Safety colours and safety signs – Registered safety signs,” for the following symbols (See Note A-3.4.5.1.(2)(c)):
   i) E001 emergency exit (left hand),
   ii) E002 emergency exit (right hand),
   iii) E005 Direction, arrow (90° increments), safe condition, and
   iv) E006 Direction, 45° arrow (90° increments), safe condition.

3) Internally illuminated exit signs shall be continuously illuminated and
   a) where illumination of the sign is powered by an electrical circuit, conform to CSA C22.2 No. 141, “Emergency Lighting Equipment,” or
   b) where illumination of the sign is not powered by an electrical circuit, conform to CAN/ULC-S572, “Photoluminescent and Self-Luminous Exit Signs and Path Marking Systems.”

4) Externally illuminated exit signs shall be continuously illuminated and conform to CAN/ULC-S572, “Photoluminescent and Self-Luminous Exit Signs and Path Marking Systems.” (See Note A-3.4.5.1.(4).)

5) The circuitry serving lighting for externally and internally illuminated exit signs shall
   a) serve no equipment other than emergency equipment, and
   b) be connected to an emergency power supply as described in Sentences 9.9.12.3.(2), (3) and (7).

6) Where no exit is visible from a public corridor, from a corridor used by the public, or from principal routes serving an open floor area having an occupant load of more than 150, an exit sign conforming to Clauses (2)(b) and (c) with an arrow or pointer indicating the direction of egress shall be provided.

9.9.11.4. Signs for Stairs and Ramps at Exit Level

1) In buildings that are 3 storeys in building height, any part of an exit ramp or stairway that continues up or down past the lowest exit level shall be clearly marked to indicate that it does not lead to an exit, if the portion beyond the exit level may be mistaken as the direction of exit travel.

9.9.11.5. Floor Numbering

1) Arabic numerals indicating the assigned floor number shall be
   a) mounted permanently on the stair side of the wall at the latch side of doors to exit stair shafts,
   b) not less than 60 mm high, raised approximately 0.8 mm above the surface,
   c) located 1 500 mm from the finished floor and not more than 300 mm from the door, and
   d) contrasting in colour with the surface on which they are applied. (See Note A-3.4.6.19.(1)(d).)

9.9.12. Lighting

9.9.12.1. Application

1) This Subsection applies to the lighting of all means of egress except those within dwelling units.

9.9.12.2. Required Lighting in Egress Facilities

1) Every exit, public corridor or corridor providing access to exit for the public shall be equipped to provide illumination to an average level of not less than 50 lx at floor or tread level and at all points such as angles and intersections at changes of level where there are stairs or ramps.

2) The minimum value of the illumination required by Sentence (1) shall be not less than 10 lx.

9.9.12.3. Emergency Lighting

1) Emergency lighting shall be provided in
   a) exits,
   b) principal routes providing access to exit in an open floor area,
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

Section 9.10. Fire Protection

9.10.1. Definitions and Application

9.10.1.1. Sloped Roofs

1) For the purposes of this Section, roofs with slopes of 60° or more to the horizontal that are adjacent to a room or space intended for occupancy shall be considered as a wall.

1) Where life safety and fire protection systems and systems with fire protection and life safety functions are integrated with each other, they shall be tested as a whole in accordance with CAN/ULC-S1001, “Integrated Systems Testing of Fire Protection and Life Safety Systems,” and the Fire By-law, to verify that they have been properly integrated. (See Note A-3.2.9.1.(1).)

9.10.1.3. Items under Part 3 Jurisdiction

1) Tents, air-supported structures, transformer vaults, walkways, elevators and escalators shall conform to Part 3.
2) Where rooms or spaces are intended for an assembly occupancy, such rooms or spaces shall conform to Part 3.
3) Basements containing more than 1 storey or exceeding 600 m² in area shall conform to Part 3.
4) Where rooms or spaces are intended for the storage, manufacture or use of hazardous or explosive material, such rooms or spaces shall conform to Part 3. (See Note A-3.3.1.2.(1).)
5) Except as provided in Article 3.3.5.8., facilities for the dispensing of fuel shall not be installed in any building.
6) Openings through floors that are not protected by shafts or closures shall be protected in conformance with Subsection 3.2.8. (See also Sentence 9.9.4.7.(1).)
7) Chutes and shafts shall conform to Subsection 3.6.3. except where they are entirely contained within a dwelling unit.
8) Sprinkler systems shall be designed, constructed and installed in conformance with Articles 3.2.5.12. to 3.2.5.15. and 3.2.5.17.
9) Standpipe and hose systems shall be designed, constructed and installed in conformance with Articles 3.2.5.8. to 3.2.5.11. and 3.2.5.17.
10) Fire pumps shall be installed in conformance with Articles 3.2.5.17. and 3.2.5.18.
11) Where fuel-fired appliances are installed on a roof, such appliances shall be installed in conformance with Article 3.6.1.5.
9.10.1.4. Items under Part 6 Jurisdiction
1) In kitchens containing commercial cooking equipment used in processes producing grease-laden vapours, the equipment shall be designed and installed in conformance with Article 6.3.1.7. (See Note A-9.10.1.4.(1).)

9.10.2. Occupancy Classification

9.10.2.1. Occupancy Classification
1) Except as provided in Article 9.10.2.2., every building or part thereof shall be classified according to its major occupancy as belonging to one of the groups or divisions described in Table 9.10.2.1.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Notes to Table 9.10.2.1.:  
⁽¹⁾ See Note A-3.1.2.1.(1).

9.10.2.2. Custodial, Convalescent and Residential Care Homes
1) Children's custodial homes and convalescent homes for ambulatory occupants living as a single housekeeping unit in a dwelling unit with sleeping accommodation for not more than 10 persons are permitted to be classified as residential occupancies.
2) A care facility accepted for residential use pursuant to provincial legislation is permitted to be classified as a residential occupancy, provided
   a) occupants live as a single housekeeping unit in a dwelling unit with sleeping accommodation for not more than 10 persons,
   b) smoke alarms are installed in conformance with Subsection 9.10.19.,
   c) emergency lighting is provided in conformance with Article 9.9.12.3., and
   d) the building is sprinklered throughout.

9.10.2.3. Group A, Division 2, Low Occupant Load
1) This Part may apply to a Group A, Division 2 assembly occupancy that is permitted by Article 3.1.2.6. to be classified as a Group D, business and personal services occupancy, provided the building in which the assembly occupancy is located complies with Sentence 1.3.3.3.(1) of Division A.  
(See Note A-3.1.2.6.)

9.10.2.4. Major Occupancies above Other Major Occupancies
1) Except as permitted in Article 9.10.2.4., in any building containing more than one major occupancy in which one major occupancy is located entirely above another, the requirements of Article 9.10.8.1. for each portion of the building containing a major occupancy shall be applied to that portion as if the entire building was of that major occupancy.

9.10.2.5. Buildings Containing More Than One Major Occupancy

1) In a building containing more than one major occupancy, where the aggregate area of all major occupancies in a particular group or division does not exceed 10% of the floor area on the storey on which they are located, they need not be considered as major occupancies for the purposes of Articles 9.10.8.1. and 9.10.2.3. provided they are not classified as Group F, Division 2 occupancies.

9.10.3. Ratings

9.10.3.1. Fire-Resistance and Fire-Protection Ratings

1) Where a fire-resistance rating or a fire-protection rating is required in this Section for an element of a building, such rating shall be determined in conformance with
   a) the test methods described in Part 3,
   b) the calculation method presented in Appendix D, or
   c) the construction specifications presented in Tables 9.10.3.1.-A and 9.10.3.1.-B.

9.10.3.2. Flame-Spread Ratings

1) Where a flame-spread rating is required in this Section for an element of a building, such rating shall be determined in accordance with the test methods described in Part 3, or in accordance with Appendix D.

2) Unless the flame-spread rating is referred to herein as a “surface flame-spread rating,” it shall apply to any surface of the element being considered that would be exposed by cutting through it as well as to the exposed surface of the element.

9.10.3.3. Fire Exposure

1) Floor, roof and ceiling assemblies shall be rated for exposure to fire on the underside.

2) Exterior walls shall be rated for exposure to fire from inside the building, except that such walls need not comply with the temperature rise limitations required by the standard tests referred to in Article 9.10.3.1. if such walls have a limiting distance of not less than 1.2 m, and due allowance is made for the effects of heat radiation in accordance with the requirements in Part 3.

3) Interior vertical fire separations required to have fire-resistance ratings shall be rated for exposure to fire on each side.

9.10.3.4. Suspended Membrane Ceilings

1) Where a ceiling construction has a suspended membrane ceiling with lay-in panels or tiles which contribute to the required fire-resistance rating, hold down clips or other means shall be provided to prevent the lifting of such panels or tiles in the event of a fire.

9.10.4. Building Size Determination

9.10.4.1. Mezzanines not Considered as Storeys

1) Except as required by Sentences (2) and 9.10.4.2.(1), the space above a mezzanine is permitted to be excluded from the calculation of building height, provided
   a) the aggregate area of mezzanines that are not superimposed does not exceed 10% of the floor area of the building in which they are located, and
   b) the area of mezzanine in a suite does not exceed 10% of the area of that suite on the storey on which it is located.
2) Except as required by Sentence 9.10.4.2.(1), the space above a *mezzanine* need not be considered as a *storey* in calculating the *building height*, provided
   a) not less than 60% of the horizontal plane separating the *mezzanine* from the room or floor space in which it is located is open, and
   b) except from within enclosed spaces described in Sentence (3), the space above the *mezzanine* is used as an open area without *partitions* or subdividing walls higher than 1,070 mm above the *mezzanine* floor.

   (See also Note A-3.2.1.1.(3).)

3) The space above a *mezzanine* conforming to Sentence (2) is permitted to include an enclosed space whose area does not exceed 10% of the open area of the room in which the *mezzanine* is located, provided the enclosed space does not obstruct visual communication between the open space above the *mezzanine* and the room in which it is located.

4) For the purpose of determining *occupant load*, the areas of *mezzanines* that are not considered as *storeys* shall be added to the *floor area* of the *storey* on which they are located. (See Note A-9.10.4.1.(4).)

5) Platforms and catwalks intended solely for periodic inspection and maintenance need not be considered as floor assemblies or *mezzanines* for the purpose of calculating *building height*, provided
   a) they are not used for storage, and
   b) they are constructed with *noncombustible* materials, unless the *building* is permitted to be of *combustible construction*.

9.10.4.2. More Than One Level of Mezzanine

1) Each level of *mezzanine* that is partly or wholly superimposed above the first level of *mezzanine* shall be considered as a *storey* in calculating the *building height*.

9.10.4.3. Basement Storage Garages

1) Where a *basement* is used primarily as a *storage garage*, the *basement* is permitted to be considered as a separate *building* for the purposes of this Section provided the floor above the *basement* and the exterior walls of the *basement* above the adjoining ground level are constructed as *fire separations* of masonry or concrete having a *fire-resistance rating* of not less than 2 h, except as permitted by Sentences 3.2.1.2.(2) and (3).

9.10.4.4. Roof-Top Enclosures

1) A roof-top enclosure shall not be considered as a *storey* in calculating the *building height* if the roof-top enclosure is
   a) provided for elevator machinery, a stairway or a *service room*, and
   b) used for no purpose other than for service to the *building*.

9.10.5. Permitted Openings in Wall and Ceiling Membranes

9.10.5.1. Permitted Openings in Wall and Ceiling Membranes

1) Except as permitted in Sentences (2) and (4), a membrane forming part of an assembly required to have a *fire-resistance rating* shall not be pierced by openings into the assembly unless the assembly has been tested and rated for such openings.

2) A wall or ceiling membrane forming part of an assembly required to have a *fire-resistance rating* is permitted to be pierced by openings for electrical and similar service outlet boxes provided such outlet boxes are tightly fitted.

3) Where boxes referred to in Sentence (2) are located on both sides of walls required to provide a *fire-resistance rating*, they shall be offset where necessary to maintain the integrity of the *fire separation*.

4) A membrane ceiling forming part of an assembly assigned a *fire-resistance rating* on the basis of Table 9.10.3.1.-B or Appendix D is permitted to be pierced by openings leading to ducts within the ceiling space provided the ducts, the amount of openings and their protection conform to the requirements of Appendix D.
9.10.6. Construction Types

9.10.6.1. Combustible Elements in Noncombustible Construction
1) Where a building or part of a building is required to be of noncombustible construction, combustible elements shall be limited in conformance with the requirements in Subsection 3.1.5.

9.10.6.2. Heavy Timber Construction
1) Heavy timber construction shall be considered to have a 45 min fire-resistance rating when it is constructed in accordance with the requirements for heavy timber construction in Article 3.1.4.7.

9.10.7. Steel Members

9.10.7.1. Protection of Steel Members
1) Except as permitted in Article 3.2.2.3., structural steel members used in construction required to have a fire-resistance rating shall be protected to provide the required fire-resistance rating.

9.10.8. Fire Resistance and Combustibility in Relation to Occupancy, Height and Supported Elements

9.10.8.1. Fire-Resistance Ratings for Floors and Roofs
1) Except as otherwise provided in this Subsection, the fire-resistance ratings of floors and roofs shall conform to Table 9.10.8.1. (See Subsection 9.10.2. for mixed occupancies and Subsection 9.10.21. for construction camps.)

Table 9.10.8.1.

9.10.8.2. Fire-Resistance Ratings in Sprinklered Buildings
1) The requirements in Table 9.10.8.1. for roof assemblies to have a fire-resistance rating are permitted to be waived in sprinklered buildings where
   a) the sprinkler system is electrically supervised in conformance with Sentence 3.2.4.9.(3), and
   b) the operation of the sprinkler system will cause a signal to be transmitted to the fire department in conformance with Sentence 3.2.4.7.(4).

9.10.8.3. Fire-Resistance Ratings for Walls, Columns and Arches
1) Except as otherwise provided in this Subsection, all loadbearing walls, columns and arches in the storey immediately below a floor or roof assembly shall have a fire-resistance rating of not less than that required for the supported floor or roof assembly.
2) Reserved.
9.10.8.4. Support of Noncombustible Construction
1) Where an assembly is required to be of noncombustible construction and to have a fire-resistance rating, it shall be supported by noncombustible construction.

9.10.8.5. Service Rooms
1) Construction supporting a service room need not conform to Article 9.10.8.3.

9.10.8.6. Mezzanines
1) Mezzanines required to be counted as storeys in Articles 9.10.4.1. and 9.10.4.2. shall be constructed in conformance with the requirements for “Floors Except Floors over Crawl Spaces” in Table 9.10.8.1.

9.10.8.7. Roofs Supporting an Occupancy
1) Where a portion of a roof supports an occupancy, that portion shall be constructed as a fire separation having a fire-resistance rating conforming to the rating for “Floors Except Floors over Crawl Spaces” in Table 9.10.8.1.

9.10.8.8. Floors of Exterior Passageways
1) Except as provided in Sentences (2) and (3), the floor assembly of every exterior passageway used as part of a means of egress shall have a fire-resistance rating of not less than 45 min or be of noncombustible construction.
2) No fire-resistance rating is required for floors of exterior passageways serving buildings of Group D, E or F major occupancy that are not more than 2 storeys in building height.
3) No fire-resistance rating is required for floors of exterior passageways serving a single dwelling unit where no suite is located above or below the dwelling unit.

9.10.8.9. Crawl Spaces
1) Where a crawl space exceeds 1.8 m in height or is used for any occupancy or as a plenum in combustible construction or for the passage of flue pipes, it shall be considered as a basement in applying the requirements in Article 9.10.8.1.

9.10.8.10. Application to Houses
1) Table 9.10.8.1. does not apply to
a) a dwelling unit that has no other dwelling unit above or below it,
b) reserved, or
  c) a dwelling unit that is not above or below another major occupancy.

9.10.8.11. Part 3 as an Alternative
1) The fire-resistance ratings of floors, roofs, loadbearing walls, columns and arches need not conform to this Subsection if such assemblies conform in all respects to the appropriate requirements in Section 3.2.

9.10.9. Fire Separations between Rooms and Spaces within Buildings

9.10.9.1. Application
1) This Subsection applies to fire separations required between rooms and spaces in buildings, except between rooms and spaces within a dwelling unit.

9.10.9.2. Continuous Barrier
1) Except as permitted in Article 9.10.9.3., a wall or floor assembly required to be a fire separation shall be constructed as a continuous barrier against the spread of fire and retard the passage of smoke.
2) Reserved.
3) The continuity of a fire separation shall be maintained where it abuts another fire separation, a floor, a ceiling, a roof, or an exterior wall assembly. (See Note A-3.1.8.3.(4.).)

4) Reserved.

9.10.9.3. Openings to be Protected with Closures
1) Except as permitted in Articles 9.10.9.5., 9.10.9.6. and 9.10.9.7., openings in required fire separations shall be protected with closures conforming to Subsection 9.10.13.
2) Reserved.

9.10.9.4. Floor Assemblies
1) Except as permitted in Sentences (2) to (4), all floor assemblies shall be constructed as fire separations.
2) Floor assemblies contained within dwelling units need not be constructed as fire separations.
3) Floor assemblies for which no fire-resistance rating is required by Subsection 9.10.8. and floors of mezzanines not required to be counted as storeys in Articles 9.10.4.1. and 9.10.4.2. need not be constructed as fire separations.
4) Where a crawl space is not required by Article 9.10.8.9. to be constructed as a basement, the floor above it need not be constructed as a fire separation.

9.10.9.5. Interconnected Floor Spaces
1) Interconnected floor spaces shall conform to Subsection 3.2.8.

9.10.9.6. Penetration of Fire Separations
(See Note A-3.1.9.)
1) Piping, tubing, ducts, chimneys, wiring, conduit, electrical outlet boxes and other similar service equipment that penetrate a required fire separation shall be tightly fitted or fire stopped to maintain the integrity of the separation. (See Note A-9.10.9.6.(1.).)
2) Penetrations of a firewall shall be sealed at the penetration by a fire stop that, when subjected to the fire test method in CAN/ULC-S115, “Fire Tests of Firestop Systems,” has an FT rating not less than the fire-resistance rating for the fire separation.
3) Except as provided in Sentences (4) to (12) and Article 9.10.9.7., pipes, ducts, electrical boxes, totally enclosed raceways or other similar service equipment that partly or wholly penetrate an assembly required to have a fire-resistance rating shall be noncombustible unless the assembly has been tested incorporating such equipment. (See Note A-3.1.9.2.(1.).)
4) Electrical wires or similar wiring enclosed in noncombustible totally enclosed raceways are permitted to partly or wholly penetrate an assembly required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required in Sentence (3).
5) Single conductor metal-sheathed cables with combustible jacketing that are more than 25 mm in overall diameter are permitted to penetrate a fire separation required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required in Sentence (3), provided the cables are not grouped and are spaced a minimum of 300 mm apart.
6) Electrical wires or cables, single or grouped, with combustible insulation or jacketing that is not totally enclosed in raceways of noncombustible material, are permitted to partly or wholly penetrate an assembly required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required in Sentence (3), provided the cables are not grouped and are spaced a minimum of 300 mm apart.
7) Combustible totally enclosed raceways which are embedded in a concrete floor slab are permitted in an assembly required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required in Sentence (3), where the concrete provides not less than 50 mm of cover between the raceway and the bottom of the slab.
8) Combustible outlet boxes are permitted in an assembly required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required in Sentence (3), provided the opening through the membrane into the box does not exceed 160 cm².
9) Combustible water distribution piping is permitted to partly or wholly penetrate a fire separation that is required to have a fire-resistance rating without being incorporated in the assembly at the time of testing as required in Sentence (3), provided the piping is protected with a fire stop in conformance with Sentence 3.1.9.5.(4).

10) Combustible sprinkler piping is permitted to penetrate a fire separation provided the fire compartments on each side of the fire separation are sprinklered.

11) Sprinklers are permitted to penetrate a fire separation or a membrane forming part of an assembly required to have a fire-resistance rating without having to meet the fire stop requirements of Sentence (1), provided the annular space created by the penetration of a fire sprinkler is covered by a metal escutcheon plate in accordance with NFPA 13, “Installation of Sprinkler Systems.”

12) Combustible piping for central vacuum systems is permitted to penetrate a fire separation provided the installation conforms to the requirements that apply to combustible drain, waste and vent piping specified in Sentences 9.10.9.7.(2) to (6).

13) Fire dampers are permitted to penetrate a fire separation or a membrane forming part of an assembly required to have a fire-resistance rating without having to meet the fire stop requirements of Sentence (1), provided the fire damper is
   a) installed in conformance with NFPA 80, “Fire Doors and Other Opening Protectives,” or
   b) specifically designed with a fire stop.

9.10.9.7. Combustible Drain, Waste and Vent Piping
(See Note A-3.1.9.)

1) Except as permitted in Sentences (2) to (6), combustible piping shall not be used in any part of a drain, waste and vent piping system where any part of that system partly or wholly penetrates a fire separation required to have a fire-resistance rating or penetrates a membrane that contributes to the required fire-resistance rating of an assembly.

2) Combustible drain, waste and vent piping not located in a vertical shaft is permitted to penetrate a fire separation required to have a fire-resistance rating or a membrane that forms part of an assembly required to have a fire-resistance rating provided the piping is sealed at the penetration by a fire stop that has an F rating not less than the fire-resistance rating required for the fire separation.

