9.20.13.6. Flashing for Weep Holes in Masonry Veneer
   1) Flashing beneath weep holes in masonry veneer over masonry backing walls shall conform to the
      flashing requirements for cavity walls and masonry veneer/masonry backing walls in Article 9.20.13.5.
   2) Flashing beneath weep holes in masonry veneer over wood-frame walls shall be installed so that it
      extends from a point not less than 5 mm beyond the outer face of the building element below the flashing to
      a point 150 mm up the wood-frame wall.
   3) Where the frame wall is sheathed with a sheathing membrane, a non-wood-based rigid exterior insulating
      sheathing or a semi-rigid insulating sheathing with an integral sheathing membrane, the flashing shall be
      installed behind the sheathing membrane or insulating sheathing.
   4) Flashing described in Sentence (2) is permitted to conform to the requirements for concealed flashing in
      Table 9.20.13.1.

9.20.13.7. Flashing Joints
   1) Joints in flashing shall be made watertight.

9.20.13.8. Required Weep Holes
   1) Weep holes spaced not more than 800 mm apart shall be provided at the bottom of
      a) cavities in cavity walls, and
      b) cavities or air spaces in masonry veneer walls.
   2) The cavities or air spaces described in Sentence (1) shall include those above lintels over window and
      door openings required to be flashed in conformance with Article 9.20.13.3.

9.20.13.9. Protection of Interior Finish
   1) Except as provided in Sentence (3), where the interior finish of the exterior walls of a building is a type
      that may be damaged by moisture, exterior masonry walls, other than cavity walls or walls that are protected
      for their full height by a roof of a carport or porch, shall be covered on the interior surface with sheathing
      membrane conforming to CAN/CGSB-51.32-M, "Sheathing, Membrane, Breather Type," lapped not less
      than 100 mm at the joints.
   2) In situations described in Sentence (1), flashing shall be provided where water will accumulate, to lead it
      to the exterior.
   3) Where insulation that effectively limits the passage of water is applied by a waterproof adhesive or mortar
      directly to parged masonry, the requirements for sheathing membrane in Sentence (1) do not apply. (See
      Note A-9.20.13.9.(3).)

9.20.13.10. Mortar Droppings
   1) Cavity walls shall be constructed so that mortar droppings are prevented from forming a bridge to allow
      the passage of rain water across the cavity.

9.20.13.11. Caulking at Door and Window Frames
   1) The junction of door and window frames with masonry shall be caulked in conformance with Subsection
      9.27.4.

9.20.13.12. Drips beneath Window Sills
   1) Where no flashing is installed beneath window sills, such sills shall be provided with a drip not less than
      25 mm from the wall surface.

9.20.14.1. Laying Temperature of Mortar and Masonry
1) Mortar and masonry shall be maintained at a temperature not below 5°C during installation and for not less than 48 h after installation.
2) No frozen material shall be used in mortar mix.

9.20.14.2. Protection from Weather
1) The top surface of uncompleted masonry exposed to the weather shall be completely covered with a waterproofing material when construction is not in progress.

9.20.15. Reinforcement for Earthquake Resistance

9.20.15.1. Amount of Reinforcement
1) Where reinforcement is required in this Section, masonry walls shall be reinforced horizontally and vertically with steel having a total cross-sectional area of not less than 0.002 times the horizontal cross-sectional area of the wall, so that not less than one-third of the required steel area is installed either horizontally or vertically and the remainder in the other direction.

9.20.15.2. Installation Standard
1) Where reinforcement for masonry is required in this Section, it shall be installed in conformance with the requirements for reinforced masonry as contained in CSA A371, “Masonry Construction for Buildings.”

9.20.16. Corrosion Resistance

1) Carbon steel connectors required to be corrosion-resistant shall be galvanized to at least the minimum standards in Table 9.20.16.1.

<table>

Notes to Table 9.20.16.1.:
(1) ASTM A 123/A 123M does not apply to metal less than 3.18 mm thick. Galvanizing coatings may be interpolated for thicknesses between 3.18 mm and 0.76 mm.

9.20.17. Above-Ground Flat Insulating Concrete Form Walls

9.20.17.1. Thickness of Flat Insulating Concrete Form Walls
1) The thickness of the concrete in flat insulating concrete form walls not in contact with the ground shall be
   a) not less than 140 mm, and
b) constant for the entire height of the wall.

9.20.17.2. Reinforcement for Flat Insulating Concrete Form Walls

1) Horizontal reinforcement in above-grade flat insulating concrete form walls shall
a) consist of
   i) one 10M bar placed not more than 300 mm from the top of the wall, and
   ii) 10M bars at 600 mm o.c., and
   b) be placed in the middle third of the wall section.
2) Vertical reinforcement in above-grade flat insulating concrete form walls shall
a) consist of 10M bars at 400 mm o.c., and
   b) be placed in the middle third of the wall section.
3) Vertical reinforcement required by Sentence (2) and interrupted by wall openings shall be placed not more than 600 mm from each side of the opening.

9.20.17.3. Openings in Non-Loadbearing Flat Insulating Concrete Form Walls

1) No openings shall occur within 1 200 mm of interior and exterior corners of exterior non-loadbearing flat insulating concrete form walls.
2) Portions of walls above openings in non-loadbearing flat insulating concrete form walls shall have a minimum depth of concrete of no less than 200 mm across the width of the opening.
3) Openings that are more than 600 mm but not more than 3 000 mm in width in non-loadbearing flat insulating concrete form walls shall be reinforced at the top and bottom with one 10M bar.
4) Openings more than 3 000 mm in width in non-loadbearing flat insulating concrete form walls shall be reinforced on all four sides with two 10M bars.
5) Reinforcing bars described in Sentences (3) and (4) shall extend 600 mm beyond the edges of the opening.
6) The cumulative width of openings in non-loadbearing flat insulating concrete form walls shall not make up more than 70% of the length of any wall.

9.20.17.4. Openings in Loadbearing Flat Insulating Concrete Form Walls

1) No openings shall occur within 1 200 mm of interior and exterior corners of exterior loadbearing flat insulating concrete form walls.
2) In loadbearing flat insulating concrete form walls, lintels shall be provided over all openings wider than 900 mm.
3) Lintels described in Sentence (2) shall be constructed in accordance with Span Table 9.20.17.4.-A, 9.20.17.4.-B or 9.20.17.4.-C.
4) Lintels described in Sentence (2) over openings wider than 1 200 mm shall be reinforced for shear with 10M stirrups at a maximum spacing of half the distance from the bottom reinforcing bar to the top of the lintel.

9.20.17.5. Framing Supported on Flat Insulating Concrete Form Walls

1) Floor joists supported on the side of flat insulating concrete form walls shall be supported with joist hangers secured to wood ledger boards.
2) The ledger boards referred to in Sentence (1) shall be not less than
   a) 38 mm thick, and
   b) the depth of the floor joists.
3) Anchor bolts shall be used to secure ledger boards to flat insulating concrete form walls and shall be
   a) embedded in the wall to a depth not less than 100 mm, and
   b) spaced in accordance with Table 9.20.17.5.
4) Floor joists and building frames supported on the top of flat insulating concrete form walls shall be anchored in conformance with Article 9.23.6.1.

9.20.17.6. Anchoring of Roof Framing to the Top of Flat Insulating Concrete Form Walls
1) Roof framing supported on the top of flat insulating concrete form walls shall be fixed to the top plates, which shall be anchored to the wall with anchor bolts
   a) not less than 12.7 mm in diameter, and
   b) spaced at not more than 1200 mm o.c.
2) The anchor bolts described in Sentence (1) shall be placed in the centre of the flat insulating concrete form wall and shall be embedded no less than 100 mm into the concrete.
3) Attachment of roof framing to wood top plates shall be in accordance with Table 9.23.3.4.

9.20.17.7. Protection from Precipitation and Damage
1) Above-ground flat insulating concrete form walls shall be protected from precipitation and damage in conformance with Section 9.27.

Section 9.21. Masonry and Concrete Chimneys and Flues

9.21.1. General

9.21.1.1. Application
1) This Section applies to
   a) rectangular masonry or concrete chimneys not more than 12 m in height serving fireplaces or serving appliances having a combined total rated heat output of 120 kW or less, and
   b) flue pipes connected to such chimneys.
2) Chimneys, other than those described in Sentence (1), gas vents and flue pipes serving gas-, oil- or solid-fuel-burning appliances and their associated equipment, including stoves, cooktops, ovens and space heaters, covered by the standards referenced in Sentences 9.33.5.2.(1) and 9.33.5.3.(1) shall conform to Subsection 9.33.10.
3) Chimneys and flue pipes other than those described in Sentences (1) and (2) shall conform to Section 6.3.

9.21.1.2. Chimney or Flue Pipe Walls
1) The walls of any chimney or flue pipe shall be constructed so as to be smoke- and flame-tight.

9.21.2. Chimney Flues
9.21.2.1. Chimney Flue Limitations

1) A chimney flue that serves a fireplace or incinerator shall not serve any other appliance.

2) A chimney flue that serves a solid-fuel-burning appliance shall not be connected to a natural-gas- or propane-fired appliance.

3) A chimney flue that serves a solid-fuel-burning appliance shall not be connected to an oil-burning appliance unless the solid-fuel-burning appliance is certified for such installation and the installation of both appliances meets the requirements of the relevant standards referenced in Article 9.33.5.2.

9.21.2.2. Connections of More Than One Appliance

1) Except as required by Article 9.21.2.1., where two or more fuel-burning appliances are connected to the same chimney flue, the connections shall be made as described in Sentences (2) to (4) and an adequate draft shall be provided for the connected appliances in conformance with the requirements of applicable provincial or municipal bylaws and regulations or, in the absence of such regulations or bylaws, with the requirements of the relevant standards listed in Subsection 9.33.10.

2) Where 2 or more fuel-burning appliances are connected to the same chimney flue, the appliances shall be located on the same storey.

3) The connection referred to in Sentence (2) for a solid-fuel-burning appliance shall be made below connections for appliances burning other fuels.

4) The connection referred to in Sentence (2) for a liquid-fuel-burning appliance shall be made below any connections for appliances burning natural gas or propane.

9.21.2.3. Inclined Chimney Flues

1) Chimney flues shall not be inclined more than 45° to the vertical.

9.21.2.4. Size of Chimney Flues

1) Except for chimneys serving fireplaces, the size of a chimney flue shall conform to the requirements of the appliance installation standards referenced in Sentences 9.33.5.2.(1) and 9.33.5.3.(1).

2) Where a chimney flue serves only one appliance, the flue area shall be at least equal to that of the flue pipe connected to it.

9.21.2.5. Fireplace Chimneys

1) The size of a chimney flue serving a masonry fireplace shall conform to Table 9.21.2.5.-A or 9.21.2.5.-B.

</table>
9.21.2.6. Oval Chimney Flues
   1) The width of an oval chimney flue shall be not less than two-thirds its breadth.

9.21.3. Chimney Lining

9.21.3.1. Lining Materials
   1) Every masonry or concrete chimney shall have a lining of clay, concrete, firebrick or metal.

9.21.3.2. Joints in Chimney Liners
   1) Joints of chimney liners shall be sealed to provide a barrier to the passage of flue gases and condensate into the cavity between the liner and the surrounding masonry.
   2) Joints of clay, concrete or firebrick chimney liners shall be struck flush to provide a straight, smooth, aligned chimney flue.

9.21.3.3. Clay Liners
   2) Liners referred to in Sentence (1) shall be not less than 15.9 mm thick and shall be capable of resisting, without softening or cracking, a temperature of 1 100°C.

9.21.3.4. Firebrick Liners
   1) Firebrick liners shall conform to ASTM C 27, “Fireclay and High-Alumina Refractory Brick.”
   2) Firebrick liners shall be laid with high temperature cement mortar conforming to CAN/CGSB-10.3, “Air Setting Refractory Mortar.”

9.21.3.5. Concrete Liners
   1) Concrete flue liners shall conform to Clause 4.2.6.4 of CAN/CSA-A405-M, “Design and Construction of Masonry Chimneys and Fireplaces.”

9.21.3.6. Metal Liners
   1) Metal liners shall be constructed of not less than 0.3 mm thick stainless steel.
   2) Metal liners referred to in Sentence (1) shall only be used in chimneys serving gas- or oil-burning appliances. (See Note A-9.21.3.6.(2.).)

9.21.3.7. Installation of Chimney Liners
   1) Chimney liners shall be installed when the surrounding masonry or concrete is placed.

9.21.3.8. Spaces between Liners and Surrounding Masonry
   1) A space not less than 10 mm wide shall be left between a chimney liner and surrounding masonry.
   2) The space required in Sentence (1) shall not be filled with mortar.

9.21.3.9. Mortar for Chimney Liners
   1) Chimney liners used in chimneys for solid-fuel-burning appliances shall be laid in a full bed of a) high temperature cement mortar conforming to CAN/CGSB-10.3, “Air Setting Refractory Mortar,” or b) mortar consisting of 1 part Portland cement to 3 parts sand by volume.
   2) Chimney liners used in chimneys for oil- or gas-burning appliances shall be laid in a full bed of mortar consisting of 1 part Portland cement to 3 parts sand by volume.
9.21.3.10. Extension of Chimney Liners
   1) Chimney liners shall extend from a point not less than 200 mm below the lowest flue pipe connection to a point not less than 50 mm or more than 100 mm above the chimney cap.

9.21.4. Masonry and Concrete Chimney Construction

9.21.4.1. Unit Masonry
   1) Unit masonry shall conform to Section 9.20.

9.21.4.2. Concrete
   1) Concrete shall conform to Section 9.3.

9.21.4.3. Footings
   1) Footings for masonry chimneys and concrete chimneys shall conform to Section 9.15.

9.21.4.4. Height of Chimney Flues
   1) A chimney flue shall extend not less than
      a) 900 mm above the highest point at which the chimney comes in contact with the roof, and
      b) 600 mm above the highest roof surface or structure within 3 m of the chimney.
      (See Note A-9.21.4.4.(1).)

9.21.4.5. Lateral Stability
   1) Except as provided in Sentence (2), chimneys shall be braced in accordance with Subsection 4.3.2. to provide lateral stability under wind loads.
   2) A chimney need not be laterally braced provided
      a) no horizontal outside dimension is less than 400 mm, and
      b) the chimney extends not more than 3.6 m above a roof or the masonry wall of which it forms a part.
      (See Note A-9.21.4.5.(2).)

9.21.4.6. Chimney Caps
   1) The top of a chimney shall have a waterproof cap of reinforced concrete, masonry or metal.
   2) The cap required in Sentence (1) shall slope from the lining and be provided with a drip not less than 25 mm from the chimney wall.
   3) Cast-in-place concrete caps shall be separated from the chimney liner by a bond break and be sealed at that location.
   4) Jointed precast concrete or masonry chimney caps shall have flashing installed beneath the cap extending from the liner to the drip edge.

9.21.4.7. Cleanout
   1) A cleanout opening with a metal frame and a tight-fitting metal door shall be installed near the base of the chimney flue.

9.21.4.8. Wall Thickness
   1) The walls of a masonry chimney shall be built of solid masonry units not less than 75 mm thick.

9.21.4.9. Separation of Flue Liners
   1) Flue liners in the same chimney shall be separated by not less than 75 mm of masonry or concrete exclusive of liners where clay liners are used, or 90 mm of firebrick where firebrick liners are used.
   2) Flue liners referred to in Sentence (1) shall be installed to prevent significant lateral movement.
9.21.4.10. Flashing
1) Junctions with adjacent materials shall be adequately flashed to shed water.

9.21.5. Clearance from Combustible Construction

9.21.5.1. Clearance from Combustible Materials
1) The clearance between masonry or concrete chimneys and combustible framing shall be not less than
   a) 50 mm for interior chimneys, and
   b) 12 mm for exterior chimneys.
(See Note A-9.21.5.1.(1).)
2) A clearance of not less than 150 mm shall be provided between a cleanout opening and combustible material.
3) Combustible flooring and subflooring shall have not less than a 12 mm clearance from masonry or concrete chimneys.

9.21.5.2. Sealing of Spaces
1) All spaces between masonry or concrete chimneys and combustible framing shall be sealed top or bottom with noncombustible material.

9.21.5.3. Support of Joists or Beams
1) Joists or beams may be supported on masonry walls which enclose chimney flues provided the combustible members are separated from the flue by not less than 290 mm of solid masonry.

Section 9.22. Fireplaces

9.22.1. General

9.22.1.1. Application
1) Except when otherwise specifically stated herein, this Section applies to masonry fireplaces constructed on-site.

9.22.1.2. Masonry and Concrete
1) Except as otherwise stated in this Section, unit masonry shall conform to Section 9.20. and concrete to Section 9.3.
2) Masonry above openings shall be supported by steel lintels conforming to Sentence 9.20.5.2.(2), reinforced concrete or a masonry arch.

9.22.1.3. Footings
1) Footings for masonry and concrete fireplaces shall conform to Section 9.15.

9.22.1.4. Combustion Air
1) Where a supply of combustion air is provided directly to the fire chamber of a fireplace, including a factory-built fireplace, the installation shall comply with the “Outdoor Air Supply” requirements provided in CAN/CSA-A405-M, “Design and Construction of Masonry Chimneys and Fireplaces.”

9.22.2. Fireplace Liners

9.22.2.1. Brick or Steel Liners
1) Except where a fireplace is equipped with a steel liner, every fireplace shall have a firebrick liner.
9.22.2.2. Firebrick Liners
   1) Firebrick liners shall be not less than
      a) 50 mm thick for the sides and back, and
      b) 25 mm thick for the floor.
   2) Firebrick liners shall be laid with high temperature cement mortar conforming to CAN/CGSB-10.3, “Air Setting Refractory Mortar.”
   3) Joints between a firebrick liner and the adjacent backing masonry shall be offset.

9.22.2.3. Steel Liners
   1) Steel liners for fireplaces shall conform to CAN/ULC-S639-M, “Steel Liner Assemblies for Solid-Fuel Burning Masonry Fireplaces,” and shall be installed in accordance with the installation instructions in that standard.

9.22.3. Fireplace Walls

9.22.3.1. Thickness of Walls
   1) Except as provided in Sentence (2), the thickness of the back and sides of a fireplace, including the thickness of any firebrick liner, shall be not less than 190 mm where a metal liner or a firebrick liner less than 51 mm thick is used.
   2) When a steel fireplace liner is used with an air circulating chamber surrounding the firebox, the back and sides of the fireplace shall consist of
      a) solid masonry units not less than 90 mm thick, or
      b) hollow masonry units not less than 190 mm thick.

9.22.4. Fire Chamber

9.22.4.1. Fire Chamber Dimensions
   1) The distance from the back of the fire chamber to the plane of the fireplace opening shall be not less than 300 mm.

9.22.5. Hearth

9.22.5.1. Hearth Extension
   1) Except as required in Sentence (2), fireplaces shall have a noncombustible hearth extending not less than 400 mm in front of the fireplace opening and not less than 200 mm beyond each side of the fireplace opening.
   2) Where the fire chamber floor is elevated more than 150 mm above the hearth, the dimension of the hearth measured perpendicular to the plane of the fireplace opening shall be increased by not less than
      a) 50 mm for an elevation above 150 mm and not more than 300 mm, and
      b) an additional 25 mm for every 50 mm in elevation above 300 mm.

9.22.5.2. Support of Hearth
   1) Except as permitted in Sentence (2), the fire chamber floor and hearth shall be supported on a reinforced concrete slab not less than 100 mm thick at its supports and, if cantilevered, not less than 50 mm thick at its unsupported edge.
   2) A hearth for a fireplace with an opening raised not less than 200 mm from a combustible floor is permitted to be supported on that floor provided the requirements of Clauses 5.3.6.5. to 5.3.6.7. of CAN/CSA-A405-M, “Design and Construction of Masonry Chimneys and Fireplaces,” are followed.

9.22.6. Damper
9.22.6.1. Required Damper and Size
   1) The throat of every fireplace shall be equipped with a metal damper sufficiently large to cover the full area of the throat opening.

9.22.7. Smoke Chamber

9.22.7.1. Slope of Smoke Chamber
   1) The sides of the smoke chamber connecting a fireplace throat with a flue shall not be sloped at an angle greater than 45° to the vertical.

9.22.7.2. Wall Thickness
   1) The thickness of masonry walls surrounding the smoke chamber shall be not less than 190 mm at the sides, front and back, except that the portions of the back exposed to the outside may be 140 mm thick.

9.22.8. Factory-Built Fireplaces

9.22.8.1. Conformance to Standard
   1) Factory-built fireplaces and their installation shall conform to CAN/ULC-S610-M, “Factory-Built Fireplaces.”

9.22.9. Clearance of Combustible Material

9.22.9.1. Clearance to the Fireplace Opening
   1) Combustible material shall not be placed on or near the face of a fireplace within 150 mm of the fireplace opening, except that where the combustible material projects more than 38 mm out from the face of the fireplace above the opening, such material shall be not less than 300 mm above the top of the opening.

9.22.9.2. Metal Exposed to the Interior
   1) Metal exposed to the interior of a fireplace such as the damper control mechanism shall have not less than a 50 mm clearance from any combustible material on the face of the fireplace where such metal penetrates through the face of the fireplace.

9.22.9.3. Clearance to Combustible Framing
   1) Not less than a 100 mm clearance shall be provided between the back and sides of a fireplace and combustible framing, except that a 50 mm clearance is permitted where the fireplace is located in an exterior wall.
   2) Not less than a 50 mm clearance shall be provided between the back and sides of the smoke chamber of a fireplace and combustible framing, except that a 25 mm clearance is permitted where the fireplace is located in an exterior wall.

9.22.9.4. Heat-Circulating Duct Outlets
   1) The clearance of combustible material above heat-circulating duct outlets from those outlets shall be not less than
      a) 300 mm where the combustible material projects not less than 38 mm from the face, and
      b) 150 mm where the projection is less than 38 mm.

9.22.10. Fireplace Inserts and Hearth-Mounted Stoves

9.22.10.1. Appliance Standard
   1) Fireplace inserts and hearth-mounted stoves vented through the throat of a fireplace shall conform to ULC-S628, “Fireplace Inserts.”
**Section 9.23. Wood-Frame Construction**

**9.23.1. Application**

**9.23.1.1. Limitations**

(See Note A-9.23.1.1.) (See also Note A-9.4.2.1.(1.).)

1) This Section applies to constructions where wall, floor and roof planes are generally comprised of lumber frames of small repetitive structural members, or engineered components, and where:
   a) roof and wall planes are clad, sheathed or braced on at least one side,
   b) the small repetitive structural members are spaced not more than 600 mm o.c.,
   c) the constructions do not serve as foundations,
   d) the specified live load on supported subfloors and floor framing does not exceed 2.4 kPa, and
   e) the span of any structural member does not exceed 12.20 m.

(See Note A-9.23.1.1.(1.).)

2) Where the conditions in Sentence (1) are exceeded for wood constructions, the design of the framing and fastening shall conform to Subsection 4.3.1.

**9.23.2. General**

**9.23.2.1. Strength and Rigidity**

1) All members shall be so framed, anchored, fastened, tied and braced to provide the necessary strength and rigidity.

**9.23.2.2. Protection from Decay**

1) Ends of wood joists, beams and other members framing into masonry or concrete shall be treated to prevent decay where the bottom of the member is at or below ground level, or a 12 mm air space shall be provided at the end and sides of the member.

2) Air spaces required in Sentence (1) shall not be blocked by insulation, vapour barriers or airtight materials.

**9.23.2.3. Protection from Dampness**

1) Except as permitted in Sentence (2), wood framing members that are not pressure-treated with a wood preservative and that are supported on concrete in contact with the ground or fill shall be separated from the concrete by not less than 0.05 mm polyethylene film or Type S roll roofing.

2) Dampproofing material referred to in Sentence (1) is not required where the wood member is at least 150 mm above the ground.

**9.23.2.4. Lumber**

1) Lumber shall conform to Subsection 9.3.2.

**9.23.3. Fasteners**

**9.23.3.1. Standards for Nails and Screws**

1) Except as provided in Sentence (2) and unless otherwise indicated, nails specified in this Section shall be common steel wire nails or common spiral nails conforming to...
a) ASTM F 1667, “Driven Fasteners: Nails, Spikes, and Staples,” or
b) CSA B111, “Wire Nails, Spikes and Staples.”

2) Nails used to comply with Table 9.23.3.4. shall have a diameter not less than that stated in Table 9.23.3.1. (See Note A-9.23.3.1.(2).)

### Table 9.23.3.1.

</tbody>
</table>

3) Wood screws specified in this Section shall conform to ASME B18.6.1, “Wood Screws (Inch Series).” (See Note A-9.23.3.1.(3).)

### 9.23.3.2. Length of Nails
1) All nails shall be long enough so that not less than half their required length penetrates into the second member.

### 9.23.3.3. Prevention of Splitting
1) Splitting of wood members shall be minimized by staggering the nails in the direction of the grain and by keeping nails well in from the edges. (See Note A-9.23.3.3.(1).)