3) The rating referred to in Sentence (2) shall be based on CAN/ULC-S115, “Fire Tests of Firestop Systems,” with a pressure differential of 50 Pa between the exposed and unexposed sides, with the higher pressure on the exposed side.

4) Combustible drain piping is permitted to penetrate a horizontal fire separation or a membrane that contributes to the required fire-resistance rating of a horizontal fire separation, provided it leads directly from a noncombustible watercloset through a concrete floor slab.

5) Combustible drain, waste and vent piping is permitted on one side of a vertical fire separation provided it is not located in a vertical shaft.

6) In buildings containing 2 dwelling units only, combustible drain, waste and vent piping is permitted on one side of a horizontal fire separation.

9.10.9.8. Collapse of Combustible Construction

1) Combustible construction that abuts on or is supported by a noncombustible fire separation shall be constructed so that its collapse under fire conditions will not cause collapse of the fire separation.

9.10.9.9. Reduction in Thickness of Fire Separation by Beams and Joists

1) Where pockets for the support of beams or joists are formed in masonry or concrete fire separation, the remaining total thickness of masonry and/or grout and/or concrete shall be not less than the required equivalent thickness shown for Type S monolithic concrete in Table D-2.1.1. in Appendix D for the required fire-resistance rating.

9.10.9.10. Concealed Spaces above Fire Separations
1) Except as provided in Sentence (2), a horizontal service space or other concealed space located above a required vertical fire separation shall be divided at the fire separation by an equivalent fire separation within the space.
2) Where a horizontal service space or other concealed space is located above a required vertical fire separation other than a vertical shaft, such space need not be divided as required in Sentence (1) provided the construction between such space and the space below is constructed as a fire separation having a fire-resistance rating not less than that required for the vertical fire separation, except that where the vertical fire separation is not required to have a fire-resistance rating greater than 45 min, the fire-resistance rating of the ceiling may be reduced to 30 min.

9.10.9.11. Separation of Residential Occupancies
1) Except as provided in Sentence (2), residential occupancies shall be separated from all other major occupancies by a fire separation having a fire-resistance rating of not less than 1 h.
2) Except as provided in Sentence (3), a major occupancy classified as a residential occupancy shall be separated from other major occupancies classified as mercantile or medium-hazard industrial occupancies by a fire separation having a fire-resistance rating of not less than 2 h.
3) Where not more than 2 dwelling units are located in a building containing a mercantile occupancy, such mercantile occupancy shall be separated from the dwelling units by a fire separation having not less than 1 h fire-resistance rating.

9.10.9.12. Residential Suites in Industrial Buildings
1) Not more than one suite of residential occupancy shall be contained within a building classified as a Group F, Division 2 major occupancy.

9.10.9.13. Separation of Suites
1) Except as required in Article 9.10.9.14. and as permitted by Sentences (2) and (3), a suite shall be separated from adjoining suites by a fire separation having a fire-resistance rating of not less than 45 min.
2) In sprinklered buildings, suites of business and personal services occupancy and mercantile occupancy that are served by public corridors conforming with Clause 3.3.1.4.(4)(b) are not required to be separated from each other by fire separations.
3) No fire separation is required between suites of business and personal services occupancy.

1) Except as provided in Sentences (2) and (3) and Article 9.10.21.2., suites in residential occupancies shall be separated from adjacent rooms and suites by a fire separation having a fire-resistance rating of not less than 45 min.
2) Sleeping rooms in boarding and lodging houses where sleeping accommodation is provided for not more than 8 boarders or lodgers need not be separated from the remainder of the floor area as required in Sentence (1) where the sleeping rooms form part of the proprietor’s residence and do not contain cooking facilities.
3) Dwelling units that contain 2 or more storeys including basements shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 1 h. (See Note A-3.3.4.4.(1).)
4) Reserved.

9.10.9.15. Separation of Public Corridors
1) Except as provided in Sentences (2) and (3), public corridors shall be separated from the remainder of the building by a fire separation having not less than a 45 min fire-resistance rating.
2) In other than residential occupancies, no fire-resistance rating is required for fire separations between a public corridor and the remainder of the building if
   a) the floor area is sprinklered,
b) the sprinkler system is electrically supervised in conformance with Sentence 3.2.4.9.(3), and
c) the operation of the sprinkler system will cause a signal to be transmitted to the fire department
in conformance with Sentence 3.2.4.7.(4).

3) In other than residential occupancies, no fire separation is required between a public corridor and the
remainder of the building if
   a) the floor area is sprinklered,
b) the sprinkler system is electrically supervised in conformance with Sentence 3.2.4.9.(3),
c) the operation of the sprinkler system will cause a signal to be transmitted to the fire department
in conformance with Sentence 3.2.4.7.(4), and
d) the corridor exceeds 5 m in width.

4) Reserved.

9.10.9.16. Separation of Storage Garages
1) Except as provided in Sentences (2) and (3), a storage garage shall be separated from other
   occupancies by a fire separation having not less than a 1.5 h fire-resistance rating.
2) Except as permitted in Sentence (3), storage garages containing 5 motor vehicles or fewer shall be
   separated from other occupancies by a fire separation of not less than 1 h.
3) Where a storage garage serves only the dwelling unit to which it is attached or in which it is built, it shall
   be considered as part of that dwelling unit and the fire separation required in Sentence (2) need not be
   provided between the garage and the dwelling unit.
4) Except as provided in Sentence (5), where a storage garage is attached to or built into a building of
   residential occupancy,
   a) an air barrier system conforming to Subsection 9.25.3. shall be installed between the garage
      and the remainder of the building to provide an effective barrier to gas and exhaust fumes, and
   b) every door between the garage and the remainder of the building shall conform to Article
      9.10.13.15.
   (See Note A-9.10.9.16.(4).)
5) Where membrane materials are used to provide the required airtightness in the air barrier system, all
   joints shall be sealed and structurally supported.

9.10.9.17. Separation of Repair Garages
1) Except as provided in Sentences (2) and (3), a repair garage shall be separated from other occupancies
   by a fire separation having a fire-resistance rating of not less than 2 h.
2) Ancillary spaces directly serving a repair garage, including waiting rooms, reception rooms, tool and parts
   storage areas and supervisory office space, need not be separated from the repair garage but shall be
   separated from other occupancies as required in Sentence (1).
3) The fire separation referred to in Sentence (1) shall have a fire-resistance rating of not less than 1 h, where
   a) the building is not more than one storey in building height,
   b) the building is operated as a single suite, and
   c) the only occupancy other than the repair garage is a mercantile occupancy.
4) Except as provided in Sentence (5), where a building containing a repair garage also contains a dwelling
   unit, an air barrier system conforming to Subsection 9.25.3. shall be installed between the dwelling unit and
   the suite containing the garage to provide an effective barrier to gas and exhaust fumes. (See Note A-
   9.10.9.16.(4).)
5) Where membrane materials are used to provide the required airtightness in the air barrier system, all
   joints shall be sealed and structurally supported.

9.10.9.18. Exhaust Ducts Serving More Than One Fire Compartment
1) Where a vertical service space contains an exhaust duct that serves more than one fire compartment, the duct shall have a fan located at or near the exhaust outlet to ensure that the duct is under negative pressure.

2) Individual fire compartments referred to in Sentence (1) shall not have fans that exhaust directly into the duct in the vertical service space.

9.10.9.19. Central Vacuum Systems
1) A central vacuum system shall serve not more than one suite.

9.10.9.20. Multiple Tenant Self Storage Warehouses
1) Multiple tenant self-storage warehouses shall comply with Article 3.3.5.9.

9.10.10. Service Rooms

9.10.10.1. Application
1) This Subsection applies to service rooms in all buildings except rooms located within a dwelling unit.

9.10.10.2. Service Room Floors
1) The fire-resistance rating requirements in this Subsection do not apply to the floor assembly immediately below a service room.

9.10.10.3. Separation of Service Rooms
1) Except as provided in Sentence (2) and Articles 9.10.5. and 9.10.6., service rooms shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 1 h when the floor containing the service room is not sprinklered.
2) Where a room contains a limited quantity of service equipment and the service equipment does not constitute a fire hazard, the requirements in Sentence (1) shall not apply.

9.10.10.4. Location of Fuel-Fired Appliances
1) Except as provided in Sentences (2) and (3) and Article 9.10.5., fuel-fired appliances shall be located in a service room separated from the remainder of the building by a fire separation having not less than a 1 h fire-resistance rating.
2) Except as required in the appliance installation standards referenced in Sentences 6.2.1.5.(1), 9.33.5.2.(1) and 9.33.5.3.(1), fuel-fired space-heating appliances, space-cooling appliances, service water heaters and laundry appliances need not be separated from the remainder of the building as required in Sentence (1), where the appliances serve
   a) not more than one room or suite, or
   b) a building with a building area of not more than 400 m² and a building height of not more than 2 storeys.
3) Sentence (1) does not apply to fireplaces and cooking appliances.

9.10.10.5. Incinerators
1) Service rooms containing incinerators shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 2 h.
2) The design, construction, installation and alteration of each indoor incinerator shall conform to NFPA 82, “Incinerators and Waste and Linen Handling Systems and Equipment.”
3) Every incinerator shall be connected to a chimney flue conforming to the requirements in Section 9.21. and serving no other appliance.
4) An incinerator shall not be located in a room with other fuel-fired appliances.

9.10.10.6. Storage Rooms
1) Rooms for the temporary storage of combustible refuse in all occupancies or for public storage in residential occupancies shall be separated from the remainder of the building by a fire separation having not less than a 1 h fire-resistance rating, except that a 45 min fire separation is permitted where the fire-resistance rating of the floor assembly is not required to exceed 45 min, or where such rooms are sprinklered.

9.10.11. Firewalls

9.10.11.1. Required Firewalls
1) Except as provided in Article 9.10.11.2., a party wall on a property line shall be constructed as a firewall. (See Note A-3.2.3.4.(1.).)

9.10.11.2. Firewalls Not Required
1) In a building of residential occupancy in which there is no dwelling unit above another dwelling unit, a party wall on a property line between dwelling units need not be constructed as a firewall provided it is constructed as a fire separation having a fire-resistance rating of not less than a 1 h.
2) Reserved.
3) The wall described in Sentence (1) shall provide continuous protection from the top of the footings to the underside of the roof deck.
4) Any space between the top of the wall described in Sentence (1) and the roof deck shall be tightly filled with mineral wool or noncombustible material.

9.10.11.3. Construction of Firewalls
1) Where firewalls are used, the requirements in Part 3 shall apply.

9.10.12. Prevention of Fire Spread at Exterior Walls and between Storeys

9.10.12.1. Termination of Floors or Mezzanines
1) Except as provided in Sentence (2) and in Articles 9.10.1.3. and 9.10.9.5., the portions of a floor area or mezzanine that do not terminate at an exterior wall, a firewall or a vertical shaft, shall terminate at a vertical fire separation having a fire-resistance rating not less than that required for the floor assembly that terminates at the separation.
2) A mezzanine need not terminate at a vertical fire separation where the mezzanine is not required to be considered as a storey in Articles 9.10.4.1. and 9.10.4.2.

9.10.12.2. Location of Skylights
1) Where a wall in a building is exposed to a fire hazard from an adjoining roof of a separate unsprinklered fire compartment in the same building, the roof shall contain no skylights within a horizontal distance of 5 m of the windows in the exposed wall.

9.10.12.3. Exterior Walls Meeting at an Angle
1) Except as provided in Article 9.9.4.5., where exterior walls of a building meet at an external angle of 135° or less, the horizontal distance from an unprotected opening in one exterior wall to an unprotected opening in the other exterior wall shall be not less than 1.2 m, where these openings are
   a) in different fire compartments, or
   b) in different dwelling units.
2) The exterior wall of each fire compartment referred to in Sentence (1) within the 1.2 m distance shall have a fire-resistance rating not less than that required for the interior vertical fire separation between the compartment and the remainder of the building.
3) Reserved.
9.10.12.4. Protection of Soffits

1) This Article applies to the portion of any soffit enclosing a projection that is
   a) less than 2.5 m vertically above a window or door, and
   b) less than 1.2 m from either side of the window or door.
   (See Note A-9.10.12.4.(1).)

2) Except as provided in Sentences (4) and (5), the construction described in Sentence (1) shall have no unprotected openings and shall be protected in accordance with Sentence (3), where the soffit encloses
   a) a common attic or roof space that spans more than 2 suites of residential occupancy and projects beyond the exterior wall of the building,
   b) a floor space where an upper storey projects beyond the exterior wall of a lower storey and
      i) a fire separation is required at the floor between the two,
         ii) reserved, or
   c) a floor space where an upper storey projects beyond the exterior wall of a lower storey, and the projection is continuous across
      i) a vertical fire separation separating two suites, or
      ii) reserved.

3) Protection required by Sentence (2) shall be provided by
   a) noncombustible material having a minimum thickness of 0.38 mm and a melting point not below 650°C,
   b) not less than 12.7 mm thick gypsum soffit board or gypsum board installed according to CSA A82.31-M, “Gypsum Board Application,”
   c) not less than 11 mm thick plywood,
   d) not less than 12.5 mm thick OSB or waferboard, or
   e) not less than 11 mm thick lumber.
   (See Note A-9.10.12.4.(3).)

4) In the case of a soffit described in Sentence (1) that is at the edge of an attic or roof space and completely separated from the remainder of that attic or roof space by fire blocks, the requirements in Sentence (2) do not apply.

5) Where all suites spanned by a common attic or roof space or situated above or below the projecting floor are sprinklered, the requirements of Sentence (2) do not apply, provided that all rooms, including closets and bathrooms, having openings in the wall beneath the soffit are sprinklered, notwithstanding any exceptions in the sprinkler standards referenced in Article 3.2.5.12.

9.10.13. Doors, Dampers and Other Closures in Fire Separations

9.10.13.1. Closures

1) Except as provided in Article 9.10.13.2., openings in required fire separations shall be protected with a closure conforming to Table 9.10.13.1. and shall be installed in conformance with Chapters 2 to 14 of NFPA 80, “Fire Doors and Other Opening Protectives,” unless otherwise specified herein. (See also Article 9.10.3.1.)

Notes to Table 9.10.13.1:

(1) See Article 9.10.13.2.

### 9.10.13.2 Solid Core Wood Door as a Closure

1) A 45 mm thick solid core wood door is permitted to be used where a minimum fire-protection rating of 20 min is permitted, between an ancillary residential unit and its principal dwelling unit, or between a public corridor and a suite provided that the door conforms to CAN/ULC-S113, “Wood Core Doors Meeting the Performance Required by CAN/ULC-S104 for Twenty Minute Fire Rated Closure Assemblies.” (See Note A-9.10.13.2.(1).)

2) Doors described in Sentence (1) shall have not more than a 6 mm clearance beneath and not more than 3 mm at the sides and top.

### 9.10.13.3 Unrated Wood Door Frames

1) Doors required to provide a 20 min fire-protection rating or permitted to be 45 mm solid core wood shall be mounted in a wood frame of not less than 38 mm thickness where the frame has not been tested and rated.

### 9.10.13.4 Doors as a Means of Egress

1) Doors forming part of an exit or a public means of egress shall conform to Subsection 9.9.6. in addition to this Subsection.

### 9.10.13.5 Wired Glass as a Closure

1) Wired glass conforming to Article 9.6.1.2. which has not been tested in accordance with Article 9.10.3.1. is permitted as a closure in a vertical fire separation required to have a fire-resistance rating of not more than 1 h provided such glass is not less than 6 mm thick and is mounted in conformance with Sentence (2).

2) Wired glass described in Sentence (1) shall be mounted in fixed steel frames having a metal thickness of not less than 1.35 mm and a glazing stop of not less than 20 mm on each side of the glass.

3) Individual panes of glass described in Sentence (1) shall not exceed 0.8 m² in area or 1.4 m in height or width, and the area of glass not structurally supported by mullions shall not exceed 7.5 m².

### 9.10.13.6 Steel Door Frames

1) Steel door frames forming part of a closure in a fire separation, including anchorage requirements, shall conform to CAN/ULC-S105, “Fire Door Frames Meeting the Performance Required by CAN/ULC-S104.”

### 9.10.13.7 Glass Block as a Closure

1) Glass block that has not been tested in accordance with Article 9.10.3.1. is permitted as a closure in a fire separation required to have a fire-resistance rating of not more than 1 h. (See Article 9.20.9.6.)

### 9.10.13.8 Maximum Size of Opening

1) The size of an opening in an interior fire separation, even where protected with a closure, shall not exceed 11 m², with no dimension greater than 3.7 m, when the fire compartments on both sides of the fire separation are not sprinklered.
2) The size of an opening in an interior fire separation, even where protected with a closure, shall not exceed 22 m², with no dimension greater than 6 m, when the fire compartments on both sides of the fire separation are sprinklered.

9.10.13.9. Door Latch
1) Every swing type door in a fire separation shall be equipped with a latch.

9.10.13.10. Self-closing Device
1) Except as described in Sentence (2), every door in a fire separation shall have a self-closing device.
2) Self-closing doors are not required between public corridors and suites in business and personal services occupancies, except in dead-end corridors.

9.10.13.11. Hold-Open Devices
1) Where hold-open devices are used on doors in required fire separations, they shall be installed in accordance with Article 3.1.8.14.

9.10.13.12. Service Room Doors
1) Swing-type doors shall open into service rooms containing fuel-fired equipment where such doors lead to public corridors or rooms used for assembly but shall swing outward from such rooms in all other cases.

9.10.13.13. Fire Dampers
1) Except as permitted by Sentences (2) to (5) and Sentence 9.10.5.1.(4), a duct that penetrates an assembly required to be a fire separation with a fire-resistance rating shall be equipped with a fire damper in conformance with Articles 3.1.8.4. and 3.1.8.10.
2) A fire damper is not required where a noncombustible branch duct pierces a required fire separation provided the duct
   a) has a melting point not below 760°C,
   b) has a cross-sectional area less than 130 cm², and
   c) supplies only air-conditioning units or combined air-conditioning and heating units discharging air at not more than 1.2 m above the floor.
3) A fire damper is not required where a noncombustible branch duct pierces a required fire separation around an exhaust duct riser in which the airflow is upward provided
   a) the melting point of the branch duct is not below 760°C,
   b) the branch duct is carried up inside the riser not less than 500 mm, and
   c) the exhaust duct is under negative pressure as described in Article 9.10.9.18.
4) Noncombustible ducts that penetrate a fire separation separating a vertical service space from the remainder of the building need not be equipped with a fire damper at the fire separation provided
   a) the ducts have a melting point above 760°C, and
   b) each individual duct exhausts directly to the outside at the top of the vertical service space.
5) A duct serving commercial cooking equipment and piercing a required fire separation need not be equipped with a fire damper at the fire separation. (See also Article 6.3.1.7.)

9.10.13.14. Fire Stop Flaps
1) Fire stop flaps in ceiling membranes referred to in Sentence 9.10.5.1.(4) shall
   a) conform to CAN/ULC-S112.2, “Fire Test of Ceiling Firestop Flap Assemblies,” and
   b) activate at a temperature approximately 30°C above the normal maximum temperature that occurs in the ducts, whether the air duct system is operating or shut down.

9.10.13.15. Doors between Garages and Dwelling Units
1) A door between an attached or built-in garage and a *dwelling unit* shall be tight fitting and weather-stripped to provide an effective barrier against the passage of gas and exhaust fumes and shall be fitted with a self-closing device.

2) A doorway between an attached or built-in garage and a *dwelling unit* shall not be located in a room intended for sleeping.

### 9.10.13.16. Door Stops
1) Where a door is installed so that it may damage the integrity of a *fire separation* if its swing is unrestricted, door stops shall be installed to prevent such damage.

#### 9.10.14.1. Application
1) This Subsection applies to *buildings* other than those to which Subsection 9.10.15. applies.

#### 9.10.14.2. Area and Location of Exposing Building Face
1) Except as permitted by Sentence (2), the area of an *exposing building face* shall be
   a) taken as the exterior wall area facing in one direction on any side of a *building*, and
   b) calculated as the total area measured from the finished ground level to the uppermost ceiling.

2) If a *building* is divided by *fire separations* into *fire compartments*, the area of exposing building face is permitted to be calculated for each fire compartment, provided the fire separations have a fire-resistance rating not less than 45 min.

3) For the purpose of using Table 9.10.14.4.-A to determine the maximum aggregate area of *unprotected openings* in an irregularly shaped or skewed exterior wall, the location of the exposing building face shall be taken as a vertical plane located so that there are no unprotected openings between the vertical plane and the line to which the *limiting distance* is measured. (See Note A-3.2.3.1.(4).)

4) For the purpose of using Table 9.10.14.5.-A to determine the required type of construction, cladding and fire-resistance rating for an irregularly shaped or skewed exterior wall,
   a) the location of the exposing building face shall be taken as a vertical plane located so that no portion of the actual exposing building face is between the vertical plane and the line to which the *limiting distance* is measured, and
   b) the value for the maximum area of unprotected openings (See second column of Table 9.10.14.5.-A) shall be determined using the *limiting distance* measured from the location described in Clause (a). (See Note A-3.2.3.1.(4).)

#### 9.10.14.3. Limiting Distance and Fire Department Response
1) Except for the purpose of applying Sentences 9.10.14.4.(2), (3), (8) and (9), and Sentences 9.10.14.5.(3), (8) and (13), a *limiting distance* equal to half the actual limiting distance shall be used as input to the requirements of this Subsection, where
   a) the time from receipt of notification of a fire by the fire department until the first fire department vehicle arrives at the *building* exceeds 10 min in 10% or more of all calls to the *building*, and
   b) any storey in the *building* is not sprinklered.
(See Notes A-3.2.3. and A-3.2.3.1.(8).)

#### 9.10.14.4. Openings in Exposing Building Face
1) Except as provided in Sentences (6) to (10), the maximum aggregate area of unprotected openings in an exposing building face shall
   a) conform to Table 9.10.14.4.-A,
   b) conform to Subsection 3.2.3., or
   c) where the *limiting distance* is not less than 1.2 m, be equal to or less than
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

i) the limiting distance squared, for residential occupancies, business and personal services occupancies and low-hazard industrial occupancies, and

ii) half the limiting distance squared, for mercantile occupancies and medium-hazard industrial occupancies.

Notes to Table 9.10.14.4.-A:

See also Sentences (6) and (7) to calculate the maximum permitted area of unprotected openings in sprinklered buildings or where wired glass or glass blocks are used.

2) Openings in a wall having a limiting distance of less than 1.2 m shall be protected by closures, of other than wired glass or glass block, whose fire-protection rating is in conformance with the fire-resistance rating required for the wall. (See Table 9.10.13.1.)

3) Except for buildings that are sprinklered and for openable windows having an unobstructed opening equal to 0.35 m² installed in accordance with Sentences 9.9.10.1.(1) and (2), where the limiting distance is 2 m or less, individual unprotected openings shall be no greater than

a) the area stated in Table 9.10.14.4.-B, or

b) where the limiting distance is equal to or greater than 1.2 m, the area calculated by
Area = 0.24(2 × LD - 1.2)^2

where

Area = area of the unprotected opening, and
LD = limiting distance.

4) The spacing between individual unprotected openings described in Sentence (3) that serve a single room or space described in Sentence (5) shall be not less than
   a) 2 m horizontally of another unprotected opening that is on the same exposing building face and serves the single room or space, or
   b) 2 m vertically of another unprotected opening that serves the single room or space, or another room or space on the same storey.

5) For the purpose of Sentence (4), “single room or space” shall mean
   a) two or more adjacent spaces having a full-height separating wall extending less than 1.5 m from the interior face of the exterior wall, or
   b) two or more stacked spaces that are on the same storey.

6) If a building is not sprinklered, the maximum aggregate area of unprotected openings shall be not more than twice the area determined according to Sentence (1), where the unprotected openings are glazed with
   i) wired glass in steel frames, as described in Article 9.10.13.5., or
   ii) glass blocks, as described in Article 9.10.13.7.

7) Where the building is sprinklered, the maximum aggregate area of unprotected openings shall be not more than twice the area determined according to Sentence (1), provided all rooms, including closets and bathrooms, that are adjacent to the exposing building face and that have unprotected openings are sprinklered, notwithstanding any exemptions in the sprinkler standards referenced in Article 3.2.5.12.

8) The maximum aggregate area of unprotected openings in an exposing building face of a storage garage need not comply with Sentence (1), where
   a) all storeys are constructed as open-air storeys, and
   b) the storage garage has a limiting distance of not less than 3 m.

9) The maximum aggregate area of unprotected openings in an exposing building face of a storey that faces a street and is at the same level as the street need not comply with Sentence (1), where the limiting distance is not less than 9 m.

10) Except as provided in Sentence (11), for garages or accessory buildings that serve a single dwelling unit only and are detached from any building, the maximum aggregate area of glazed openings shall comply with the requirements for unprotected openings.

11) The limits on the area of glazed openings stated in Sentence (10) need not apply to the exposing building face of a detached garage or accessory building facing a dwelling unit, where
   a) the detached garage or accessory building serves only one dwelling unit,
   b) the detached garage or accessory building is located on the same property as that dwelling unit, and
c) the dwelling unit served by the detached garage or accessory building is the only major occupancy on the property.

12) Where a building of residential occupancy is sprinklered and the limiting distance is less than 1.2 m but no less than 1 m, the maximum percentage of unprotected openings may be 10% provided
   a) the windows are glazed with tempered, wired or laminated glass, or glass block, and
   b) the exposing building face is constructed according to Article 9.10.14.5.

9.10.14.5. Construction of Exposing Building Face and Walls above Exposing Building Face

1) Except as permitted in Sentences (3) to (15), each exposing building face and any exterior wall located above an exposing building face that encloses an attic or roof space shall be constructed in conformance with Table 9.10.14.5.-A. (See Note A-9.10.14.5.(1).) (See also Subsection 9.10.8.)

2) Except as provided in Sentences (3) to (8), cladding on exposing building faces and exterior walls located above exposing building faces that enclose an attic or roof space, for buildings or fire compartments where the maximum permitted area of unprotected openings is more than 10% of the exposing building face, need not be noncombustible where the wall assembly complies with the requirements of Clause 3.1.5.5.(1)(b) when tested in conformance with CAN/ULC-S134, “Fire Test of Exterior Wall Assemblies.”

3) Except as provided in Sentences (4) to (8) and permitted by Sentence (9), cladding on exposing building faces and on exterior walls located above exposing building faces of buildings or fire compartments where
the maximum permitted area of unprotected openings is more than 25% but not more than 50% of the exposing building face need not be noncombustible, where

a) the limiting distance is greater than 5.0 m,
b) the limiting distance is greater than 2.5 m where the area and width-to-height ratio of the exposing building face conform to Table 9.10.14.5.-B,
c) the building or fire compartment is sprinklered,
d) the cladding
   i) conforms to Subsections 9.27.6., 9.27.7., 9.27.8. or 9.27.9.,
   ii) is installed without furring members, or on furring not more than 25 mm thick, over gypsum sheathing at least 12.7 mm thick or over masonry, and
   iii) after conditioning in conformance with ASTM D 2898, “Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing,” has a flame-spread rating not greater than 25 when tested in accordance with Sentence 3.1.12.1.(2), or
e) the cladding
   i) conforms to Subsection 9.27.12.,
   ii) is installed with or without furring members over a gypsum sheathing at least 12.7 mm thick or over masonry,
   iii) has a flame-spread rating not greater than 25 when tested in accordance with Sentence 3.1.12.1.(2), and
   iv) does not exceed 2 mm in thickness exclusive of fasteners, joints and local reinforcements.

4) Except as provided in Sentence (5), if a detached garage or accessory building serves one dwelling unit; or if a detached garage serves both units in a building containing not more than two principal dwelling units and has a continuous internal fire separation, with a 45 minute fire resistance rating from the floor slab to the roof sheathing separating the parking spaces for each unit, the exposing building face
   a) need not conform to the minimum required fire-resistance rating stated in Table 9.10.14.5.-A, where the limiting distance is 0.6 m or more,
   b) shall have a fire-resistance rating of not less than 45 min, where the limiting distance is less than 0.6 m, and
   c) need not conform to the type of cladding required by Table 9.10.14.5.-A, regardless of the limiting distance.
5) The requirements regarding fire-resistance rating, type of construction and type of cladding need not apply to the exposing building face of a detached garage or accessory building conforming to Sentence 9.10.14.5.(4) facing a building containing not more than two principal dwelling units, where
   a) the detached garage or accessory building serves only a building containing not more than two principal dwelling units;
   b) the detached garage or accessory building is located on the same property as that building containing not more than two principal dwelling units, and
   c) the building containing not more than two principal dwelling units served by the detached garage or accessory building is the only major occupancy on the property.

6) Except as provided in Sentence (7), combustible projections on the exterior of a wall that are more than 1 m above ground level and that could expose an adjacent building to fire spread shall not be permitted within
   a) 1.2 m of a property line or the centre line of a public way, or
   b) 2.4 m of a combustible projection on another building on the same property.

7) Except as provided in Sentences (9) to (12), Sentence (6) shall not apply to
   a) buildings containing not more than two principal dwelling units only, and
   b) detached garages or accessory buildings, where
      i) the detached garage or accessory building conforming to Sentence 9.10.14.5.(4) serves only a building containing not more than two principal dwelling units,
      ii) the detached garage or accessory building conforming to Sentence 9.10.14.5.(4) is located on the same property as that building containing not more than two principal dwelling units, and
      iii) the building containing not more than two principal dwelling units served by the detached garage or accessory building is the only major occupancy on the property.

(See Note A-9.10.14.5.(7).)

8) Where combustible projections on an exposing building face are permitted by Sentence (7), are totally enclosed and constructed with solid faces, such as for fireplaces and chimneys, and extend within 1.2 m of a property line,
   a) the construction of the face and sides of the projection shall comply with the corresponding requirements for exposing building faces for limiting distances less than 1.2 m as stated in Sentence (2) or (3), and
   b) where the underside of the projection is more than 0.6 m above finished ground level, it shall be protected by
      i) not less than 0.38 mm thick noncombustible material,
      ii) unvented aluminum conforming to CAN/CGSB-93.2-M, “Prefinished Aluminum Siding, Soffits, and Fascia, for Residential Use,”
      iii) not less than 12.7 mm thick gypsum soffit board or gypsum ceiling board installed according to CSA A82.31-M, “Gypsum Board Application,”
      iv) not less than 11 mm thick plywood,
      v) not less than 12.5 mm thick OSB or waferboard, or
      vi) not less than 11 mm thick lumber.

(See Note A-9.10.14.5.(8).)

9) Except as provided in Sentence (11), where the exposing building face has a limiting distance of not more than 0.45 m, projecting roof soffits shall not be constructed above the exposing building face. (See Note A-3.2.3.6.(2).)

10) Except as provided in Sentence (11), where the exposing building face has a limiting distance of more than 0.45 m, the face of roof soffits shall not project to less than 0.45 m from the property line. (See Note A-3.2.3.6.(2).)

11) The face of a roof soffit is permitted to project to the property line, where it faces a street, lane or public thoroughfare. (See Note A-9.10.14.5.(11) and 9.10.15.5.(10).)
12) Where roof soffits project to less than 1.2 m from the property line, the centre line of a lane or public thoroughfare, or an imaginary line between two buildings or fire compartments on the same property, they shall
   a) have no openings, and
   b) be protected by
      i) not less than 0.38 mm thick sheet steel,
      ii) unvented aluminum conforming to CAN/CGSB-93.2-M, “Prefinished Aluminum Siding, Soffits, and Fascia, for Residential Use,”
      iii) not less than 12.7 mm thick gypsum soffit board or gypsum ceiling board installed according to CSA A82.31-M, “Gypsum Board Application,”
      iv) not less than 11 mm thick plywood,
      v) not less than 12.5 mm thick OSB or waferboard, or
      vi) not less than 11 mm thick lumber.

(See Note A-3.2.3.6.(2).)

13) Heavy timber and steel columns need not conform to the requirements of Sentence (1), provided the limiting distance is not less than 3 m.

14) Non-loadbearing wall components need not have a minimum fire-resistance rating, where the building
    a) is 1 storey in building height,
    b) is of noncombustible construction,
    c) is classified as a low-hazard industrial occupancy and used only for low fire load occupancies, such as power-generating plants or plants for the manufacture or storage of noncombustible materials, and
    d) has a limiting distance of 3 m or more.

15) Where a residential building is sprinklered, and Table 9.10.14.5.A requires non-combustible construction, the exposing building faces may use a wood stud wall assembly having a 1 hour fire-resistance rating provided the limiting distance is at least 1.0 m and the wall assembly is of non-combustible construction throughout excepting structural elements and sheathing.

9.10.15. Spatial Separation Between Residential Buildings
(See Note A-9.10.15.)

9.10.15.1. Application
1) This Subsection applies to
   a) residential buildings containing not more than two principal dwelling units where no principal dwelling unit, including their contained ancillary residential unit, is above another,
   b) accessory buildings that serve a building described in Clause (a).

9.10.15.2. Area and Location of Exposing Building Face
1) Except as permitted by Sentences (2) and (3), the area of an exposing building face shall be
   a) taken as the exterior wall area facing in one direction on any side of a building, and
   b) calculated as
      i) the total area measured from the finished ground level to the uppermost ceiling,
      ii) reserved, or
      iii) except as provided in Sentence (3), where Table 9.10.15.4. is used to determine the maximum aggregate area of unprotected openings, the area of any number of individual vertical portions of the wall measured from the finished ground level to the uppermost ceiling. (See Note A-9.10.15.4.(2).)

2) If a building is divided by fire separations into fire compartments, the area of exposing building face is permitted to be calculated for each fire compartment provided the fire separations have a fire-resistance ratings not less than 45 min.
3) Where the exposing building face of any section of an exterior wall enclosing a single room or space, or combination room and space, has a limiting distance of 2 m or less, that section of the exposing building face serving the room or space shall not be divided into portions for the purpose of calculating area of exposing building face. (See Sentence 9.10.15.4.(5) and Note A-9.10.15.4.(2).)

4) For the purpose of using Table 9.10.15.4. to determine the maximum permitted area of unprotected openings in an irregularly shaped or skewed exterior wall, the location of the exposing building face shall be taken as a vertical plane located so that there are no unprotected openings between the vertical plane and the line to which the limiting distance is measured. (See Note A-3.2.3.1.(4).)

5) In determining the required cladding-sheathing assembly and fire-resistance rating for an irregularly shaped or skewed exterior wall, the location of the exposing building face shall be taken as a vertical plane located so that no portion of the actual exposing building face is between the vertical plane and the line to which the limiting distance is measured. (See Article 9.10.15.5. and Note A-3.2.3.1.(4).)

9.10.15.3. Limiting Distance and Fire Department Response
1) Except for the purpose of applying Sentences 9.10.15.2.(2), 9.10.15.4.(3) and 9.10.15.5.(13), a limiting distance equal to half the actual limiting distance shall be used as input to the requirements of this Subsection, where
   a) the time from receipt of notification of a fire by the fire department until the first fire department vehicle arrives at the building exceeds 10 min in 10% or more of all calls to the building, and
   b) any storey in the building is not sprinklered.
(See Notes A-3.2.3. and A-3.2.3.1.(8).)

9.10.15.4. Unprotected Openings in Exposing Building Face
1) Except as provided in Sentences (6), (7) and (8), the maximum aggregate area of glazed openings in an exposing building face shall
   a) conform to Table 9.10.15.4.,
   b) in a building which conforms to Sentence (8), comply with Subsection 3.2.3., or
   c) where the limiting distance is not less than 1.2 m, be equal to or less than the limiting distance squared.

2) Where the limits on the area of unprotected openings glazed openings are determined for individual portions of the exterior wall, as described in Sentence 9.10.15.2.(3), the maximum aggregate area of unprotected openings glazed openings for any portion shall conform to the values in the row of Table 9.10.15.4. corresponding to the maximum total area of exposing building face (See column 1 of the Table) that is equal to the sum of all portions of the exposing building face. (See Note A-9.10.15.4.(2).)

3) Except for buildings that are sprinklered and for openable windows having an unobstructed opening equal to 0.35 m² installed in accordance with Sentences 9.9.10.1.(1) and (2), where the limiting distance is 2 m or less, individual unprotected openings glazed openings or a group of unprotected openings glazed openings in an exposing building face shall not exceed 50% of the maximum allowable aggregate area unprotected openings of glazed openings determined in Sentence (1).

4) The spacing between individual unprotected openings described in Sentence (3) serving a single room or space described in Sentence (5) shall be not less than
   a) 2 m horizontally of another unprotected openings that is on the same exposing building face and serves the single room or space, or
   b) 2 m vertically of another unprotected openings that serves the single room or space, or another room or space on the same storey.

5) For the purpose of Sentence (4), “single room or space” shall mean
   a) two or more adjacent spaces having a full-height separating wall extending less than 1.5 m from the interior face of the exterior wall, or
   b) two or more stacked spaces that are on the same storey.

6) The limits on the area of unprotected openings shall not apply to the exposing building face of a building containing not more than two principal dwelling units facing a detached garage or accessory building, where
Division B: Acceptable Solutions
Part 9 – Housing and Small Buildings

a) the detached garage or accessory building conforming to Sentence 9.10.15.5.(4) serves only one building containing not more than two principal dwelling units,
b) the detached garage or accessory building conforming to Sentence 9.10.15.5.(4) is located on the same property as that building containing not more than two principal dwelling units, and
c) the building containing not more than two principal dwelling units served by the detached garage or accessory building conforming to Sentence 9.10.15.5.(4) is the only major occupancy on the property.

7) If a building is sprinklered and the limiting distance is less than 1.2 m but not less than 1 m, the maximum percentage of unprotected openings shall be 10% provided
   a) the windows are glazed with tempered, wired, or laminated glass or glass block, and
   b) the exposing building face is constructed according to Sentence 9.10.15.5.(13).

8) If a building is sprinklered, the maximum aggregate area of unprotected openings may be no more than twice the area as determined in Table 9.10.15.4., provided all rooms, including closets and bathrooms, that are adjacent to the exposing building face and that have unprotected openings shall be sprinklered, notwithstanding any exemptions in the sprinkler standards referenced in Article 3.2.5.12.

9) If a storage garage has a limiting distance of no less than 3 m, the exposing building face of such storage garage may have unlimited unprotected openings.

9.10.15.5. Construction of Exposing Building Face of Houses
1) Except as provided in Sentences (4), (13) and (14), each exposing building face and any exterior wall located above an exposing building face that encloses an attic or roof space shall be constructed in conformance with Sentences (2) and (3)
a) for the exposing building face as a whole, or
b) for any number of separate portions of the exposing building face (See Subclause 9.10.15.2.(1)(b)(iii), Sentence 9.10.15.4.(2), and Note A-9.10.15.4.(2)).
(See also Subsection 9.10.8.)
2) Except as provided in Sentences (4) and (5), where the limiting distance is less than 0.6 m, the exposing building face and exterior walls located above the exposing building face that enclose an attic or roof space shall have a fire-resistance rating of not less than 45 min, and
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

a) the cladding shall be metal or noncombustible cladding installed in accordance with Section 9.20., 9.27. or 9.28. (See Note A-9.10.14.5.(1)),
b) the cladding shall
   i) conform to Subsection 9.27.12.,
   ii) be installed without furring members over gypsum sheathing at least 12.7 mm thick or over masonry,
   iii) have a flame-spread rating not greater than 25 when tested in accordance with Sentence 3.1.12.1.(2), and
   iv) not exceed 2 mm in thickness exclusive of fasteners, joints and local reinforcements,
or
c) the wall assembly shall comply with Clause 3.1.5.5.(1)(b) when tested in conformance with CAN/ULC-S134, “Fire Test of Exterior Wall Assemblies.”

3) Except as provided in Sentence (4), where the limiting distance is equal to or greater than 0.6 m and less than 1.2 m, the exposing building face and any exterior wall located above the exposing building face that encloses an attic or roof space shall have a fire-resistance rating of not less than 45 min, and
   a) the cladding shall be metal or noncombustible cladding installed in accordance with Section 9.20., or 9.28. (See Note A-9.10.14.5.(1)),
   b) the cladding shall
      i) conform to Subsection 9.27.6., 9.27.7., 9.27.8., or 9.27.10.,
      ii) be installed without furring members, or on furring not more than 25 mm thick, over gypsum sheathing at least 12.7 mm thick or over masonry, and
      iii) after conditioning in conformance with ASTM D 2898, “Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing,” have a flame-spread rating not greater than 25 when tested in accordance with Sentence 3.1.12.1.(2),
   c) the cladding shall
      i) conform to Subsection 9.27.12.,
      ii) be installed with or without furring members over gypsum sheathing at least 12.7 mm thick or over masonry,
      iii) have a flame-spread rating not greater than 25 when tested in accordance with Sentence 3.1.12.1.(2), and
      iv) not exceed 2 mm in thickness exclusive of fasteners, joints and local reinforcements,
or
d) the wall assembly shall comply with Clause 3.1.5.5.(1)(b) when tested in conformance with CAN/ULC-S134, “Fire Test of Exterior Wall Assemblies.”

4) The requirements regarding fire-resistance rating and type of cladding-sheathing assembly shall not apply to the exposing building face or projections from an exposing building face of a dwelling unit facing a detached garage or accessory building, or a garage or accessory building facing a dwelling unit, where
   a) the detached garage or accessory building serves only one dwelling unit,
   b) the detached garage or accessory building is located on the same property as that dwelling unit, and
   c) the dwelling unit served by the detached garage or accessory building is the only major occupancy on the property.

5) Except as provided in Sentence (6), combustible projections on the exterior of a wall that are more than 1 m above ground level and that could expose an adjacent building to fire spread shall not be permitted within
   a) 1.2 m of a property line or the centre line of a public way, or
   b) 2.4 m of a combustible projection on another building on the same property.

6) Except as provided in Sentences (8) to (11), Sentence (5) shall not apply to
   a) buildings containing 1 or 2 dwelling units only, and
   b) detached garages or accessory buildings, where
      i) the detached garage or accessory building serves only one dwelling unit,
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

7) Where combustible projections on an exposing building face are permitted by Sentence (6), are totally enclosed and constructed with solid faces, such as for fireplaces and chimneys, and extend within 1.2 m of a property line,
   a) the construction of the face and sides of the projection shall comply with the corresponding requirements for exposing building faces for limiting distances less than 1.2 m as stated in Sentence (2) or (3), and
   b) where the underside of the projection is more than 0.6 m above finished ground level, it shall be protected by
      i) not less than 0.38 mm thick noncombustible material,
      ii) unvented aluminum conforming to CAN/CGSB-93.2-M, “Prefinished Aluminum Siding, Soffits, and Fascia, for Residential Use,”
      iii) not less than 12.7 mm thick gypsum soffit board or gypsum ceiling board installed according to CSA A82.31-M, “Gypsum Board Application,”
      iv) not less than 11 mm thick plywood,
      v) not less than 12.5 mm thick OSB or waferboard, or
      vi) not less than 11 mm thick lumber.