### 9.23.3.4. Nailing of Framing
1) Except as provided in Sentence (2), nailing of framing shall conform to Table 9.23.3.4.
2) Where the bottom wall plate or sole plate of an exterior wall is not nailed to floor joists, *rim joists* or blocking in conformance with Table 9.23.3.4., the exterior wall is permitted to be fastened to the floor framing by
   a) having plywood, OSB or waferboard sheathing extend down over floor framing and fastened to the floor framing by nails or staples conforming to Article 9.23.3.5., or
   b) tying the wall framing to the floor framing by galvanized-metal strips
      i) 50 mm wide,
      ii) not less than 0.41 mm thick,
      iii) spaced not more than 1.2 m apart, and
      iv) fastened at each end with at least two 63 mm nails.

### Division B: Acceptable Solutions

#### Part 9 – Housing and Small Buildings

| Required braced wall panels – in interior walls – to framing above and below | 82 | 150 mm o.c. |
| Horizontal member over openings in non-loadbearing walls – each end | 82 | 2 |
| Lintels to studs | 82 | 2 at each end |
| Ceiling joist to plate – toe nail each end | 82 | 2 |
| Roof rafter, roof truss or roof joist to plate – toe nail(3) | 82 | 3 |
| Rafter plate to each ceiling joist | 101 | 2 |
| Rafter to joist (with ridge supported) | 76 | 3 |
| Rafter to joist (with ridge unsupported) | 76 | see Table 9.23.14.8. |
| Gusset plate to each rafter at peak | 57 | 4 |
| Rafter to ridge board – toe nail – end nail | 82 | 3 |
| Collar tie to rafter – each end | 76 | 3 |
| Collar tie lateral support to each collar tie | 57 | 2 |
| Jack rafter to hip or valley rafter | 82 | 2 |
| Roof strut to rafter | 76 | 3 |
| Roof strut to loadbearing wall – toe nail | 82 | 2 |
| 38 mm × 140 mm or less plank decking to support | 82 | 2 |
| Plank decking wider than 38 mm × 140 mm to support | 82 | 3 |
| 38 mm edge laid plank decking to support (toe nail) | 76 | 1 |
| 38 mm edge laid plank to each other | 76 | 450 mm o.c. |

**Notes to Table 9.23.3.4.**:

1. See Article 9.23.11.4. for requirements on the nailing of top plates in braced wall bands.
2. See Sentence 9.23.3.4.(2).
3. See Sentence 9.23.3.4.(3).
4. Where the 1-in-50 hourly wind pressure is equal to or greater than 0.8 kPa, roof rafters, joists or trusses shall be tied to the wall framing with connectors that will resist a factored uplift load of 3 kN.
5. Galvanized-steel straps are deemed to comply with Sentence (3), provided they are
   a) 50 mm wide,
   b) not less than 0.91 mm thick, and
   c) fastened at each end with at least four 63 mm nails.

#### 9.23.3.5. Fasteners for Sheathing or Subflooring
1) Except as provided in Sentences (2) to (4), fastening of sheathing and subflooring shall conform to Table 9.23.3.5.-A.

### Table 9.23.3.5.-A

Fasteners for Subflooring and for Sheathing where the 1-in-50 HWP < 0.8 kPa and \( S_a(0.2) \leq 0.70 \)

Forming Part of Sentence 9.23.3.5.(1)

<table>
<thead>
<tr>

<td>51</td>
</tr>
<tr>
<td>Plywood, OSB or waferboard over 20 mm and up to 25 mm thick</td>
<td>57</td>
</tr>
</tbody>
</table>

2) Fastening of roof sheathing and sheathing in required braced wall panels shall conform to Table 9.23.3.5.-B, where

- a) the 1-in-50 hourly wind pressure (HWP) is equal to or greater than 0.8 kPa and less than 1.2 kPa and the seismic spectral response acceleration, \( S_a(0.2) \), is not more than 0.90, or
- b) the seismic spectral response acceleration, \( S_a(0.2) \), is greater than 0.70 and not more than 0.90.
### Table 9.23.3.5.-B

Fasteners for Sheathing where $0.8 \text{ kPa} \leq 1\text{-in-50 HWP} < 1.2 \text{ kPa}$ and $S_a(0.2) \leq 0.90$ or where $0.70 < S_a(0.2) \leq 0.90$

<td>57</td>
</tr>
</tbody>
</table>

**Notes to Table 9.23.3.5.-B:**

1. See Note A-Table 9.23.3.5.-B.

3) Fastening of roof sheathing and sheathing in required braced wall panels shall conform to Table 9.23.3.5.-C, where

   a) the 1-in-50 hourly wind pressure (HWP) is equal to or greater than 0.8 kPa and less than 1.2 kPa and the spectral response acceleration, $S_a(0.2)$, is not more than 1.8, or
   b) the seismic spectral response acceleration, $S_a(0.2)$, is greater than 0.90 and not more than 1.8.
### Table 9.23.3.5-C

**Fasteners for Sheathing where 0.8 kPa ≤ 1-in-50 HWP < 1.2 kPa and Sₐ(0.2) ≤ 1.8 or where 0.90 < Sₐ(0.2) ≤ 1.8**

<td>57</td>
</tr>
</tbody>
</table>

**Notes to Table 9.23.3.5-C:**

(1) See Note A-Table 9.23.3.5.-B.

---

4) Fastening of sheathing shall conform to Part 4,
   a) where the 1-in-50 hourly wind pressure is equal to or greater than 1.2 kPa, or
   b) for required braced wall panels, where the seismic spectral response acceleration, Sₐ(0.2), is greater than 1.8.

5) Staples shall not be less than 1.6 mm in diameter or thickness, with not less than a 9.5 mm crown driven with the crown parallel to framing.

6) Roofing nails for the attachment of fibreboard or gypsum sheathing shall not be less than 3.2 mm in diameter with a minimum head diameter of 11.1 mm.

7) Flooring screws shall not be less than 3.2 mm in diameter.

8) The edges of sheathing in a braced wall panel shall be supported and fastened to wood blocking where
   a) the seismic spectral response acceleration, Sₐ(0.2), is greater than 1.2, or
   b) the braced wall panel supports more than a roof of lightweight construction.

---

### 9.23.4. Maximum Spans

#### 9.23.4.1. Application

1) Spans provided in this Subsection for joists, beams and lintels supporting floors shall apply only where
   a) the floors serve residential areas as described in Table 4.1.5.3., or
   b) the uniformly distributed live load on the floors does not exceed that specified for residential areas as described in Table 4.1.5.3.

2) Spans for joists, beams and lintels supporting floors shall be determined according to Subsection 4.1.3. where the supported floors
   a) serve other than residential areas, or
   b) support a uniform live load in excess of that specified for residential areas.
9.23.4.2. Spans for Joists, Rafters and Beams
(See Note A-9.23.4.2.)
1) Except as required in Sentence (2) and Article 9.23.14.10., spans for wood joists and rafters shall conform to the spans shown in Span Tables 9.23.4.2.-A to 9.23.4.2.-G for the uniform live loads shown in the Tables. (See Article 9.4.2.2.)
2) Spans for floor joists that are not selected from Span Tables 9.23.4.2.-A and 9.23.4.2.-B and that are required to be designed for the same loading conditions, shall not exceed the design requirements for uniform loading and vibration criteria. (See Note A-9.23.4.2.(2).)
3) Spans for built-up wood and glued-laminated timber floor beams shall conform to the spans in Span Tables 9.23.4.2.-H to 9.23.4.2.-K. (See Article 9.4.2.2.)
4) Spans for roof ridge beams shall conform to the spans in Span Table 9.23.4.2.-L for the uniform snow load shown. (See Articles 9.4.2.2. and 9.23.14.8.)

9.23.4.3. Steel Beams
1) The spans for steel floor beams with laterally supported top flanges shall conform to Table 9.23.4.3. (See Note A-9.23.4.3.(1).)
2) Beams described in Sentence (1) shall at least meet the requirements for Grade 350 W steel contained in CSA G40.21, “Structural Quality Steel.”

9.23.4.4. Concrete Topping
(See Note A-9.23.4.4.)
1) Except as permitted in Sentence (2), where a floor is required to support a concrete topping, the joist spans shown in Span Table 9.23.4.2.-A or the spacing of the members shall be reduced to allow for the loads due to the topping.

2) Where a floor is required to support a concrete topping, joist spans are permitted to be selected from Span Table 9.23.4.2.-B provided the concrete
   a) is 38 to 51 mm thick,
   b) is normal weight,
   c) is placed directly on the subflooring, and
   d) has not less than 20 MPa compressive strength after 28 days.

3) Where a floor is required to support a concrete topping not more than 51 mm thick, the allowable beam spans shown in Span Tables 9.23.4.2.-H to 9.23.4.2.-K shall be multiplied by 0.8 or the supported length of the floor joists shall be reduced to allow for the loads due to the topping.

9.23.4.5. Heavy Roofing Materials
1) Where a roof is required to support an additional uniform dead load from roofing materials such as concrete roofing tile, or materials other than as specified in Section 9.27., such as clay roofing tiles, the additional load shall be allowed for by reducing
   a) the spans for roof joists and rafters in Span Tables 9.23.4.2.-D to 9.23.4.2.-G, or the spacing of the members, and
   b) the spans for ridge beams and lintels in Span Tables 9.23.4.2.-L and 9.23.12.3.-A to 9.23.12.3.-D.

(See Note A-9.23.4.2.)

9.23.5. Notching and Drilling

9.23.5.1. Holes Drilled in Framing Members
1) Holes drilled in roof, floor or ceiling framing members shall be not larger than one-quarter the depth of the member and shall be located not less than 50 mm from the edges, unless the depth of the member is increased by the size of the hole.
9.23.5.2. Notching of Framing Members
1) Floor, roof and ceiling framing members are permitted to be notched provided the notch is located on the top of the member within half the joist depth from the edge of bearing and is not deeper than one-third the joist depth, unless the depth of the member is increased by the size of the notch.

9.23.5.3. Wall Studs
1) Wall studs shall not be notched, drilled or otherwise damaged so that the undamaged portion of the stud is less than two-thirds the depth of the stud if the stud is loadbearing or 40 mm if the stud is non-loadbearing, unless the weakened studs are suitably reinforced.

9.23.5.4. Top Plates
1) Top plates in walls shall not be notched, drilled or otherwise weakened to reduce the undamaged width to less than 50 mm unless the weakened plates are suitably reinforced.

9.23.5.5. Roof Trusses
1) Roof truss members shall not be notched, drilled or otherwise weakened unless such notching or drilling is allowed for in the design of the truss.

9.23.6. Anchorage

9.23.6.1. Anchorage of Building Frames
1) Except as required by Sentence 9.23.6.3.(1), building frames shall be anchored to the foundation unless a structural analysis of wind and earthquake pressures shows anchorage is not required.
2) Except as provided in Sentences (3) to (6), anchorage shall be provided by
   a) embedding the ends of the first floor joists in concrete, or
   b) fastening the sill plate to the foundation with not less than 12.7 mm diam anchor bolts spaced not more than 2.4 m o.c.
3) For buildings with 2 or more floors supported by frame walls that are in areas where the seismic spectral response acceleration, $S_a(0.2)$, is not greater than 0.70 or the 1-in-50 hourly wind pressure (HWP) is equal to or greater than 0.80 kPa but not greater than 1.20 kPa, anchorage shall be provided by fastening the sill plate to the foundation with not less than two anchor bolts per braced wall panel, where all anchor bolts used are
   a) not less than 15.9 mm in diameter, located within 0.5 m of the end of the foundation, and spaced not more than 2.4 m o.c, or
   b) not less than 12.7 mm in diameter, located within 0.5 m of the end of the foundation, and spaced not more than 1.7 m o.c.
4) For buildings supported by frame walls that are in areas where the seismic spectral response acceleration, $S_a(0.2)$, is greater than 0.70 but not greater than 1.8 and the 1-in-50 hourly wind pressure (HWP) is not greater than 1.20 kPa, anchorage shall be provided by fastening the sill plate to the foundation with not less than two anchor bolts per braced wall panel located within 0.5 m of the end of the foundation and spaced in accordance with Table 9.23.6.1.
**Table 9.23.6.1.**

</table>
Notes to Table 9.23.6.1.:
(1) See Note A-9.23.13.2.(1)(a)(i).
(2) All constructions include support of a roof load in addition to the indicated number of floors.

5) Anchor bolts referred to in Sentences (2) to (4) shall be
   a) fastened to the sill plate with nuts and washers,
   b) embedded not less than 100 mm in the foundation, and
   c) so designed that they may be tightened without withdrawing them from the foundation.

6) Where the seismic spectral response acceleration, $S_a(0.2)$, is greater than 1.8 or the 1-in-50 hourly wind pressure is equal to or greater than 1.2 kPa, anchorage shall be designed according to Part 4.

9.23.6.2. Anchorage of Columns and Posts

1) Except as provided in Sentences (2) and (3), exterior columns and posts shall be anchored to resist uplift and lateral movement.

2) Except as provided in Sentence (3), where columns or posts support balconies, decks, verandas or other exterior platforms, and the distance from finished ground to the underside of the joists is not more than 600 mm,
   a) the columns or posts shall be anchored to the foundation to resist uplift and lateral movement, or
   b) the supported joists or beams shall be directly anchored to the ground to resist uplift.

3) Anchorage is not required for platforms described in Sentence (2) that
   a) are not more than 1 storey in height,
   b) are not more than 55 m² in area,
   c) do not support a roof, and
   d) are not attached to another structure, unless it can be demonstrated that differential movement will not adversely affect the performance of the structure to which the platform is attached.

9.23.6.3. Anchorage of Smaller Buildings

1) Buildings not more than 4.3 m wide and not more than 1 storey in building height that are not anchored in accordance with Sentence 9.23.6.1.(1) shall be anchored in conformance with the requirements of CSA Z240.10.1, “Site Preparation, Foundation, and Anchorage of Manufactured Homes.”

9.23.7. Sill Plates

9.23.7.1. Size of Sill Plates

1) Where sill plates provide bearing for the floor system, they shall be not less than 38 mm by 89 mm material.

9.23.7.2. Levelling and Sealing of Sill Plates

1) Sill plates shall be
   a) levelled by setting them on a full bed of mortar, or
   b) laid directly on the foundation if the top of the foundation is level.

(See also Article 9.23.2.3.)

2) The joint between the sill plate for exterior walls and the foundation shall be sealed in accordance with Subsection 9.25.3.

9.23.8. Beams to Support Floors

9.23.8.1. Bearing for Beams

1) Beams shall have even and level bearing and the bearing at end supports shall be not less than 89 mm long, except as stated in the notes to Span Tables 9.23.4.2.-H to 9.23.4.2.-K.
9.23.8.2. Priming of Steel Beams
   1) Exterior steel beams shall be shop primed.

9.23.8.3. Built-up Wood Beams
   (See Note A-9.23.8.3.)
   1) Where a beam is made up of individual pieces of lumber that are nailed together, the individual members shall be 38 mm or greater in thickness and installed on edge.
   2) Except as permitted in Sentence (3), where individual members of a built-up beam are butted together to form a joint, the joint shall occur over a support.
   3) Where a beam is continuous over more than one span, individual members are permitted to be butted together to form a joint at or within 150 mm of the end quarter points of the clear spans, provided the quarter points are not those closest to the ends of the beam.
   4) Members joined at quarter points shall be continuous over adjacent supports.
   5) Joints in individual members of a beam that are located at or near the end quarter points shall not occur in adjacent members at the same quarter point and shall not reduce the effective beam width by more than half.
   6) Not more than one butt joint shall occur in any individual member of a built-up beam within any one span.
   7) Except as provided in Sentence (8), where 38 mm members are laid on edge to form a built-up beam, individual members shall be nailed together with a double row of nails not less than 89 mm in length, spaced not more than 450 mm apart in each row with the end nails located 100 mm to 150 mm from the end of each piece.
   8) Where 38 mm members in built-up wood beams are not nailed together as provided in Sentence (7), they shall be bolted together with not less than 12.7 mm diam bolts equipped with washers and spaced not more than 1.2 m o.c., with the end bolts located not more than 600 mm from the ends of the members.

9.23.9. Floor Joists

9.23.9.1. End Bearing for Joists
   1) Except when supported on ribbon boards, floor joists shall have not less than 38 mm length of end bearing.
   2) Ribbon boards referred to in Sentence (1) shall be not less than 19 mm by 89 mm lumber let into the studs.

9.23.9.2. Joists Supported by Beams
   1) Floor joists may be supported on the tops of beams or may be framed into the sides of beams.
   2) When framed into the side of a wood beam, joists referred to in Sentence (1) shall be supported on
      a) joist hangers or other acceptable mechanical connectors, or
      b) not less than 38 mm by 64 mm ledger strips nailed to the side of the beam, except that 38 mm by 38 mm ledger strips may be used provided each joist is nailed to the beam by not less than four 89 mm nails, in addition to the nailing for the ledger strip required in Table 9.23.3.4.
   3) When framed into the side of a steel beam, joists referred to in Sentence (1) shall be supported on the bottom flange of the beam or on not less than 38 mm by 38 mm lumber bolted to the web with not less than 6.3 mm diam bolts spaced not more than 600 mm apart.
   4) Joists referred to in Sentence (3) shall be spliced above the beam with not less than 38 mm by 38 mm lumber at least 600 mm long to support the flooring.
   5) Not less than a 12 mm space shall be provided between the splice required in Sentence (4) and the beam to allow for shrinkage of the wood joists.
9.23.9.3. Restraint of Joist Bottoms
1) Except as provided in Sentence 9.23.9.4.(1), bottoms of floor joists shall be restrained from twisting at each end by toe-nailing to the supports, end-nailing to the header joists or by providing continuous strapping, blocking between the joists or cross-bridging near the supports.

9.23.9.4. Strapping, Bridging, Furring and Ceilings in Span Tables 9.23.4.2.-A and -B
   (See Note A-9.23.4.2.(2).)
   1) Except as permitted by Sentence (5), where strapping is specified in Span Table 9.23.4.2.-A, it shall be
      a) not less than 19 mm by 64 mm, nailed to the underside of floor joists,
      b) located not more than 2 100 mm from each support or other rows of strapping, and
      c) fastened at each end to a sill or header.
   2) Where bridging is specified in Span Table 9.23.4.2.-A, it shall consist of not less than 19 mm by 64 mm or 38 mm by 38 mm cross bridging located not more than 2 100 mm from each support or other rows of bridging.
   3) Where bridging and strapping are specified in Span Table 9.23.4.2.-A,
      a) bridging shall
         i) comply with Sentence (2), or
         ii) consist of 38 mm solid blocking located not more than 2 100 mm from each support or other rows of bridging and
      b) except as provided in Sentence (5), strapping shall comply with Sentence (1) and be installed under the bridging.
   4) Bridging specified in Span Table 9.23.4.2.-B shall consist of
      a) bridging as described in Sentence (2), or
      b) 38 mm solid blocking located not more than 2 100 mm from each support or other rows of bridging and securely fastened between the joists.
   5) Strapping described in Sentence (1) and Clause (3)(b) is not required where
      a) furring strips complying with Table 9.29.3.1. are fastened directly to the joists, or
      b) a panel-type ceiling finish complying with Subsection 9.29.5., 9.29.6., 9.29.7., 9.29.8., or 9.29.9. is attached directly to the joists.
   6) Where a ceiling attached to wood furring is specified in Span Table 9.23.4.2.-B,
      a) the ceiling finish shall consist of gypsum board, plywood or OSB not less than 12.7 mm thick, and
      b) the furring shall be
         i) 19 mm by 89 mm wood furring spaced at not more than 600 mm o.c., or
         ii) 19 mm by 64 mm wood furring spaced at not more than 400 mm o.c.

9.23.9.5. Header Joists
1) Header joists around floor openings shall be doubled when they exceed 1.2 m in length.
2) The size of header joists exceeding 3.2 m in length shall be determined by calculations.

9.23.9.6. Trimmer Joists
1) Trimmer joists around floor openings shall be doubled when the length of the header joist exceeds 800 mm.
2) When the header joist exceeds 2 m in length the size of the trimmer joists shall be determined by calculations.

9.23.9.7. Support of Tail and Header Joists
1) When tail joists and header joists are supported by the floor framing, they shall be supported by suitable joist hangers or nailing in accordance with Table 9.23.3.4.
9.23.9.8. Support of Walls
1) Non-loadbearing walls parallel to the floor joists shall be supported by joists beneath the wall or on blocking between the joists.
2) Blocking referred to in Sentence (1) for the support of non-loadbearing walls shall be
   a) not less than 38 mm by 89 mm lumber, and
   b) except as required for the fastening of walls constructed with required braced wall panels, spaced not more than 1.2 m apart.
3) Except as provided in Sentence (6), non-loadbearing interior walls at right angles to the floor joists are not restricted as to location.
4) Loadbearing interior walls parallel to floor joists shall be supported by beams or walls of sufficient strength to safely transfer the specified live loads to the vertical supports.
5) Unless the joist size is designed to support such loads, loadbearing interior walls at right angles to floor joists shall be located
   a) not more than 900 mm from the joist support where the wall does not support a floor, and
   b) not more than 600 mm from the joist support where the wall supports one or more floors.
6) Loadbearing and non-loadbearing walls constructed with required braced wall panels shall be continuously supported by floor joists, blocking or rim joists to allow for the required fastening (See Table 9.23.3.4.).

9.23.9.9. Cantilevered Floor Joists
1) Floor joists supporting roof loads shall not be cantilevered more than 400 mm beyond their supports where 38 mm by 184 mm joists are used and not more than 600 mm beyond their supports where 38 mm by 235 mm or larger joists are used.
2) The cantilevered portions referred to in Sentence (1) shall not support floor loads from other storeys unless calculations are provided to show that the design resistances of the cantilevered joists are not exceeded.
3) Where cantilevered floor joists described in Sentences (1) and (2) are at right angles to the main floor joists, the tail joists in the cantilevered portion shall extend inward away from the cantilever support a distance equal to not less than 6 times the length of the cantilever, and shall be end nailed to an interior doubled header joist in conformance with Table 9.23.3.4.

9.23.10. Wall Studs

9.23.10.1. Stud Size and Spacing
1) The size and spacing of studs shall conform to Table 9.23.10.1.

**Notes to Table 9.23.10.1:**

1. See Note A-9.4.2.1.(1).
2. See Article 9.23.10.3.

### 9.23.10.2. Bracing and Lateral Support

1. Where loadbearing interior walls are not finished in accordance with Section 9.29., blocking or strapping shall be fastened to the studs at mid-height to prevent sideways buckling.

### 9.23.10.3. Orientation of Studs

1. Except as permitted in Sentences (2) and (3), all studs shall be placed at right angles to the wall face.
2. Studs on the flat are permitted to be used in gable ends of roofs that contain only unfinished space or in non-loadbearing interior walls within the limits described in Article 9.23.10.1.
3. Wall studs that support only a load from an attic not accessible by a stairway are permitted to be placed on the flat within the limits permitted in Article 9.23.10.1. provided
Division B: Acceptable Solutions  
Part 9 – Housing and Small Buildings

a) the studs are clad on not less than one side with plywood, OSB or waferboard sheathing fastened to the face of the studs with a structural adhesive, and
b) the portion of the roof supported by the studs does not exceed 2.1 m in width.

9.23.10.4. Continuity of Studs

1) Wall studs shall be continuous for the full storey height except at openings and shall not be spliced except by fingerjoining with a structural adhesive. (See Note A-9.23.10.4.(1).)

9.23.10.5. Support for Cladding, Sheathing and Finishing Materials

1) Corners and intersections shall be designed to provide adequate support for the vertical edges of interior finishes, sheathing and cladding materials, and in no instance shall exterior corners be framed with less than the equivalent of 2 studs.

2) Where the vertical edges of interior finishes at wall intersections are supported at vertical intervals by blocking or furring, the vertical distance between such supports shall not exceed the maximum distance between supports specified in Section 9.29.

9.23.10.6. Studs at Sides of Openings

1) Where the lintel spanning the opening is more than 3 m long, studs shall be tripled on each side of the opening so that
   a) the two inner studs on each side extend from the bottom of the supported lintel to the top of the bottom wall plate, and
   b) the outer stud on each side extends from the bottom of the top wall plate to the bottom wall plate.

2) Except as provided in Sentence (3), where the lintel spanning the opening is not more than 3 m long, studs shall be doubled on each side of the opening so that
   a) the inner studs on each side extend from the bottom of the supported lintel to the top of the bottom wall plate, and
   b) the outer stud on each side extends from the bottom of the top wall plate to the bottom wall plate.

3) Single studs are permitted to be used on either side of openings
   a) in non-loadbearing interior walls not required to have fire-resistance ratings, provided the studs extend from the top wall plate to the bottom wall plate, or
   b) in loadbearing or non-loadbearing interior or exterior walls, provided
      i) the opening is less than and within the required stud spacing, and
      ii) no 2 such openings of full stud-space width are located in adjacent stud spaces.

   (See Note A-9.23.10.6.(3).)

9.23.11. Wall Plates

9.23.11.1. Size of Wall Plates

1) Except as provided in Sentence (2), wall plates shall be
   a) not less than 38 mm thick, and
   b) not less than the required width of the wall studs.

2) In non-loadbearing walls and in loadbearing walls where the studs are located directly over framing members, the bottom wall plate is permitted to be 19 mm thick.

9.23.11.2. Bottom Wall Plates

1) A bottom wall plate shall be provided in all cases.