(See Note A-9.10.14.5.(8).)

8) Except as provided in Sentence (10), where the exposing building face has a limiting distance of not more than 0.45 m, projecting roof soffits shall not be constructed above the exposing building face. (See Note A-3.2.3.6.(2).)

9) Except as provided in Sentence (10), where the exposing building face has a limiting distance of more than 0.45 m, the face of roof soffits shall not project to less than 0.45 m from the property line. (See Note A-3.2.3.6.(2).)

10) The face of a roof soffit is permitted to project to the property line, where it faces a street, lane or public thoroughfare. (See Note A-9.10.14.5.(11) and 9.10.15.5.(10).)

11) Where roof soffits project to less than 1.2 m from the property line, the centre line of a public way, or an imaginary line between two buildings or fire compartments on the same property, they shall
    a) have no openings, and
    b) be protected by
       i) not less than 0.38 mm thick sheet steel,
       ii) unvented aluminum conforming to CAN/CGSB-93.2-M, “Prefinished Aluminum Siding, Soffits, and Fascia, for Residential Use,”
       iii) not less than 12.7 mm thick gypsum soffit board or gypsum ceiling board installed according to CSA A82.31-M, “Gypsum Board Application,”
       iv) not less than 11 mm thick plywood,
       v) not less than 12.5 mm thick OSB or waferboard, or
       vi) not less than 11 mm thick lumber.

(See Note A-3.2.3.6.(2).)

12) For buildings of combustible construction, materials installed to provide the required protection for soffits may be covered with a combustible or noncombustible finish material.

13) Heavy timber and steel columns need not conform to the requirements of Sentence (1), provided the limiting distance is not less than 3 m.

14) If a building is sprinklered, and the maximum percentage of unprotected openings complies with Sentence 9.10.15.4.(7), the exposing building faces may be constructed with a wood stud wall assembly provided
    a) the exposing building face has a one hour fire-resistance rating,
9.10.16. Fire Blocks

9.10.16.1. Required Fire Blocks in Concealed Spaces
1) Vertical concealed spaces in interior walls and exterior walls shall be separated by fire blocks
   a) one from the other, and
   b) from horizontal concealed spaces.
2) Horizontal concealed spaces in attics, roof spaces, ceilings, floors, and crawl spaces shall be separated by fire blocks
   a) one from the other, and
   b) from vertical concealed spaces.
3) Fire blocks shall be provided at all interconnections between concealed vertical and horizontal spaces in interior coved ceilings, drop ceilings and soffits where the exposed construction materials within the concealed spaces have a surface flame-spread rating greater than 25.
4) Fire blocks shall be provided at the top and bottom of each run of stairs where they pass through a floor containing concealed space in which the exposed construction materials within the space have a surface flame-spread rating greater than 25.
5) Unsprinklered concealed spaces of combustible construction created by a ceiling, roof space or unoccupied attic space shall be separated by fire blocks into compartments
   a) not more than 60 m in greatest dimension, and
   b) where such space contains exposed construction materials having a surface flame-spread rating greater than 25, not more than 300 m² in area.
6) No dimension of the concealed space described in Clause (5)(b) shall exceed 20 m.
7) Concealed spaces in mansard or gambrel style roofs, exterior cornices, balconies and canopies of combustible construction in which the exposed construction materials within the space have a surface flame-spread rating exceeding 25 shall have vertical fire blocks at intervals of not more than 20 m and at points where such concealed spaces extend across the ends of required vertical fire separations.

9.10.16.2. Required Fire Blocks in Wall Assemblies
1) Except as permitted in Sentence (2), fire blocks shall be provided to block off concealed spaces within wall assemblies, including spaces created by furring,
   a) at each floor level,
   b) at each ceiling level where the ceiling contributes to part of the required fire-resistance rating,
   and
   c) at other locations within the wall, so that the distance between fire blocks does not exceed 20 m horizontally and 3 m vertically.
2) Fire blocks described in Sentence (1) are not required, provided
   a) the insulated wall assembly contains not more than one concealed air space whose horizontal thickness is not more than 25 mm,
   b) the exposed construction materials within the space are noncombustible,
   c) the exposed construction materials within the space, including insulation, but not including wiring, piping or similar services, have a flame-spread rating of not more than 25, or
   d) the concealed wall space is filled with insulation.

9.10.16.3. Fire Block Materials
1) Except as permitted by Sentences (2) and (3), fire blocks shall be constructed of materials that will remain in place and prevent the passage of flames for not less than 15 min when subjected to the standard
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

9.10.16.4. Penetration of Fire Blocks

1) Where fire blocks are pierced by pipes, ducts or other elements, the effectiveness of the fire blocks shall be maintained around such elements.

9.10.17. Flame-Spread Limits

9.10.17.1. Flame-Spread Rating of Interior Surfaces

1) Except as otherwise provided in this Subsection, the exposed surface of every interior wall and ceiling, including skylights and glazing, shall have a surface flame-spread rating of not more than 150.

2) Except as permitted in Sentence (3), doors need not conform to Sentence (1) provided they have a surface flame-spread rating of not more than 200.

3) Doors within dwelling units, other than garage doors, need not conform to Sentences (1) and (2).

9.10.17.2. Ceilings in Exits or Public Corridors

1) At least 90% of the exposed surface of every ceiling in an exit or unsprinklered ceiling in a public corridor shall have a surface flame-spread rating of not more than 25. (See Article 9.10.17.6.)

9.10.17.3. Walls in Exits

1) Except as provided in Sentence (2), at least 90% of the exposed surfaces of every wall in an exit shall have a surface flame-spread rating of not more than 25. (See Article 9.10.17.6.)

2) At least 75% of the wall surface of a lobby used as an exit in Article 9.9.8.5. shall have a surface flame-spread rating of not more than 25. (See Article 9.10.17.6.)

9.10.17.4. Exterior Exit Passageways

1) Where an exterior exit passageway provides the only means of egress from the rooms or suites it serves, the wall and ceiling finishes of that passageway, including the soffit beneath and the guard on the passageway, shall have a surface flame-spread rating of not more than 25, except that up to 10% of the total wall area and 10% of the total ceiling area is permitted to have a surface flame-spread rating of not more than 150.

9.10.17.5. Walls in Public Corridors

2) Fire blocks are deemed to comply with Sentence (1) if they are constructed of not less than

   a) 0.38 mm sheet steel,
   b) 12.7 mm gypsum board,
   c) 12.5 mm plywood, OSB or waferboard, with joints having continuous supports,
   d) 2 layers of 19 mm lumber with joints staggered, or
   e) 38 mm lumber.

3) In a building permitted to be of combustible construction, semi-rigid fibre insulation board produced from glass, rock or slag is permitted to be used to block the vertical space in a double-frame wall assembly formed at the intersection of the floor assembly and the walls, provided the width of the vertical space does not exceed 25 mm and the insulation board

   a) has a density not less than 45 kg/m3,
   b) is securely fastened to one set of studs,
   c) extends from below the bottom of the top plates in the lower storey to above the top of the bottom plate in the upper storey, and
   d) completely fills the portion of the vertical space between the headers and between the wall plates.

(See Note A-3.1.11.7.(7).)
1) At least 90% of the total wall surface in any unsprinklered public corridor shall have a surface flame-spread rating of not more than 75, or at least 90% of the upper half of such walls shall have a surface flame-spread rating of not more than 25. (See Article 9.10.17.6.)

9.10.17.6. Calculation of Wall and Ceiling Areas
1) Skylights, glazing, combustible doors, and combustible light diffusers and lenses shall not be considered in the calculation of wall and ceiling areas in this Subsection.

9.10.17.7. Corridors Containing an Occupancy
1) Where a public corridor or a corridor used by the public contains an occupancy, the interior finish materials used on the walls or ceiling of such occupancy, shall have a surface flame-spread rating in conformance with that required for public corridors.

9.10.17.8. Light Diffusers and Lenses
1) Light diffusers and lenses having flame-spread ratings that exceed those permitted for the ceiling finish, shall conform to the requirements of Sentence 3.1.13.4.(1).

9.10.17.9. Combustible Skylights
1) Individual combustible skylights in corridors required to be separated from the remainder of the building by fire separations shall not exceed 1 m² in area and shall be spaced not less than 1.2 m apart.

9.10.17.10. Protection of Foamed Plastics
(See Note A-3.1.4.2.)
1) Except as provided in Sentences (2) and (3), foamed plastics that form part of a wall or ceiling assembly shall be protected from adjacent space in the building, other than adjacent concealed spaces within attic or roof spaces, crawl spaces, wall assemblies and ceiling assemblies
   a) by one of the interior finishes described in Subsections 9.29.4. to 9.29.9.,
      i) provided the building does not contain a Group C major occupancy, by sheet metal that
      ii) is mechanically fastened to the supporting assembly independent of the insulation,
      iii) is not less than 0.38 mm thick, and
   b) has a melting point not less than 650°C, or
   c) by any thermal barrier that meets the requirements of Sentence 3.1.5.15.(2).
(See Note A-3.1.4.2.(1)(c).)
2) A walk-in cooler or freezer consisting of factory-assembled wall, floor or ceiling panels containing foamed plastics is permitted to be used, provided the panels
   a) are protected on both sides by sheet metal not less than 0.38 mm thick having a melting point not less than 650°C,
   b) do not contain an air space, and
   c) have a flame-spread rating, determined by subjecting a sample panel with an assembled joint typical of field installation to the applicable test described in Subsection 3.1.12., that is not more than that permitted for the room or space in which they are located or that they bound.
3) Thermosetting foamed plastic insulation having a flame-spread rating of not more than 200 is permitted to be used in factory-assembled doors in storage garages serving single dwelling units provided that
   a) the insulation is covered on the interior with a metallic foil,
   b) the assembly has a flame-spread rating of not more than 200, and
   c) the assembly incorporates no air spaces.

9.10.17.11. Walls and Ceilings in Bathrooms
1) The interior finish of walls and ceilings in bathrooms within suites of residential occupancy shall have a surface flame-spread rating of not more than 200.
9.10.17.12. Coverings or Linings of Ducts
   1) Where a covering or a lining is used with a duct, such lining or covering shall have a *flame-spread rating* conforming to Article 3.6.5.4. or 9.33.6.4.

9.10.18. Alarm and Detection Systems

9.10.18.1. Access Provided through a Firewall
   1) Where access is provided through a *firewall*, the requirements in this Subsection shall apply to the *floor areas* on both sides of the *firewall* as if they were in the same *building*.

9.10.18.2. Fire Alarm System Required
   1) Except as permitted in Sentences (3) and (4), a fire alarm system shall be installed in *buildings* in which a sprinkler system is required by this Part.
   2) Except as provided in Sentence (5), a fire alarm system shall be installed
      a) in every *building* that contains more than 3 *storeys*, including storeys below the *first storey*,
      b) where the total *occupant load* exceeds 300, or
      c) when the *occupant load* for any *major occupancy* in Table 9.10.18.2. is exceeded.

<table>
<thead>
<tr>
<th>Major Occupancy Classification</th>
<th>Occupant Load Above which a Fire Alarm System is Required</th>
</tr>
</thead>

<td>150 above or below the first storey</td>
</tr>
<tr>
<td>Low- or medium-hazard industrial</td>
<td>75 above or below the first storey</td>
</tr>
</tbody>
</table>

3) In *buildings* in which a sprinkler system has been installed in accordance with NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes,” a fire alarm system need not be installed.

4) In *buildings* that contain fewer than 9 sprinklers conforming to Sentence 3.2.5.12.(4), a fire alarm system need not be installed.

5) A fire alarm system is not required in a *residential occupancy* where an *exit* or *public corridor* serves not more than 4 *suites* or where each *suite* has direct access to an exterior *exit* facility leading to ground level.

9.10.18.3. Design and Installation Requirements
   1) Except as stated in Sentence (2) and as required by this Subsection, where fire alarm, fire detection and smoke detection devices and systems are installed, these devices and systems and their installation shall conform to Subsection 3.2.4.
   2) The following Articles in Subsection 3.2.4. regarding fire alarm systems do not apply to Part 9 *buildings*:
      Articles 3.2.4.1., 3.2.4.10., 3.2.4.11., 3.2.4.12., 3.2.4.13. and 3.2.4.22.

9.10.18.4. Rooms and Spaces Requiring Heat Detectors or Smoke Detectors
   1) Where a fire alarm system is required, every *public corridor* in *buildings* of *residential occupancy* and every *exit* stair shaft shall be provided with *smoke detectors*.
   2) Except as provided in Sentence (3), if a fire alarm system is required in a *building* that is not *sprinklered*, *fire detectors* shall be installed in the following spaces:
a) storage rooms not within dwelling units,
b) service rooms not within dwelling units,
c) janitors’ rooms
d) rooms in which hazardous substances are to be used or stored (See Note A-3.3.1.2.(1)),
e) elevator hoist ways, chutes and dumbwaiter shafts, and
f) laundry rooms in buildings of residential occupancy, but not those within dwelling units.

3) Except as required in Sentence (4), heat detectors and smoke detectors described in Sentence (2) are not required in dwelling units or in sprinklered buildings in which the sprinkler system is electrically supervised and equipped with a water flow alarm.

4) Heat detectors or smoke detectors shall be installed in any elevator hoist way or dumbwaiter shaft which is not equipped with a sprinkler system.

9.10.18.5. Smoke Detectors in Recirculating Air-Handling Systems
1) Except for a recirculating air system serving not more than one dwelling unit, where a fire alarm system is required to be installed, every recirculating air-handling system shall be designed to prevent the circulation of smoke upon a signal from a duct-type smoke detector where such system supplies more than one suite on the same floor or serves more than 1 storey.

9.10.18.6. Portions of Buildings Considered as Separate Buildings
1) Except as provided in Sentence (2), where a vertical fire separation having a fire-resistance rating of not less than 1 h separates a portion of a building from the remainder of the building and there are no openings through the fire separation other than those for piping, tubing, wiring and conduit, the requirements for fire alarm and detection systems may be applied to each portion so separated as if it were a separate building.
2) The permission in Sentence (1) to consider separated portions of a building as separate buildings does not apply to service rooms and storage rooms.

9.10.18.7. Central Vacuum Systems
1) Central vacuum cleaning systems serving more than one suite or storey in buildings equipped with a fire alarm system shall be designed to shut down upon activation of the fire alarm system.

9.10.18.8. Open-Air Storage Garages
1) A fire alarm system is not required in a storage garage conforming to Article 3.2.2.90. provided there are no other occupancies in the building.

9.10.19. Smoke Alarms

9.10.19.1. Required Smoke Alarms
1) Except as permitted by Article 9.10.19.8., smoke alarms conforming to CAN/ULC-S531, “Standard for Smoke Alarms,” shall be installed in
   a) each dwelling unit, and
   b) each sleeping room not within a dwelling unit, and
   c) Reserved.

2) All smoke alarms installed in dwelling units in unsprinklered buildings shall be equipped with a battery powered back up system and a wired in manually operated device which is capable of silencing a smoke alarm signal for a period of not more than 10 minutes and re-sounding the signal if smoke levels in the vicinity trigger the smoke alarm.

9.10.19.2. Sound Patterns of Smoke Alarms
1) The sound patterns of smoke alarms shall
   a) meet the temporal patterns of alarm signals (See Note A-3.2.4.18.(2)), or
   b) be a combination of temporal pattern and voice relay.
9.10.19.3. Location of Smoke Alarms

1) Within dwelling units, sufficient smoke alarms shall be installed so that
   a) there is at least one smoke alarm installed on each storey, including basements, and
   b) on any storey of a dwelling unit containing sleeping rooms, a smoke alarm is installed
      i) in each sleeping room, and
      ii) in a location between the sleeping rooms and the remainder of the storey, and if the
          sleeping rooms are served by a hallway, the smoke alarm shall be located in the hallway.

   (See Note A-9.10.19.3.(1).)

2) A smoke alarm required by Sentence (1) shall be installed in conformance with CAN/ULC-S553,
   “Installation of Smoke Alarms.”

3) Smoke alarms required in Article 9.10.19.1. and Sentence (1) shall be installed on or near the ceiling.

9.10.19.4. Power Supply

1) Except as provided in Sentences (2) and (3), smoke alarms described in Sentence 9.10.19.1.(1) shall
   a) be installed with permanent connections to an electrical circuit (See Note A-3.2.4.20.(7)(a)),
   b) have no disconnect switch between the overcurrent device and the smoke alarm, and
   c) in case the regular power supply to the smoke alarm is interrupted, be provided with a battery as
      an alternative power source that can continue to provide power to the smoke alarm for a period of
      no less than 7 days in the normal condition, followed by 4 minutes of alarm.

2) Where the building is not supplied with electrical power, smoke alarms are permitted to be battery-
   operated.

3) Suites of residential occupancy are permitted to be equipped with smoke detectors in lieu of smoke
   alarms, provided the smoke detectors
      a) are capable of independently sounding audible signals within the individual suites,
      b) except as permitted in Sentence (4), are installed in conformance with CAN/ULC-S524,
         “Installation of Fire Alarm Systems,” and
      c) form part of the fire alarm system.

   (See Note A-3.2.4.20.(8).)

4) Smoke detectors permitted to be installed in lieu of smoke alarms as stated in Sentence (3) are permitted
   to sound localized alarms within individual suites, and need not sound an alarm throughout the rest of the
   building.

9.10.19.5. Interconnection of Smoke Alarms

1) Where more than one smoke alarm is required in a dwelling unit, the smoke alarms shall be wired so that
   the activation of one alarm will cause all alarms within the dwelling unit to sound.

2) Reserved.

9.10.19.6. Silencing of Smoke Alarms

1) Except as permitted in Sentence (2), a manually operated device shall be incorporated within the circuitry
   of a smoke alarm installed in a dwelling unit so that the signal emitted by the smoke alarm can be silenced
   for a period of not more than 10 min, after which the smoke alarm will reset and sound again if the level of
   smoke in the vicinity is sufficient to re-actuate it.

2) Suites of residential occupancy equipped with smoke detectors installed to CAN/ULC-S524, “Installation
   of Fire Alarm Systems,” which are part of the fire alarm system in lieu of smoke alarms as permitted in
   Sentence 9.10.19.4.(3), need not incorporate the manually operated device required in Sentence (1).

9.10.19.7. Instructions for Maintenance and Care

1) Where instructions are necessary to describe the maintenance and care required for smoke alarms to
   ensure continuing satisfactory performance, they shall be posted in a location where they will be readily
   available to the occupants for reference.
9.10.19.8. Residential Fire Warning Systems

1) Except where a fire alarm system is installed or required in a building, smoke detectors forming part of a residential fire warning system installed in conformance with CAN/ULC-S540, “Residential Fire and Life Safety Warning Systems: Installation, Inspection, Testing and Maintenance,” are permitted to be installed in lieu of all smoke alarms required by Articles 9.10.19.1. and 9.10.19.3., provided that the fire warning system:
   a) is capable of sounding audible signals as stated in Articles 9.10.19.2. and 9.10.19.5.,
   b) is powered as stated in Article 9.10.19.4., and
   c) is equipped with a silencing device as stated in Article 9.10.19.6.

9.10.20. Firefighting

9.10.20.1. Windows or Access Panels Required

1) Except as provided in Sentence (3), a window or access panel providing an opening not less than 1.100 mm high and 550 mm wide and having a sill height of not more than 900 mm above the floor shall be provided on the second and third storeys of every building in at least one wall facing on a street if such storeys are not sprinklered.
2) Access panels required in Sentence (1) shall be readily openable from both inside and outside or be glazed with plain glass.
3) Access panels required in Sentence (1) need not be provided in
   a) buildings containing only dwelling units where there is no dwelling unit above another dwelling unit, or
   b) Reserved.

9.10.20.2. Access to Basements

1) Except for basements serving not more than one dwelling unit, each unsprinklered basement exceeding 25 m in length or width shall be provided with direct access to the outdoors to at least one street.
2) Access required in Sentence (1) may be provided by a door, window or other means that provides an opening not less than 1.100 mm high and 550 mm wide, the sill height of which shall not be more than 900 mm above the floor.
3) Access required in Sentence (1) may also be provided by an interior stair accessible from the outdoors.