2) The bottom plate in exterior walls shall not project more than one-third the plate width over the support.
9.23.11.3. Top Plates

1) Except as permitted in Sentences (2) to (4), at least 2 top plates shall be provided in loadbearing walls.
2) A single top plate is permitted to be used in a section of a loadbearing wall containing a lintel provided the top plate forms a tie across the lintel.
3) A single top plate is permitted to be used in loadbearing walls where the concentrated loads from ceilings, floors and roofs are not more than 50 mm to one side of the supporting studs and in all non-loadbearing walls.
4) The top plates need not be provided in a section of loadbearing wall containing a lintel provided the lintel is tied to the adjacent wall section with not less than:
   a) 75 mm by 150 mm by 0.91 mm thick galvanized steel, or
   b) 19 mm by 89 mm by 300 mm wood splice nailed to each wall section with at least three 63 mm nails.

9.23.11.4. Joints in Top Plates

1) Joints in the top plates of loadbearing walls shall be staggered not less than one stud spacing.
2) The top plates in loadbearing walls shall be lapped or otherwise tied at corners and intersecting walls in accordance with Sentence (4).
3) Joints in single top plates used with loadbearing walls shall be tied in accordance with Sentence (4).
4) Ties referred to in Sentences (2) and (3) shall be the equivalent of not less than 75 mm by 150 mm by 0.91 mm thick galvanized steel nailed to each wall with at least three 63 mm nails.
5) Where the seismic spectral response acceleration, $S_a(0.2)$, is greater than 0.70 but not more than 1.8, doubled top plates in braced wall bands shall be fastened on each side of a splice with 76 mm long common steel wire nails or spiral nails in accordance with Table 9.23.11.4.

Notes to Table 9.23.11.4.:
2. All constructions include support of a roof load in addition to the number of floors indicated.

9.23.12. Framing over Openings

9.23.12.1. Openings in Non-Loadbearing Walls
1) Except as provided in Sentence (2), openings in non-loadbearing walls shall be framed with not less than 38 mm material the same width as the studs, securely nailed to adjacent studs.
2) Openings for doors in non-loadbearing walls required to be fire separations with a fire-resistance rating shall be framed with the equivalent of at least two 38 mm thick members that are the same width as the wall plates.

9.23.12.2. Openings in Loadbearing Walls
1) Openings in loadbearing walls greater than the required stud spacing shall be framed with lintels designed to carry the superimposed loads to adjacent studs. (See Note A-9.23.10.6.(3).)
2) Except as provided in Sentence 9.23.12.3.(2), where 2 or more members are used in lintels, they shall be fastened together with not less than 82 mm nails in a double row, with nails not more than 450 mm apart in each row.
3) Lintel members are permitted to be separated by filler pieces.

9.23.12.3. Lintel Spans and Sizes
1) Spans and sizes of wood lintels shall conform to the spans shown in Span Tables 9.23.4.2.-L and 9.23.12.3.-A to 9.23.12.3.-D
   a) for buildings of residential occupancy,
   b) where the wall studs exceed 38 mm by 64 mm in size,
   c) where the spans of supported joists do not exceed 4.9 m, and
   d) where the spans of trusses do not exceed 9.8 m.
2) In loadbearing exterior and interior walls of 38 mm by 64 mm framing members, lintels shall consist of:
   a) 64 mm thick members on edge, or
   b) 38 mm thick and 19 mm thick members fastened together with a double row of nails not less than 63 mm long and spaced not more than 450 mm apart.
3) Lintels referred to in Sentence (2)
   a) shall be not less than 50 mm greater in depth than those shown in Span Tables 9.23.4.2.-L and 9.23.12.3.-A to 9.23.12.3.-D for the maximum spans shown, and
   b) shall not exceed 2.24 m in length.

9.23.13. Bracing to Resist Lateral Loads Due to Wind and Earthquake
(See Note A-9.23.13.)

9.23.13.1. Requirements for Low to Moderate Wind and Seismic Forces
(See Note A-9.23.13.1.)
1) This Article applies in locations where the seismic spectral response acceleration, $S_a(0.2)$, is not more than 0.70 and the 1-in-50 hourly wind pressure is less than 0.80 kPa.
2) Bracing to resist lateral loads shall be designed and constructed as follows:
   a) exterior walls shall be
      i) clad with panel-type cladding in accordance with Section 9.27.,
ii) sheathed with plywood, OSB, waferboard, fibreboard, gypsum board or diagonal lumber sheathing complying with Subsection 9.23.167. and fastened in accordance with Table 9.23.3.5.-A, or

iii) finished on the interior with a panel-type material in accordance with the requirements of Section 9.29., or

b) in accordance with

i) Articles 9.23.13.4. to 9.23.13.7.,

ii) Part 4, or

iii) good engineering practice such as that provided in CWC 2014, “Engineering Guide for Wood Frame Construction.”

9.23.13.2. Requirements for High Wind and Seismic Forces

1) Except as provided in Article 9.23.13.1., this Article applies in locations where

a) the seismic spectral response acceleration, Sa(0.2), is greater than 0.70 but not more than 1.8 and

i) the lowest exterior frame wall supports not more than 1 floor in buildings of heavy construction (See Note A-9.23.13.2.(1)(a)(i)), or

ii) the lowest exterior frame wall supports not more than 2 floors in other types of construction, and

b) the 1-in-50 hourly wind pressure is less than 1.20 kPa.

2) Bracing to resist lateral loads shall be designed and constructed in accordance with

a) Articles 9.23.13.4. to 9.23.13.7.,

b) Part 4, or

c) good engineering practice such as that provided in CWC 2014, “Engineering Guide for Wood Frame Construction.”

9.23.13.3. Requirements for Extreme Wind and Seismic Forces

1) Except as provided in Articles 9.23.13.1. and 9.23.13.2., this Article applies in locations where

a) the seismic spectral response acceleration, Sa(0.2), is

i) greater than 1.8,

ii) greater than 0.70 and the lowest exterior frame wall supports more than 2 floors in buildings of light construction, or

iii) greater than 0.70 and the lowest exterior frame wall supports more than 1 floor in buildings of heavy construction, or

b) the 1-in-50 hourly wind pressure is equal to or greater than 1.20 kPa.

2) Bracing to resist lateral loads shall be designed and constructed in accordance with

a) Part 4, or

b) good engineering practice such as that provided in CWC 2014, “Engineering Guide for Wood Frame Construction.”

9.23.13.4. Braced Wall Bands

(See Note A-9.23.13.4.)

1) Braced wall bands shall

a) be full storey height,

b) be not more than 1.2 m wide,

c) lap at both ends with another braced wall band,

d) be aligned with braced wall bands on storeys above and below, and

e) conform to the spacing and dimensions given in Table 9.23.13.5.

2) The perimeter of the building shall be located within braced wall bands.

3) For split-level buildings, a braced wall band shall be located where there is a change in floor level greater than the depth of one floor joist.
9.23.13.5. Braced Wall Panels in Braced Wall Bands

1) Except as provided in Sentences (2) to (5) and Article 9.23.13.7., braced wall panels shall
a) be located within braced wall bands,
b) extend, as applicable, from the top of the supporting footing, slab or subfloor to the underside of
   the floor, ceiling or roof framing above, and
c) conform to the spacing and dimensions given in Table 9.23.13.5.

Table 9.23.13.5.

Notes to Table 9.23.13.5.:
<sup>(1)</sup> See Note A-Table 9.23.13.5.
<sup>(2)</sup> All constructions include support of a roof load in addition to the indicated number of floors.
(3) See Article 9.23.13.7. for alternative methods of compliance.
(4) See Sentence 9.23.13.3.(1) for overall limit on application to heavy construction.

2) In basements or crawl spaces where the perimeter foundation walls extend from the footings to the underside of the supported floor, braced wall bands constructed with braced wall panels shall be spaced not more than
   a) 15 m from the perimeter foundation walls,
   b) 15 m from interior foundation walls, and
   c) 15 m from adjacent braced wall bands constructed with braced wall panels.

(See Note A-9.23.13.5.(2).)

3) Portions of the perimeter of a single open or enclosed space need not comply with Sentence (1), where
   a) the roof of the space projects not more than
      i) 3.5 m from the face of the framing of the nearest parallel braced wall band, and
      ii) half the perpendicular plan dimension,
   b) that portion of the perimeter structure does not support a floor, and
   c) the roof of the space is
      i) integral with the roof of the rest of the building with framing members not more than 400 mm o.c., or
      ii) constructed with roof framing not more than 400 mm o.c. fastened to the wall framing
      (See Table 9.23.3.4. and Article 9.23.9.1. for balloon framing).

(See Note A-9.23.13.5.(3).)

4) Walls in detached garages and in accessory buildings serving a single dwelling unit, and the front wall of attached garages serving a single dwelling unit need not comply with Sentence (1) where these walls do not support a floor.

5) Braced wall panels in the braced wall band at the front of an attached garage serving a single dwelling unit need not comply with Sentence (1), provided
   a) the maximum spacing between the front of the garage and the back wall of the garage does not exceed 7.6 m,
   b) there is not more than one floor above the garage,
   c) not less than 50% of the length of the back wall of the garage is constructed of braced wall panels, and
   d) not less than 25% of the length of the side walls is constructed of braced wall panels.

9.23.13.6.Materials in Braced Wall Panels

1) Required braced wall panels shall be
   a) clad with panel-type cladding complying with Section 9.27. and Table 9.23.3.4.,
   b) sheathed with plywood, OSB, waferboard or diagonal lumber sheathing complying with Subsection 9.23.167. and Table 9.23.13.6., and fastened in accordance with Article 9.23.3.5., or
   c) finished on the interior with a panel-type material in accordance with the requirements of Section 9.29. and Table 9.23.13.6.

**Notes to Table 9.23.13.6.**:

\(^{(1)}\) See Sentences (5) and (6).

2) Except as provided in Sentence (3), required interior braced wall panels shall be
   a) sheathed or finished on both sides with a wood-based material, or
   b) finished on both sides with gypsum board.

3) Required interior braced wall panels of wood-based material may be sheathed on one side only, provided
   a) the sheathing material is plywood, OSB or waferboard, and
   b) the maximum spacing of fasteners along the edge is half of the maximum spacing shown in
      Table 9.23.3.5.-B.

4) For stacked braced wall bands, where the construction of any one braced wall panel is required to be of a
   wood-based material, a wood-based material shall be installed in all the required braced wall panels in that
   braced wall band.

5) Gypsum board interior finish shall not be considered as an acceptable sheathing material to provide the
   required bracing in exterior walls. (See Note A-9.23.13.6.(5) and (6).)

6) At braced wall band spacing intervals of not more than 15 m, braced wall panels shall be constructed with
   OSB, plywood or diagonal lumber. (See Note A-9.23.13.6.(5) and (6).)

### 9.23.13.7. Additional System Considerations

1) Except as provided in Sentences (2) and (3), one exterior wall of the uppermost storey in each orthogonal
   direction may be set back from the exterior wall of the storey below, provided the adjacent interior braced
   wall band of the storey below the setback
   a) is spaced not more than 10.6 m from the exterior wall of the storey below the setback wall,
   b) consists of braced wall panels that are constructed of a wood-based material in conformance
      with Sentence 9.23.13.6.(2),
   c) extends to the foundation, and
   d) is not taken into consideration when providing braced wall panels constructed of a wood-based
      material at spacing intervals of not more than 15 m as per Sentence 9.23.13.6.(6).
2) Where the exterior wall of the uppermost storey is set back from the exterior wall of the storey below, the roof and floor space supporting the setback wall shall be sheathed with a wood-based material between the exterior wall of the storey below the setback and the adjacent interior braced wall bands of the storey below the setback.

3) Where the exterior wall of the uppermost storey is set back from the exterior wall of the storey below, the exterior walls perpendicular to the setback wall shall
   a) have their top plate connected with nails that are spaced at no greater than half the spacing required in Table 9.23.3.4., and
   b) have their top plate splices fastened with twice the number of nails specified in Sentences 9.23.11.4.(4) and (5).

4) The maximum distance between adjacent required braced wall panels in a braced wall band, measured from the edge of the panels, may be increased to 7.3 m provided that, throughout the height of the building, the length of any braced wall panel within the braced wall band is not less than 1.2 m.

5) The maximum spacing between the centre lines of required braced wall bands given in Table 9.23.13.5. may be increased from 7.6 m to no more than 10.6 m, provided that the interior braced wall band whose spacing is being increased is replaced with an interior braced wall band that
   a) consists of braced wall panels that are constructed of a wood-based material in conformance with Sentence 9.23.13.6.(2),
   b) extends to the foundation, and
   c) is not taken into consideration when providing braced wall panels constructed of a wood-based material at spacing intervals no greater than 15 m as per Sentence 9.23.13.6.(6).

6) For each orthogonal direction of the building, the length of required braced wall panels of one exterior wall given in Table 9.23.13.5. may be reduced from 40% to no less than 25% of the length of the braced wall band, provided an additional parallel and adjacent interior braced wall band is constructed that
   a) is spaced not more than 10.6 m from the exterior wall,
   b) consists of braced wall panels that are constructed of a wood-based material in conformance with Sentence 9.23.13.6.(2) and whose lengths sum to no less than 25% of the length of the braced wall band,
   c) extends to the foundation, and
   d) is not taken into consideration when providing braced wall panels constructed of a wood-based material at spacing intervals no greater than 15 m as per Sentence 9.23.13.6.(6).

7) Where the length of required braced wall panels of an exterior wall is reduced as described in Sentence (6), the ratio of the length of braced wall panels in the respective upper braced wall bands to the length of braced wall panels in the reduced exterior braced wall band shall not exceed 2.

   1) Roof rafters and joists and ceiling joists shall be continuous or shall be spliced over vertical supports that extend to suitable bearing.

9.23.14.2. Framing around Openings
   1) Roof and ceiling framing members shall be doubled on each side of openings greater than 2 rafter or joist spacings wide.

9.23.14.3. End Bearing Length
   1) The length of end bearing of joists and rafters shall be not less than 38 mm.

9.23.14.4. Location and Attachment of Rafters
   1) Rafters shall be located directly opposite each other and tied together at the peak, or may be offset by their own thickness if nailed to a ridge board not less than 17.5 mm thick.
2) Except as permitted in Sentence (3), framing members shall be connected by gusset plates or nailing at the peak in conformance with Table 9.23.3.4.
3) Where the roof framing on opposite sides of the peak is assembled separately, such as in the case of factory-built houses, the roof framing on opposite sides is permitted to be fastened together with galvanized-steel strips not less than 200 mm by 75 mm by 0.41 mm thick spaced not more than 1.2 m apart and nailed at each end to the framing by at least two 63 mm nails.

9.23.14.5. Shaping of Rafters
1) Rafters shall be shaped at supports to provide even bearing surfaces and supported directly above the exterior walls.

1) Hip and valley rafters shall be not less than 50 mm greater in depth than the common rafters and not less than 38 mm thick, actual dimension.

1) Ceiling joists and collar ties of not less than 38 mm by 89 mm lumber are permitted to be assumed to provide intermediate support to reduce the span for rafters and joists where the roof slope is 1 in 3 or greater.
2) Collar ties referred to in Sentence (1) more than 2.4 m long shall be laterally supported near their centres by not less than 19 mm by 89 mm continuous members at right angles to the collar ties.
3) Dwarf walls and struts are permitted to be used to provide intermediate support to reduce the span for rafters and joists.
4) When struts are used to provide intermediate support they shall be not less than 38 mm by 89 mm material extending from each rafter to a loadbearing wall at an angle of not less than 45° to the horizontal.
5) When dwarf walls are used for rafter support, they shall be framed in the same manner as loadbearing walls and securely fastened top and bottom to the roof and ceiling framing to prevent over-all movement.
6) Solid blocking shall be installed between floor joists beneath dwarf walls referred to in Sentence (5) that enclose finished rooms.

1) Except as provided in Sentence (4), roof rafters and joists shall be supported at the ridge of the roof by a) a loadbearing wall extending from the ridge to suitable bearing, or b) a ridge beam supported by not less than 89 mm length of bearing.
2) Except as provided in Sentence (3), the ridge beam referred to in Sentence (1) shall conform to the sizes and spans shown in Span Table 9.23.4.2.-L, provided a) the supported rafter or joist length does not exceed 4.9 m, and b) the roof does not support any concentrated loads.
3) The ridge beam referred to in Sentence (1) need not comply with Sentence (2) where a) the beam is of not less than 38 mm by 140 mm material, and b) the beam is supported at intervals not exceeding 1.2 m by not less than 38 mm by 89 mm members extending vertically from the ridge to suitable bearing.
4) When the roof slope is 1 in 3 or more, ridge support need not be provided when the lower ends of the rafters are adequately tied to prevent outward movement.
5) Ties required in Sentence (4) are permitted to consist of tie rods or ceiling joists forming a continuous tie for opposing rafters and nailed in accordance with Table 9.23.14.8.

6) Ceiling joists referred to in Sentence (5) shall be fastened together with at least one more nail per joist splice than required for the rafter to joist connection shown in Table 9.23.14.8.
7) Members referred to in Sentence (6) are permitted to be fastened together either directly or through a gusset plate.

1) Roof joists supporting a finished ceiling, other than plywood, OSB or waferboard, shall be restrained from twisting along the bottom edges by means of furring, blocking, cross bridging or strapping conforming to Article 9.23.9.3.

1) Except as permitted in Sentence (2), ceiling joists supporting part of the roof load from the rafters shall be not less than 25 mm greater in depth than required for ceiling joists not supporting part of the roof load.
2) When the roof slope is 1 in 4 or less, the ceiling joist sizes referred to in Sentence (1) shall be determined from Span Tables 9.23.4.2.-C to 9.23.4.2.-F and 9.23.4.2.-L for roof joists.
9.23.14.11. Roof Trusses

1) Roof trusses which are not designed in accordance with Part 4 shall
   a) be capable of supporting a total ceiling load (dead load plus live load) of 0.35 kPa plus two and
      two-thirds times the specified live roof load for 24 h, and
   b) not exceed the deflections shown in Table 9.23.14.11. when loaded with the ceiling load plus one
      and one-third times the specified roof snow load for 1 h.

</tbody>
</table>

2) The joint connections used in trusses described in Sentence (1) shall be designed in conformance with the requirements in Subsection 4.3.1. (See Note A-9.23.14.11.(2).)

3) Where the length of compression web members in roof trusses described in Sentence (1) exceeds 1.83 m, such web members shall be provided with continuous bracing to prevent buckling.

4) Bracing required in Sentence (3) shall consist of not less than 19 mm by 89 mm lumber nailed at right angles to the web members near their centres with at least two 63 mm nails for each member.

5) Where the ability of a truss design to satisfy the requirements of Sentence (1) is demonstrated by testing, it shall consist of a full scale load test carried out in conformance with CSA S307-M, "Load Test Procedure for Wood Roof Trusses for Houses and Small Buildings."

6) Where the ability of a truss design to satisfy the requirements of Sentence (1) is demonstrated by analysis, it shall be carried out in accordance with good engineering practice such as that described in TPIC 2014, “Truss Design Procedures and Specifications for Light Metal Plate Connected Wood Trusses (Limit States Design).”

9.23.15. Subflooring

9.23.15.1. Subflooring Required

1) Subflooring shall be provided beneath finish flooring where the finish flooring does not have adequate strength to support the specified live loads (See Subsection 9.30.3.).

9.23.15.2. Material Standards

1) Except as provided in Sentence (2), wood-based panels for subfloors shall conform to
   a) CSA O121, “Douglas Fir Plywood,”
   b) CSA O151, “Canadian Softwood Plywood,”
   c) CSA O153, “Poplar Plywood,”
   d) CSA O325, “Construction Sheathing,” or
   e) CSA O437.0, “OSB and Waferboard.”

2) Particleboard subflooring may be used only where a building is constructed in a factory so that the subfloor will not be exposed to the weather.

3) Subflooring described in Sentence (2) shall conform to grade D-2 or D-3 in ANSI A208.1, “Particleboard.”
4) Subflooring described in Sentence (2) shall have its upper surface and all edges treated to restrict water absorption, where the subfloor is used in bathrooms, kitchens, laundry rooms or other areas subject to periodic wetting. (See Note A-9.23.15.2.(4).)

9.23.15.3. Edge Support
1) Where the edges of panel-type subflooring are required to be supported (See Sentence 9.30.2.1.(2)), such support shall consist of tongue-and-groove panel edges or not less than 38 mm by 38 mm blocking securely nailed between framing members.

9.23.15.4. Direction of Installation
1) Plywood subflooring shall be installed with the surface grain at right angles to the joists and with joints parallel to floor joists staggered.
2) OSB subflooring conforming to CSA O325, “Construction Sheathing,” or to O-1 and O-2 grades in CSA O437.0, “OSB and Waferboard,” and waferboard subflooring conforming to R-1 grade in CSA O437.0 shall be installed so that the direction of face orientation is at right angles to the joists and the joints parallel to the floor joists are staggered. (See Note A-9.23.15.4.(2).)

9.23.15.5. Subfloor Thickness or Rating
1) Except as provided in Sentences (2) and (3), subfloors shall conform to either Table 9.23.15.5.-A or 9.23.15.5.-B.

### Table 9.23.15.5.-A
Thickness of Subflooring

2) Where the finished flooring consists of not less than 19 mm matched wood strip flooring laid at right angles to joists spaced not more than 600 mm o.c., subflooring shall be permitted to consist of not less than
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

9.23.15.6. Annular Grooved Nails

1) When resilient flooring is applied directly to an OSB, waferboard, particleboard or plywood subfloor, the subfloor shall be fastened to the supports with annular grooved nails.

9.23.15.7. Lumber Subflooring

1) Lumber subflooring shall be laid at an angle of not less than 45° to the joists.
2) Lumber subflooring shall be fully supported at the ends on solid bearing.
3) Lumber for subflooring shall be of uniform thickness and not more than 184 mm wide.

9.23.16. Roof Sheathing

9.23.16.1. Required Roof Sheathing

1) Except where the 1-in-50 hourly wind pressure is less than 0.8 kPa and the seismic spectral response acceleration, $S_a(0.2)$, is less than or equal to 0.70, continuous lumber or panel-type roof sheathing shall be installed to support the roofing.

9.23.16.2. Material Standards

1) Wood-based panels used for roof sheathing shall conform to the requirements of
   a) CSA O121, “Douglas Fir Plywood,”
   b) CSA O151, “Canadian Softwood Plywood,”
   c) CSA O153, “Poplar Plywood,”
   d) CSA O325, “Construction Sheathing,” or
   e) CSA O437.0, “OSB and Waferboard.”

9.23.16.3. Direction of Installation

1) Plywood roof sheathing shall be installed with the surface grain at right angles to the roof framing.
2) OSB roof sheathing conforming to CSA O325, “Construction Sheathing,” or to O-1 and O-2 grades as specified in CSA O437.0, “OSB and Waferboard,” shall be installed with the direction of face orientation at right angles to the roof framing members. (See Note A-9.23.15.4.(2).)

9.23.16.4. Joints in Panel-Type Sheathing

1) Panel-type sheathing board shall be applied so that joints perpendicular to the roof ridge are staggered where
   a) the sheathing is applied with the surface grain parallel to the roof ridge, and
   b) the thickness of the sheathing is such that the edges are required to be supported.
2) A gap of not less than 2 mm shall be left between sheets of plywood, OSB or waferboard.
9.23.16.5. Lumber Roof Sheathing

1) Lumber roof sheathing shall not be more than 286 mm wide and shall be applied so that all ends are supported with end joints staggered.

2) Lumber roof sheathing shall be installed diagonally, where
   a) the seismic spectral response acceleration, $S_a(0.2)$, is greater than 0.70 but not greater than 1.2, or
   b) the 1-in-50 hourly wind pressure is equal to or greater than 0.80 kPa but less than 1.20 kPa.

3) Lumber roof sheathing shall be designed according to Part 4, where
   a) the seismic spectral response acceleration, $S_a(0.2)$, is greater than 1.2, or
   b) the 1-in-50 hourly wind pressure is equal to or greater than 1.20 kPa.

9.23.16.6. Edge Support

1) Where panel-type roof sheathing requires edge support, the support shall consist of metal H clips or not less than 38 mm by 38 mm blocking securely nailed between framing members.

9.23.16.7. Thickness or Rating

1) The thickness or rating of roof sheathing on a flat roof used as a walking deck shall conform to either Table 9.23.15.5.-A or Table 9.23.15.5.-B for subfloors.

2) The thickness or rating of roof sheathing on a roof not used as a walking deck shall conform to either Table 9.23.16.7.-A or Table 9.23.16.7.-B.

3) Asphalt-coated or asphalt-impregnated fibreboard not less than 11.1 mm thick conforming to CAN/ULC-S706, “Wood Fibre Insulating Boards for Buildings,” is permitted to be used as a roof sheathing over supports spaced not more than 400 mm o.c. provided the roofing consists of
   a) a continuous sheet of galvanized steel not less than 0.33 mm in thickness, or
   b) a continuous sheet of aluminum not less than 0.61 mm in thickness.

4) All edges of sheathing described in Sentence (3) shall be supported by blocking or framing.

9.23.17. Wall Sheathing

9.23.17.1. Required Sheathing
1) Exterior walls and gable ends shall be sheathed when the exterior cladding requires intermediate fastening between supports or if the exterior cladding requires solid backing.

9.23.17.2. Thickness, Rating and Material Standards
1) Where wall sheathing is required for the purpose of complying with this Section, it shall conform to either Table 9.23.17.2.-A or 9.23.17.2.-B. (See also Article 9.25.5.1.)

9.23.17.3. Attachment of Cladding to Sheathing
1) Gypsum sheathing, rigid insulation and fibreboard shall not be used for the attachment of cladding materials.

9.23.17.4. Lumber Sheathing
1) Lumber wall sheathing shall be applied so that all ends are supported.
2) Where lumber wall sheathing is required to provide bracing according to Article 9.23.10.2., it shall be applied with end joints staggered.

9.23.17.5. Joints in Panel-Type Sheathing
1) A gap of not less than 2 mm shall be left between sheets of plywood, OSB, waferboard or fibreboard.

9.23.17.6. Mansard Style Roofs
1) Where the bottom portions of mansard style roofs are vented, the vertical framing members behind the sloping portions shall be considered on the same basis as exterior wall studs and shall conform to Articles 9.27.3.2. to 9.27.3.6.

Section 9.24. Sheet Steel Stud Wall Framing

9.24.1. General

9.24.1.1. Application
1) This Section applies to sheet steel studs for use in non-loadbearing exterior and interior walls.
2) Where loadbearing steel studs are used, they shall be designed in conformance with Part 4.

9.24.1.2. Material Standards
1) Steel studs and runners shall conform to AISI S201, “North American Standard for Cold-Formed Steel Framing – Product Data.”

9.24.1.3. Metal Thickness
1) Metal thickness specified in this Section shall be the minimum base steel thickness exclusive of coatings.

9.24.1.4. Screws
1) Screws for the application of cladding, sheathing or interior finish materials to steel studs, runners and furring channels shall conform to
   a) ASTM C 954, “Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs from 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness,” or
   b) ASTM C 1002, “Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs.”

9.24.1.5. Cladding, Sheathing and Interior Finish Required
1) Cladding or sheathing, and interior finish shall be installed on steel stud framing and shall be fastened with screws
   a) spaced at the appropriate spacing described in Section 9.29., and
   b) penetrating not less than 10 mm through the metal.

9.24.2. Size of Framing

9.24.2.1. Size and Spacing of Studs in Interior Walls
1) Except as required in Articles 9.24.2.3. and 9.24.2.4., the size and spacing of steel studs for non-loadbearing interior walls shall conform to Table 9.24.2.1.

Table 9.24.2.1.

Notes to Table 9.24.2.1.:
(1) The values in the Table are based on a single layer of 12.7 mm gypsum panel sheathing installed on each side of the studs. Where one side is not accessible, gypsum panels on only one side will suffice. The values are also based on attaching gypsum panel sheathing using screws not smaller than No. 6 spaced at a maximum of 300 mm at edges and at intermediate supports.

9.24.2.2. Thickness of Studs
1) Except as required in Article 9.24.2.4., steel studs in non-loadbearing interior walls shall have a metal thickness of not less than 0.46 mm.
9.24.2.3. Runners
1) Runners for interior and exterior non-loadbearing walls shall have a thickness not less than the thickness of the corresponding studs and shall have not less than 30 mm flanges.

9.24.2.4. Openings in Fire Separations
1) Where openings for doors in non-loadbearing fire separations required to have a fire-resistance rating do not exceed 1 200 mm in width,
   a) the width of steel studs shall be not less than 63 mm, and
   b) the metal thickness shall be not less than 0.46 mm.
2) Where openings described in Sentence (1) exceed 1 200 mm in width,
   a) the width of steel studs shall be not less than 91 mm, and
   b) the metal thickness shall be not less than 0.85 mm.
3) The distance to the first stud beyond the jamb of any door opening in a fire separation required to have a fire-resistance rating shall not exceed 400 mm.
4) Where the distance between the framing over the opening referred to in Sentence (3) and the top runner exceeds 400 mm in such walls, intermediate support shall be installed at intervals of not more than 400 mm above the opening.

9.24.2.5. Size and Spacing of Studs in Exterior Walls
1) The size and spacing of non-loadbearing steel studs for exterior walls shall conform to Table 9.24.2.5.

Table 9.24.2.5.
Size and Spacing of Steel Studs for Non-Loadbearing Exterior Walls
Forming Part of Sentence 9.24.2.5.(1)

</tbody>
</table>

9.24.3. Installation

9.24.3.1. Installation of Runners
1) Runners shall be provided at the tops and bottoms of walls.
2) Runners required in Sentence (1) shall be securely attached to the building at approximately 50 mm from the ends, and at intervals of not more than 600 mm o.c. for interior walls and 300 mm o.c. for exterior walls.
3) Fasteners used for attachment described in Sentence (2) shall consist of the equivalent of 63 mm nails or 25 mm screws.
4) Studs at openings and which are not full wall height shall be supported by a runner at the ends of the studs, securely fastened to the full length studs at the sides of the opening.

9.24.3.2. Fire-Rated Walls
1) Steel studs used in walls required to have a fire-resistance rating shall be installed so that there is not less than a 12 mm clearance between the top of the stud and the top of the runner to allow for expansion in the event of fire.

2) Except as provided in Article 9.24.3.6., studs in walls referred to in Sentence (1) shall not be attached to the runners in a manner that will prevent such expansion.

3) Framing above doors with steel door frames in non-loadbearing fire separations required to have a fire-resistance rating shall consist of 2 runners on the flat fastened back to back. (See Note A-9.24.3.2.(3).)

4) The upper runner required in Sentence (3) shall be bent at each end to extend upwards not less than 150 mm and fastened to the adjacent studs.

5) A gypsum board filler piece, the width and length of the runner, shall be provided between the door frame referred to in Sentence (3) and the adjacent runner.

9.24.3.3. Orientation of Studs

1) Steel studs shall be installed with webs at right angles to the wall face and, except at openings, shall be continuous for the full wall height.

9.24.3.4. Support for Cladding Materials

1) Corners and intersections of walls shall be constructed to provide support for the cladding materials.

9.24.3.5. Framing around Openings

1) Studs shall be doubled on each side of every opening where such openings involve more than one stud space, and shall be tripled where the openings in exterior walls exceed 2.4 m in width.

2) Studs described in Sentence (1) shall be fastened together by screws, crimping or welding to act as a single structural unit in resisting transverse loads.

9.24.3.6. Attachment of Studs to Runners

1) Studs shall be attached to runners by screws, crimping or welding around wall openings and elsewhere where necessary to keep the studs in alignment during construction.

2) Where clearance for expansion is required in Article 9.24.3.2., attachment required in Sentence (1) shall be applied between studs and bottom runners only.

9.24.3.7. Openings for Fire Dampers

1) Openings for fire dampers in non-loadbearing fire separations required to have a fire-resistance rating shall be framed with double studs on each side of the opening.

2) The sill and header for openings described in Sentence (1) shall consist of a runner track with right angle bends made on each end so as to extend 300 mm above the header or below the sill and fastened to the studs.

3) The openings described in Sentence (1) shall be lined with a layer of gypsum board not less than 12.7 mm thick fastened to stud and runner webs.

Section 9.25. Heat Transfer, Air Leakage and Condensation Control

9.25.1. General

9.25.1.1. Scope and Application

1) This Section is concerned with heat, air and water vapour transfer and measures to control condensation. (See Sentence 1.3.3.2. (3) of Division A for Part 5 application to Group C multi-family residential occupancies and artist live/work studios.)
2) All walls, ceilings and floors separating conditioned space from unconditioned space, the exterior air or the ground shall be
   a) provided with
      i) thermal insulation conforming to Subsection 9.25.2. and Part 10,
      ii) an air barrier conforming to Subsection 9.25.3. and Part 10, and
      iii) a vapour barrier conforming to Subsection 9.25.4., and
   b) constructed in such a way that the properties and relative position of all materials conform to Subsection 9.25.5.

4) Except for buildings containing only dwelling units or for portions of buildings containing dwelling units, the design and installation of thermal insulation and measures to control heat transfer and condensation shall conform to Part 10.

9.25.2. Thermal Insulation

9.25.2.1. Required Insulation

1) All walls, ceilings and floors separating heated space from unheated space, the exterior air or the exterior soil shall be provided with sufficient thermal insulation to prevent moisture condensation on their room side during the winter and to ensure comfortable conditions for the occupants. (See Note A-9.1.1.1.(1).)

9.25.2.2. Insulation Materials

1) Except as required in Sentence (2), thermal insulation shall conform to the requirements of
   a) ASTM C 726, “Mineral Wool Roof Insulation Board,”
   b) CAN/CGSB-51.25-M, “Thermal Insulation, Phenolic, Faced,”
   c) CGSB 51-GP-27M, “Thermal Insulation, Polystyrene, Loose Fill,”
   d) CAN/ULC-S701, “Thermal Insulation, Polystyrene, Boards and Pipe Covering,”
   e) CAN/ULC-S702, “Mineral Fibre Thermal Insulation for Buildings,”
   f) CAN/ULC-S703, “Cellulose Fibre Insulation for Buildings,”
   g) CAN/ULC-S704, “Thermal Insulation, Polyurethane and Polyisocyanurate, Boards, Faced,”
   i) CAN/ULC-S706, “Wood Fibre Insulating Boards for Buildings.”

2) The flame-spread ratings requirements contained in the standards listed in Sentence (1) shall not apply. (See Note A-9.25.2.2.(2).)

3) Insulation in contact with the ground shall be inert to the action of soil and water and shall be such that its insulative properties are not significantly reduced by moisture.

9.25.2.3. Installation of Thermal Insulation

1) Insulation shall be installed so that there is a reasonably uniform insulating value over the entire face of the insulated area.

2) Insulation shall be applied to the full width and length of the space between furring or framing.

3) Except where the insulation provides the principal resistance to air leakage, thermal insulation shall be installed so that at least one face is in full and continuous contact with an element with low air permeance. (See Note A-9.25.2.3.(3).)

4) Insulation on the interior of foundation walls enclosing a crawl space shall be applied so that there is not less than 50 mm clearance above the crawl space floor, if the insulation is of a type that may be damaged by water.

5) Insulation around concrete slabs-on-ground shall be located so that heat from the building is not restricted from reaching the ground beneath the perimeter, where exterior walls are not supported by footings extending below frost level.
6) Where insulation is exposed to the weather and subject to mechanical damage, it shall be protected with not less than
   a) Reserved,
   b) 6 mm preservative-treated plywood, or
   c) 12 mm cement parging on wire lath applied to the exposed face and edge.
7) Insulation located in areas where it may be subject to mechanical damage shall be protected by a covering such as gypsum board, plywood, particleboard, OSB, waferboard or hardboard.
8) Insulation in factory-built buildings shall be installed so that it will not become dislodged during transportation.

9.25.2.4. Installation of Loose-Fill Insulation
   1) Except as provided in Sentences (2) to (6), loose-fill insulation shall be used on horizontal surfaces only.
   2) Where loose-fill insulation is installed in an unconfined sloped space, such as an attic space over a sloped ceiling, the supporting slope shall not be more than
      a) 4.5 in 12 for mineral fibre or cellulose fibre insulation, and
      b) 2.5 in 12 for other types of insulation.
   3) Loose-fill insulation is permitted to be used in wood-frame walls of existing buildings. (See Note A-9.25.2.4.(3).)
   4) Where blown-in insulation is installed in above-ground or below-ground wood-frame walls of new buildings,
      a) the density of the installed insulation shall be sufficient to preclude settlement,
      b) the insulation shall be installed behind a membrane that will permit visual inspection prior to the installation of the interior finish,
      c) the insulation shall be installed in a manner that will not interfere with the installation of the interior finish, and
      d) no water shall be added to the insulation, unless it can be shown that the added water will not adversely affect other materials in the assembly.
   5) Water repellent loose-fill insulation is permitted to be used between the outer and inner wythes of masonry cavity walls. (See Note A-9.25.2.4.(5).)
   6) Where soffit venting is used, measures shall be taken
      a) to prevent loose-fill insulation from blocking the soffit vents and to maintain an open path for circulation of air from the vents into the attic or roof space, and
      b) to minimize airflow into the insulation near the soffit vents to maintain the thermal performance of the material. (See Article 9.19.1.3.)

9.25.2.5. Installation of Spray-Applied Polyurethane
   1) Spray-applied polyurethane insulation shall be installed in accordance with CAN/ULC-S705.2, “Thermal Insulation – Spray Applied Rigid Polyurethane Foam, Medium Density – Application.”

9.25.3. Air Barrier Systems

9.25.3.1. Required Barrier to Air Leakage
   1) Wall, ceiling and floor assemblies separating conditioned space from unconditioned space or from the ground shall be constructed so as to include an air barrier system that will provide a continuous barrier to air leakage
      a) from the interior of the building into wall, floor, attic or roof spaces, sufficient to prevent excessive moisture condensation in such spaces during the winter, and
      b) from the exterior or the ground inward sufficient to
         i) prevent moisture condensation on the room side during winter,
         ii) ensure comfortable conditions for the occupants, and
         iii) minimize the ingress of soil gas.
(See Note A-9.25.3.1.(1).)

9.25.3.2. Air Barrier System Properties
(See Note A-9.25.5.1.(1).)
1) Air barrier systems shall possess the characteristics necessary to provide an effective barrier to air infiltration and exfiltration under differential air pressure due to stack effect, mechanical systems or wind.
2) Where polyethylene sheet is used to provide airtightness in the air barrier system, it shall conform to CAN/CGSB-51.34-M, "Vapour Barrier, Polyethylene Sheet for Use in Building Construction."

9.25.3.3. Continuity of the Air Barrier System
1) Where the air barrier system consists of an air-impermeable panel-type material, all joints shall be sealed to prevent air leakage.
2) Except as provided in Sentence 9.25.3.6.(3), where the air barrier system consists of flexible sheet material, all joints shall be
   a) sealed, or
   b) lapped not less than 100 mm and clamped, such as between framing members, furring or blocking, and rigid panels.
3) Where an interior wall meets an exterior wall, ceiling, floor or roof required to be provided with air barrier protection, the air barrier system shall extend across the intersection.
4) Where an interior wall projects through a ceiling or extends to become an exterior wall, spaces in the wall shall be blocked to provide continuity across those spaces with the air barrier system in the abutting walls or ceiling.
5) Where an interior floor projects through an exterior wall or extends to become an exterior floor, continuity of the air barrier system shall be maintained from the abutting walls across the floor assembly.
6) Penetrations of the air barrier system, such as those created by the installation of doors, windows, electrical wiring, electrical boxes, piping or ductwork, shall be sealed to maintain the integrity of the air barrier system over the entire surface.
7) Where access hatches and sump pit covers are installed through assemblies constructed with an air barrier system, they shall be weatherstripped around their perimeters to prevent air leakage.
8) Clearances between chimneys or gas vents and the surrounding construction that would permit air leakage from within the building into a wall or attic or roof space shall be sealed by noncombustible material to prevent such leakage.

9.25.3.4. Air Leakage Control in Masonry Walls
(See Note A-9.25.3.4. and 9.25.3.6.)
1) Masonry walls required to provide a barrier to the ingress of air from the ground shall
   a) include a course of masonry units without voids, or
   b) be sealed with flashing material extending across the full width of the masonry.
2) The masonry course or flashing described in Sentence (1) shall
   a) be located at the level of the adjoining floor and be sealed to it in accordance with Article 9.25.3.6., or
   b) in the absence of a floor, be located at the level of the ground cover required by Article 9.18.6.1. and be sealed to it.

9.25.3.5. Air Leakage Control in Underground Roofs
1) Waterproofing systems for roofs of underground structures shall be sealed to the air barrier in the walls.

9.25.3.6. Air Barrier Systems in Floors-on-ground
(See Note A-9.25.3.4. and 9.25.3.6.)
1) Materials used to provide a barrier to the ingress of air through floors-on-ground shall conform to CAN/CGSB-51.34-M, "Vapour Barrier, Polyethylene Sheet for Use in Building Construction."
2) Where the floor-on-ground is a concrete slab, the air barrier shall be
   a) installed below the slab, or
   b) applied to the top of the slab, provided a separate floor is installed over the slab.
   (See Note A-9.25.3.6.(2) and (3).)
3) Where the air barrier installed below a floor-on-ground is flexible sheet material, joints in the barrier shall
   be lapped not less than 300 mm. (See Note A-9.25.3.6.(2) and (3).)
4) Where installed in conjunction with a framed floor-on-ground or above a floor-on-ground, the air barrier
   shall be installed in accordance with Article 9.25.3.3.
5) A floor-on-ground shall be sealed around its perimeter to the inner surfaces of adjacent walls using
   flexible sealant.
6) All penetrations of a floor-on-ground that are required to drain water from the floor surface shall be sealed
   in a manner that prevents the upward flow of air without preventing the downward flow of liquid water.

9.25.4. Vapour Barriers

9.25.4.1. Required Barrier to Vapour Diffusion
   1) Thermally insulated wall, ceiling and floor assemblies shall be constructed with a vapour barrier so as to
      provide a barrier to diffusion of water vapour from the interior into wall spaces, floor spaces or attic or roof
      spaces.

9.25.4.2. Vapour Barrier Materials
   1) Vapour barriers shall have a permeance not greater than 60 ng/(Pa•s•m²) measured in accordance with
   2) Where the intended use of the interior space will result in high moisture generation, the assembly shall be
      designed according to Part 5. (See Note A-9.25.4.2.(2).)
   3) Where polyethylene is installed to serve only as the vapour barrier, it shall comply with Clause 4.4,
      Thermal Stability, and Clause 5.7, Oxidative Induction Time, of CAN/CGSB-51.34-M, “Vapour Barrier,
      Polyethylene Sheet for Use in Building Construction.”
   4) Membrane-type vapour barriers other than polyethylene shall conform to the requirements of
   5) Where a coating is applied to gypsum board to function as the vapour barrier, the permeance of the
      coating shall be determined in accordance with CAN/CGSB-1.501-M, “Method for Permeance of Coated
      Wallboard.”
   6) Where foamed plastic insulation functions as the vapour barrier, it shall be sufficiently thick so as to meet
      the requirement of Sentence (1).

9.25.4.3. Installation of Vapour Barriers
   1) Products installed to function as the vapour barrier shall protect the warm side of wall, ceiling and floor
      assemblies.
   2) Where different products are used for the vapour barrier and the insulation, the vapour barrier shall be
      installed sufficiently close to the warm side of the insulation to prevent condensation at design conditions.
      (See Note A-9.25.4.3.(2) and Note A-9.25.5.1.(1).)
   3) Where the same product is used for the vapour barrier and the insulation, the product shall be installed
      sufficiently close to the warm side of the assembly to prevent condensation at design conditions. (See Notes
      A-9.25.4.3.(2), A-9.25.5.1.(1) and A-9.25.5.2.)

9.25.5. Properties and Position of Materials in the Building Envelope

9.25.5.1. General
   (See Note A-9.25.5.1.)
1) Except as provided in Sentences (2) to (4), sheet and panel-type materials incorporated into assemblies described in Article 9.25.1.1. shall conform to Article 9.25.5.2., where
   a) the material has
      i) an air leakage characteristic less than 0.1 L/(s·m²) at 75 Pa, and
      ii) a water vapour permeance less than 60 ng/(Pa·s·m²) when measured in accordance with ASTM E 96/E 96M, "Water Vapor Transmission of Materials," using the desiccant method (dry cup) (See Note A-9.25.5.1.(1)(a)(ii)), and
   b) the intended use of the interior space where the materials are installed will not result in high moisture generation.
   (See Note A-9.25.5.1.(1).)
2) Where the intended use of the interior space will result in high moisture generation, the assembly shall be designed according to Part 5.
3) Wood-based sheathing materials not more than 12.5 mm thick and complying with Article 9.23.17.2. need not comply with Sentence (1). (See Note A-9.25.5.1.(3).)
4) Where a material has a water vapour permeance not less than 30 ng/(Pa·s·m²) and a thermal resistance not less than 0.7 (m²·K)/W and the heating degree-days of the building location are less than 6 000, the assembly need not comply with Sentence (1).

9.25.5.2. Position of Low Permeance Materials
(See Note A-9.25.5.2.)
1) Sheet and panel-type materials described in Article 9.25.5.1. shall be installed
   a) on the warm face of the assembly (See also Article 9.25.4.2.),
   b) at a location where the ratio between the total thermal resistance of all materials outboard of its innermost impermeable surface and the total thermal resistance of all materials inboard of that surface is not less than that required by Table 9.25.5.2., or
   c) outboard of an air space that is vented to the outdoors.
2) For walls, the air space described in Clause (1)(c) shall comply with Clause 9.27.2.2.(1)(a).

Notes to Table 9.26.2.:  
(1) See Sentence 1.1.3.1.(1).

## Section 9.26. Roofing

#### 9.26.1.1. Definitions

1) For the purpose of this Section, the term “roof” shall mean sloped or near-horizontal assemblies that protect the spaces beneath them, including platforms that effectively serve as roofs with respect to the accumulation or drainage of precipitation. (See Note A-9.26.1.1.(1).)  
2) For the purpose of this Section, the term “roofing” shall mean the primary covering for roofs.

#### 9.26.1.2. Required Protection

1) Roofs shall be protected with roofing, including flashing, installed so as to
   a) effectively shed water,
   b) prevent the ingress of water and moisture into building assemblies and occupied space, and
   c) minimize the ingress of water due to ice damming into building assemblies.  
2) Compliance with Sentence (1) shall be demonstrated by conforming to
   a) the remainder of this Subsection, or
   b) Part 5.

#### 9.26.1.3. Alternative Installation Methods

1) Methods described in CAN3-A123.51-M, “Asphalt Shingle Application on Roof Slopes 1:3 and Steeper,” or in CAN3-A123.52-M, “Asphalt Shingle Application on Roof Slopes 1:6 to Less Than 1:3,” are permitted to be used for asphalt shingle applications not described in this Section.

### 9.26.2. Roofing Materials

#### 9.26.2.1. Material Standards

1) Materials used for the preparation of the substrate for roofing shall conform to the requirements of the applicable standards in Table 9.26.2.1.-A.

</tbody>
</table>

### Notes to Table 9.26.2.1.-B:

\(^{(1)}\) For the purpose of this Subsection, ASTM D 3019 shall only apply to the non-fibered and non-asbestos-fibered types of asphalt roll roofing.

3) Except where otherwise permitted by the Chief Building Official, cedar shingles and shakes shall be certified as to grade by an agency accredited by the Standards Council of Canada.
9.26.2.2. Installation of Materials

1) Materials listed in Tables 9.26.2.1.-A and 9.26.2.1.-B shall be installed in conformance with the manufacturer's written instructions. (See Sentence 1.5.1.2.(1) of Division A.)

9.26.2.3. Nails

1) Nails used for roofing shall be corrosion-resistant roofing or shingle nails conforming to
   a) ASTM F 1667, "Driven Fasteners: Nails, Spikes, and Staples," or
   b) CSA B111, "Wire Nails, Spikes and Staples."
2) Nails shall have sufficient length to penetrate through, or 12 mm into, roof sheathing.
3) Nails used with asphalt roofing shall have a head diameter of not less than 9.5 mm and a shank thickness of not less than 2.95 mm.
4) Nails used with wood shingles or shakes shall have a head diameter of not less than 4.8 mm and a shank thickness of not less than 2.0 mm and shall be stainless steel, aluminum or hot-dipped galvanized. (See Note A-9.26.2.3.(4).)

9.26.2.4. Staples

1) Staples used to apply asphalt or wood shingles shall be corrosion-resistant and shall be driven with the crown parallel to the eaves.
2) Staples used with asphalt shingles shall be not less than 19 mm long, 1.6 mm diam or thickness, with not less than a 25 mm crown, except that an 11 mm crown may be used as provided in Sentence 9.26.7.4.(2).
3) Staples used with wood shingles shall be not less than 29 mm long, 1.6 mm diam or thickness, with not less than a 9.5 mm crown and shall be stainless steel or aluminum. (See Note A-9.26.2.3.(4).)

9.26.3. Slope of Roofed Surfaces

9.26.3.1. Slope

1) Except as provided in Sentences (2) and (3), the slopes on which roof coverings may be applied shall conform to Table 9.26.3.1.
2) Asphalt and gravel or coal tar and gravel roofs may be constructed with lower slopes than required in Sentence (1) when effective drainage is provided by roof drains located at the lowest points on the roofs.
3) Profiled metal roof cladding systems specifically designed for low-slope applications are permitted to be installed with lower slopes than required by Sentence (1), provided they are installed in conformance with the manufacturer's written recommendations.
4) Except where back-slope will not adversely affect adjacent supported or supporting constructions due to water ingress, roofs and constructions that effectively serve as roofs shall be constructed with sufficient slope away from
   a) exterior walls, and
   b) guards that are connected to the roof, or to a construction that effectively serves as a roof, by more than pickets or posts.
(See Notes A-9.26.1.1.(1), A-9.26.4.1. and A-9.27.3.8.(4).)
5) The slope required by Sentence (4) shall be sufficient to maintain a positive slope
   a) after expected shrinkage of the building frame, where these surfaces are supported by exterior walls and exterior columns (See Note A-9.27.3.8.(4)), and
   b) once design loading is taken into consideration, where these surfaces are cantilevered from exterior walls.