9.10.20.3. Fire Department Access to Buildings

1) Access for fire department vehicles shall be provided to each principal entrance of a building in accordance with Articles 3.2.5.4., 3.2.5.5. and 3.2.5.6. (See Notes A-9.10.20.3.(1) and A-3.2.5.6.(1).)
2) Where access to a building as required in Sentence (1) is provided by means of a roadway or yard, the design and location of such roadway or yard shall take into account connection with public thoroughfares, weight of firefighting equipment, width of roadway, radius of curves, overhead clearance, location of fire hydrants, location of fire department connections and vehicular parking.
3) Despite the provisions of Sentence (1), an unobstructed path of travel for firefighters shall be provided to an ancillary residential building and the path of travel shall:
   a) lead continuously from the street to the lane,
   b) have a travel distance of no more than 45 m from the street to the principal entrance of the ancillary residential building,
   c) be at least 900 mm wide,
   d) have an overhead clearance of at least 2 m, and
   e) consist of concrete, asphalt, or similar material.
4) An ancillary residential building shall have a strobe light installed and maintained outside the principal entrance, connected to an internal smoke alarm within the ancillary residential building.
5) Despite Clause 9.10.20.3.(3)(b) the path of travel for firefighters towards not more than one ancillary residential building on a parcel may exceed 45 m to a maximum of 70 m provided the principal entrance to that ancillary residential building is visible from the street.

6) If the principal building and the ancillary residential building are adjacent to a lane, the path of foot travel for firefighters to the ancillary residential building may be through the lane if:
   a) the travel distance from the street to the principal entrance of the ancillary residential building is no more than 70 m,
   b) the path has an overhead clearance of at least 3 m,
   c) the path consists of concrete, asphalt, or similar material, and
   d) the principal entrance of the ancillary residential building is visible from the street.

7) Two adjacent parcels may have a single shared path of travel for firefighters over the common property line and the adjacent specified area to access both, provided:
   a) each parcel contains an ancillary residential building,
   b) each parcel is subject to a covenant registered on title which prohibits construction upon or obstruction of the common property line and of a specified area adjacent to the property line; and
   c) the path of travel meets the requirements of Sentences (3), (4) and (5).

9.10.20.4. Portable Extinguishers
   1) Portable extinguishers shall be installed in all buildings, except within dwelling units, in conformance with the Fire By-law.

9.10.20.5. Freeze Protection of Fire Protection Systems
   1) Equipment forming part of a fire protection system that may be adversely affected by freezing temperatures and that is located in an unheated area shall be protected from freezing.

9.10.21. Fire Protection for Construction Camps

9.10.21.1. Requirements for Construction Camps
   1) Except as provided in Articles 9.10.21.2. to 9.10.21.9., construction camps shall conform to Subsections 9.10.1. to 9.10.20.

9.10.21.2. Separation of Sleeping Rooms
   1) Except for sleeping rooms within dwelling units, sleeping rooms in construction camps shall be separated from each other and from the remainder of the building by a fire separation having not less than a 30 min fire-resistance rating.

9.10.21.3. Floor Assemblies between the First and Second Storey
   1) Except in a dwelling unit, a floor assembly in a construction camp building separating the first storey and the second storey shall be constructed as a fire separation having not less than a 30 min fire-resistance rating.

9.10.21.4. Walkways Connecting Buildings
   1) Walkways of combustible construction connecting buildings shall be separated from each connected building by a fire separation having not less than a 45 min fire-resistance rating.

9.10.21.5. Spatial Separations
   1) Construction camp buildings shall be separated from each other by a distance of not less than 10 m except as otherwise permitted in Subsections 9.10.14. and 9.10.15.

9.10.21.6. Flame-Spread Ratings
1) Except in dwelling units and except as provided in Sentence (2), the surface flame-spread rating of wall and ceiling surfaces in corridors and walkways, exclusive of doors, shall not exceed 25 over not less than 90% of the exposed surface area and not more than 150 over the remaining surface area.

2) Except within dwelling units, corridors that provide access to exit from sleeping rooms and that have a fire-resistance rating of not less than 45 min shall have a flame-spread rating conforming to the appropriate requirements in Subsection 9.10.17.

9.10.21.7. Smoke Detectors
1) Except in dwelling units, corridors providing access to exit from sleeping rooms in construction camp buildings with sleeping accommodation for more than 10 persons shall be provided with a smoke detector connected to the building alarm system.

9.10.21.8. Portable Fire Extinguishers
1) Each construction camp building shall be provided with portable fire extinguishers in conformance with the Fire By-law.

9.10.21.9. Hose Stations
1) Every construction camp building providing sleeping accommodation for more than 30 persons shall be provided with a hose station that is protected from freezing and is equipped with a hose of sufficient length so that every portion of the building is within reach of a hose stream.

2) Hose stations required in Sentence (1) shall be located near an exit.

3) Hoses referred to in Sentence (1) shall be not less than 19 mm inside diam and shall be connected to a central water supply or to a storage tank having a capacity of not less than 4 500 L with a pumping system capable of supplying a flow of not less than 5 L/s at a gauge pressure of 300 kPa.

9.10.22. Fire Protection for Gas, Propane and Electric Cooktops and Ovens
(See Note A-9.10.22.)

9.10.22.1. Installation of Cooktops and Ovens
1) Except as required in Sentence (2), natural gas and propane cooktops and ovens shall be installed in accordance with the Gas Safety Regulation. (See also Article 9.34.1.1.)

2) Clearances for and protection around gas, propane and electric ranges shall be not less than those provided in Articles 9.10.22.2. and 9.10.22.3.

9.10.22.2. Vertical Clearances above Cooktops
1) Except as provided in Sentence (2), framing, finishes and cabinetry installed directly above the location of the cooktop shall be not less than 750 mm above the level of cooktop burners or elements.

2) The vertical clearance described in Sentence (1) for framing, finishes and cabinets located directly above the location of the cooktop may be reduced to 600 mm above the level of the elements or burners, provided the framing, finishes and cabinets

   a) are noncombustible, or

   b) are protected by

      i) non-combustible cementitious board not less than 6 mm thick, covered with sheet metal not less than 0.33 mm thick, or

      ii) a metal hood with a 125 mm projection beyond the framing, finishes and cabinets.

9.10.22.3. Protection around Cooktops
1) Except as provided in Sentences (2) and (3), combustible wall framing, finishes or cabinets within 450 mm of the area where the cooktop is to be located shall be protected above the level of the heating elements or burners by material providing fire resistance at least equivalent to that provided by a 9.5 mm thickness of gypsum board.
2) Counter-top splash boards or back plates that extend above the level of heating elements or burners need not be protected as described in Sentence (1).
3) Except for cabinetry described in Article 9.10.22.2., cabinetry located not less than 450 mm above the level of the heating elements or burners need not be protected as described in Sentence (1).

Section 9.11. Sound Transmission
(See Note A-9.11.)

9.11.1. Protection from Airborne Noise

9.11.1.1. Required Protection
1) Except as provided in Sentence (3), a dwelling unit shall be separated from every other space in a building in which noise may be generated by
   a) a separating assembly and adjoining constructions, which together provide an apparent sound transmission class (ASTC) rating of not less than 47, or
   b) a separating assembly providing a sound transmission class (STC) rating of not less than 50 and adjoining constructions that conform to Article 9.11.1.4.
(See Note A-9.11.1.4.)
2) Reserved.
3) Construction separating a dwelling unit from an elevator shaft or refuse chute shall have an STC rating of not less than 55.

9.11.1.2. Determination of Sound Transmission Ratings
1) The STC ratings shall be determined in accordance with ASTM E 413, “Classification for Rating Sound Insulation,” using the results from measurements carried out in accordance with ASTM E 90, “Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements.”
2) The ASTC ratings shall be
   a) determined in accordance with ASTM E 413, “Classification for Rating Sound Insulation,” using the results from measurements carried out in accordance with ASTM E 336, “Measurement of Airborne Sound Attenuation between Rooms in Buildings,” or
   b) calculated in accordance with Article 5.8.1.4. or 5.8.1.5.

9.11.1.3. Compliance with Required Ratings
1) Compliance with the required STC ratings shall be demonstrated through
   a) measurements carried out in accordance with Sentence 9.11.1.2.(1), or
   b) the construction of separating assemblies conforming to Table 9.10.3.1.-A or 9.10.3.1.-B, as applicable.
2) Compliance with the required ASTC ratings shall be demonstrated through
   a) measurements or calculations carried out in accordance with Sentence 9.11.1.2.(2), or
   b) the construction of separating assemblies conforming to Table 9.10.3.1.-A or 9.10.3.1.-B, as applicable, that have an STC rating of not less than 50 in conjunction with flanking assemblies constructed in accordance with Article 9.11.1.4. (See Note A-9.11.1.3.(2)(b)).

9.11.1.4. Adjoining Constructions
(See Note A-9.11.1.4.)
1) This Article applies where the required protection is provided in accordance with Clause 9.11.1.1.(1)(b) and compliance is demonstrated in accordance with Clause 9.11.1.3.(2)(b).
2) Flanking wall assemblies connected to a separating floor or ceiling assembly shall be constructed with
   a) concrete or concrete block having a mass per area greater than 200 kg/m², or
   b) gypsum board finish that
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

i) is supported on wood or steel framing, and
ii) ends or is interrupted where it meets the structure of the separating floor or ceiling assembly.

3) Flanking wall and ceiling assemblies connected to a separating wall assembly shall be constructed with
a) concrete or concrete block having a mass per area greater than 300 kg/m², or
b) gypsum board finish that
i) is supported on wood or steel framing, and
ii) ends or is interrupted where it meets the structure of the separating wall assembly or, for double-stud walls, where it meets the space between the two lines of studs.

4) Flanking floor assemblies connected to a separating wall assembly shall be
a) constructed
i) with concrete having a mass per area greater than 300 kg/m², or
ii) in accordance with Section 9.16., or
b) supported on joists or trusses that are not continuous across the junction and are covered with floor treatments in accordance with Table 9.11.1.4. for the applicable wall construction.

Table 9.11.1.4.
Floor Treatments for Flanking Wood-Framed Floor Assemblies in Horizontally Adjoining Spaces

| W8, W9 (staggered studs) | • concrete or gypsum concrete topping not less than 19 mm thick bonded to the subfloor plus finished flooring, or
• one additional material layer plus finished flooring having a combined mass per area not less than 32 kg/m²(1) |
| W13, W14, W15 (double stud walls) | • where a continuous subfloor or other rigid materials at the floor/wall junction provide structural connection between the two rows of studs in the separating wall:
• hardwood strip flooring not less than 16 mm thick aligned parallel to separating wall, or
• one layer OSB or plywood not less than 15.5. mm thick plus finished flooring, or
• one additional material layer plus finished flooring having a combined mass per area not less than 8 kg/m²(1)
• any finished flooring where the subfloor and other rigid materials are not connected at the floor/wall junction and where there are no structural connections between the two rows of studs in the separating wall |
B1 to B10

• any finished flooring

Notes to Table 9.11.1.4.:  
(1) See Note A-Table 9.11.1.4.

9.11.1.5. Acoustical Sealant  
1) If acoustical sealant is provided for walls, ceilings and floors, it shall conform to CAN/CSGB-19.21-M87, “Sealing and Bedding Compound, Acoustical”.

Section 9.12. Excavation

9.12.1. General

1) The topsoil and vegetable matter in all unexcavated areas under a building shall be removed.  
2) In localities where termite infestation is known to be a problem, all stumps, roots and other wood debris shall be removed from the soil to a depth of not less than 300 mm in unexcavated areas under a building.  
3) The bottom of every excavation shall be free of all organic material.

9.12.1.2. Standing Water  
1) Excavations shall be kept free of standing water.

9.12.1.3. Protection from Freezing  
1) The bottom of excavations shall be kept from freezing throughout the entire construction period.

9.12.2. Depth

9.12.2.1. Excavation to Undisturbed Soil  
1) Excavations for foundations shall extend to undisturbed soil.

9.12.2.2. Minimum Depth of Foundations  
1) Except as provided in Sentences (4) to (7), the minimum depth of foundations below finished ground level shall conform to Table 9.12.2.2.

Table 9.12.2.2.  
Minimum Depths of Foundations  
Forming Part of Sentence 9.12.2.2.(1)

Notes to Table 9.12.2.2.:

(1) Foundation not insulated to reduce heat loss through the footings.
(2) Including foundations insulated to reduce heat loss through the footings.
(3) Good soil drainage to not less than the depth of frost penetration.
(4) See Note A-Table 9.12.2.2.

2) Where a foundation is insulated in a manner that will reduce heat flow to the soil beneath the footings, the foundation depth shall conform to that required for foundations containing no heated space. (See Note A-9.12.2.2.(2).)

3) The minimum depth of foundations for exterior concrete steps with more than 2 risers shall conform to Sentences (1), (2) and (5).

4) Concrete steps with 1 and 2 risers are permitted to be laid on ground level.

5) The foundation depths required in Sentence (1) are permitted to be decreased where experience with local soil conditions shows that lesser depths are satisfactory, or where the foundation is designed for lesser depths.

6) The foundation depths required by Sentence (1) do not apply to foundations for
   a) buildings
      i) that are not of masonry or masonry veneer construction, and
      ii) whose superstructure conforms to the requirements of the deformation resistance test in CSA Z240.2.1, “Structural Requirements for Manufactured Homes,” or
   b) accessory buildings
      i) that are not of masonry or masonry veneer construction,
      ii) not more than 1 storey in height,
      iii) not more than 55 m² in building area, and
      iv) where the distance from finished ground to the underside of the floor joists is not more than 600 mm.

7) The foundation depths required by Sentence (1) do not apply to foundations for decks and other accessible exterior platforms
   a) of not more than 1 storey,
   b) not more than 55 m² in area,
   c) where the distance from finished ground to the underside of the joists is not more than 600 mm,
   d) not supporting a roof, and
   e) not attached to another structure, unless it can be demonstrated that differential movement will not adversely affect the performance of that structure.

8) Where decks or other accessible exterior platforms are supported on surface foundations supported on other than coarse-grained soil with good drainage or rock, access to the foundation positions to permit re-levelling of the platform shall be provided
   a) by passageways with a clear height under the platform of not less than 600 mm and a width of not less than 600 mm, or
   b) by installing the decking in a manner that allows easy removal.

9.12.3. Backfill
9.12.3.1. Placement of Backfill
1) Backfill shall be placed to avoid damaging the foundation wall, the drainage tile, externally applied thermal insulation and waterproofing or dampproofing of the wall.

9.12.3.2. Grading of Backfill
1) Backfill shall be graded to prevent drainage towards the foundation after settling.

9.12.3.3. Deleterious Debris and Boulders
1) Backfill that is within 600 mm of the foundation shall be free of deleterious debris and boulders larger than 250 mm diam. (See Note A-9.12.3.3.(1).)
2) Except as provided in Sentence (3), backfill shall not contain pyritic material or material that is susceptible to ice lensing in concentrations that will damage the building to a degree that would adversely affect its stability or the performance of assemblies. (See Note A-9.4.4.4.(1).)
3) Backfill with material of any concentration that is susceptible to ice lensing is permitted where foundation walls are
   a) cast-in-place concrete,
   b) concrete block insulated on the exterior, or
   c) concrete block protected from the backfill by a material that serves as a slip plane.
   (See Note A-9.4.4.4.(1).)

9.12.4. Trenches beneath Footings

9.12.4.1. Support of Footings
1) The soil in trenches beneath footings for sewers and watermains shall be compacted by tamping up to the level of the footing base, or shall be filled with concrete having a strength not less than 10 MPa to support the footing.

Section 9.13. Dampproofing, Waterproofing and Soil Gas Control

9.13.1. General

9.13.1.1. Scope and Application
1) This Section presents measures to control the ingress of water, moisture and soil gas.
2) Subsection 9.13.2. applies to below-ground walls and floors-on-ground where drainage is provided in accordance with Section 9.14. over and along the entire below-ground portion of the foundation wall.
3) Subsection 9.13.3. applies to below-ground walls, floors-on-ground and roofs of underground structures that are subject to hydrostatic pressure.
4) Subsection 9.13.4. applies to walls, roofs and floors that are in contact with the ground.

9.13.2. Dampproofing

9.13.2.1. Required Dampproofing
1) Except as provided in Article 9.13.3.1., where the exterior finished ground level is at a higher elevation than the ground level inside the foundation walls, exterior surfaces of foundation walls below ground level shall be dampproofed.
2) Except as provided in Sentence (3) and Article 9.13.3.1., floors-on-ground shall be dampproofed.
3) Dampproofing required in Sentence (2) need not be provided for
   a) floors in garages,
b) floors in unenclosed portions of buildings, or
c) floors installed over not less than 100 mm of coarse clean granular material containing not more than 10% of material that will pass a 4 mm sieve.

9.13.2.2. Dampproofing Materials

1) Materials installed to provide required dampproofing shall be
   a) capable of protecting assemblies against moisture transfer from the ground,
   b) compatible with adjoining materials, and
   c) resistant to mechanisms of deterioration that may reasonably be expected, given the nature, function and exposure of the materials.

2) Except as otherwise specified in this Section, materials used for exterior dampproofing shall
   a) conform to one of the following standards:
      i) ASTM D 1227, “Emulsified Asphalt Used as a Protective Coating for Roofing,” Type III, Class I,
      ii) ASTM D 4479/D 4479M, “Asphalt Roof Coatings – Asbestos-Free,” Type III,
      iii) CAN/CGSB-51.34-M, “Vapour Barrier, Polyethylene Sheet for Use in Building Construction,” or
      iv) CAN/CSA-A123.4, “Asphalt for Constructing Built-Up Roof Coverings and Waterproofing Systems,” or
   b) have a water vapour permeance of not more than 43 ng/Pa·s·m² when tested in accordance with Procedure A (wet cup) of ASTM E 96/E 96M, “Water Vapor Transmission of Materials,” and consist of one of the following material types:
      i) a vapour-resistant coating,
      ii) a cold-fluid-applied or hot-rubberized bituminous dampproofing membrane,
      iii) a liquid-applied or spray-applied asphalt-based emulsion dampproofing, or
      iv) a type III hot-applied asphalt.

9.13.2.3. Preparation of Surface

1) The area in which dampproofing is to be carried out shall be kept free of water during the application and curing of the dampproofing system.

2) The surface to be dampproofed shall be prepared in accordance with the instructions of the dampproofing material manufacturer.

3) Where the dampproofing material is to be applied on insulating concrete form (ICF) walls, the instructions of the ICF wall manufacturer shall be followed.

4) Unit masonry walls to be dampproofed shall be parged on the exterior face below ground level with not less than 6 mm of mortar conforming to Section 9.20. coved over the footing.

5) Concrete walls to be dampproofed shall have holes and recesses sealed with cement mortar or a mastic or sealant that is suitable for vertical applications and compatible with the dampproofing material.

6) The surface required to be dampproofed shall be clean and dry and free of ice, snow, frost, dust, dirt, oil, grease, cracks, projections and depressions, loose particles and debris that could be detrimental to the performance of the material to be applied.

9.13.2.4. Application of Dampproofing Material

1) Exterior dampproofing shall be applied from finished ground level to the top of the exterior of the footing.

2) Unless otherwise stated in this Subsection, dampproofing shall be installed in accordance with the manufacturer’s instructions with regard to
   a) surface priming,
   b) conditions during application,
   c) application quantity and rate, and
   d) curing times.
3) Joints, cracks and penetrations shall be sealed to maintain the continuity of the dampproofing, where the dampproofing material is not capable of bridging such discontinuities.

9.13.2.5. Moisture Protection for Interior Finishes
(See Note A-9.13.2.5.)
1) The interior surface of foundation walls below ground level shall be protected by means that minimize the ingress of moisture from the foundation wall into interior spaces, where
   a) a separate interior finish is applied to a concrete or unit masonry wall that is in contact with the soil, or
   b) wood members are placed in contact with such walls for the installation of insulation or finish.
2) Except as provided in Sentence (3), where the protection of interior finishes required in Sentence (1) consists of membranes or coatings,
   a) the membrane or coating shall extend from the basement floor surface up to the highest extent of the interior insulation or finish, but not higher than the exterior finished ground level, and
   b) no membrane or coating with a permeance less than 170 ng/(Pa·s·m²) shall be applied to the interior surface of the foundation wall above ground level between the insulation and the foundation wall.
3) Where insulation functions as both moisture protection for interior finishes and as a vapour barrier in accordance with Subsection 9.25.4., it shall be applied over the entire interior surface of the foundation wall.

9.13.2.6. Dampproofing of Floors-on-Ground
1) Where dampproofing is installed below the floor, it shall consist of
   a) polyethylene not less than 0.15 mm thick with joints lapped not less than 100 mm,
   b) type S roll roofing with joints lapped not less than 100 mm, or
   c) rigid extruded/expanded polystyrene with sealed or ship-lapped joints that has
      i) sufficient compressive strength to support the floor assembly, and
      ii) a water vapour permeance complying with Clause 9.13.2.2.(2)(a).
2) Where dampproofing is installed between a floor-on-ground and a finished floor, it shall consist of
   a) rigid extruded/expanded polystyrene with sealed or ship-lapped joints that has
      i) sufficient compressive strength to support the floor assembly, and
      ii) a water vapour permeance complying with Clause 9.13.2.2.(2)(b), or
   b) polyethylene not less than 0.05 mm thick with joints lapped not less than 100 mm.

9.13.3. Waterproofing

9.13.3.1. Required Waterproofing
1) Where hydrostatic pressure occurs, waterproofing is required for assemblies separating interior space from the ground to prevent the ingress of water into building assemblies and interior spaces.
2) Waterproofing is required for roofs of underground structures to prevent the ingress of water into building assemblies and interior spaces.