**Notes to Table 9.26.3.1.**:

<sup>(1)</sup> See Sentence 9.26.3.1.(3).

### 9.26.4. Flashing at Intersections

#### 9.26.4.1. Required Flashing at Intersections

(See Notes A-9.26.4.1. and A-9.26.1.1.(1).)

1) Except where the omission of flashing will not adversely affect adjacent supported or supporting constructions, flashing shall be installed at junctions between roofs and
   a) walls that rise above the roof, and
b) guards that are connected to the roof by more than pickets or posts.

2) For the purpose of Sentence (1), roofs shall include platforms that effectively serve as roofs with respect to the accumulation or drainage of precipitation.

9.26.4.2. Materials

1) Sheet metal flashing shall consist of not less than
   a) 1.73 mm thick sheet lead,
   b) 0.33 mm thick galvanized steel,
   c) 0.33 mm thick copper,
   d) 0.35 mm thick zinc, or
   e) 0.48 mm thick aluminum.

9.26.4.3. Valley Flashing

1) Where sloping surfaces of shingled roofs intersect to form a valley, the valley shall be flashed.
2) Valley flashing shall be installed over continuous sheathing.
3) Closed valleys shall not be used with rigid shingles on slopes of less than 1 in 1.2.
4) Open valleys shall be flashed with at least
   a) one layer of sheet metal not less than 600 mm wide, or
   b) 2 layers of roll roofing.
5) The bottom layer of roofing required in Sentence (4) shall consist of at least Type S smooth roll roofing or Type M mineral surface roll roofing (mineral surface down) not less than 457 mm wide, centred in the valley and fastened with nails spaced not more than 450 mm o.c. located 25 mm away from the edges.
6) The top layer of roofing required in Sentence (4) shall consist of at least Type M mineral surface roll roofing (mineral surface up), 914 mm wide, centred in the valley, applied over a 100 mm wide strip of cement along each edge of the bottom layer, and fastened with a sufficient number of nails to hold it in place until the shingles are applied.

9.26.4.4. Intersection of Shingle Roofs and Masonry

1) The intersection of shingle roofs and masonry walls or chimneys shall be protected with flashing.
2) Counter flashing required in Sentence (1) shall be embedded not less than 25 mm in the masonry and shall extend not less than 150 mm down the masonry and lap the lower flashing not less then 100 mm.
3) Flashing along the slopes of a roof described in Sentence (1) shall be stepped so that there is not less than a 75 mm head lap in both the lower flashing and counter flashing.
4) Where the roof described in Sentence (1) slopes upwards from the masonry, the flashing shall extend up the roof slope to a point equal in height to the flashing on the masonry, but not less than 1.5 times the shingle exposure.

9.26.4.5. Intersection of Shingle Roofs and Walls other than Masonry

1) The intersection of shingle roofs and walls clad with other than masonry shall be protected with flashing.
2) Flashing required in Sentence (1) shall be installed so that it extends up the wall not less than 75 mm behind the sheathing paper, and extends not less than 75 mm horizontally.
3) Along the slope of the roof, the flashing required in Sentence (1) shall be stepped with not less than a 75 mm head lap.

9.26.4.6. Intersection of Built-Up Roofs and Masonry

1) The intersection of built-up roofs with masonry walls or chimneys shall have a cant strip at the intersection, and a roofing membrane shall be mopped over the cant strip and not less than 150 mm up the wall.
2) Counter flashing installed over the intersection referred to in Sentence (1) shall be embedded not less than 25 mm in the masonry, and shall be of sufficient length to extend down not less than 150 mm, lapping the membrane on the masonry not less than 100 mm.
9.26.4.7. Intersection of Built-Up Roofs and Walls other than Masonry

1) The intersection of built-up roofs with walls clad with other than masonry shall have a cant strip at the intersection.
2) The roofing membrane shall be mopped over the cant strip referred to in Sentence (1).
3) Flashing plies shall extend not less than 150 mm up the wall referred to in Sentence (1) behind the sheathing paper.

9.26.4.8. Chimney Saddles

1) Except as otherwise permitted in Sentence (5), chimney saddles shall be installed where the upper side of a chimney on a sloping roof is more than 750 mm wide.
2) Chimney saddles shall be covered with sheet metal or roofing material of weight and quality equivalent to the roofing.
3) Saddles shall be flashed where they intersect the roof.
4) The intersection of the saddle and the chimney shall be flashed and counterflashed as described in Article 9.26.4.4.
5) A chimney saddle need not be installed if the intersection between the chimney and roof is protected by sheet metal flashing that extends up the chimney to a height equal to at least one sixth the width of the chimney, but not less than 150 mm, and up the roof slope to a point equal in height to the flashing on the chimney, but not less than 1.5 times the shingle exposure.
6) Flashing described in Sentence (5) at the chimney shall be counterflashed as required by Article 9.26.4.4.

9.26.5. Eave Protection for Shingles and Shakes

9.26.5.1. Required Eave Protection

1) Except as provided in Sentence (2), eave protection shall be provided on shingle, shake or tile roofs, extending from the edge of the roof a minimum of 900 mm up the roof slope to a line not less than 300 mm inside the inner face of the exterior wall.
2) Eave protection is not required
   a) over unheated garages, carports and porches,
   b) where the roof overhang exceeds 900 mm measured along the roof slope from the edge of the roof to the inner face of the exterior wall,
   c) on roofs of asphalt shingles installed in accordance with Subsection 9.26.8.,
   d) on roofs with slopes of 1 in 1.5 or greater, or
   e) in regions with 3 500 or fewer degree-days.

9.26.5.2. Materials

1) Eave protection shall be laid beneath the starter strip and shall consist of
   a) No. 15 asphalt-saturated felt laid in two plies lapped 480 mm and cemented together with lap cement,
   b) Type M or S roll roofing laid with not less than 100 mm head and end laps cemented together with lap cement,
   c) glass fibre or polyester fibre coated base sheets, or
   d) self-sealing composite membranes consisting of modified bituminous coated material.

9.26.6. Underlay beneath Shingles

1) Except as required in Sentence (2), when underlay is used beneath shingles, it shall be
   a) asphalt-saturated sheathing paper weighing not less than 0.195 kg/m², or
   b) No. 15 plain or perforated asphalt-saturated felt.
2) Underlay used beneath wood shingles shall be breather type.

9.26.6.2. Installation
1) When used with shingles, underlay shall be installed parallel to the eaves with head and end lap of not less than 50 mm.
2) The top edge of each strip of underlay referred to in Sentence (1) shall be fastened with sufficient roofing nails to hold it in place until the shingles are applied.
3) The underlay referred to in Sentence (1) shall overlap the eave protection by not less than 100 mm. (See Article 9.26.10.2. for underlay beneath wood shakes.)

9.26.7. Asphalt Shingles on Slopes of 1 in 3 or Greater

9.26.7.1. Coverage
1) Coverage shall be not less than 2 thicknesses of shingle over the entire roof, disregarding cutouts.

9.26.7.2. Starter Strip
1) A starter strip shall be installed along the lower edge of the roof so that it extends approximately 12 mm beyond the eaves and rake of the roof and fastened along the bottom edge with nails spaced not more than 300 mm o.c.
2) Starter strips shall be
   a) at least Type M mineral-surfaced roll roofing not less than 300 mm wide,
   b) shingles of the same weight and quality as those used as a roof covering with tabs facing up the roof slope, or
   c) pre-manufactured starter strips installed with sealant at the eaves.
3) Starter strips need not be provided where eave protection of not less than Type M mineral-surfaced roll roofing is provided.

9.26.7.3. Head Lap
1) Shingles shall have a head lap of not less than 50 mm.

9.26.7.4. Fasteners
1) Except as provided in Sentence (2), shingles shall be fastened with at least 4 nails or staples for 1 m wide shingles so that no nails or staples are exposed.
2) Where staples with an 11 mm crown are used, shingles shall be fastened with at least 6 staples.
3) Fasteners may be reduced for narrower shingles in proportion to the width of the shingle or when shingles incorporating interlocking devices are used.
4) Fasteners referred to in Sentences (1) and (2) shall be located 25 mm to 40 mm from each end of each strip shingle with other fasteners equally spaced between them.
5) Fasteners referred to in Sentences (1) and (2) shall be located not less than 12 mm above the tops of the cutouts.

9.26.7.5. Securing of Tabs
1) Shingle tabs shall be secured by a spot of plastic cement not exceeding 25 mm diam under the centre of each tab or by interlocking devices or self-sealing strips.

9.26.7.6. Hips and Ridges
1) Shingles on hips and ridges shall be applied so they extend not less than 100 mm on either side of the hip or ridge, and shall be lapped not less than 150 mm.
2) Shingles referred to in Sentence (1) shall be fastened with nails or staples on each side located not more than 25 mm from the edge and 25 mm above the butt of the overlying shingle.
9.26.7.7. Eave Protection
   1) Eave protection shall conform to Subsection 9.26.5.

9.26.7.8. Flashing
   1) Flashing shall conform to Subsection 9.26.4.

9.26.8. Asphalt Shingles on Slopes of less than 1 in 3

   1) Except for the first 2 courses, coverage shall be not less than 3 thicknesses of shingle over the entire roof, disregarding cutouts.

9.26.8.2. Starter Strip
   1) A starter strip shall be installed as in Article 9.26.7.2.
   2) Starter strips required in Sentence (1) shall be laid in a continuous band of cement not less than 200 mm wide.

9.26.8.3. Securing of Tabs
   1) Shingle tabs shall be secured with cold application cement applied at the rate of not less than 0.5 L/m² of cemented area, or hot application asphalt applied at the rate of 1 kg/m² of cemented area.

9.26.8.4. Securing of Shingle Courses
   1) The first course of shingles shall be secured by a continuous band of cement along the eaves applied so that the width of the band equals the shingle exposure plus 100 mm.
   2) The succeeding courses of shingles shall be secured by a continuous band of cement applied so that the width of the band equals the shingle exposure plus 50 mm.
   3) The band required in Sentence (2) shall be located not more than 50 mm above the butt of the overlying course of shingles.

9.26.8.5. Hips and Ridges
   1) Shingles on hips and ridges shall be not less than 300 mm wide applied to provide triple coverage.
   2) Shingles referred to in Sentence (1) shall be cemented to the roof shingles and to each other with a coat of cement and fastened with nails or staples located 40 mm above the butt of the overlying shingle and 50 mm from each edge.

9.26.8.6. Flashing
   1) Flashing shall conform to Subsection 9.26.4.

9.26.8.7. Fastening
   1) Shingles shall be fastened in accordance with Article 9.26.7.4.

9.26.9. Wood Roof Shingles

9.26.9.1. Decking
   1) Except as provided in Sentence 9.23.16.1.(1), deckings for wood-shingled roofs may be continuous or spaced.

9.26.9.2. Grade
   1) Western cedar shingles shall be not less than No. 2 grade.
   2) Eastern white cedar shingles shall be not less than B (clear) grade.
9.26.9.3. Size
1) Wood shingles shall be not less than 400 mm long and not less than 75 mm or more than 350 mm wide.

9.26.9.4. Spacing and Joints
1) Shingles shall be spaced approximately 6 mm apart and offset at the joints in adjacent courses not less than 40 mm so that joints in alternate courses are staggered.

9.26.9.5. Fastening
1) Shingles shall be fastened with 2 nails or staples located approximately 20 mm from the sides of the shingle and 40 mm above the exposure line.

9.26.9.6. Exposure
1) The exposure of wood roof shingles shall conform to Table 9.26.9.6.

9.26.9.7. Flashing
1) Flashing shall conform to Subsection 9.26.4.

9.26.9.8. Eave Protection
1) Eave protection shall conform to Subsection 9.26.5.

9.26.10. Cedar Roof Shakes

9.26.10.1. Size and Thickness
1) Shakes shall be not less than 450 mm long and not less than 100 mm nor more than 350 mm wide with a butt thickness of not more than 32 mm and not less than 9 mm.

9.26.10.2. Underlay
1) Where eave protection is not provided, an underlay conforming to the requirements in Article 9.26.6.1. for wood shingles shall be laid as a strip not less than 900 mm wide along the eaves.
2) A strip of material similar to that described in Sentence (1) not less than 450 mm wide shall be interlaid between each course of shakes with the bottom edge of the strip positioned above the butt line at a distance equal to double the exposure of the shakes.
3) Interlaid strips referred to in Sentence (2) shall be lapped not less than 150 mm at hips and ridges in a manner that will prevent water from reaching the roof sheathing.

9.26.10.3. Spacing and Joints
1) Shakes shall be spaced 6 mm to 9 mm apart and the joints in any one course shall be separated not less than 40 mm from joints in adjacent courses.
9.26.10.4. Fastening
1) Shakes shall be fastened with nails located approximately 20 mm from the sides of the shakes and 40 mm above the exposure line.

9.26.10.5. Exposure
1) The exposure of wood shakes shall not exceed
   a) 190 mm for shakes not less than 450 mm long, and
   b) 250 mm for shakes not less than 600 mm long.

9.26.10.6. Flashing
1) Flashing shall conform to Subsection 9.26.4.

9.26.10.7. Eave Protection
1) Eave protection shall conform to Subsection 9.26.5.

9.26.10.8. Grade
1) Shakes shall be not less than No. 1 or Handsplit grade.

9.26.11.1. Quantity of Materials
1) The quantities of bituminous materials used on built-up roofs shall conform to Table 9.26.11.1.

<table>
<thead>
<tr>
<th>Type of Roof</th>

</tbody>
</table>

9.26.11.2. Coal-Tar and Asphalt Products
1) Coal-tar products and asphalt products shall not be used together in built-up roof construction.

9.26.11.3. Roof Felts
1) Bitumen roofing felts shall be at least No. 15 felt.

9.26.11.4. Aggregate Surfacing
1) Aggregate used for surfacing built-up roofs shall be clean, dry and durable and shall consist of particles of gravel, crushed stone or air-cooled blast furnace slag having a size of from 6 mm to 15 mm.
2) The minimum amount of aggregate surfacing per square metre of roof surface shall be 15 kg gravel or crushed stone or 10 kg crushed slag.

9.26.11.5. Flashing
1) Flashing for built-up roofs shall conform to Subsection 9.26.4.
9.26.11.6. Number of Layers
   1) Built-up roofing shall consist of not less than 3 mopped-down layers of roofing felt flood coated with bitumen.

9.26.11.7. Installation of Layers
   1) In hot process applications each layer of bitumen-saturated felt shall be laid while the bitumen is hot, with each layer overlapping the previous one.
   2) The full width under each lap referred to in Sentence (1) shall be coated with bitumen so that in no place does felt touch felt.
   3) Felt shall be laid free of wrinkles and shall be rolled directly into the hot bitumen and broomed forward and outward from the centre to ensure complete adhesion.

9.26.11.8. Roofing over Wood-Based Sheathing
   1) Except as permitted in Sentence (2), built-up roofing applied over wood, plywood, OSB or waferboard roof sheathing shall be laid over an additional base layer of felt laid dry over the entire roof deck with not less than a 50 mm headlap and a 50 mm sidelp between each sheet.
   2) Where plywood, OSB or waferboard roof sheathing is used, the dry layer of felt required in Sentence (1) may be omitted when the joints are taped and the sheathing is primed with asphalt.

9.26.11.9. Attachment to Decking
   1) Roofing shall be securely attached to the decking or where insulation is applied above the deck, the insulation shall be securely attached to the deck before the first layer of felt is fastened to the insulation.

9.26.11.10. Cant Strips
   1) Except as permitted in Sentence (4), a cant strip shall be provided at the edges of roofs.
   2) At least 2 plies of the roofing membrane shall be carried over the top of the cant strip.
   3) Flashing shall extend over the top of the cant strip and be shaped to form a drip.
   4) The cant strip required in Sentence (1) need not be provided where a gravel stop is installed at the edge of roofs.
   5) The roofing membranes shall be carried over the edge of the roof before the gravel stop referred to in Sentence (4) is fastened and 2 plies of roofing membrane mopped to the top surface of the gravel stop before the flood coat is applied.
   6) The gravel stop referred to in Sentence (4) shall extend over the edge of the roof to form a drip or shall be flashed so that the flashing extends over the edge to form a drip.

   1) Wide selvage asphalt roofing shall provide double coverage over the entire roof surface.

   1) Plies of selvage roofing shall be cemented together to ensure a watertight joint.

   1) Sheet metal roofing shall be not less than
      a) 0.33 mm thick galvanized steel,
      b) 0.46 mm thick copper,
      c) 0.46 mm thick zinc,
d) 0.48 mm thick aluminum.

9.26.13.2 Support
1) Except as provided in Sentence 9.23.16.1.(1), where sheet metal roofing is not supported by roof decking but spans between spaced supports, the panels shall be designed to support the specified live loads for roofs.

1) Except as provided in Sentence 9.23.16.1.(1), where glass-reinforced polyester roofing panels are not supported by roof decking but span between spaced supports, the panels shall be designed to support the specified live roof loads.

9.26.15.1 Installation

9.26.16 Polyvinyl Chloride Sheet Roofing

9.26.16.1 Installation

9.26.17 Concrete Roof Tiles

9.26.17.1 Installation
1) Except as provided in Sentence 9.23.16.1.(1), concrete roof tiles shall be installed according to CAN/CSA-A220, “Concrete Roof Tiles.” (See Note A-9.26.17.1.(1).)

9.26.18 Roof Drains and Downspouts

9.26.18.1 Roof Drains
1) When roof drains are provided they shall conform to Part 7.

9.26.18.2 Downspouts
1) Where downspouts are provided and are not connected to a sewer, extensions shall be provided to carry rainwater away from the building in a manner which will prevent soil erosion.

9.26.18.3 Roof or Balcony Parapet Walls
1) Where a roof or balcony is entirely enclosed by parapet walls, a secondary means of drainage, such as scuppers or overflow outlets shall be installed in the parapet walls, in addition to drains. (See Note A-9.26.18.3.(1).)

Section 9.27 Cladding

9.27.1 Application
9.27.1.1. General
1) Where lumber, wood shingles, shakes, fibre-cement shingles, planks and sheets, plywood, OSB, waferboard, hardboard, vinyl, aluminum or steel, including trim and soffits, are installed as cladding on wood-frame walls exposed to precipitation, the cladding assembly shall comply with
   a) Subsections 9.27.2. to 9.27.12., or
   b) Part 5.
2) Where stucco is installed as cladding on wood-frame or masonry walls exposed to precipitation, the cladding assembly shall comply with
   a) Subsections 9.27.2. to 9.27.5., and Section 9.28., or
   b) Part 5.
3) Where masonry serves as cladding on wood-frame or masonry walls exposed to precipitation, the cladding assembly shall comply with
   a) Subsections 9.27.2. to 9.27.4., and Section 9.20., or
   b) Part 5.
4) Where asphalt shingles are installed as cladding on wood-frame walls exposed to precipitation, the cladding assembly shall comply with
   a) Subsections 9.26.7. and 9.27.2. to 9.27.4., or
   b) Part 5.
5) Where an exterior insulation finish system is installed as cladding on wood-frame, masonry, cold-formed steel stud or cast-in-place concrete walls exposed to precipitation, the cladding assembly shall comply with
   a) Subsections 9.25.5., 9.27.2. to 9.27.4., and 9.27.13., or
   b) Part 5.
   (See Note A-9.27.1.1.(5).)
6) Where cladding materials other than those described in Sentences (1) to (5) are installed, or where the cladding materials described in Sentences (1) to (5) are installed on substrates other than those identified in Sentences (1) to (5), the materials and installation shall comply with Part 5.

9.27.2. Required Protection from Precipitation
(See Note A-9.27.2.)

9.27.2.1. Minimizing and Preventing Ingress and Damage
1) Except where exterior walls are protected from precipitation or where it can be shown that precipitation ingress will not adversely affect occupant health or safety, exterior walls shall be designed and constructed to
   a) minimize the ingress of precipitation into the assembly, and
   b) prevent the ingress of precipitation into interior space.
   (See Note A-9.27.2.1.(1).)
2) Except where exterior walls are protected from specific mechanisms of deterioration, such as mechanical impact and ultraviolet radiation, exterior walls shall be designed and constructed to minimize the likelihood of their required performance being reduced to an unacceptable level as a result of those mechanisms.

9.27.2.2. Minimum Protection from Precipitation Ingress
(See Note A-9.27.2.2.)
1) Except as provided in Sentence (2), a cladding assembly is deemed to have a capillary break between the cladding and the backing assembly, where
   a) there is a drained and vented air space not less than 9.5 mm deep behind the cladding, over the full height and width of the wall (See also Article 9.27.5.3.),
   b) an open drainage material, not less than 9.5 mm thick and with a cross-sectional area that is not less than 80% open, is installed between the cladding and the backing, over the full height and width of the wall,
c) the cladding’s components are hollow-backed metal or vinyl and are the cladding is composed of non-insulating type, hollow backed aluminum or vinyl which is horizontally oriented and loosely fastened to the backing substrate,
d) the wall is a masonry cavity wall or the cladding is masonry veneer constructed according to Section 9.20., or
e) the cladding conforms to Subsection 9.27.13.

2) The drained and vented air space, and drainage material described in Sentence (1) may be interrupted by
   a) penetrations for windows, doors and services,
   b) flashing,
   c) nominally vertical furring or strapping, provided the furring or strapping does not make up more than 20% of the drained and vented air space, and
   d) insect screen, provided the screen allows for drainage and venting of the airspace.

3) Where a construction projects over the top of the drained and vented air space described in Clause (1)(a) or over the drainage material described in Clause (1)(b), the air space or drainage material shall not be contiguous with concealed spaces in the projecting construction.

4) Exterior walls exposed to precipitation shall be protected against precipitation ingress by an exterior cladding assembly consisting of a first plane of protection and a second plane of protection, where such walls enclose spaces of residential occupancy or spaces that directly serve spaces of residential occupancy.

5) Except as provided in Sentence (6), exterior walls exposed to precipitation shall be protected against precipitation ingress by an exterior cladding assembly consisting of a first plane of protection and a second plane of protection incorporating a capillary break, where
   a) the number of degree-days is less than 3 400 and the moisture index is greater than 0.90, or
   b) the number of degree-days is 3 400 or more, and the moisture index is greater than 1.00.
   (See Sentence 1.1.3.1.(1) and Appendix C for information on the moisture index.)

6) In exterior walls described in Sentence (5), the first and second planes of protection need not incorporate a capillary break, where
   a) it can be shown that omitting the capillary break will not adversely affect the performance of the building assemblies,
   b) the building is an accessory building, or
   c) the wall
      i) is constructed of non-moisture-sensitive materials, and intersecting or supported floors are also constructed of non-moisture-sensitive materials, or
      ii) is constructed as a mass wall of sufficient thickness to minimize the transfer of moisture to the interior.

9.27.2.3. First and Second Planes of Protection
1) Where walls required to provide protection from precipitation comprise cladding assemblies with first and second planes of protection,
   a) the first plane of protection shall
      i) consist of cladding with appropriate trim, accessory pieces and fasteners, and
      ii) be designed and constructed to minimize the passage of rain and snow into the wall by minimizing holes and managing precipitation ingress caused by the kinetic energy of raindrops, surface tension, capillarity, gravity, and air pressure differences (See Subsection 9.27.4.),
   b) the second plane of protection shall be designed and constructed to (See Subsection 9.27.3.)
      i) intercept all rain and snow that gets past the first plane of protection, and
      ii) effectively dissipate any rain or snow to the exterior, and
   c) the protection provided by the first and second planes of protection shall be maintained
      i) at wall penetrations created by the installation of components and services such as windows, doors, ventilation ducts, piping, wiring and electrical outlets, and
ii) at the interface with other wall assemblies.

9.27.2.4. Protection of Cladding from Moisture

1) A clearance of not less than 200 mm shall be provided between finished ground and cladding that is adversely affected by moisture, such as untreated wood, plywood, OSB, waferboard and hardboard.

2) A clearance of not less than 50 mm shall be provided between a roof surface and cladding that is adversely affected by moisture, such as untreated wood, plywood, OSB, waferboard and hardboard.

9.27.3. Second Plane of Protection

9.27.3.1. Elements of the Second Plane of Protection

(See Note A-9.27.3.1.)

1) The second plane of protection shall consist of a drainage plane having an appropriate inner boundary and flashing to dissipate rainwater to the exterior.

2) Except for cladding systems conforming to Subsection 9.27.13., the inner boundary of the drainage plane shall comply with Articles 9.27.3.2. to 9.27.3.6.

3) The protection provided by the second plane of protection shall be maintained
   a) at wall penetrations created by the installation of components and services such as windows, doors, ventilation ducts, piping, wiring and electrical outlets, and
   b) at the interface with other wall assemblies.

4) Flashing material and its installation shall comply with Articles 9.27.3.7. and 9.27.3.8.

9.27.3.2. Sheathing Membrane Material Standard

1) Sheathing membranes shall conform to the performance requirements of CAN/CGSB-51.32-M, “Sheathing, Membrane, Breather Type.”

9.27.3.3. Required Sheathing Membrane and Installation

1) Except as provided in Articles 9.27.3.4. to 9.27.3.6., at least one layer of sheathing membrane shall be applied beneath cladding.

2) Sheathing membrane required in Sentence (1) shall be applied so that joints are lapped not less than 100 mm.

3) Where sheathing membrane required in Sentence (1) is applied horizontally, the upper sheets shall overlap the lower sheets.

9.27.3.4. Insulating Sheathing in lieu of Sheathing Membrane

1) Where non-wood-based rigid exterior insulating sheathing, or exterior insulating sheathing with an integral sheathing membrane is installed, a separate sheathing membrane is not required.

2) Where insulating sheathing is installed as provided in Sentence (1),
   a) sheathing panels subject to moisture deterioration shall be sealed at all joints, and
   b) the joints of sheathing panels not subject to moisture deterioration shall be
      i) sealed at all joints, or
      ii) lapped or tongue and groove, and detailed to ensure drainage of water to the exterior.

(See Note A-9.27.3.4.(2).)

9.27.3.5. Sheathing Membranes in lieu of Sheathing

1) Except as provided in Article 9.27.3.6., where no sheathing is used, at least 2 layers of sheathing membrane shall be applied beneath the cladding. (See Article 9.23.17.1. and Note A-9.27.3.5.(1).)

2) All joints in the sheathing membrane required in Sentence (1) shall occur over framing, and the membrane shall be fastened to the framing with roofing nails or staples spaced not more than 150 mm along the edges of the outer layer of sheathing membrane.
3) Wall sheathing is permitted to be used in lieu of one layer of sheathing membrane required in Sentence (1), and its thickness need not conform to Table 9.23.17.2.-A.

9.27.3.6. Face Sealed Cladding

(See Note A-9.27.3.6.)

1) Sheathing membrane is permitted to be omitted beneath cladding when the joints in the cladding are formed to effectively prevent the passage of wind and rain in conformance with Sentences (2) or (3), as applicable.

2) Cladding consisting of sheets of plywood, hardboard, OSB, waferboard or fibre cement is considered to meet the requirements of Sentence (1), provided the cladding is applied so that
   a) all edges are directly supported by framing,
   b) the vertical joints between adjacent sheets are sealed and
      i) covered with battens,
      ii) shiplapped, or
      iii) otherwise matched to provide weathertight joints, and
   c) the horizontal joints between adjacent sheets are sealed and
      i) shiplapped, or
      ii) otherwise matched to provide weathertight joints.

3) Metal siding consisting of sheets of metal is considered to meet the requirements of Sentence (1) where the joints between sheets are of the locked-seam type.

9.27.3.7. Flashing Materials

1) Flashing shall consist of not less than
   a) 1.73 mm thick sheet lead,
   b) 0.33 mm thick galvanized steel,
   c) 0.46 mm thick copper,
   d) 0.46 mm thick zinc,
   e) 0.48 mm thick aluminum, or
   f) 1.02 mm thick vinyl.

9.27.3.8. Flashing Installation

1) Except as provided in Sentence (2), flashing shall be installed at
   a) every horizontal junction between cladding elements,
   b) every horizontal offset in the cladding, and
   c) every horizontal line where the cladding substrates change and where
      i) the substrates differ sufficiently for stresses to be concentrated along that line, or
      ii) the installation of the cladding on the lower substrate may compromise the drainage of moisture from behind the cladding above.

(See Note A-9.27.3.8.(1.).)

2) Flashing need not be installed as described in Sentence (1)
   a) where the upper cladding elements overlap the lower cladding elements by not less than 25 mm,
   b) where
      i) the cladding above and below the joint is installed outboard of a drained and vented air space (See Clause 9.27.2.2.(1)(a)), and
      ii) the horizontal detail is constructed so as to minimize the ingress of precipitation into the air space, or
   c) at horizontal construction joints in stucco, where
      i) the joint is finished with an expansion-contraction strip, and
      ii) the cladding is installed outboard of a drained and vented air space (See Clause 9.27.2.2.(1)(a)).
3) Flashing shall be installed over exterior wall openings where the vertical distance from the bottom of the eave to the top of the trim is more than one-quarter of the horizontal overhang of the eave. (See Note A-9.27.3.8.(3).)

4) Flashing described in Sentences (1) and (3) shall
   a) extend not less than 50 mm upward inboard of the sheathing membrane or sheathing installed in lieu of the sheathing membrane (See Article 9.27.3.4.),
   b) have a slope of not less than 6% toward the exterior after the expected shrinkage of the building frame,
   c) terminate at each end with an end-dam
      i) with a height in millimetres not less than 25 mm or 1/10 the value of the 1-in-5 driving rain wind pressure in Pa, and
      ii) at the height defined in Subclause (c)(i), extending to the face of the adjacent cladding, lap not less than 10 mm vertically over the building element below, and
   d) terminate in a drip offset not less than 5 mm outward from the outer face of the building element below.
(See Note A-9.27.3.8.(4).)

5) Where the sills of windows and doors installed in exterior walls are not self-flashing, flashing shall be installed between the underside of the window or door and the wall construction below. (See Note A-9.27.3.8.(5).)

9.27.4. Sealants

9.27.4.1. Required Sealants
   1) Sealant shall be provided where required to prevent the entry of water into the structure.
   2) Sealant shall be provided between masonry, siding or stucco and the adjacent door and window frames or trim, including sills, unless such locations are completely protected from the entry of rain.
   3) Sealant shall be provided at vertical joints between different cladding materials unless the joint is suitably lapped or flashed to prevent the entry of rain. (See Articles 9.7.6.2., 9.20.13.12. and 9.28.1.5.)

9.27.4.2. Materials
   1) Sealants shall be
      a) a non-hardening type suitable for exterior use,
      b) selected for their ability to resist the effects of weathering, and
      c) compatible with and adhere to the substrate to which they are applied.
(See Note A-9.27.4.2.(1).)
   2) Sealants shall conform to
      a) ASTM C 834, “Latex Sealants,”
      b) ASTM C 920, “Elastomeric Joint Sealants,”
      c) ASTM C 1184, “Structural Silicone Sealants,” or
   3) Backer rod shall conform to ASTM C 1330, “Cylindrical Sealant Backing for Use with Cold Liquid-Applied Sealants.” (See Note A-9.27.4.2.(1).)

9.27.5. Attachment of Cladding

9.27.5.1. Attachment
   1) Except as permitted by Sentences (2) to (6), cladding shall be fastened to the framing members or furring members, or to blocking between the framing members.
   2) Vertical lumber and stucco lath or reinforcing are permitted to be attached to sheathing only where the sheathing consists of not less than
      a) 14.3 mm lumber,
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

b) 12.5 mm plywood, or
c) 12.5 mm OSB or waferboard.

3) Vertically applied metal siding and wood shingles and shakes are permitted to be attached to the
sheathing only where the sheathing consists of not less than
   a) 14.3 mm lumber,
   b) 7.5 mm plywood, or
   c) 7.5 mm OSB or waferboard.

4) Where wood shingles or shakes are applied to sheathing which is not suitable for attaching the shingles
or shakes, the shingles or shakes are permitted to be attached to a wood lath not less than 38 mm by 9.5
mm thick securely nailed to the framing and applied as described in Article 9.27.7.5.

5) Reserved.

6) Reserved.

9.27.5.2. Blocking
   1) Blocking for the attachment of cladding shall be not less than 38 mm by 38 mm lumber securely nailed to
      the framing and spaced not more than 600 mm o.c.

9.27.5.3. Furring
   1) Except as permitted in Sentences 9.27.5.1.(4) and (5), furring for the attachment of cladding shall be not
      less than 19 mm by 38 mm lumber when applied over sheathing.
   2) When applied without sheathing, furring referred to in Sentence (1) shall be not less than
      a) 19 mm by 64 mm lumber on supports spaced not more than 400 mm o.c., or
      b) 19 mm by 89 mm lumber on supports spaced not more than 600 mm o.c.
   3) Furring referred to in Sentence (1) shall be
      a) securely fastened to the framing, and
      b) spaced not more than 600 mm o.c.

9.27.5.4. Size and Spacing of Fasteners
   1) Nail or staple size and spacing for the attachment of cladding and trim shall conform to Table 9.27.5.4.

Table 9.27.5.4. Attachment of Cladding
   Forming Part of Sentence 9.27.5.4.(1)

9.27.5.5. Fastener Materials

1) Nails or staples for the attachment of cladding and wood trim shall be corrosion-resistant and shall be compatible with the cladding material.

9.27.5.6. Expansion and Contraction

1) Fasteners for metal or vinyl cladding shall be positioned to permit expansion and contraction of the cladding.

9.27.5.7. Penetration of Fasteners

1) Fasteners for shakes and shingles shall penetrate through the nail-holding base or not less than 19 mm into the framing.
2) Fasteners for cladding other than that described in Sentence (1) shall penetrate through the nail-holding base or not less than 25 mm into the framing.

9.27.6. Lumber Siding

9.27.6.1. Materials

1) Lumber siding shall be sound, free of knot holes, loose knots, through checks or splits.

9.27.6.2. Thickness and Width

1) Drop, rustic, novelty, lapped board and vertical wood siding shall be not less than 14.3 mm thick and not more than 286 mm wide.
2) Bevel siding shall be
   a) not less than 5 mm thick at the top, and
   b) not less than
      i) 12 mm thick at the butt for siding 184 mm or less in width, and
      ii) 14.3 mm thick at the butt for siding wider than 184 mm.
3) Bevel siding shall be not more than 286 mm wide.

9.27.6.3. Joints

1) Lumber siding shall prevent water from entering at the joints by the use of lapped or matched joints or by vertical wood battens.
2) Siding shall overlap not less than 1 mm per 16 mm width of lumber, but not less than
   a) 9.5 mm for matched siding,
   b) 25 mm for lapped bevel siding, or
   c) 12 mm for vertical battens.

9.27.7. Wood Shingles and Shakes
9.27.7.1. Materials
1) Shingles and shakes shall conform to
   a) CSA O118.1, “Western Red Cedar Shakes and Shingles,” or
   b) CSA O118.2, “Eastern White Cedar Shingles.”
2) Western cedar shakes shall be not less than No. 1 or Handsplit grade, and western cedar shingles not less than No. 2 grade, except that No. 3 grade may be used for undercoursing.
3) Eastern white cedar shingles shall be at least B (clear) grade, except that C grade may be used for the lower course of double course applications.

9.27.7.2. Width
1) Shingles and shakes shall be not less than 65 mm or more than 350 mm wide.

9.27.7.3. Fasteners
1) Shingles or shakes shall be fastened with nails or staples located approximately 20 mm from each edge and not less than 25 mm above the exposure line for single-course applications, or approximately 50 mm above the butt for double-course applications.

9.27.7.4. Offsetting of Joints
1) In single-course application, joints in succeeding courses shall be offset not less than 40 mm so that joints in any 2 of 3 consecutive courses are staggered.
2) In double-course application, joints in the outer course shall be offset from joints in the under-course by not less than 40 mm, and joints in succeeding courses shall be offset not less than 40 mm.

9.27.7.5. Fastening to Lath
1) When lath is used with double-course application (See Sentence 9.27.5.1.(4)), it shall be spaced according to the exposure and securely fastened to the framing.
2) The butts of the under-course of the application referred to in Sentence (1) shall rest on the top edge of the lath.
3) The outer course of the application referred to in Sentence (1) shall be fastened to the lath with nails of sufficient length to penetrate through the lath.
4) The butts of the shingles or shakes shall be so located that they project not less than 12 mm below the bottom edge of the lath referred to in Sentence (1).
5) If wood lath is not used, the butts of the under-course shingles or shakes of the application referred to in Sentence (1) shall be located 12 mm above the butts of the outer course.

9.27.7.6. Exposure and Thickness
1) The exposure and butt thickness of shingles and shakes shall conform to Table 9.27.7.6.

<table>
<thead>
<tr>

</table>
9.27.8. Plywood

9.27.8.1. Material Standards
1) Plywood cladding shall be exterior type conforming to
a) ANSI/HPVA HP-1, "Hardwood and Decorative Plywood,"
b) CSA O121, "Douglas Fir Plywood,"
c) CSA O151, "Canadian Softwood Plywood," or
d) CSA O153, "Poplar Plywood."

9.27.8.2. Thickness
1) Plywood cladding shall be not less than 6 mm thick when applied directly to sheathing.
2) When applied directly to framing or over furring strips, plywood cladding thickness shall conform to Table 9.27.8.2.

<table>
<thead>
<tr>
<th>Spacing of Supports, mm</th>
<th>Minimum Thickness, mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Face Grain Parallel to Supports</td>
</tr>
<tr>
<td>400</td>
<td>8</td>
</tr>
<tr>
<td>600</td>
<td>11</td>
</tr>
</tbody>
</table>

3) The thickness of grooved or textured plywood cladding shall be measured at the point of least thickness.

9.27.8.3. Edge Treatment
1) The edges of plywood cladding shall be treated with a suitable paint or sealer.

9.27.8.4. Panel Cladding
1) Plywood applied in panels shall have all edges supported.
2) Not less than a 2 mm gap shall be provided between panels referred to in Sentence (1).
3) Vertical joints in cladding referred to in Sentence (1) shall be protected with batten strips or sealant when the plywood joints are not matched.
4) Horizontal joints in cladding referred to in Sentence (1) shall be lapped not less than 25 mm or shall be suitably flashed.

9.27.8.5. Lapped Strip Siding
1) Plywood applied in horizontal lapped strips shall have not less than a 2 mm gap provided at the butted ends, which shall be caulked.
2) The horizontal joints of siding described in Sentence (1) shall be lapped not less than 25 mm.
3) Wedges shall be inserted under all vertical butt joints and at all corners when horizontal lapped plywood is applied without sheathing.

9.27.9. Hardboard

9.27.9.1. Material Standards
1) Factory-finished hardboard cladding shall conform to CAN/CGSB-11.5-M, "Hardboard, Precoated, Factory Finished, for Exterior Cladding."
2) Hardboard cladding that is not factory finished shall conform to Types 1, 2 or 5 in CAN/CGSB-11.3-M, "Hardboard."

9.27.9.2. Thickness
1) Type 1 or 2 hardboard cladding shall be not less than
   a) 6 mm thick when applied over sheathing that provides continuous support, and
   b) 7.5 mm thick when applied over furring or framing members not more than 400 mm o.c.
2) Type 5 hardboard cladding shall be not less than 9 mm thick when applied over sheathing that provides continuous support or over furring or framing members spaced not more than 400 mm o.c.
3) Where hardboard cladding is grooved, the grooves shall not extend more than 1.5 mm into the minimum required thickness. (See Note A-9.27.9.2.(3).)

9.27.9.3. Panel Cladding
1) Hardboard cladding applied in panels shall have all edges supported with not less than a 5 mm gap provided between sheets.
2) Vertical joints in cladding described in Sentence (1) shall be protected with batten strips or sealant when the joints are not matched.
3) Horizontal joints in cladding described in Sentence (1) shall be lapped not less than 25 mm or shall be suitably flashed.

9.27.9.4. Lapped Strip Siding
1) Hardboard applied in horizontal lapped strips shall have not less than a 5 mm gap provided at the butted ends, which shall be sealed or otherwise protected with suitable mouldings.
2) The horizontal joints of siding described in Sentence (1) shall overlap not less than 1 mm per 16 mm width of siding board but not less than 9.5 mm for matched joint siding or 25 mm for lapped siding.

9.27.9.5. Clearance
1) Not less than 3 mm clearance shall be provided between hardboard cladding and door or window frames.

9.27.10. OSB and Waferboard

9.27.10.1. Material Standard
1) OSB and waferboard cladding shall conform to CSA O437.0, “OSB and Waferboard.”

9.27.10.2. Thickness
1) OSB conforming to O-2 grade shall be not less than 6.0 mm thick where applied directly to sheathing.
2) OSB conforming to O-2 grade applied directly to framing or over furring strips shall conform to the thickness shown for plywood in Table 9.27.8.2. (See Note A-9.27.10.2.(2).)
3) OSB conforming to O-1 grade and waferboard conforming to R-1 grade shall be not less than 7.9 mm thick where applied directly to sheathing.
4) Where applied directly to framing or over furring strips, OSB conforming to O-1 grade and waferboard conforming to R-1 grade shall be not less than
   a) 9.5 mm thick on supports spaced not more than 400 mm o.c., and
   b) 12.7 mm thick on supports spaced not more than 600 mm o.c.

9.27.10.3. Panel Cladding
1) OSB and waferboard applied in panels shall have all edges supported and treated with a primer or sealer.
2) Not less than a 3 mm gap shall be provided between sheets in cladding described in Sentence (1).
3) Vertical joints in cladding described in Sentence (1) shall be protected with batten strips or sealant when the OSB and waferboard joints are not matched.
4) Horizontal joints in cladding described in Sentence (1) shall be lapped not less than 25 mm or shall be suitably flashed.

9.27.10.4.Clearance
1) Not less than a 3 mm clearance shall be provided between OSB and waferboard cladding and door or window frames.

9.27.11. Metal

9.27.11.1.Material Standards
1) Horizontal and vertical strip steel siding, including flashing and trim accessories, shall conform to CAN/CGSB-93.4, “Galvanized Steel and Aluminum-Zinc Alloy Coated Steel Siding, Soffits and Fascia, Prefinished, Residential.”
2) Steel sheet cladding shall have a minimum thickness of 0.3 mm and conform to CAN/CGSB-93.3-M, “Prefinished Galvanized and Aluminum-Zinc Alloy Steel Sheet for Residential Use.”
3) Horizontal and vertical strip aluminum siding, including flashing and trim accessories, shall conform to CAN/CGSB-93.2-M, “Prefinished Aluminum Siding, Soffits, and Fascia, for Residential Use.” (See Note A-9.27.11.1.(3) and (4).)
4) Aluminum sheet cladding shall conform to CAN/CGSB-93.1-M, “Sheet, Aluminum Alloy, Prefinished, Residential,” and shall have a thickness of not less than 0.58 mm, except that siding supported by backing or sheathing shall have a thickness of not less than 0.46 mm. (See Note A-9.27.11.1.(3) and (4).)

9.27.12. Vinyl Siding

9.27.12.1.Material Standard
1) Vinyl siding, including flashing and trim accessories, shall conform to CAN/CGSB-41.24, “Rigid Vinyl Siding, Soffits and Fascia.”

9.27.12.2.Attachment
1) The attachment of vinyl siding shall conform to the requirements in Subsection 9.27.5. for metal siding.

9.27.13. Exterior Insulation Finish Systems

9.27.13.1.Application
1) Except as provided in Sentence (2), this Subsection applies to exterior insulation finish systems (EIFS) that
   a) are covered in the scope of CAN/ULC-S716.1, “Exterior Insulation and Finish Systems (EIFS) - Materials and Systems,” and
   b) have a geometrically defined drainage cavity with a minimum cavity depth of 9.5 mm and an open area equal to not less than 13% of the area of a full-size EIFS panel.
(See Note A-9.27.13.1.(1).)
2) EIFS that are not covered by Sentence (1) shall comply with Part 5.

9.27.13.2.Materials
2) The substrate on which the EIFS is installed shall
   a) be compatible with that particular system (See Note A-9.27.13.2.(2)(a)), and
   b) comply with the structural requirements for sheathing materials stated in Section 9.23.

9.27.13.3.Design and Installation
1) The design and installation of EIFS on the substrate described in Sentence 9.27.13.2.(2) shall comply with

Section 9.28. Stucco

9.28.1. General

9.28.1.1. Sheathing beneath Stucco
   1) Sheathing shall be provided beneath stucco applied over wood-frame walls except as permitted in Article 9.28.4.2.
   2) Where applied beneath stucco, sheathing shall conform to Subsection 9.23.17.

9.28.1.2. Lath and Reinforcing
   1) Stucco lath or reinforcing shall be used to attach stucco to any substrate other than masonry.
   2) Stucco lath or reinforcing shall be used to attach stucco to masonry where
      a) the masonry is soft-burned tile or brick of less strength than the stucco, or
      b) the masonry surface is not sound, clean and sufficiently rough to provide a good key.
   3) Stucco applied over masonry chimneys shall be reinforced.

9.28.1.3. Concrete Masonry Units
   1) Stucco finish shall not be applied over concrete masonry units less than one month old unless the units have been cured by the autoclave process.

9.28.1.4. Clearance over Ground Level
   1) Stucco shall be not less than 200 mm above finished ground level except when it is applied over concrete or masonry.

9.28.1.5. Flashing and Caulking
   1) Flashing and caulking used with stucco shall conform to Subsections 9.27.3. and 9.27.4., except that if aluminum flashing is used, it shall be separated from the stucco by an impervious membrane or coating. (See Article 9.7.6.2. for caulking around window frames.)

9.28.2. Stucco Materials

9.28.2.1. Portland Cement
   1) Portland cement shall conform to CSA A3001, “Cementitious Materials for Use in Concrete.”

9.28.2.2. Aggregate
   1) Aggregate shall be clean, well-graded natural sand or sand manufactured from crushed stone, gravel or air-cooled blast furnace slag and shall contain no significant amounts of deleterious material.
   2) Aggregate grading shall conform to Table 9.28.2.2.

<table>
<thead>

</table>

9.28.2.3. Water
1) Water shall be clean and free of significant amounts of deleterious material.

9.28.3. Fasteners

9.28.3.1. Materials
1) Fasteners for stucco lath or reinforcing shall be corrosion-resistant and of a material other than aluminum.

9.28.3.2. Nails and Staples
1) Nails for stucco lath or reinforcing shall be not less than 3.2 mm diam with a head diameter of not less than 11.1 mm.
2) Staples for stucco lath or reinforcing shall be not less than 1.5 mm diam or thickness.
3) Staples and nails for attaching stucco lath or reinforcing to vertical surfaces shall be of sufficient length to penetrate 25 mm into framing members or to the full depth of the sheathing where the sheathing is used for attachment.
4) On horizontal surfaces nails for stucco lath or reinforcing shall be not less than 38 mm long.

9.28.4. Stucco Lath

9.28.4.1. Materials
1) Rib lath or expanded metal stucco mesh shall be
   a) copper-alloy steel coated with rust-inhibitive paint after fabrication, or
   b) galvanized.
2) Woven or welded wire mesh shall be galvanized.

9.28.4.2. No Sheathing Required
1) Sheathing need not be provided beneath stucco where not less than 1.19 mm diam galvanized wire is applied horizontally to the framing at vertical intervals of not more than 150 mm, or where paper-backed welded wire metal lath is used.

9.28.4.3. Stucco Lath Specifications
1) Stucco lath shall conform to Table 9.28.4.3.
Table 9.28.4.3.

Notes to Table 9.28.4.3.:  
(1) See Note A-Table 9.28.4.3.  
(2) Wire with other than a circular cross-section is acceptable if its cross-sectional area is equal to or greater than that of the wire listed.

9.28.4.4. Self-Furring Devices  
1) Stucco lath shall be held not less than 6 mm away from the backing by means of suitable self-furring devices.

9.28.4.5. Application of Stucco Lath  
1) Stucco lath shall be applied with the long dimension horizontal.  
2) Horizontal and vertical joints in stucco lath shall be lapped not less than 50 mm.  
3) End joints of stucco lath shall be staggered and shall occur over framing members.  
4) External corners of stucco lath shall be reinforced with a vertical strip of lath or reinforcing extending not less than 150 mm on both sides of the corner, or the lath or reinforcing shall extend around corners not less than 150 mm.

9.28.4.6. Fastening  
1) Stucco lath shall be fastened in conformance with Subsection 9.27.5.  
2) Fasteners on vertical surfaces shall be spaced not more than  
   a) 150 mm o.c. vertically and 400 mm o.c. horizontally, or  
   b) 100 mm o.c. vertically and 600 mm o.c. horizontally.  
3) Nailing patterns other than those required in Sentence (2) are permitted to be used provided there are at least 20 fasteners per square metre of wall surface.  
4) Fasteners on horizontal surfaces shall be spaced not more than  
   a) 150 mm o.c. along the framing members when members are spaced not more than 400 mm o.c., and  
   b) 100 mm o.c. along members when members are spaced not more than 600 mm o.c.

9.28.5. Stucco Mixes  

9.28.5.1. Mixes  
1) Stucco mixes shall conform to Table 9.28.5.1.
### Table 9.28.5.1. Stucco Mixes
Forming Part of Sentence 9.28.5.1.(1)

<table>
<thead>

</tbody>
</table>

9.28.5.2. Pigments
1) Pigment if used shall consist of pure mineral oxides inert to the action of sun, lime and cement.
2) Pigment shall not exceed 6% of the Portland cement by weight.

9.28.5.3. Mixing
1) Materials shall be thoroughly mixed before and after water is added.
2) Stucco shall be applied not later than 3 h after the initial mixing.

9.28.6. Stucco Application

9.28.6.1. Low Temperature Conditions
1) The base for stucco shall be maintained above freezing.
2) Stucco shall be maintained at a temperature of not less than 10°C during application, and for not less than 48 h afterwards.

9.28.6.2. Number of Coats and Total Thickness
1) Stucco shall be applied with at least 2 base coats and one finish coat, providing a total thickness of not less than 15 mm, measured from the face of the lath or the face of the masonry where no lath is used.