9.13.3.2. Waterproofing Materials
1) Materials installed to provide required waterproofing shall be
   a) compatible with adjoining materials,
   b) resistant to mechanisms of deterioration that may reasonably be expected, given the nature, function and exposure of the materials, and
   c) free of asbestos or components that contain asbestos
2) Materials used for exterior waterproofing shall conform to
   a) ASTM D 1227, “Emulsified Asphalt Used as a Protective Coating for Roofing,” in which case, they shall be installed in accordance with Sentence 9.13.3.3.(3),
b) ASTM D 3019, “Lap Cement Used with Asphalt Roll Roofing, Non-Fibered, Asbestos-Fibered, and Non-Asbestos-Fibered,” where non-fibered and non-asbestos-fibered types (I and III) asphalt roll roofing is permitted,

c) ASTM D 4479/D 4479M, “Asphalt Roof Coatings – Asbestos-Free,” in which case, they shall be installed in accordance with Sentence 9.13.3.3.(3) and with reinforcing material,

d) ASTM D 4637/D 4637M, “EPDM Sheet Used In Single-Ply Roof Membrane,”

e) ASTM D 4811/D 4811M, “Nonvulcanized (Uncured) Rubber Sheet Used as Roof Flashing,”

f) ASTM D 6878/D 6878M, “Thermoplastic Polyolefin Based Sheet Roofing,”

g) CGSB 37-GP-9Ma, “Primer, Asphalt, Unfilled, for Asphalt Roofing, Dampproofing and Waterproofing,” where a primer is required,

h) CAN/CGSB-37.50-M, “Hot-Applied, Rubberized Asphalt for Roofing and Waterproofing,”

i) CAN/CGSB-37.54, “Polyvinyl Chloride Roofing and Waterproofing Membrane,”

k) CAN/CGSB-37.58-M, “Membrane, Elastomeric, Cold-Applied Liquid, for Non-Exposed Use in Roofing and Waterproofing,”

l) CAN/CSA-A123.2, “Asphalt-Coated Roofing Sheets,”

m) CAN/CSA-A123.4, “Asphalt for Constructing Built-Up Roof Coverings and Waterproofing Systems,” in which case, they shall be installed with reinforcing material, or

n) CSAA123.17, “Asphalt Glass Felt Used in Roofing and Waterproofing.”

9.13.3.3. Preparation of Surface

1) Surfaces to be waterproofed shall be prepared in accordance with the instructions of the waterproofing material manufacturer.

2) Where the waterproofing material is to be applied on ICF walls, the instructions of the ICF wall manufacturer shall be followed.

3) Unit masonry walls that are to be waterproofed shall be parged on exterior surfaces below ground level with not less than 6 mm of mortar conforming to Section 9.20. coved over the footing.

4) Concrete walls that are to be waterproofed shall have all holes and recesses sealed with mortar or waterproofing material.

5) Surfaces required to be waterproofed shall be clean and dry and free of ice, snow, frost, dust, dirt, oil, grease, cracks, projections and depressions, loose particles and debris that could be detrimental to the performance of the waterproofing material.

9.13.3.4. Application of Waterproofing Membranes

1) Unless otherwise stated in this Subsection, waterproofing shall be installed in accordance with the manufacturer’s instructions with regard to

   a) surface priming,

   b) conditions during application,

   c) the required number of layers of reinforcing fabric on foundation, footings, floors, walls and structural slabs,

   d) application quantity and rate, and

   e) curing times.

2) Waterproofing shall be continuous across joints and at junctions between different building elements.

3) The waterproofed surface shall be protected with a suitable material to minimize mechanical damage during backfilling.

4) The area in which the waterproofing is to be carried out shall be kept free of water during the application and curing of the waterproofing system.

9.13.3.5. Floor Waterproofing System
1) Basement floors-on-ground to be waterproofed shall have a system of membrane waterproofing provided between 2 layers of concrete, each of which shall be not less than 75 mm thick, with the floor membrane made continuous with the wall membrane to form a complete seal.

9.13.4. Soil Gas Control
(See Note A-9.13.4.)

9.13.4.1. Application and Scope
1) This Subsection applies to
   a) wall, roof and floor assemblies separating conditioned space from the ground, and
   b) the rough-in of a radon vent pipe to allow the future protection of conditioned space that is separated from the ground by a wall, roof or floor assembly.

2) This Subsection addresses the leakage of soil gas from the ground into the building.

9.13.4.2. Protection from Soil Gas Ingress
1) All wall, roof and floor assemblies separating conditioned space from the ground shall be protected by an air barrier system conforming to Subsection 9.25.3.

2) Except as permitted by Sentence (4), unless the space between the air barrier system and the ground is designed to be accessible for the future installation of a subfloor depressurization system, dwelling units and buildings containing residential occupancies shall be provided with the rough-in for a radon extraction system conforming to Article 9.13.4.3.

3) Except as permitted by Sentence (4) or (5), where buildings are used for occupancies other than those described in Sentence (2) and are intended to be occupied on average for greater than 4 hours within a 24 hour period, protection from radon ingress and the means to address high radon concentrations in the future shall conform to
   a) Article 9.13.4.3., or
   b) Parts 5 and 6 (See Article 5.4.1.1. and 6.2.1.1.).
(See Note A-9.13.4.2.(3).)

4) Locations requiring radon rough-ins shall be determined in accordance with Article 1.1.3.3. of Division B. Buildings described in Clause 9.16.2.1.(2)(b) need not conform to Sentence (3).

9.13.4.3. Rough-in for a Subfloor Depressurization System
(See Note A-9.13.4.3.)

1) Floors-on-ground shall be provided with a rough-in for subfloor depressurization consisting of
   a) a gas-permeable layer and a radon vent pipe as described in Sentence (2), or
   b) a gas-permeable layer consisting of coarse clean granular material and a radon vent pipe as described in Sentence (3).

2) Where a rough-in referred to in Clause (1)(a) is provided, the rough-in shall include
   a) a gas-permeable layer installed in the space between the air barrier system and the ground to allow the depressurization of that space,
   b) reserved, and
   c) a radon vent pipe that
      i) has one or more inlets that allow for the effective depressurization of the gas-permeable layer (See Notes A-9.13.4.3.(2)(c)(i) and (3)(b)(i)),
      ii) terminates outside the building in a manner that does not constitute a hazard, and
      iii) is clearly labeled “RADON VENT PIPE”.

3) Where a rough-in referred to in Clause (1)(b) is provided, the rough-in shall include
   a) a gas-permeable layer, consisting of not less than 100 mm of clean granular material containing not more than 10% of material that will pass a 4 mm sieve, installed below the floor-on-ground, and
   b) a radon vent pipe not less than 100 mm in diameter that is constructed so as to be airtight and installed through the floor-on-ground, such that
Section 9.14. Drainage

1) This Section applies to subsurface drainage and to surface drainage.

9.14.1.2. Crawl Spaces
1) Drainage for crawl spaces shall conform to Section 9.18.

9.14.1.3. Floors-on-Ground
1) Drainage requirements beneath floors-on-ground shall conform to Section 9.16.

9.14.2. Foundation Drainage

9.14.2.1. Foundation Wall Drainage
1) Unless it can be shown to be unnecessary, the bottom of every exterior foundation wall shall be drained by drainage tile or pipe laid around the exterior of the foundation in conformance with Subsection 9.14.3. or by a layer of gravel or crushed rock in conformance with Subsection 9.14.4.
2) Where mineral fibre insulation or crushed rock backfill is provided adjacent to the exterior surface of a foundation wall,
   a) the insulation or backfill shall extend to the footing level to facilitate the drainage of ground water to the foundation's drainage system (See Note A-9.14.2.1.(2)(a)), and
   b) any pyritic material in the crushed rock shall be limited to a concentration that will not damage the building to a degree that would adversely affect its stability or the performance of assemblies (See Sentence 9.12.3.3.(2) and Note A-9.4.4.4.(1)).

9.14.3. Drainage Tile and Pipe

9.14.3.1. Material Standards
1) Drain tile and drain pipe for foundation drainage shall conform to
   a) ASTM C 4, “Clay Drain Tile and Perforated Clay Drain Tile,”
   b) ASTM C 412M, “Concrete Drain Tile (Metric),”
   c) ASTM C 444M, “Perforated Concrete Pipe (Metric),”
9.14.3.2. Minimum Size
1) Drain tile or pipe used for foundation drainage shall be not less than 100 mm in diam.

9.14.3.3. Installation
1) Drain tile or pipe shall be laid on undisturbed or well-compacted soil so that the top of the tile or pipe is below the bottom of the floor slab or the ground cover of the crawl space.
2) Drain tile or pipe with butt joints shall be laid with 6 mm to 10 mm open joints.
3) The top half of joints referred to in Sentence (2) shall be covered with sheathing paper, 0.10 mm polyethylene or No. 15 asphalt or tar-saturated felt.
4) The top and sides of drain pipe or tile shall be covered with not less than 150 mm of crushed stone or other coarse clean granular material containing not more than 10% of material that will pass a 4 mm sieve.

9.14.4.1. Type of Granular Material
1) Granular material used to drain the bottom of a foundation shall consist of a continuous layer of crushed stone or other coarse clean granular material containing
   a) not more than 10% of material that will pass a 4 mm sieve, and
   b) no pyritic material in a concentration that will damage the building to a degree that would adversely affect its stability or the performance of assemblies (See Note A-9.4.4.4.(1)).

9.14.4.2. Installation
1) Granular material described in Article 9.14.4.1. shall be laid on undisturbed or compacted soil to a minimum depth of not less than 125 mm beneath the footing of the building and extend not less than 300 mm beyond the outside edge of the footings.

9.14.4.3. Grading
1) The bottom of an excavation drained by a granular layer shall be graded so that the entire area described in Article 9.14.4.2. is drained to a sump conforming to Article 9.14.5.2.

9.14.4.4. Wet Site Conditions
1) Where because of wet site conditions soil becomes mixed with the granular drainage material, sufficient additional granular material shall be provided so that the top 125 mm are kept free of soil.

9.14.5. Drainage Disposal

9.14.5.1. Drainage Disposal
1) Foundation drains shall drain to a sewer, drainage ditch or dry well.

9.14.5.2. Sump Pits
1) Where a sump pit is provided it shall be
   a) not less than 750 mm deep,
   b) not less than 0.25 m² in area, and
   c) provided with a cover.
2) Covers for sump pits shall be designed
   a) to resist removal by children, and
   b) to be airtight in accordance with Sentence 9.25.3.3.(7).
3) Where gravity drainage is not practical, an automatic sump pump shall be provided to discharge the water from the sump pit described in Sentence (1) into a sewer, drainage ditch or dry well.

9.14.5.3. Dry Wells
1) Dry wells may be used only when located in areas where the natural groundwater level is below the bottom of the dry well.
2) Dry wells shall be not less than 5 m from the building foundation and located so that drainage is away from the building.

9.14.6.1. Surface Drainage
1) The building shall be located or the building site graded so that water will not accumulate at or near the building.

9.14.6.2. Drainage away from Wells or Septic Disposal Beds
1) Surface drainage shall be directed away from the location of a water supply well or septic tank disposal bed.

9.14.6.3. Window Wells
1) Every window well shall be drained to the footing level or other suitable location.

1) Where runoff water from a driveway is likely to accumulate or enter a garage, a catch basin shall be installed to provide adequate drainage.

9.14.6.5. Downspouts
1) Downspouts shall conform to Article 9.26.18.2.

Section 9.15. Footings and Foundations

9.15.1. Application

9.15.1.1. General
(See Notes A-9.15.1.1. and A-9.4.4.6. and 9.15.1.1.)
1) Except as provided in Articles 9.15.1.2. and 9.15.1.3., this Section applies to
   a) concrete or unit masonry foundation walls and concrete footings not subject to surcharge
      i) on stable soils with an allowable bearing pressure of 75 kPa or greater, and
      ii) for buildings of wood-frame or masonry construction,
   b) wood-frame foundation walls and wood or concrete footings not subject to surcharge
      i) on stable soils with an allowable bearing pressure of 75 kPa or greater, and
      ii) for buildings of wood-frame construction, and
   c) flat insulating concrete form foundation walls and concrete footings not subject to surcharge
      (See Note A-9.15.1.1.(1)(c) and 9.20.1.1.(1)(b))
      i) on stable soils with an allowable bearing pressure of 75 kPa or greater, and
ii) for buildings of light-frame or flat insulating concrete form construction that are not more than 2 storeys in building height, with a maximum floor to floor height of 3 m, and containing only a single dwelling unit.

2) Foundations for applications other than as described in Sentence (1) shall be designed in accordance with Section 9.4.

9.15.1.2. Permafrost

1) Buildings erected on permafrost shall have foundations designed by a designer competent in this field in accordance with the appropriate requirements of Part 4.

9.15.1.3. Foundations for Deformation-Resistant Buildings

1) Where the superstructure of a detached building conforms to the requirements of the deformation resistance test in CSA Z240.2.1, “Structural Requirements for Manufactured Homes,” the foundation shall be constructed in conformance with
   a) the remainder of this Section, or
   b) CSA Z240.10.1, “Site Preparation, Foundation, and Anchorage of Manufactured Homes.”

9.15.2. General

9.15.2.1. Concrete

1) Concrete shall conform to Section 9.3.

9.15.2.2. Unit Masonry Construction

1) Concrete block shall conform to CSA A165.1, “Concrete Block Masonry Units,” and shall have a compressive strength over the average net cross-sectional area of the block of not less than 15 MPa.

2) Mortar, grout, mortar joints, corbelling and protection for unit masonry shall conform to Section 9.20.

3) For concrete block foundation walls required to be reinforced,
   a) mortar shall be Type S, conforming to CSA A179, “Mortar and Grout for Unit Masonry,”
   b) grout shall be coarse, conforming to CSA A179, “Mortar and Grout for Unit Masonry,” and
   c) placement of grout shall conform to CSA A371, “Masonry Construction for Buildings.”

9.15.2.3. Pier-Type Foundations

1) Where pier-type foundations are used, the piers shall be designed to support the applied loads from the superstructure.

2) Where piers are used as a foundation system in a building of 1 storey in building height, the piers shall be installed to support the principal framing members and shall be spaced not more than 3.5 m apart along the framing, unless the piers and their footings are designed for larger spacings.

3) The height of piers described in Sentence (2) shall not exceed 3 times their least dimension at the base of the pier.

4) Where concrete block is used for piers described in Sentence (2), they shall be laid with cores placed vertically, and where the width of the building is 4.3 m or less, placed with their longest dimension at right angles to the longest dimension of the building.

9.15.2.4. Wood-Frame Foundations

1) Foundations of wood-frame construction shall conform to
   a) CSA S406, “Permanent Wood Foundations for Housing and Small Buildings,” or
   b) Part 4.

(See Note A-9.15.2.4.(1).)

9.15.3. Footings
9.15.3.1. Footings Required
1) Footings shall be provided under walls, pilasters, columns, piers, fireplaces and chimneys that bear on soil or rock, except that footings may be omitted under piers or monolithic concrete walls if the safe loadbearing capacity of the soil or rock is not exceeded.

9.15.3.2. Support of Footings
1) Footings shall rest on undisturbed soil, rock or compacted granular fill.
2) Granular fill shall not contain pyritic material in a concentration that will damage the building to a degree that would adversely affect its stability or the performance of assemblies. (See also Article 9.4.4.4. and Note A-9.4.4.4.(1).)

9.15.3.3. Application of Footing Width and Area Requirements
1) Except as provided in Sentence 9.15.3.4.(2), the minimum footing width or area requirements provided in Articles 9.15.3.4. to 9.15.3.7. shall apply to footings, where
   a) the footings support
      i) foundation walls of masonry, concrete, or flat insulating concrete form walls,
      ii) above-ground walls of masonry, flat insulating concrete form walls or light wood-frame construction, and
      iii) floors and roofs of light wood-frame construction,
   b) the span of supported joists does not exceed 4.9 m, and
   c) the specified live load on any floor supported by the footing does not exceed 2.4 kPa (See Table 4.1.5.3.).
2) Except as provided in Sentence 9.15.3.4.(2), where the span of the supported joists exceeds 4.9 m, footings shall be designed in accordance with Section 4.2.
3) Where the specified live load exceeds 2.4 kPa, footings shall be designed in accordance with Section 4.2.

9.15.3.4. Basic Footing Widths and Areas
1) Except as provided in Sentences (2) and (3) and in Articles 9.15.3.5. to 9.15.3.7., the minimum footing width or area shall comply with Table 9.15.3.4.
2) Where the supported joist span exceeds 4.9 m in buildings with light wood-frame walls, floors and roofs, footing widths shall be determined according to
   a) Section 4.2., or
   b) the following formula
   \[
   W = w \cdot \left( \sum \frac{sjs}{\text{storeys} \cdot 4.9} \right)
   \]
   where
   \( W \) = minimum footing width,
   \( w \) = minimum width of footings supporting joists not exceeding 4.9 m, as defined by Table 9.15.3.4.,
   \( \sum \ sjs \) = sum of the supported joist spans on each storey whose load is transferred to the footing, and
   \( \text{storeys} \) = number of storeys supported by the footing.
   (See Note A-9.15.3.4.(2.).)
3) Where a foundation rests on gravel, sand or silt in which the water table level is less than the width of the footings below the bearing surface,
   a) the footing width for walls shall be not less than twice the width required by Sentences (1) and (2), and Articles 9.15.3.5. and 9.15.3.6., and
   b) the footing area for columns shall be not less than twice the area required by Sentences (1) and (2) and Article 9.15.3.7.

Notes to Table 9.15.3.4.:
(1) See Sentence 9.15.3.7.(1).
(2) See Sentence 9.15.3.5.(1).
(3) See Sentence 9.15.3.6.(1).

9.15.3.5. Adjustments to Footing Widths for Exterior Walls
1) The strip footing widths for exterior walls shown in Table 9.15.3.4. shall be increased by
   a) 65 mm for each storey of masonry veneer over wood-frame construction supported by the
      foundation wall,
   b) 130 mm for each storey of masonry construction supported by the foundation wall, and
   c) 150 mm for each storey of flat insulating concrete form wall construction supported by the
      foundation wall.

9.15.3.6. Adjustments to Footing Widths for Interior Walls
1) The minimum strip footing widths for interior loadbearing masonry walls shown in Table 9.15.3.4. shall be increased by 100 mm for each storey of masonry construction supported by the footing.
2) Footings for interior non-loadbearing masonry walls shall be not less than 200 mm wide for walls up to 5.5 m high and the width shall be increased by 100 mm for each additional 2.7 m of height.

9.15.3.7. Adjustments to Footing Area for Columns
1) The footing area for column spacings other than shown in Table 9.15.3.4. shall be adjusted in proportion to the distance between columns.

9.15.3.8. Footing Thickness
1) Footing thickness shall be not less than the greater of
   a) 100 mm, or
   b) the width of the projection of the footing beyond the supported element.

9.15.3.9. Step Footings
1) Where step footings are used,
   a) the vertical rise between horizontal portions shall not exceed 600 mm, and
   b) the horizontal distance between risers shall not be less than 600 mm.

9.15.4. Foundation Walls

9.15.4.1. Permanent Form Material
1) Insulating concrete form units shall be manufactured of polystyrene conforming to the performance requirements of CAN/ULC-S701, “Thermal Insulation, Polystyrene, Boards and Pipe Covering,” for Type 2, 3 or 4 polystyrene.

**9.15.4.2. Foundation Wall Thickness and Required Lateral Support**

1) Except as required in Sentence (2), the thickness of foundation walls made of unreinforced concrete block or solid concrete and subject to lateral earth pressure shall conform to Table 9.15.4.2.-A for walls not exceeding 3.0 m in unsupported height.

2) The thickness of concrete in flat insulating concrete form foundation walls shall be not less than the greater of
   a) 140 mm, or
   b) the thickness of the concrete in the wall above.

3) Foundation walls made of flat insulating concrete form units shall be laterally supported at the top and at the bottom.

Notes to Table 9.15.4.2.-A:
(1) See Article 9.15.4.3.
(2) See Article 9.15.4.6.
(3) See Table 9.15.4.2.-B.

4) The thickness and reinforcing of foundation walls made of reinforced concrete block and subject to lateral earth pressure shall conform to Table 9.15.4.2.-B and Sentences (5) to (8), where
   a) the walls are laterally supported at the top,
   b) average stable soils are encountered, and
   c) wind loads on the exposed portion of the foundation are no greater than 0.70 kPa.

5) For concrete block walls required to be reinforced, continuous vertical reinforcement shall
   a) be provided at wall corners, wall ends, wall intersections, at changes in wall height, at the jambs
      of all openings and at movement joints,
   b) extend from the top of the footing to the top of the foundation wall, and
   c) where foundation walls are laterally supported at the top, have not less than 50 mm embedment
      into the footing, if the floor slab does not provide lateral support at the wall base.

6) For concrete block walls required to be reinforced, a continuous horizontal bond beam containing not less
   than one 15M bar shall be installed
   a) along the top of the wall,
   b) at the sill and head of all openings greater than 1.20 m in width, and
   c) at structurally connected floors.

7) In concrete block walls required to be reinforced, all vertical bar reinforcement shall be installed along the centre line of the wall.

8) In concrete block walls required to be reinforced, ladder- or truss-type lateral reinforcement not less than 3.8 mm in diameter (no. 9 ASWG) shall be installed in the bed joint of every second masonry course.

### 9.15.4.3. Foundation Walls Considered to be Laterally Supported at the Top

1) Sentences (2) to (4) pertain to lateral support for walls described in Sentence 9.15.4.2.(1).