9.28.6.3. First Coat
1) The first coat shall be not less than 6 mm thick, measured from the face of the lath or masonry, fully embedding the lath.
2) The surface of the first coat shall be scored to provide a key with the second coat.

9.28.6.4. Second Coat
1) The second coat shall be not less than 6 mm thick.
2) The surface of the second coat shall be lightly roughened to provide a key with the finish coat if the finish coat is other than stone dash.

9.28.6.5. Finish Coat
1) When the finish coat is other than stone dash, the base shall be dampened but not saturated before the finish coat is applied.
2) The thickness of the finish coat shall be not less than 3 mm.
3) When a stone dash finish is used, the stone shall be partially embedded in the second coat before the second coat starts to set or stiffen.
Section 9.29. Interior Wall and Ceiling Finishes

9.29.1. General

9.29.1.1. Fire Protection and Sound Control
1) A wall or ceiling finish shall also conform to the appropriate requirements in Sections 9.10. and 9.11., in addition to the requirements in this Section.

9.29.2. Waterproof Wall Finish

9.29.2.1. Where Required
1) Waterproof finish shall be provided to a height of not less than
   a) 1.8 m above the floor in shower stalls,
   b) 1.2 m above the rims of bathtubs equipped with showers, and
   c) 400 mm above the rims of bathtubs not equipped with showers.

9.29.2.2. Materials
1) Waterproof finish shall consist of ceramic, plastic or metal tile, sheet vinyl, tempered hardboard, laminated thermosetting decorative sheets or linoleum.

9.29.3. Wood Furring

9.29.3.1. Size and Spacing of Furring
1) Wood furring for the attachment of wall and ceiling finishes shall conform to Table 9.29.3.1.

<table>
<thead>
<tr>
<th>Maximum Spacing of Furring, mm</th>
<th>Minimum Size of Furring, mm</th>
</tr>
</thead>

</tbody>
</table>

9.29.3.2. Fastening
1) Furring shall be fastened to the framing or to wood blocks with not less than 51 mm nails.

9.29.4. Plastering

9.29.4.1. Application
1) Application of plaster wall and ceiling finishes, including installation of metal or gypsum lath, shall conform to CSA A82.30-M, “Interior Furring, Lathing and Gypsum Plastering.”

9.29.5. Gypsum Board Finish (Taped Joints)
9.29.5.1. Application
1) The requirements for application of gypsum board in this Subsection apply to the single layer application of gypsum board to wood furring or framing using nails or screws.
2) Gypsum board applications not described in this Subsection shall conform to CSA A82.31-M, “Gypsum Board Application.”

9.29.5.2. Materials
1) Gypsum products shall conform to
   a) ASTM C 1178/C 1178M, “Coated Glass Mat Water-Resistant Gypsum Backing Panel,” or
   b) ASTM C 1396/C 1396M, “Gypsum Board,” except that the flame-spread rating of gypsum board shall be determined in accordance with CAN/ULC-S102, “Test for Surface Burning Characteristics of Building Materials and Assemblies.”

9.29.5.3. Maximum Spacing of Supports
1) Maximum spacing of supports for gypsum board applied as a single layer shall conform to Table 9.29.5.3.

9.29.5.4. Support of Insulation
1) Gypsum board supporting insulation shall be not less than 12.7 mm thick.

9.29.5.5. Length of Fasteners
1) The length of fasteners for gypsum board shall conform to Table 9.29.5.5., except that lesser depths of penetration are permitted for assemblies required to have a fire-resistance rating provided it can be shown, on the basis of fire tests, that such depths are adequate for the required rating.

9.29.5.6. Nails
1) Nails for fastening gypsum board to wood supports shall conform to
   a) ASTM F 1667, “Driven Fasteners: Nails, Spikes, and Staples,” or
   b) CSA B111, “Wire Nails, Spikes and Staples.”

9.29.5.7. Screws
1) Screws for fastening gypsum board to wood supports shall conform to ASTM C 1002, “Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs.”

9.29.5.8. Spacing of Nails
1) For single-layer application on a ceiling, nails shall be spaced
   a) not more than 180 mm o.c. on ceiling supports, or
   b) every 300 mm o.c. along ceiling supports, in pairs about 50 mm apart.
2) Where the ceiling sheets are supported by the wall sheets around the perimeter of the ceiling, this support may be considered as equivalent to nailing at this location.
3) Except as required by Sentence (4), for single-layer application on walls, nails shall be spaced
   a) not more than 200 mm o.c. on vertical wall supports, or
   b) every 300 mm o.c. along vertical wall supports, in pairs about 50 mm apart.
4) For single-layer application on walls, where gypsum board provides required bracing in braced wall panels, lateral support for studs, or fire protection, nails shall be spaced not more than 200 mm o.c. on
   a) vertical wall supports, and
   b) top and bottom plates.
   (See Article 9.23.10.2. and Section 9.10.)
5) The uppermost nails on vertical wall supports shall be not more than 200 mm below the ceiling.
6) Nails shall be located not less than 10 mm from the side or edge of the board.
7) Nails shall be driven so that the heads do not puncture the paper.

9.29.5.9. Spacing of Screws
1) For single-layer application on a ceiling, screws shall be spaced not more than 300 mm o.c. on ceiling supports.
2) Where the ceiling sheets are supported by the wall sheets around the perimeter of the ceiling, this support may be considered as equivalent to screwing at this location.
3) Except as required by Sentence (4), for single-layer application on walls, screws shall be spaced
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

a) not more than 300 mm o.c. on vertical wall supports where the supports are more than 400 mm o.c., or
b) not more than 400 mm o.c. on vertical wall supports where the supports are not more than 400 mm o.c.

4) Except as provided in Sentence (5), for single-layer application on walls, where gypsum board provides required bracing in braced wall panels, lateral support for studs, or fire protection, screws shall be spaced not more than 300 mm o.c. on
   a) vertical wall supports, and
   b) top and bottom plates.
(See Article 9.23.10.2. and Section 9.10.)

5) Where a fire-resistance rating is determined based on Table 9.10.3.1.-A, Sentence (4) need not apply for the purpose of fire protection.

6) Screws shall be located not less than 10 mm from the edge of the board.

7) Screws shall be driven so that the heads do not puncture the paper.

9.29.5.10. Low Temperature Conditions
1) In cold weather, heat shall be provided to maintain a temperature not below 10°C for 48 h prior to taping and finishing and maintained for not less than 48 h thereafter.

9.29.6. Plywood Finish

9.29.6.1. Thickness
1) Except as provided in Sentences (2) and (3), the minimum thickness of plywood interior finish shall conform to Table 9.29.6.1.

<table>
<thead>
<tr>
<th>Maximum Spacing of Supports, mm o.c.</th>
<th>Minimum Thickness, mm(1)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>On Supports with no Horizontal Blocking</td>
</tr>
<tr>
<td>400</td>
<td>4.7</td>
</tr>
<tr>
<td>600</td>
<td>8.0</td>
</tr>
</tbody>
</table>

Notes to Table 9.29.6.1.:
(1) Thickness limits shall apply to the net effective thickness (NET) of grooved, striated, textured and/or embossed panels and to the actual thickness of flat panels.

2) A manufacturing tolerance of −0.4 mm may be applied to the thicknesses listed in Table 9.29.6.1.

3) No minimum thickness is required where plywood is applied over continuous backing.

9.29.6.2. Grooved Plywood
1) Except as permitted in Sentence (2), where plywood for interior finish is grooved, the grooves shall not extend through the face ply and into the plies below the face ply unless the groove is supported by framing or furring.
2) If the grain of the face ply is at right angles to the supporting members, the groove is permitted to extend into plies below the face ply provided the thickness of the plywood exceeds the value shown in Table
9.29.6.1. by an amount equal to not less than the depth of penetration of the grooves into the plies below the face ply.

9.29.6.3. Nails and Staples
1) Except as provided in Sentence (2), nails for attaching plywood finishes shall not be less than 38 mm casing or finishing nails spaced not more than 150 mm o.c. along edge supports and 300 mm o.c. along intermediate supports, except that staples providing equivalent lateral resistance may also be used.
2) Where plywood finish provides required bracing in braced wall panels, the plywood shall be fastened in accordance with the fastening requirements for sheathing stated in Sentence 9.23.3.5.(2).

9.29.6.4. Edge Support
1) All plywood edges shall be supported by furring, blocking or framing.

9.29.7. Hardboard Finish

9.29.7.1. Material Standard
1) Hardboard shall conform to CAN/CGSB-11.3-M, “Hardboard.”

9.29.7.2. Thickness
1) Hardboard shall be not less than
   a) 3 mm thick where applied over continuous backing,
   b) 6 mm thick when applied over supports spaced not more than 400 mm o.c., and
   c) 9 mm thick when applied over supports spaced not more than 600 mm o.c.

9.29.7.3. Nails
1) Nails for fastening hardboard shall be casing or finishing nails not less than 38 mm long, spaced not more than 150 mm o.c. along edge supports and 300 mm o.c. along intermediate supports.

9.29.7.4. Edge Support
1) All hardboard edges shall be supported by furring, blocking or framing where the backing is not continuous.

9.29.8. Insulating Fibreboard Finish

9.29.8.1. Material Standard
1) Insulating fibreboard shall conform to CAN/ULC-S706, “Wood Fibre Insulating Boards for Buildings.”

9.29.8.2. Thickness
1) Insulating fibreboard sheets shall be not less than 11.1 mm thick on supports not more than 400 mm o.c.
2) Insulating fibreboard tile shall be not less than 12.7 mm thick on supports spaced not more than 400 mm o.c.

9.29.8.3. Nails
1) Nails for fastening fibreboard sheets shall be not less than 2.6 mm shank diameter casing or finishing nails of sufficient length to penetrate not less than 20 mm into the supports.
2) Nails shall be spaced not more than 100 mm o.c. along edge supports and 200 mm o.c. along intermediate supports.

9.29.8.4. Edge Support
1) All fibreboard edges shall be supported by blocking, furring or framing.
9.29.9. Particleboard, OSB or Waferboard Finish

9.29.9.1. Material Standard
1) Particleboard finish shall conform to ANSI A208.1, “Particleboard.”
2) OSB or waferboard finish shall conform to
   a) CSA O325, “Construction Sheathing,” or
   b) CSA O437.0, “OSB and Waferboard.”

9.29.9.2. Minimum Thickness
1) Except as provided in Sentences (2) and (3), the minimum thickness of O-2 grade OSB used as an interior finish shall conform to that shown for plywood in Table 9.29.6.1.
2) Thicknesses listed in Table 9.29.6.1. shall permit a manufacturing tolerance of −0.4 mm.
3) No minimum thickness is required where O-2 grade OSB is applied over continuous backing.
4) OSB conforming to O-1 grade, waferboard conforming to R-1 grade and particleboard shall be
   a) not less than 6.35 mm thick on supports not more than 400 mm o.c.,
   b) not less than 9.5 mm thick on supports not more than 600 mm o.c., and
   c) not less than 6.35 mm thick on supports not more than 600 mm o.c. in walls where blocking is provided at midwall height.
5) OSB conforming to CSA O325, “Construction Sheathing,” shall meet the minimum panel mark of
   a) W16, on supports not more than 400 mm o.c.,
   b) W24, on supports not more than 600 mm o.c., and
   c) W16, on supports not more than 600 mm o.c. where blocking is provided at mid-wall height.

9.29.9.3. Nails
1) Except as provided in Sentence (2), nails for fastening particleboard, OSB or waferboard shall be not less than 38 mm casing or finishing nails spaced not more than 150 mm o.c. along edge supports and 300 mm o.c. along intermediate supports.
2) Where OSB or waferboard provides required bracing in braced wall panels, the OSB or waferboard shall be fastened in accordance with the fastening requirements for sheathing stated in Sentence 9.23.3.5.(2).

9.29.9.4. Edge Support
1) All particleboard, OSB or waferboard edges shall be supported by furring, blocking or framing.

9.29.10. Wall Tile Finish

9.29.10.1. Tile Application
1) Ceramic tile shall be set in a mortar base or applied with an adhesive.
2) Plastic tile shall be applied with an adhesive.

9.29.10.2. Mortar Base
1) When ceramic tile is applied to a mortar base the cementitious material shall consist of one part Portland cement to not more than one-quarter part lime by volume.
2) The cementitious material described in Sentence (1) shall be mixed with not less than 3 nor more than 5 parts of aggregate per part of cementitious material by volume.
3) Mortar shall be applied over metal lath or masonry.
4) Ceramic tile applied to a mortar base shall be thoroughly soaked and pressed into place forcing the mortar into the joints while the tile is wet.

9.29.10.3. Adhesives
1) Adhesives to attach ceramic and plastic tile shall be applied to the finish coat or brown coat of plaster that has been steel-trowelled to an even surface or to gypsum board or to masonry provided the masonry has an even surface.

9.29.10.4. Moisture-Resistant Backing
1) Ceramic and plastic tile installed on walls around bathtubs or showers shall be applied over moisture-resistant backing.

9.29.10.5. Joints between Tiles and Bathtub
1) The joints between wall tiles and a bathtub shall be suitably caulked with material conforming to CAN/CGSB-19.22-M, “Mildew-Resistant Sealing Compound for Tubs and Tiles.”

Section 9.30. Flooring

9.30.1. General

9.30.1.1. Required Finished Flooring
1) Finished flooring shall be provided in all residential occupancies.

9.30.1.2. Water Resistance
1) Where water permeable finished flooring in bathrooms, kitchens, public entrance halls and laundry areas is supported by a subfloor of a type that would be damaged by water, such flooring shall be installed over a membrane with a water permeance not exceeding 18 ng/(Pa·s·m²) when tested in accordance with ASTM E 96/E 96M, “Water Vapor Transmission of Materials.” (See Note A-9.30.1.2.(1).)

9.30.1.3. Sleepers
1) Wood sleepers supporting finished flooring over a concrete base supported on the ground shall be not less than 19 mm by 38 mm and shall be treated with a wood preservative.

9.30.1.4. Finish Quality
1) Finished flooring shall have a surface that is smooth, even and free from roughness or open defects.

9.30.2. Panel-Type Underlay

9.30.2.1. Required Underlay
1) A panel-type underlay shall be provided under resilient flooring, parquet flooring, ceramic tile, felted-synthetic-fibre floor coverings or carpeting laid over lumber subflooring. (See Sentence 9.30.3.2.(1).)
2) Panel-type underlay shall be provided under resilient flooring, parquet flooring, felted-synthetic-fibre floor coverings or carpeting on panel-type subflooring whose edges are unsupported. (See Article 9.23.15.3.)
3) Panel-type underlay shall be provided under ceramic tile applied with adhesive.

9.30.2.2. Materials and Thickness
1) Panel-type underlay shall be not less than 6 mm thick and shall conform to
   a) ANSI A208.1, “Particleboard,”
   b) CAN/CGSB-11.3-M, “Hardboard,”
   c) ANSI/HPVA HP-1, “Hardwood and Decorative Plywood,”
   d) CSA O121, “Douglas Fir Plywood,”
   e) CSA O151, “Canadian Softwood Plywood,”
   f) CSA O153, “Poplar Plywood,” or
   g) CSA O437.0, “OSB and Waferboard.”
2) Panel-type underlay under ceramic tile applied with adhesive shall be not less than
   a) 6 mm thick where the supports are spaced up to 300 mm o.c., and
   b) 11 mm thick where the supports are spaced wider than 300 mm o.c.

9.30.2.3. Fastening
   1) Panel-type underlay shall be fastened to the subfloor with staples, annular grooved flooring nails or spiral
      nails, spaced not more than 150 mm o.c. along the edges and 200 mm o.c. both ways at other locations.
   2) Nails for panel-type underlay shall be not less than 19 mm long for 6 mm thick underlay and 22 mm long
      for 7.9 mm thick underlay.
   3) Staples for panel-type underlay shall
      a) have not less than a 1.2 mm shank diameter or thickness with a 4.7 mm crown, and
      b) be not less than
         i) 22 mm long for 6 mm underlay, and
         ii) 28 mm long for 7.9 mm and 9.5 mm underlay.

9.30.2.4. Joints Offset
   1) Where panel-type underlay is required to be installed over plywood, OSB or waferboard, the joints in the
      underlay shall be offset not less than 200 mm from the joints in the underlying subfloor.

9.30.2.5. Surface Defects
   1) Underlay beneath resilient or ceramic floors applied with an adhesive shall have all holes or open defects
      on the surface patched so that the defects will not be transmitted to the finished surface.

9.30.3. Wood Strip Flooring

9.30.3.1. Thickness
   1) The thickness of wood strip flooring shall conform to Table 9.30.3.1.

   Table 9.30.3.1.
   Thickness of Wood Strip Flooring
   Forming Part of Sentence 9.30.3.1.(1)

<td></td>
<td>–</td>
</tr>
</tbody>
</table>

9.30.3.2. Strip Direction and End Joints
   1) Wood strip flooring shall not be laid parallel to lumber subflooring unless a separate underlay is provided.
   2) If wood strip flooring is applied without a subfloor, it shall be laid at right angles to the joists so that the
      end joints are staggered and occur over supports or are end matched.
3) If the flooring is end matched, it shall be laid so that no 2 adjoining strips break joints in the same space between supports and each strip bears on no fewer than 2 supports.

9.30.3.3. Nailing

1) When nails are used, wood strip flooring shall be toe nailed or face nailed with not less than one nail per strip at the spacings shown in Table 9.30.3.3., except that face nailed strips more than 25 mm in width shall have at least 2 nails per strip.

</tbody>
</table>

Notes to Table 9.30.3.3.:
(1) See Article 9.30.3.4.

2) Face nails shall be countersunk.

9.30.3.4. Staples

1) Staples are permitted to be used to fasten wood strip flooring not more than 7.9 mm in thickness provided the staples are not less than 29 mm long with a shank diameter of 1.19 mm and with 4.7 mm crowns.

9.30.4. Parquet Flooring

9.30.4.1. Adhesive

1) Adhesive used to attach parquet block flooring shall be suitable for bonding wood to the applicable subfloor material.

9.30.5. Resilient Flooring

9.30.5.1. Materials

1) Resilient flooring used on concrete slabs supported on ground shall consist of asphalt, rubber, vinyl-asbestos, unbacked vinyl or vinyl with an inorganic type backing.
2) Flooring described in Sentence (1) shall be attached to the base with a suitable waterproof and alkali-resistant adhesive.

9.30.6. Ceramic Tile

9.30.6.1. Substrate
Section 9.31. Plumbing Facilities

9.31.1. Scope

9.31.1.1. Application
1) This Section applies to the plumbing facilities and plumbing systems within dwelling units.
2) In occupancies other than dwelling units, plumbing facilities, grab bars, floor drains, and floor and wall finishes around urinals shall conform to Subsection 3.7.2. (See also Section 3.8. regarding accessible plumbing facilities.)
3) Medical gas piping systems shall conform to Subsection 3.7.3.
4) Systems used for service water heating shall conform to the energy efficiency requirements in Part 10.

9.31.2. General

9.31.2.1. General
1) The construction, extension, alteration, renewal or repair of plumbing systems and sewage disposal systems shall conform to Part 7.

9.31.2.2. Corrosion Protection
1) Metal pipes in contact with cinders or other corrosive material shall be protected by a heavy coating of bitumen or other corrosion protection.

9.31.2.3. Grab Bars
1) When provided, grab bars shall be capable of resisting a load of not less than 1.3 kN applied vertically or horizontally.

9.31.2.4. Site Constructed Fixtures
1) A shower door that swings on a vertical axis shall be capable of opening outwards from a shower stall forming part of a site constructed fixture.

9.31.3. Water Supply and Distribution

9.31.3.1. Required Water Supply
1) Every dwelling unit shall be supplied with potable water.

9.31.3.2. Required Connections
1) Where a piped water supply is available, piping for hot and cold water shall be connected to every kitchen sink, lavatory, bathtub, shower, slop sink and laundry area.
2) Piping for cold water shall be run to every water closet.

9.31.4. Required Facilities

9.31.4.1. Required Fixtures
1) A kitchen sink, lavatory, bathtub or shower, and water closet shall be provided for every dwelling unit where a piped water supply is available.
9.31.4.2. Hot Water Supply
1) Where a piped water supply is available a hot water supply shall be provided in every dwelling unit.

9.31.4.3. Floor Drains
1) Where gravity drainage to a sewer, drainage ditch or dry well is possible, a floor drain shall be installed in a basement forming part of a dwelling unit.
2) A floor drain shall be provided in a garbage room, incinerator room or boiler room serving more than one dwelling unit.

9.31.5. Sewage Disposal

9.31.5.1. Building Sewer
1) Wastes from every plumbing fixture shall be piped to the building sewer.

9.31.5.2. Discharge of Sewage
1) Building sewers shall discharge into a public sewage system where such system is available.
2) Where a public sewage system is not available, the building sewer shall discharge into a private sewage disposal system.

9.31.6. Service Water Heating Facilities

9.31.6.1. Hot Water Supply
1) Where hot water is required to be supplied in accordance with Article 9.31.4.2., equipment shall
   a) provide an adequate supply of hot water, and
   b) be installed in conformance with Part 7.

9.31.6.2. Equipment and Installation
1) Service water heaters shall conform to appropriate provincial or territorial requirements or, in the absence of such requirements, to the Book II (Plumbing Systems) of this By-law.
2) The installation of service water heaters, including provisions for mounting, clearances and air supply, shall conform to
   a) the Safety Standards Act and the following of its regulations:
   i) the Gas Safety Regulation,
   ii) the Electrical Safety Regulation, and
   iii) the Power Engineers, Boiler, Pressure Vessel and Refrigeration Safety Regulation,
   b) CSA B139, “Installation Code for Oil-Burning Equipment,” and
3) Where the building is in a location where the spectral response acceleration, $S_a(0.2)$, is greater than 0.55, service water heaters shall be secured to the structure to prevent overturning. (See Note A-9.31.6.2.(3).)

9.31.6.3. Corrosion-Resistant Coating
1) Where storage tanks for service water heaters are of steel, they shall be coated with zinc, vitreous enamel (glass lined), hydraulic cement or other corrosion-resistant material.

9.31.6.4. Fuel-Burning Heaters
1) Fuel-burning service water heaters shall be connected to a chimney flue conforming to Section 9.21.

9.31.6.5. Heating Coils
1) Heating coils of service water heaters shall not be installed in a flue or in the combustion chamber of a boiler or furnace heating a building.
Section 9.32. Ventilation

9.32.1. General

9.32.1.1. Application
1) This Section applies to the ventilation of rooms and spaces in residential occupancies by natural ventilation and to self-contained mechanical ventilation systems serving only one dwelling unit.
2) Mechanical ventilation systems other than self-contained systems serving a single dwelling unit shall conform to Part 6.
3) A storage garage for more than 5 motor vehicles shall be ventilated in accordance with Part 6.
4) Systems used for ventilation shall conform to the energy efficiency requirements in Part 10.

9.32.1.2. Required Ventilation
1) Every dwelling unit shall incorporate
   a) provisions for non-heating-season ventilation in accordance with Subsection 9.32.2., and
   b) if supplied with electrical power, provisions for heating-season ventilation in accordance with Subsection 9.32.3.
2) Reserved.
3) Reserved.
4) Reserved.

9.32.1.3. Venting of Laundry-Drying Equipment
1) Exhaust ducts or vents connected to laundry-drying equipment shall discharge directly to the outdoors.
2) Exhaust ducts connected to laundry-drying equipment shall be
   a) independent of other exhaust ducts,
   b) accessible for cleaning, and
   c) constructed of a smooth corrosion-resistant material.
   (See Note A-9.32.1.3.(2).)
3) Where collective venting of multiple installations of laundry-drying equipment is used, the ventilation system shall
   a) be connected to a common exhaust duct that is vented by one central exhaust fan and incorporates one central lint trap,
   b) include an interlock to activate the central exhaust fan when laundry-drying equipment is in use, and
   c) where required by Article 9.32.3.8.4.1., be provided with make-up air.

9.32.2. Non-Heating-Season Ventilation

9.32.2.1. Required Ventilation
1) Rooms or spaces in dwelling units shall be ventilated during the non-heating season by
   a) natural ventilation in accordance with Article 9.32.2.2., or
   b) a mechanical ventilation system conforming to Subsection 9.32.3.
2) Where a habitable room or space is not provided with natural ventilation as described in Clause (1)(a), mechanical ventilation shall be provided to exhaust inside air from, or to introduce outside air to, that room or space at the rate of
   a) one-half air change per hour if the room or space is mechanically cooled during the non-heating season, or
   b) one air change per hour if the room or space is not mechanically cooled during the non-heating season.
9.32.2.2. Non-Heating-Season Natural Ventilation

1) The unobstructed openable ventilation area to the outdoors for rooms and spaces in residential buildings ventilated by natural means shall conform to Table 9.32.2.2.

2) Where a vestibule opens directly off a living or dining room within a dwelling unit, ventilation to the outdoors for such rooms may be through the vestibule.

3) Openings for natural ventilation other than windows shall provide protection from the weather and insects.

4) Screening shall be of corrosion-resistant material.

9.32.2.3. Reserved

9.32.3. Heating-Season Mechanical Ventilation

(See Note A-9.32.3.)