2) *Foundation* walls shall be considered to be laterally supported at the top if
   a) such walls support a *solid masonry* superstructure,
   b) the floor joists are embedded in the top of the *foundation* walls, or
   c) the floor system is anchored to the top of the *foundation* walls with anchor bolts, in which case the joists may run either parallel or perpendicular to the *foundation* walls.

3) Unless the wall around an opening is reinforced to withstand earth pressure, the portion of the *foundation* wall beneath an opening shall be considered laterally unsupported if
   a) the opening is more than 1.2 m wide, or
   b) the total width of the openings in the *foundation* wall constitutes more than 25% of the length of the wall.

4) For the purposes of Sentence (3), the combined width of the openings shall be considered as a single opening if the average width is greater than the width of solid wall between them.

5) Flat insulating concrete form *foundation* walls shall be considered to be laterally supported at the top if the floor joists are installed according to Article 9.20.17.5.

### 9.15.4.4. Foundation Walls Considered to be Laterally Supported at the Bottom
1) Flat insulating concrete form foundation walls shall be considered to be laterally supported at the bottom where the foundation wall
   a) supports backfill not more than 1.2 m in height,
   b) is supported at the footing by a shear key and at the top by the ground floor framing, or
   c) is doweled to the footing with not less than 15M bars spaced not more than 1.2 m o.c.

9.15.4.5. Reinforcement for Flat Insulating Concrete Form Foundation Walls
1) Horizontal reinforcement in flat insulating concrete form foundation walls shall
   a) consist of
      i) one 10M bar placed not more than 300 mm from the top of the wall, and
      ii) 10M bars at 600 mm o.c., and
   b) be located
      i) in the inside half of the wall section, and
      ii) with a minimum cover of 30 mm from the inside face of the concrete.

2) Vertical reinforcement in flat insulating concrete form foundation walls shall be
   a) provided in accordance with
      i) Table 9.15.4.5.-A for 140 mm walls,
      ii) Table 9.15.4.5.-B for 190 mm walls, and
      iii) Table 9.15.4.5.-C for 240 mm walls,
   b) located in the inside half of the wall section with a minimum cover of 30 mm from the inside face of the concrete wall, and
   c) where interrupted by wall openings, placed not more than 600 mm from each side of the openings.

3) Cold joints in flat insulating concrete form foundation walls shall be reinforced with no less than one 15M bar spaced at not more than 600 mm o.c. and embedded 300 mm on both sides of the joint.

4) Reinforcing around openings in flat insulating concrete form foundation walls shall comply with Article 9.20.17.3. or 9.20.17.4.

9.15.4.6. Extension above Ground Level
1) Exterior foundation walls shall extend not less than 150 mm above finished ground level.

9.15.4.7. Reduction in Thickness
1) Where the top of a foundation wall is reduced in thickness to permit the installation of floor joists, the reduced section shall be not more than 350 mm high and not less than 90 mm thick.
2) Where the top of a foundation wall is reduced in thickness to permit the installation of a masonry exterior facing, the reduced section shall be
   a) not less than 90 mm thick, and
   b) tied to the facing material with metal ties conforming to Sentence 9.20.9.4.(3) spaced not more than
      i) 200 mm o.c. vertically, and
      ii) 900 mm o.c. horizontally.
3) The space between wall and facing described in Sentence (2) shall be filled with mortar.

9.15.4.8. Corbelling
1) Corbelling of masonry foundation walls supporting cavity walls shall conform to Article 9.20.12.2.
9.15.4.9. Crack Control Joints
1) Crack control joints shall be provided in foundation walls more than 25 m long at intervals of not more than 15 m.
2) Joints required in Sentence (1) shall be designed to resist moisture penetration and shall be keyed to prevent relative displacement of the wall portions adjacent to the joint.

9.15.4.10. Interior Masonry Walls
1) Interior masonry foundation walls not subject to lateral earth pressure shall conform to Section 9.20.

9.15.5. Support of Joists and Beams on Masonry Foundation Walls

9.15.5.1. Support of Floor Joists
1) Except as permitted in Sentence (2), foundation walls of hollow masonry units supporting floor joists shall be capped with
   a) not less than 50 mm of concrete,
   b) solid masonry units that are 100% solid and not less than 50 mm high, or
   c) semi-solid or hollow solid masonry units that have the top course completely filled with mortar, grout or concrete.
2) Capping required in Sentence (1) need not be provided
   a) in localities where termites are not known to occur,
   b) when the joists are supported on a wood plate not less than 38 mm by 89 mm, and
   c) when the siding overlaps the foundation wall not less than 12 mm.

9.15.5.2. Support of Beams
1) Not less than 190 mm depth of solid masonry shall be provided beneath beams supported on masonry.
2) Where the beam referred to in Sentence (1) is supported below the top of the foundation walls, the ends of such beams shall be protected from the weather.

9.15.5.3. Pilasters
1) Pilasters shall be provided under beams that frame into unit masonry foundation walls 140 mm or less in thickness.
2) Pilasters required in Sentence (1) shall be not less than 90 mm by 290 mm and shall be bonded or tied into the wall.
3) The top 200 mm of pilasters required in Sentence (1) shall be solid masonry with the cells of hollow or semi-solid units filled with mortar, grout or concrete.

9.15.6. Parging and Finishing of Masonry Foundation Walls

9.15.6.1. Foundation Walls below Ground
1) Concrete block foundation walls shall be parged on the exterior face below ground level as required in Section 9.13.

9.15.6.2. Foundation Walls above Ground
1) Exterior surfaces of concrete block foundation walls above ground level shall have tooled joints, or shall be parged or otherwise suitably finished.

9.15.6.3. Form Ties
1) All form ties shall be removed at least flush with the concrete surface.
Section 9.16. Floors-on-Ground

9.16.1. Scope

9.16.1.1. Application
1) This Section applies to floors supported on ground or on granular fill that do not provide structural support for the superstructure.

9.16.1.2. Structural Floors
1) Floors-on-ground that support loads from the superstructure shall be designed in conformance with Part 4.

9.16.1.3. Required Floors-on-Ground
1) All spaces within dwelling units, except crawl spaces, shall be provided with a floor-on-ground, where
   a) access is provided to the space, and
   b) a floor supported by the structure is not provided.

9.16.1.4. Dampproofing and Waterproofing
1) Dampproofing and waterproofing shall conform to Section 9.13.

9.16.2. Material beneath Floors

9.16.2.1. Required Installation of Granular Material
1) Except as provided in Sentence (2), a drainage layer shall be installed beneath floors-on-ground. (See Note A-9.16.2.1.(1) and see also Subsection 9.13.4. and Note A-9.13.4.)
2) The drainage layer required in Sentence (1) need not be installed beneath
   a) slabs in garages, carports or accessory buildings, or
   b) buildings of industrial occupancy where the nature of the process contained therein permits or requires the use of large openings in the building envelope even during the winter.

9.16.2.2. Support of Floors
1) Material that is susceptible to changes in volume due to variations in moisture content or chemical-microbiological oxidation shall not be used as fill beneath floors-on-ground in a concentration that will damage the building to a degree that would adversely affect its stability or the performance of assemblies. (See also Article 9.4.4.4. and Note A-9.4.4.4.(1).)
2) Material that is susceptible to changes in volume due to freezing shall not be used as fill beneath floors-on-ground that will be subjected to freezing temperatures. (See also Article 9.4.4.4. and Note A-9.4.4.4.(1).)
3) Except as provided in Sentence (4), fill beneath floors-on-ground shall be compacted.
4) Fill beneath floors-on-ground need not be compacted where the material is coarse clean granular material containing not more than 10% of material that will pass a 4 mm sieve.

9.16.3. Drainage

9.16.3.1. Control of Water Ingress
1) Except as provided in Article 9.16.3.2. or where it can be shown to be unnecessary, ingress of water underneath a floor-on-ground shall be prevented by grading or drainage.

9.16.3.2. Hydrostatic Pressure
1) Where groundwater levels may cause hydrostatic pressure beneath a floor-on-ground, the floor-on-ground shall be:
   a) a poured concrete slab, and
   b) designed to resist such pressures.

9.16.3.3. Floor Drains
1) When floor drains are required (See Section 9.31.), the floor surface shall be sloped so that no water can accumulate.

9.16.4. Concrete

9.16.4.1. Surface Finish
1) The finished surface of concrete floor slabs shall be troweled smooth and even.
2) Dry cement shall not be added to the floor surfaces to absorb surplus water.

9.16.4.2. Topping Course
1) When a topping course is provided for a concrete floor slab, it shall consist of 1 part cement to 2.5 parts clean, well graded sand by volume, with a water/cement ratio approximately equal to that of the base slab.
2) When concrete topping is provided, it shall not be less than 20 mm thick.

9.16.4.3. Thickness
1) Concrete slabs shall not be less than 75 mm thick exclusive of concrete topping.

9.16.4.4. Bond Break
1) A bond-breaking material shall be placed between the slab and footings or rock.

9.16.5. Wood

9.16.5.1. Wood-Frame Floors
1) Floors-on-ground constructed of wood shall conform to CSA S406, “Permanent Wood Foundations for Housing and Small Buildings.”

Section 9.17. Columns

9.17.1. Scope

9.17.1.1. Application
1) This Section applies to columns used to support:
   a) beams carrying loads from not more than 2 wood-frame floors where:
      i) the supported length of joists bearing on such beams does not exceed 5 m, and
      ii) the live load on any floor does not exceed 2.4 kPa (See Table 4.1.5.3.),
   b) beams or header joists carrying loads from not more than 2 levels of wood-frame balconies, decks or other accessible exterior platforms, or 1 level plus the roof, where:
      i) the supported length of joists bearing on such beams or joists does not exceed 5 m,
      ii) the sum of the specified snow and occupancy loads does not exceed 4.8 kPa (See Sentence 9.4.2.3.(1) for iii) the determination of load on platform-type constructions), and
      iii) the platform serves only a single suite of residential occupancy, or
   c) carport roofs (See Section 9.35.).
2) Columns for applications other than as described in Sentence (1) shall be designed in accordance with Part 4.
9.17.2. General

9.17.2.1. Location
1) Columns shall be centrally located on a footing conforming to Section 9.15.

9.17.2.2. Lateral Support
1) Columns shall be securely fastened to the supported member to reduce the likelihood of lateral differential movement between the column and the supported member. (See also Article 9.23.6.2.)
2) Except as permitted by Sentence (3), columns shall be laterally supported to resist racking
   a) directly, or
   b) by connection to the supported members.
(See Note A-9.17.2.2.(2.).)
3) Columns need not be provided with lateral support as described in Sentence (2), where
   a) the distance from finished ground to the underside of the joists is not more than 600 mm, and
   b) the columns support a deck with no superstructure.

9.17.3. Steel Columns

9.17.3.1. Size and Thickness
1) Except as permitted in Sentence (2), steel pipe columns shall have an outside diameter of not less than 73 mm and a wall thickness of not less than 4.76 mm.
2) Columns of sizes other than as specified in Sentence (1) are permitted to be used where the loadbearing capacities are shown to be adequate.

9.17.3.2. End Bearing Plates
1) Except as permitted in Sentence (2), steel columns shall be fitted with not less than 100 mm by 100 mm by 6.35 mm thick steel plates at each end, and where the column supports a wooden beam, the top plate shall extend across the full width of the beam.
2) The top plate required in Sentence (1) need not be provided where a column supports a steel beam and provision is made for the attachment of the column to the beam.

9.17.3.3. Paint
1) Exterior steel columns shall be treated on the outside surface with at least one coat of rust-inhibitive paint.

9.17.3.4. Design of Steel Columns
(See Note A-9.17.3.4.)
1) Where the imposed load does not exceed 36 kN, adjustable steel columns shall conform to CAN/CGSB-7.2, “Adjustable Steel Columns.”
2) Steel columns other than those described in Sentence (1) shall be designed in accordance with Part 4.

9.17.4. Wood Columns

9.17.4.1. Column Sizes
1) The width or diameter of a wood column shall be not less than the width of the supported member.
2) Except as provided in Article 9.35.4.2., columns shall be not less than 184 mm for round columns and 140 mm by 140 mm for rectangular columns, unless calculations are provided to show that lesser sizes are adequate.

9.17.4.2. Materials
1) Wood columns shall be either solid, glued-laminated or built-up.
2) Built-up columns shall consist of not less than 38 mm thick full-length members
   a) bolted together with not less than 9.52 mm diam bolts spaced not more than 450 mm o.c., or
   b) nailed together with not less than 76 mm nails spaced not more than 300 mm o.c.
3) Glued-laminated columns shall conform to Section 4.3.

9.17.4.3. Columns in Contact with Concrete
1) Wood columns shall be separated from concrete in contact with the ground by 0.05 mm polyethylene film
   or Type S roll roofing.

9.17.5. Unit Masonry Columns

9.17.5.1. Materials
1) Unit masonry columns shall be built of masonry units
   a) conforming to CSA A165.1, “Concrete Block Masonry Units,” and
   b) having a compressive strength over the net area of the block of not less than 15 MPa.

9.17.5.2. Sizes
1) Unit masonry columns shall be not less than 290 mm by 290 mm or 240 mm by 380 mm in size.

9.17.6. Solid Concrete Columns

9.17.6.1. Materials
1) Concrete shall conform to Section 9.3.

9.17.6.2. Sizes
1) Concrete columns shall be not less than 200 mm by 200 mm for rectangular columns and 230 mm diam
   for circular columns.

Section 9.18. Crawl Spaces

9.18.1. General

9.18.1.1. Application
1) This Section applies to crawl spaces whose exterior walls have less than 25% of their total area above
   exterior ground level open to the outdoors.

9.18.1.2. Foundations
1) Foundations enclosing crawl spaces shall conform to Section 9.15.

9.18.1.3. Heated and Unheated Crawl Spaces
1) Crawl spaces shall be considered to be heated where the space
   a) is used as a hot air plenum,
   b) contains heating ducts that are not sealed and insulated to minimize heat loss to the space, or
   c) is not separated from heated space in accordance with Section 9.25.
2) Heating of heated crawl spaces shall conform to Section 9.33.
3) Insulation, an air barrier system and a vapour barrier shall be installed in the walls of heated crawl spaces
   in accordance with Section 9.25.

9.18.2. Access
9.18.2.1. Access Openings
1) An access opening of not less than 500 mm by 700 mm shall be provided to each crawl space where the crawl space serves a single dwelling unit, and not less than 550 mm by 900 mm for other crawl spaces.
2) Access openings shall be fitted with a door or hatch, except when the crawl space is heated and the access opening into the crawl space is from an adjacent heated space.

9.18.3. Ventilation

9.18.3.1. Ventilation of Unheated Crawl Spaces
1) Unheated crawl spaces shall be ventilated by natural or mechanical means.
2) Where an unheated crawl space is ventilated by natural means, ventilation shall be provided to the outside air by not less than 0.1 m² of unobstructed vent area for every 50 m² of floor area.
3) Vents shall be
   a) uniformly distributed on opposite sides of the building, and
   b) designed to prevent the entry of snow, rain and insects.

9.18.3.2. Ventilation of Heated Crawl Spaces
1) Heated crawl spaces shall be ventilated in accordance with Section 9.32.

9.18.4. Clearance
(See also Article 9.3.2.9.)

9.18.4.1. Access Way to Services
1) Where equipment requiring service such as plumbing cleanouts, traps and burners is located in crawl spaces, an access way with a height and width of not less than 600 mm shall be provided from the access door to the equipment and for a distance of 900 mm on the side or sides of the equipment to be serviced.

9.18.5. Drainage

9.18.5.1. Drainage
1) Except where it can be shown to be unnecessary, the ingress of water into a crawl space shall be controlled by grading or drainage.
2) Drainage of foundation walls shall conform to Article 9.14.2.1.
3) Drainage of the ground cover or floor-on-ground in the crawl space shall conform to Subsection 9.16.3.
4) Drains shall conform to Section 9.14.

9.18.6. Ground Cover

9.18.6.1. Ground Cover in Unheated Crawl Spaces
1) Where a crawl space is unheated, a ground cover shall be provided consisting of not less than
   a) 50 mm of asphalt,
   b) 100 mm of 15 MPa Portland cement concrete,
   c) Type S roll roofing, or
   d) 0.10 mm polyethylene.
2) Joints in sheet-type ground cover required in Sentence (1) shall be lapped not less than 100 mm and weighted down.

9.18.6.2. Ground Cover in Heated Crawl Spaces
1) Where a crawl space is heated, a ground cover consisting of not less than 0.15 mm polyethylene sheet conforming to CAN/CGSB-51.34-M, “Vapour Barrier, Polyethylene Sheet for Use in Building Construction,” shall be installed as part of an air barrier system in accordance with Subsection 9.25.3.

2) The ground cover required in Sentence (1) shall have its joints lapped not less than 300 mm, and
   a) be sealed and evenly weighted down, or
   b) be covered with concrete not less than 50 mm thick.

3) The perimeter of the ground cover required in Sentence (1) shall be sealed to the foundation wall. (See Notes A-9.13.4., A-9.25.3.4. and 9.25.3.6., and A-9.25.3.6.(2) and (3).)

4) All penetrations of the ground cover required in Sentence (1) shall be sealed against air leakage. (See Subsection 9.25.3.)

9.18.7. Fire Protection

9.18.7.1. Crawl Spaces as Warm Air Plenums
   1) Only crawl spaces under 1-storey portions of dwelling units shall be used as warm-air plenums.
   2) Enclosing material in crawl spaces described in Sentence (1), including insulation, shall have a surface flame-spread rating not greater than 150.
   3) Combustible ground cover in crawl spaces described in Sentence (1) shall be protected beneath each register opening with noncombustible material.
   4) The noncombustible register protection described in Sentence (3) shall
      a) extend not less than 300 mm beyond the projection of the register opening, and
      b) have up-turned edges.

(See Note A-9.18.7.1.(4).)

Section 9.19. Roof Spaces

9.19.1. Venting

9.19.1.1. Required Venting
   1) Except where it can be shown to be unnecessary, where insulation is installed between a ceiling and the underside of the roof sheathing, a space shall be provided between the insulation and the sheathing, and vents shall be installed to permit the transfer of moisture from the space to the exterior. (See Note A-9.19.1.1.(1).)

9.19.1.2. Vent Requirements
   1) Except as provided in Sentence (2), the unobstructed vent area shall be not less than 1/300 of the insulated ceiling area.
   2) Where the roof slope is less than 1 in 6 or in roofs that are constructed with roof joists, the unobstructed vent area shall be not less than 1/150 of the insulated ceiling area.
   3) Required vents may be roof type, eave type, gable-end type or any combination thereof, and shall be distributed
      a) uniformly on opposite sides of the building,
      b) with not less than 25% of the required openings located at the top of the space, and
      c) with not less than 25% of the required openings located at the bottom of the space.
   4) Except where each joist space is separately vented, roof joist spaces shall be interconnected by installing purlins not less than 36 mm by 38 mm on the top of the roof joists.
   5) Vents shall comply with CAN3-A93-M, “Natural Airflow Ventilators for Buildings.”

9.19.1.3. Clearances
1) Except as provided in Sentence (2), not less than 63 mm of space shall be provided between the top of the insulation and the underside of the roof sheathing.

2) At the junction of sloped roofs and exterior walls, where preformed baffles are used to contain the insulation, the baffles shall
   a) provide an unobstructed air space, between the insulation and the underside of the roof sheathing, that is
      i) not less than 25 mm in dimension, and
      ii) of sufficient cross area to meet the attic or roof space venting requirements of Article 9.19.1.2., and
   b) extend vertically not less than 50 mm above the top of the insulation.

3) Ceiling insulation shall be installed in a manner that will not restrict the free flow of air through roof vents or through any portion of the attic or roof space.

9.19.1.4. Mansard or Gambrel Roof

1) The lower portion of a mansard or gambrel style roof need not be ventilated.

2) The upper portion of roofs described in Sentence (1) shall be ventilated in conformance with Articles 9.19.1.1. to 9.19.1.3.

Section 9.20. Masonry and Insulating Concrete Form Walls Not in Contact with the Ground

9.20.1. Application

9.20.1.1. General

1) Except as provided in Article 9.20.1.2., this Section applies to
   a) unreinforced masonry and masonry veneer walls not in contact with the ground, where
      i) the height of the walls constructed on the foundation walls does not exceed 11 m, and
      ii) the roof or floor assembly above the first storey is not of concrete construction, and
   b) flat insulating concrete form walls not in contact with the ground that (See Note A-9.15.1.1.(1)(c) and 9.20.1.1.(1)(b))
      i) have a maximum floor-to-floor height of 3 m,
      ii) are erected in buildings not more than 2 storeys in building height and containing only a single dwelling unit, and
      iii) are erected in locations where the seismic spectral response acceleration, \( S_a(0.2) \), is not greater than 0.4 (See Note A-9.20.1.2.).
2) For walls other than those described in Sentence (1), or where the masonry walls or insulating concrete form walls not in contact with the ground are designed for specified loads on the basis of ultimate and serviceability limit states, Subsection 4.3.2. shall apply.

9.20.1.2. Earthquake Reinforcement
(See Note A-9.20.1.2.)
1) In locations where the spectral response acceleration, $S_a(0.2)$, is greater than 0.55, loadbearing elements of masonry buildings more than 1 storey in building height shall be reinforced with not less than the minimum amount of reinforcement required by Subsection 9.20.15.
2) In locations where the spectral response acceleration, $S_a(0.2)$, is greater than 0.35 but less than or equal to 0.55, loadbearing elements of masonry buildings 3 storeys in building height shall be reinforced with not less than the minimum amount of reinforcement required by Subsection 9.20.15.

9.20.2. Masonry Units

9.20.2.1. Masonry Unit Standards
1) Masonry units shall comply with
   a) ASTM C 73, "Calcium Silicate Brick (Sand-Lime Brick),"
   b) ASTM C 126, "Ceramic Glazed Structural Clay Facing Tile, Facing Brick, and Solid Masonry Units,"
   c) ASTM C 212, "Structural Clay Facing Tile,"
   d) CAN/CSA-A82, "Fired Masonry Brick Made from Clay or Shale,"
   e) CSA A165.1, "Concrete Block Masonry Units,"
   f) CSA A165.2, "Concrete Brick Masonry Units," or
   g) CSA A165.3, "Prefaced Concrete Masonry Units."

9.20.2.2. Used Brick
1) Used bricks shall be free of old mortar, soot or other surface coating and shall conform to Article 9.20.2.1.

9.20.2.3. Glass Blocks
1) Glass blocks shall not be used as loadbearing units or in the construction of fireplaces or chimneys.

9.20.2.4. Cellular Concrete
1) Masonry made with cellular concrete shall not be used in contact with the soil or exposed to the weather.

9.20.2.5. Stone
1) Stone shall be sound and resistant to deterioration.

9.20.2.6. Concrete Blocks Exposed to the Weather
1) Concrete blocks exposed to the weather shall have density and water absorption characteristics conforming to concrete types A, B, C, or D described in CSA A165.1, "Concrete Block Masonry Units."

9.20.2.7. Compressive Strength
1) The compressive strength of concrete blocks shall conform to Table 9.20.2.7.
Table 9.20.2.7.

9.20.3. Mortar and Grout

9.20.3.1. Materials

1) Cementitious materials and aggregates for mortar and grout shall comply with CSA A179, “Mortar and Grout for Unit Masonry.”
2) Water and aggregate shall be clean and free of significant amounts of deleterious materials.
3) Lime used in mortar shall be hydrated.
4) If lime putty is used in mortar, it shall be made by slaking quicklime in water for not less than 24 h or soaking hydrated lime in water for not less than 12 h.

9.20.3.2. Mortar and Grout Mixes

1) Mortar types shall be in accordance with Table 9.20.3.2.-A.
2) Mortar for glass block masonry shall be
   a) Type S Portland cement-lime where exposed to the exterior, or
   b) Type S or N where protected from the exterior.
3) Mortar shall be mixed within the proportion limits provided in Table 9.20.3.2.-B, with sufficient water to bring the mixture to a consistency adequate for laying masonry units.
4) Grout shall be mixed within the proportion limits provided in Table 9.20.3.2.-C, with sufficient water to provide a suitable flow to fill all voids completely, without excessive segregation or bleeding.
5) Except as provided in Sentence (6), mortar shall be used and placed in final position
   a) within 1.5 h after mixing when the air temperature is 25°C or higher, or
   b) within 2.5 h after mixing when the air temperature is less than 25°C.
6) Mortar and grout containing a set-control admixture shall be manufactured off-site in a batching plant and shall be used and placed in final position within a time not exceeding the useful life stipulated by the manufacturer.
7) Grout used for reinforced masonry shall be placed in accordance with the requirements of CSA A371, “Masonry Construction for Buildings.”

### 9.20.4. Mortar Joints
9.20.4.1. Thickness
   1) Except as provided in Sentence (2), mortar joint thickness for burned clay brick and concrete masonry units shall be 10 mm.
   2) Permitted tolerances in head and bed joints shall be not more than ± 5 mm.

9.20.4.2. Solid Masonry Units
   1) Solid masonry units shall be laid with full head and bed joints.

9.20.4.3. Laying of Masonry Units
   1) Hollow masonry units shall be laid with mortar applied to head and bed joints of both inner and outer face shells.
   2) Vertically aligned webs of hollow masonry units shall be laid in a full bed of mortar
      a) under the starting course,
      b) in all courses of columns, and
      c) where adjacent to cells or cavities that are to be filled with grout.
   3) Except for head joints left open for weep holes and ventilation, solid masonry units shall be laid with full head and bed joints.

9.20.5. Masonry Support

9.20.5.1. Masonry Support
   1) All masonry shall be supported on masonry, concrete or steel, except that masonry veneer walls may be supported on foundations of wood frame constructed in conformance with Sentence 9.15.2.4.(1). (See Note A-9.20.5.1.(1).)
   2) Every masonry wall shall be at least as thick as the wall it supports, except as otherwise permitted in Article 9.20.12.2.

9.20.5.2. Lintels or Arches
   1) Masonry over openings shall be supported by steel, masonry or reinforced concrete lintels, or masonry arches.
   2) Steel angle lintels supporting masonry veneer above openings shall
      a) conform to Table 9.20.5.2., and
      b) have a bearing length not less than 90 mm.

3) Steel angle lintels supporting masonry other than veneer, masonry and reinforced concrete lintels, and masonry arches shall be designed in accordance with Part 4 to support the imposed load.
4) Steel angle lintels supporting masonry shall be prime painted or otherwise protected from corrosion.

9.20.6. Thickness and Height

9.20.6.1. Thickness of Exterior Walls
1) Masonry exterior walls, other than cavity walls, in 1-storey buildings and the top storeys of 2- and 3-storey buildings shall be not less than 140 mm thick, provided the walls are not more than 2.8 m high at the eaves and 4.6 m high at the peaks of gable ends.
2) The exterior walls of the bottom storeys of 2-storey buildings, and exterior walls of the bottom 2 storeys of 3-storey buildings shall be not less than 190 mm thick.
3) In exterior walls composed of more than one wythe, each wythe shall be not less than 90 mm thick.

9.20.6.2. Cavity Walls
1) Cavity walls shall be made with not less than 90 mm wide units if the joints are raked and not less than 75 mm wide units if the joints are not raked.
2) The width of a cavity in a cavity wall shall be not less than 50 mm and not greater than 150 mm.
3) The minimum thickness of cavity walls above the supporting base shall be 230 mm for the top 7.6 m and 330 mm for the remaining portion, except that where 75 mm wide units are used, the wall height above the top of the foundation wall shall not exceed 6 m.

9.20.6.3. Thickness of Interior Walls
1) The thickness of loadbearing interior walls shall be determined on the basis of the maximum lateral support spacing as provided in Sentences 9.20.10.1.(2) and (3).
2) The thickness of interior non-loadbearing walls shall be
   a) determined on the basis of the maximum lateral support spacing as provided in Sentences 9.20.10.1.(2) and (3), and
   b) in any case, not less than 65 mm.

9.20.6.4. Masonry Veneer
1) Except for masonry veneer where each masonry unit is supported individually by the structural backing, masonry veneer shall consist of solid masonry units not less than 75 mm thick.
2) Veneer described in Sentence (1) over wood-frame walls shall have not less than a 25 mm air space behind the veneer.
3) Masonry veneer less than 90 mm thick shall have unraked joints.
4) Masonry veneer shall conform to Subsection 4.3.2., where the masonry units are required to be individually supported by the structural backing.

9.20.6.5. Parapet Walls
1) The height of parapet walls above the adjacent roof surface shall be not more than 3 times the parapet wall thickness.
2) Parapet walls shall be solid masonry
   a) with the cells of hollow or semi-solid units filled with mortar, grout, or concrete, and
   b) that extends from the top of the parapet to not less than 300 mm below the adjacent roof level.

9.20.6.6. Stone or Concrete Facings
1) Slab and panel facings of precast concrete and natural or artificial stone shall conform to Subsection 4.3.2.

9.20.7. Chases and Recesses

9.20.7.1. Maximum Dimensions
   1) Except as permitted in Sentence 9.20.7.2.(2) and Article 9.20.7.4., the depth of any chase or recess shall not exceed one third the thickness of the wall, and the width of the chase or recess shall not exceed 500 mm.

9.20.7.2. Minimum Wall Thickness
   1) Except as permitted in Sentence (2) and Article 9.20.7.4., no chase or recess shall be constructed in any wall 190 mm or less in thickness.
   2) Recesses may be constructed in 190 mm walls provided they do not exceed 100 mm in depth, 750 mm in height and 500 mm in width.

9.20.7.3. Separation of Chases or Recesses
   1) Chases and recesses shall be not less than
      a) 4 times the wall thickness apart, and
      b) 600 mm away from any pilaster, cross wall, buttress or other vertical element providing required lateral support for the wall.

9.20.7.4. Non-Conforming Chases or Recesses
   1) Chases or recesses that do not conform to the limits specified in Articles 9.20.7.1. to 9.20.7.3. shall be considered as openings, and any masonry supported above such a chase or recess shall be supported by a lintel or arch as provided in Article 9.20.5.2.

9.20.7.5. Chases or Recesses Cut into Walls
   1) Chases and recesses shall not be cut into walls made with hollow units after the masonry units are in place.

9.20.8. Support of Loads

9.20.8.1. Capping of Hollow Masonry Walls
   1) Except as permitted in Sentence (2), loadbearing walls of hollow masonry units supporting roof or floor framing members shall be capped with not less than 50 mm of solid masonry or have the top course filled with concrete.
   2) Capping required in Sentence (1) may be omitted where the roof framing is supported on a wood plate not less than 38 mm by 89 mm.

9.20.8.2. Cavity Walls Supporting Framing Members
   1) Floor joists supported on cavity walls shall be supported on solid masonry units not less than 57 mm high.
   2) Floor joists described in Sentence (1) shall not project into the cavity.
   3) Roof and ceiling framing members bearing on cavity walls shall be supported on
      a) solid masonry units not less than 57 mm high that bridge the full thickness of the wall, or
      b) a wood plate not less than 38 mm thick, bearing not less than 50 mm on each wythe.

9.20.8.3. Bearing of Beams and Joists
   1) The bearing area under beams and joists shall be sufficient to carry the supported load.
   2) In no case shall the minimum length of end bearing of beams supported on masonry be less than 90 mm.
3) The length of end bearing of floor, roof or ceiling joists supported on masonry shall be not less than 40 mm.

9.20.8.4. Support of Beams and Columns
1) Beams and columns supported on masonry walls shall be supported on pilasters where the thickness of the masonry wall or wythe is less than 190 mm.
2) Not less than 190 mm depth of solid masonry or concrete shall be provided under the beam or column referred to in Sentence (1).
3) Pilasters required in Sentence (1) shall be bonded or tied to masonry walls.
4) Concrete pilasters required in Sentence (1) shall be not less than 50 mm by 300 mm.
5) Unit masonry pilasters required in Sentence (1) shall be not less than 100 mm by 290 mm.

9.20.8.5. Projection of Masonry Veneer Beyond Supporting Members
1) Masonry veneer of hollow and solid masonry units resting on a bearing support shall not project more than one third of the thickness of the veneer. (See Note A-9.20.8.5.(1).)
2) Where the masonry veneer described in Sentence (1) is rough stone masonry,
   a) the projection shall be measured as the average projection of the units, and
   b) the thickness of the veneer shall be measured as the average thickness of the veneer.

9.20.9. Bonding and Tying

9.20.9.1. Joints to be Offset or Reinforced
1) Vertical joints in adjacent masonry courses shall be offset unless each wythe of masonry is reinforced with the equivalent of not less than 2 corrosion-resistant steel bars of 3.76 mm diam placed in the horizontal joints at vertical intervals not exceeding 460 mm.
2) Where joints in the reinforcing referred to in Sentence (1) occur, the bars shall be lapped not less than 150 mm.

9.20.9.2. Bonding or Tying of Other than Masonry Veneer
1) Except as provided in Article 9.20.9.5. regarding masonry veneer, masonry walls that consist of 2 or more wythes shall have the wythes bonded or tied together with masonry bonding units as described in Article 9.20.9.3. or with metal ties as described in Article 9.20.9.4.

9.20.9.3. Bonding
1) Where wythes are bonded together with masonry units, the bonding units shall comprise not less than 4% of the wall surface area.
2) Bonding units described in Sentence (1) shall be spaced not more than 600 mm vertically and horizontally in the case of brick masonry and 900 mm o.c. in the case of block or tile.
3) Units described in Sentence (1) shall extend not less than 90 mm into adjacent wythes.

9.20.9.4. Tying
1) Where 2 or more wythes are tied together with metal ties of the individual rod type, the ties shall conform to the requirements in Sentences (3) to (6).
2) Other ties may be used where it can be shown that such ties provide walls that are at least as strong and as durable as those made with the individual rod type.
3) Metal ties of the individual rod type shall
   a) be corrosion-resistant,
   b) have a minimum cross-sectional area of not less than 17.8 mm², and
   c) have not less than a 50 mm portion bent at right angles at each end.
4) Metal ties of the individual rod type shall
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

a) extend from within 25 mm of the outer face of the wall to within 25 mm of the inner face of the wall,
b) be completely embedded in mortar except for the portion exposed in cavity walls, and
c) be staggered from course to course.

5) Where 2 or more wythes in walls other than cavity walls and masonry veneer/masonry backing walls are tied together with metal ties of the individual rod type, the space between wythes shall be completely filled with mortar.

6) Ties described in Sentence (5) shall be
a) located within 300 mm of openings and spaced not more than 900 mm apart around openings, and
b) spaced not more than 900 mm apart horizontally and 460 mm apart vertically at other locations.

7) Except as required in Sentences (8) and (9), where the inner and outer wythes of cavity walls are tied with individual wire ties, the ties shall be spaced not more than 900 mm apart horizontally and 400 mm apart vertically.

8) Within 100 mm of the bottom of each floor or roof assembly where the cavity extends below the assemblies, the ties described in Sentence (7) shall be spaced not more than 600 mm apart horizontally.

9) Within 300 mm of any openings, the ties described in Sentence (7) shall be spaced not more than 900 mm apart.

9.20.9.5. Ties for Masonry Veneer

1) Masonry veneer 75 mm or more in thickness and resting on a bearing support shall be tied to masonry backing or to wood framing members with straps that are
a) corrosion-resistant,
b) not less than 0.76 mm thick,
c) not less than 22 mm wide,
d) shaped to provide a key with the mortar, and
e) spaced in accordance with Table 9.20.9.5.

</tbody>
</table>

2) Straps described in Sentence (1) that are fastened to wood framing members shall be
a) bent at a right angle within 6 mm from the fastener, and
b) fastened with corrosion-resistant 3.18 mm diam screws or spiral nails having a wood penetration of not less than 63 mm.

3) Masonry veneer individually supported by masonry or wood-frame backing shall be secured to the backing in conformance with Subsection 4.3.2.

9.20.9.6. Reinforcing for Glass Block

1) Glass block shall have horizontal joint reinforcement of 2 corrosion-resistant bars of not less than 3.76 mm diam or expanded metal strips not less than 75 mm wide.
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

9.20.10. Lateral Support

9.20.10.1. Lateral Support Required
1) Masonry walls shall be laterally supported by floor or roof construction or by intersecting masonry walls or buttresses.
2) The spacing of supports required in Sentence (1) shall be not more than
   a) 20 times the wall thickness for all loadbearing walls and exterior non-loadbearing walls, and
   b) 36 times the wall thickness for interior non-loadbearing walls.
3) In applying Sentence (2), the thickness of cavity walls shall be taken as the greater of
   a) two-thirds of the sum of the thicknesses of the wythes, or
   b) the thickness of the thicker wythe.
4) Floor and roof constructions providing lateral support for walls as required in Sentence (1) shall be constructed to transfer lateral loads to walls or buttresses approximately at right angles to the laterally supported walls.

9.20.11. Anchorage of Roofs, Floors and Intersecting Walls

9.20.11.1. Anchorage to Floor or Roof Assemblies where Masonry Walls Require Lateral Support
1) Where required to receive lateral support (See Subsection 9.20.10.), masonry walls shall be anchored to each floor or roof assembly at maximum intervals of 2 m, except that anchorage to floor joists not more than 1 m above grade may be omitted.
2) Anchors required in Sentence (1) shall be corrosion-resistant and be not less than the equivalent of 40 mm by 4.76 mm thick steel straps.
3) Anchors required in Sentence (1) shall be shaped to provide a mechanical key with the masonry and shall be securely fastened to the horizontal support to develop the full strength of the anchor.
4) When joists are parallel to the wall, anchors required in Sentence (1) shall extend across not less than 3 joists.

9.20.11.2. Bonding and Tying Intersecting Masonry Walls where Walls Require Lateral Support
1) Where required to provide lateral support, intersecting walls shall be bonded or tied together.
2) Where bonding is used to satisfy the requirements of Sentence (1), 50% of the adjacent masonry units in the intersecting wall, distributed uniformly over the height of the intersection, shall be embedded in the laterally supported wall.
3) Where tying is used to satisfy the requirements of Sentence (1), the ties shall be
   a) corrosion-resistant metal,
   b) equivalent to not less than 4.76 mm by 40 mm steel strapping,
   c) spaced not more than 800 mm o.c. vertically, and
   d) shaped at both ends to provide sufficient mechanical key to develop the strength of the ties.

9.20.11.3. Anchoring Intersecting Wood-Frame Walls to Masonry Walls
1) Wood-frame walls shall be anchored to masonry walls that they intersect with not less than 4.76 mm diam corrosion-resistant steel rods spaced not more than 900 mm o.c. vertically.
2) Anchors required in Sentence (1) shall be fastened to the wood framing at one end and shaped to provide a mechanical key at the other end to develop the strength of the anchor.

9.20.11.4. Anchoring Wood-Frame Roof Systems to Masonry Walls
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

1) Except as permitted in Sentence (2), roof systems of wood-frame construction shall be anchored to exterior masonry walls by not less than 12.7 mm diam anchor bolts,
   a) spaced not more than 2.4 m apart,
   b) embedded not less than 90 mm into the masonry, and
   c) fastened to a rafter plate of not less than 38 mm thick lumber.

2) The roof system described in Sentence (1) is permitted to be anchored by nailing the wall furring strips to the side of the rafter plate.

9.20.11.5. Anchoring Masonry Cornices, Sills and Trim to Masonry Walls

1) Cornices, sills or other trim of masonry material which project beyond the wall face shall have not less than 65% of their mass, but not less than 90 mm, within the wall or shall be adequately anchored to the wall with corrosion-resistant anchors.

9.20.11.6. Anchoring to Masonry Piers

1) Where anchor bolts are to be placed in the top of a masonry pier, the pier shall conform to the requirements of Sentence 9.15.2.3.(4) and shall be capped with concrete or reinforced masonry not less than 200 mm thick.

9.20.12. Corbelling

9.20.12.1. Corbelling

1) All corbelling shall consist of solid masonry units.

2) The units referred to in Sentence (1) shall be corbelled so that the horizontal projection of any unit does not exceed 25 mm and the total projection does not exceed one third of the total wall thickness.

9.20.12.2. Corbelling for Cavity Walls

1) Cavity walls of greater thickness than the foundation wall on which they rest shall not be corbelled but may project 25 mm over the outer face of the foundation wall disregarding parging.

2) Where the foundation wall referred to in Sentence (1) is unit masonry, it is permitted to be corbelled to meet flush with the inner face of a cavity wall provided
   a) the projection of each course does not exceed half the height or one third the thickness of the corbelled unit, and
   b) the total corbel does not exceed one third of the foundation wall thickness.

(See Note A-9.20.12.2.(2).)

9.20.12.3. Corbelling for Masonry Veneer

1) Masonry veneer resting on a bearing support shall not project more than 25 mm beyond the supporting base where the veneer is not less than 90 mm thick, and 12 mm beyond the supporting base where the veneer is less than 90 mm thick.

2) In the case of rough stone veneer, the projection, measured as the average projection of the stone units, shall not exceed one-third the bed width beyond the supporting base.

9.20.13. Control of Rainwater Penetration

9.20.13.1. Materials for Flashing

1) Materials used for flashing shall conform to Table 9.20.13.1.
### Table 9.20.13.1.

2) Aluminum flashing in contact with masonry or concrete shall be effectively coated or separated from the masonry or concrete by an impervious membrane.

### 9.20.13.2. Fastening of Flashing
1) Fastening devices for flashing shall be corrosion-resistant and, where metal flashing is used, shall be compatible with the flashing with respect to galvanic action.

### 9.20.13.3. Location of Flashing
1) Flashing shall be installed in masonry and masonry veneer walls
   a) beneath jointed masonry window sills,
   b) over the back and top of parapet walls,
   c) over the heads of glass block panels,
   d) beneath weep holes, and
   e) over the heads of window or door openings in exterior walls when the vertical distance between the top of a window or door frame and the bottom edge of the eave exceeds one-quarter of the horizontal eave overhang.

### 9.20.13.4. Extension of Flashing
1) When installed beneath jointed masonry window sills or over the heads of openings, flashing shall extend from the front edge of the masonry up behind the sill or lintel.

### 9.20.13.5. Flashing for Weep Holes in Masonry/Masonry Walls
1) Flashing beneath weep holes in cavity walls and masonry veneer/masonry backing walls shall
   a) be bedded not less than 25 mm in the inside wythe,
   b) extend to not less than 5 mm beyond the outer face of the building element below the flashing, and
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

c) be installed with a nominally horizontal slope toward the outside wythe.