9.32.3.1. Required Ventilation

1) Every dwelling unit that is supplied with electrical power shall be provided with a mechanical ventilation system that conforms to:

   a) CAN/CSA-F326-M, “Residential Mechanical Ventilation Systems,” or
   b) this Subsection, or
   c) reserved.

9.32.3.2. Design and Installation

1) Aspects of mechanical ventilation systems not specifically addressed in this Subsection shall be designed, constructed and installed in accordance with good practice such as that described in the ASHRAE Handbooks and Standards, the HRAI Digest, the HRAI Residential Mechanical Ventilation Manual, the TECA Ventilation Guidelines, the Hydronics Institute Manuals and the SMACNA manuals.
2) Exhaust fans and supply fans shall be installed in accordance with this Subsection and the manufacturer’s instructions.

3) The mechanical components of a mechanical ventilation system shall be installed so as to be accessible for inspection, maintenance, repair, and cleaning.

9.32.3.3. Mechanical Ventilation System Components

1) A mechanical ventilation system shall include:
   a) a principal ventilation fan system that
      i) provides supply air in accordance with Article 9.32.3.4., and
      ii) includes an exhaust fan that conforms with Article 9.32.3.5.,
   b) the kitchen and bathroom exhaust fans that are required by Article 9.32.3.6., and
   c) if the building includes a heated crawl space, the components that are required by Article 9.32.3.7.

9.32.3.4. Ventilation System Supply Air

(See Note A-9.32.3.4.)

1) Except as provided in Sentence (6), a principal ventilation system shall mechanically provide supply air in accordance with Sentence (2), (3), (4) or (5).

2) Where the principal ventilation system is a ducted forced-air heating system, the ducted forced-air heating system shall
   a) provide supply air through the ducting to
      i) each bedroom, and
      ii) each floor level without a bedroom,
   b) draw supply air from an outdoor inlet that is connected to the cabinet containing the furnace air circulating fan required by Clause (d) by ducting that measures, from that cabinet to the point at which the ducting intersects the return air plenum,
      i) between 3 m and 4.5 m in length, or
      ii) if a flow control device is used, not more than 4.5 m in length,
   c) draw supply air through ducting that is
      i) rigid ducting with an equivalent diameter of at least 100 mm, or
      ii) flexible ducting with an equivalent diameter of at least 125 mm, and
   d) have a furnace air circulating fan set to run continuously.

3) Where the principal ventilation system is a ducted forced-air heating system used in combination with a heat-recovery ventilator,
   a) the ducted forced-air heating system shall conform to Clauses (2)(a),(c) and (d),
   b) the heat-recovery ventilator shall draw supply air from an outdoor inlet into the return air plenum of the ducted forced-air heating system, and
   c) the heat-recovery ventilator shall draw exhaust air, through dedicated ducting,
      i) from one or more indoor inlets, at least one of which is located at least 2 m above the floor of the uppermost floor level, and
      ii) at the capacity rating of the heat-recovery ventilator, which shall be no less than the airflow rate specified in Table 9.32.3.5.

4) Where the principal ventilation system is a heat-recovery ventilator, the heat-recovery ventilator shall
   a) provide supply air through dedicated ducting to
      i) each bedroom, and
      ii) each floor level without a bedroom, and
   b) draw exhaust air, through dedicated ducting,
      i) from one or more indoor inlets, at least one of which is located at least 2 m above the floor of the uppermost floor level, and
      ii) at the capacity rating of the heat-recovery ventilator, which shall be no less than the airflow rate specified in Table 9.32.3.5.
5) Where the principal ventilation system is a ducted central-recirculation ventilation system, the ducted central-recirculation ventilation system shall
   a) draw supply air from an outdoor inlet connected upstream of the fan, and
   b) draw air from
      i) each bedroom and deliver it to a common area, or
      ii) a common area and deliver it to each bedroom.

6) A principal ventilation system need not conform to Sentence (1) if the principal ventilation system
   a) services a dwelling unit that
      i) is located where the January design temperature, on a 2.5% basis determined in
         conformance with Article 1.1.3.1., is greater than \(-20^\circ C\),
      ii) has only 1 storey and a floor area of less than 168 m\(^2\) within the building envelope (See
         Note A-9.32.3.4.(6)(a)(ii)),
      iii) does not have a ducted forced-air heating system, and
      iv) except for a secondary suite, is not located in a building conforming to Subsection
         9.36.6. or 10.2.3., and
   b) provides supply air passively from outdoors through dedicated inlets that
      i) are located in each bedroom and at least one common area,
      ii) are located at least 1 800 mm above the floor, and
      iii) have an unobstructed vent area of not less than 25 cm\(^2\).

9.32.3.5. Principal Ventilation System Exhaust Fan

1) A principal ventilation system exhaust fan shall
   a) run continuously, and
   b) provide at least the air-flow rate specified in Table 9.32.3.5.

2) For the purposes of Sentence (1), the capacity rating of the principal ventilation system exhaust fan shall be determined, based on air-flow performance at 50 Pa of external static pressure, in accordance with
   a) HVI Publication 916, “Airflow Test Procedure,” or

3) The principal ventilation system exhaust fan shall be
a) designed to run continuously, and  
b) controlled by a dedicated switch that  
  i) has 2 settings, on and off,  
  ii) is located where it will be accessible for the purposes of servicing the exhaust fan but  
      not likely to be turned off inadvertently, and  
  iii) is clearly marked “PRINCIPAL VENTILATION EXHAUST FAN.”

4) If the principal ventilation system exhaust fan is designed to run at multiple air-flow rates,  
a) the air-flow rate of the fan shall be controlled by a switch other than the switch described in  
   Clause (3)(b), and  
b) the lowest air-flow rate shall not be less than the air-flow rate specified in Table 9.32.3.5.

5) The sound rating of the principal ventilation system exhaust fan shall not exceed 1.0 sone when running  
   continuously at the air-flow rate specified in Table 9.32.3.5. as determined in accordance with  
a) HVI Publication 915, “Loudness Testing and Rating Procedure,” or  

9.32.3.6. Exhaust-Only Ventilation Systems Kitchen and Bathroom Exhaust Fans  
   1) An exhaust fan that provides at least the air-flow rate specified in Table 9.32.3.6. shall be installed in  
      a) every kitchen, and  
      b) every bathroom or water-closet room, unless the bathroom or water-closet room is served by the  
         principal ventilation system exhaust fan that complies with Article 9.32.3.5.
   2) For the purposes of Sentence (1), the capacity rating of the exhaust fan shall be determined, based on  
      air-flow performance at 50 Pa of external static pressure, in accordance with  
      a) HVI Publication 916, “Airflow Test Procedure,” or

9.32.3.7. Heated Crawl Space Ventilation  
   1) Where a crawl space is heated by a ducted forced-air heating system that does not draw air from the  
      crawl space to the furnace through the return air plenum, the crawl space shall be connected to the floor  
      space above the crawl space by at least one air-transfer grille.
   2) Where a crawl space is heated other than by a ducted forced-air heating system, the crawl space shall  
      a) be connected to  
         i) the floor space above the crawl space by at least one air-transfer grille, and  
         ii) the principal ventilation system by a supply air outlet or an exhaust air inlet,
      b) be connected to the floor space above the crawl space by at least 2 air-transfer grilles for every  
         30 m² of crawl space area, or  
      c) be connected to  
         i) the floor space above the crawl space by at least one air-transfer grille, and  
         ii) the outdoors by a dedicated exhaust fan that complies with Sentence (4).
   3) An air-transfer grille required by Sentence (1) or (2) shall have an unobstructed vent area of the greater of  
      a) 25 cm², and
b) 0.83 cm² for every m² of crawl space area.

4) Where a dedicated exhaust fan is installed in accordance with Subclause (2)(c)(ii), the dedicated exhaust fan shall
   a) provide an air-flow rate of at least 23 L/s, and
   b) be controlled by
      i) a humidity control device, or
      ii) an adjustable time control device that is capable of providing not less than 8 total hours of ventilation per 24 hour period.

5) Where a crawl space is divided into 2 or more compartments, each heated compartment shall conform to Sentence (1) or (2).

9.32.3.8. Air Ducts

1) Except as required by Sentence (3), this Article applies to air ducts other than those described in Article 9.32.1.3.

2) Exhaust ducts shall discharge to the outdoors.

3) Exhaust ducts that are downstream of an exhaust fan shall have no connections to other fans or ducts.

4) Exhaust ducts, and supply ducts that conduct heated or cooled air, shall
   a) be sized in accordance with the requirements of the manufacturer of the fans to which they are connected, and
   b) have an equivalent diameter not less than that specified by Table 9.32.3.8.(3).

Notes to Table 9.32.3.8.(3):
(1) The equivalent length of a duct is the length of the duct plus 10 m for the exterior hood and 3 m for each 90° elbow.
5) Where an exhaust duct passes through or is located adjacent to a space that is not conditioned space, the duct shall conform to Article 9.36.3.2., except that in no case shall such a duct be insulated to less than RSI 0.75.

6) Where a principal ventilation system supply duct passes through or is located adjacent to a conditioned space, the duct shall be
   a) insulated to not less than RSI 0.75, and
   b) provided with an effective vapour barrier.

7) Where a kitchen exhaust fan grille is installed within 1.2 m horizontally of a cooktop, the exhaust fan duct shall
   a) be constructed of a material that is noncombustible, corrosion-resistant, and cleanable, and
   b) be equipped with a grease filter at the intake end.

8) Except for a supply air system described in Sentence 9.32.3.4.(2) or (3), all joints in exhaust ducts, and in supply ducts that conduct conditioned air, shall be sealed against air leakage with
   a) sealants or gaskets made from liquids, mastics or heat-applied materials,
   b) mastic with embedded fabric,
   c) foil-faced butyl tape, or
   d) aluminum foil tape.

9) Supply ducts for a mechanical ventilation system shall not be used to provide combustion or dilution air to fuel-burning appliances.

9.32.3.9. Outdoor Inlets and Outlets
1) Outdoor air inlets and exhaust outlets shall be shielded from the weather, birds and rodents by using hoods incorporating a screen of corrosion-resistant material with openings of 6 to 12 mm.

9.32.3.10. Interior Distribution
1) Interior doors shall be undercut by a minimum of 12 mm above the finished floor or the rooms shall be provided with an air-transfer grille with an unobstructed vent area that is not less than 100 cm².

9.32.4. Additional Protection Against Depressurization

9.32.4.1. Protection Requirements
1) Additional make-up air for the actual appliance exhaust rate shall be provided for any appliance that discharges air to the exterior at an installed rate exceeding 0.5 air changes per hour when it is located within a dwelling unit that contains a vented appliance that is subject to back drafting (Naturally Aspirating Fuel Fired Vented Appliance). (See Note A-9.32.4.1.)
2) Where additional make-up air is required for appliances described in Sentence (1), it shall be provided by a supply fan rated to deliver outdoor air at the rate of the installed exhaust appliance.
3) The supply fan as required in Sentence (2) shall be interconnected with the exhaust fan for which make-up air is required.
4) The outdoor air required by Sentence (3) shall be
   a) tempered to at least 1°C before being introduced to a normally unoccupied area of the dwelling unit, or
   b) tempered to at least 12°C before being introduced to occupied areas either by passive transfer grille or directly from outside.

9.32.4.2. Carbon Monoxide Alarms
(See Note A-9.32.4.2.)
1) This Article applies to every building that contains a residential occupancy and that also contains
   a) a fuel-burning appliance, or
   b) a storage garage.
2) Carbon monoxide (CO) alarms required by this Article shall
a) conform to CAN/CSA-6.19, “Residential Carbon Monoxide Alarming Devices,”
b) be equipped with an integral alarm that satisfies the audibility requirements of CAN/CSA-6.19, “Residential Carbon Monoxide Alarming Devices,”
c) have no disconnect switch between the overcurrent device and the CO alarm, where the CO alarm is powered by the dwelling unit’s electrical system, and
d) be mechanically fixed at a height recommended by the manufacturer.

3) Where a room contains a solid-fuel-burning appliance, a CO alarm conforming to CAN/CSA-6.19, “Residential Carbon Monoxide Alarming Devices,” shall be mechanically fixed
   a) at the manufacturer’s recommended height where these instructions specifically mention solid-fuel-burning appliances, or
   b) in the absence of specific instructions related to solid-fuel-burning appliances, on or near the ceiling.

4) Where a fuel-burning appliance is installed in a suite of residential occupancy, a CO alarm shall be installed
   a) inside each bedroom, or
   b) outside each bedroom, within 5 m of each bedroom door, measured following corridors and doorways.

5) Where a fuel-burning appliance is installed in a service room that is not in a suite of residential occupancy, a CO alarm shall be installed
   a) either inside each bedroom, or if outside, within 5 m of each bedroom door, measured following corridors and doorways, in every suite of residential occupancy that shares a wall or floor/ceiling assembly with the service room, and
   b) in the service room.

6) For each suite of residential occupancy that shares a wall or floor/ceiling assembly with a storage garage or that is adjacent to an attic or crawl space to which the storage garage is also adjacent, a CO alarm shall be installed
   a) inside each bedroom, or
   b) outside each bedroom, within 5 m of each bedroom door, measured following corridors and doorways.

7) Reserved.

Section 9.33. Heating and Air-conditioning

9.33.1. General

9.33.1.1. Application
   1) This Section applies to the design and installation of heating systems, including requirements for combustion air, and air-conditioning systems serving only one dwelling unit.
   2) The design and installation of heating systems, including requirements for combustion air, and air-conditioning systems other than those described in Sentence (1) shall conform to Part 6. (See Article 9.33.4.1. and Subsection 9.10.10.)
   3) Reserved.
   4) Systems used for heating and air-conditioning shall conform to the energy efficiency requirements in Section 9.36.

9.33.2. Required Heating Systems

9.33.2.1. Required Heating Systems
   1) Residential buildings intended for use in the winter months on a continuing basis shall be equipped with heating facilities conforming to this Section.
9.33.3. Design Temperatures

9.33.3.1. Indoor Design Temperatures
1) At the outside winter design temperature, required heating facilities shall be capable of maintaining an indoor air temperature of not less than
   a) 22°C in all living spaces,
   b) 18°C in unfinished basements,
   c) reserved, and
   d) 15°C in heated crawl spaces.

9.33.3.2. Outdoor Design Temperatures
1) The outdoor conditions to be used in designing heating and air-conditioning systems shall be determined in conformance with Article 1.1.3.1.

9.33.4. General Requirements for Heating and Air-conditioning Systems

9.33.4.1. Design of Heating and Air-conditioning Systems
1) Aspects of heating and air-conditioning systems not specifically addressed in this Subsection, including ducting, and mechanical heating and refrigeration equipment, shall be designed, constructed and installed in accordance with good practice such as that described in the ASHRAE Handbooks and Standards, the HRAI Digest, the CHC Handbook on Hydronic Heating Systems, the Hydronics Institute Manuals, the SMACNA Manuals and the TECA Quality First Manuals. (See also Subsection 9.32.3. for the design of systems that also provide ventilation.)

9.33.4.2. Installation of Hydronic Heating Systems
1) The installation of a hydronic heating system shall conform to CSA B214, “Installation Code for Hydronic Heating Systems.”

9.33.4.3. Reserved

9.33.4.4. Access
1) Equipment forming part of a heating or air-conditioning system, with the exception of embedded pipes or ducts, shall be installed with provision for access for inspection, maintenance, repair and cleaning.

9.33.4.5. Protection from Freezing
1) Equipment forming part of a heating or air-conditioning system that may be adversely affected by freezing temperatures and that is located in an unheated area shall be protected from freezing.

9.33.4.6. Expansion, Contraction and System Pressure
1) Heating and cooling systems shall be designed to allow for expansion and contraction of the heat transfer fluid and to maintain the system pressure within the rated working pressure limits of all components of the system.

9.33.4.7. Structural Movement
1) Mechanical systems and equipment shall be designed and installed to accommodate the maximum amount of structural movement provided for in the construction of the building.
2) Where the building is in a location where the spectral response acceleration, $S_a(0.2)$, is greater than 0.55, heating and air-conditioning equipment with fuel or power connections shall be secured to the structure to resist overturning and displacement. (See Note A-9.31.6.2.(3).)
9.33.4.8. Asbestos
   1) Asbestos shall not be used in air distribution systems or equipment.

9.33.4.9. Contaminant Transfer
   1) Systems serving garages, and systems serving other occupied parts of a dwelling unit but located in or running through a garage, shall be designed and constructed in a manner such that means are not provided for the transfer of contaminants from the garage into other spaces in the dwelling unit.

9.33.4.10. Noise Control
   1) Heating and air-conditioning equipment shall be installed and located so that the noise generated by this equipment conforms with the Vancouver Noise Control By-law.

9.33.5. Heating and Air-conditioning Appliances and Equipment

9.33.5.1. Capacity of Heating Appliances
   1) The required capacity of heating appliances located in a dwelling unit and serving only that dwelling unit, shall be determined in accordance with CSA F280, “Determining the Required Capacity of Residential Space Heating and Cooling Appliances,” except that the design temperatures shall conform to Subsection 9.33.3.

9.33.5.2. Installation Standards
   1) Except as provided in Articles 9.33.5.3. and 9.33.5.4., the installation of heating and air-conditioning equipment, including mechanical refrigeration equipment, and including provisions for mounting, clearances and air supply, shall conform to
      a) the Safety Standards Act and the following of its regulations:
         i) the Gas Safety Regulation,
         ii) the Electrical Safety Regulation, and
         iii) the Power Engineers, Boiler, Pressure Vessel and Refrigeration Safety Regulation,
      b) CSA B139, “Installation Code for Oil-Burning Equipment,” and
         (See also Sentence 9.33.5.3.(1).)

9.33.5.3. Design, Construction and Installation Standard for Solid-Fuel-Burning Appliances
   (See Note A-9.33.5.3.)
   1) The design, construction and installation, including the provision of combustion air, of solid-fuel-burning appliances and equipment, including stoves, cooktops, ovens and space heaters, shall conform to CSA B365, “Installation Code for Solid-Fuel-Burning Appliances and Equipment.”
   2) For the purposes of Sentence (1), solid-fuel-burning boiler appliances that are approved for use under section 10 of the Safety Standards Act satisfy section 3.1 of CAN/CSA-B365 “Installation Code for Solid-Fuel-Burning Appliances and Equipment.”
      (See also Subclause 9.33.5.2.(1)(a)(ii).)

9.33.5.4. Fireplaces
   1) Fireplaces shall conform to Section 9.22.

9.33.6. Air Duct Systems

9.33.6.1. Application
   1) The design, construction and installation of air duct distribution systems serving heating systems in which the rated heat input does not exceed 120 kW shall conform to this Subsection.
2) Air duct distribution systems in which the rated heat input exceeds 120 kW shall conform to Part 6 and Subsection 3.6.5.

9.33.6.2. Materials in Air Duct Systems
1) Except as provided in Sentences (2) to (6) and in Article 3.6.4.3., all ducts, duct connectors, associated fittings and plenums used in air duct systems shall be constructed of steel, aluminum alloy, copper, clay or similar noncombustible material.
2) Ducts, associated fittings and plenums are permitted to contain combustible material provided they
   a) conform to the appropriate requirements for Class 1 duct materials in CAN/ULC-S110, “Test for Air Ducts,”
   b) conform to Article 3.1.5.18. and Subsection 3.1.9.,
   c) are not used in vertical runs serving more than 2 storeys, and
   d) are not used in air duct systems in which the air temperature may exceed 120°C.
3) Duct sealants shall have a flame-spread rating of not more than 25 and a smoke developed classification of not more than 50.
4) Duct connectors that contain combustible materials and that are used between ducts and air outlet units shall
   a) conform to the appropriate requirements for Class 1 air duct materials in CAN/ULC-S110, “Test for Air Ducts,”
   b) be limited to 4 m in length,
   c) be used only in horizontal runs, and
   d) not penetrate required fire separations.
5) Combustible ducts that are part of a duct system carrying only ventilation air and that are contained entirely within a dwelling unit need not comply with the requirements of Sentences (1) to (4).
6) Except as provided in Sentences 9.33.6.13.(2) and (3), ducts that are part of a return-air duct system and that are contained entirely within a dwelling unit need not comply with the requirements of Sentences (1) to (4).
7) Materials referred to in Sentences (1) to (6), when used in a location where they may be subjected to excessive moisture, shall
   a) have no appreciable loss of strength when wet, and
   b) be corrosion-resistant.

9.33.6.3. Tape
1) Tape used for sealing duct joints in air ducts, plenums and other parts of air duct systems shall meet the flame-resistance requirements for fabric in CAN/ULC-S109, “Flame Tests of Flame-Resistant Fabrics and Films.”

9.33.6.4. Coverings, Linings, Adhesives and Insulation
1) Coverings, linings and associated adhesives and insulation of air ducts, plenums and other parts of air duct systems shall be of noncombustible material when exposed to heated air or radiation from heat sources that would result in the exposed surface exceeding a temperature of 120°C.
2) Except as provided in Sentence (3), when combustible coverings and linings, including associated adhesives and insulation, are used, they shall have
   a) a flame-spread rating of not more than 25 on any exposed surface or any surface that would be exposed by cutting through the material in any direction, and
   b) a smoke developed classification of not more than 50.
3) The outer covering of ducts, plenums and other parts of air duct systems used within an assembly of combustible construction are permitted to have
   a) an exposed surface flame-spread rating of not more than 75, and
   b) a smoke developed classification greater than 50.
4) Combustible coverings and linings described in Sentences (2), (3) and (6) shall not flame, glow, smoulder or smoke when tested in accordance with the method of test in ASTM C 411, “Hot-Surface Performance of High-Temperature Thermal Insulation,” at the maximum temperature to which the coverings and linings are to be exposed in service.

5) Except as provided in Sentences (6) and (7), foamed plastic insulation shall not be used as part of an air duct or for insulating an air duct.

6) Foamed plastic insulation conforming to Article 9.25.2.2. is permitted to be used to insulate a galvanized steel, stainless steel or aluminum air duct, provided
   a) the foamed plastic insulation applied to supply ductwork is not less than 3 m from the furnace bonnet,
   b) the temperature within the ductwork where the insulation is installed is not greater than 50°C,
   c) duct joints are taped with a product conforming to Sentence 9.33.6.3.(1),
   d) return air plenums are separated from the foamed plastic insulation, and
   e) the foamed plastic insulation is protected
      i) by one of the interior finishes described in Subsections 9.29.4. to 9.29.9.,
      ii) provided the building does not contain a Group C major occupancy, by sheet metal that is mechanically fastened to the supporting assembly independent of the insulation, is not less than 0.38 mm thick and has a melting point of 650°C or more, or
      iii) by any thermal barrier that meets the requirements of Clause 3.1.5.15.(2)(e).

7) Foamed plastic insulation is permitted to be used in a ceiling space that acts as a return air plenum provided the foamed plastic insulation is protected from exposure to the plenum in accordance with Sentence 3.1.5.14.(4).

8) Combustible coverings and linings of ducts, including associated adhesives and insulation, shall be interrupted
   a) at the immediate area of operation of heat sources in a duct system, such as electric resistance heaters or fuel-burning heaters or furnaces, and
   b) where the duct penetrates a fire separation.

9) Linings of ducts shall be installed so that they will not interfere with the operation of volume or balancing dampers or of fire dampers, fire stop flaps and other closures.

9.33.6.5. Galvanized Steel or Aluminum Supply Ducts

1) Galvanized steel or aluminum supply ducts shall conform to Table 9.33.6.5.

2) The design of fittings for ducts shall conform to ANSI/SMACNA 006, “HVAC Duct Construction Standards – Metal and Flexible,” except that metal thicknesses shall conform to Table 9.33.6.5.

Table 9.33.6.5.

9.33.6.6. Construction of Ducts and Plenums

1) Where the installation of heating supply ducts in walls and floors creates a space between the duct and construction material, the space shall be fire stopped with noncombustible material at each end.

2) Ducts shall be securely supported by metal hangers, straps, lugs or brackets, except that, where zero clearance is permitted, wooden brackets are permitted to be used.

3) All round duct joints shall be tight-fitting and lapped not less than 25 mm.

4) Rectangular duct connections shall be made with S and drive cleats or equivalent mechanical connections.

5) Duct systems shall have no openings other than those required for the proper operation and maintenance of the system.

9.33.6.7. Installation of Ducts and Plenums

1) Air duct systems serving garages shall not be interconnected with other parts of the dwelling unit.

2) Trunk supply ducts shall not be nailed directly to wood members.

3) Branch ducts shall be supported at suitable spacings to maintain alignment and prevent sagging.

4) Ducts passing through unheated spaces shall have all joints taped or otherwise sealed to ensure that the ducts are airtight throughout their length.

5) Combustible ducts in concrete slabs-on-ground that are connected to a furnace supply plenum shall be located not closer than 600 mm to that plenum and not less than 600 mm from its connection to a riser or register.

6) Ducts in or beneath concrete slabs-on-ground shall be watertight and corrosion-, decay-, and mildew-resistant.

7) Underground ducts shall
   a) be constructed to provide interior drainage from and access to all low points, and
   b) not be connected directly to a sewer.

9.33.6.8. Clearances of Ducts and Plenums

1) The clearance of furnace plenums from combustible material shall conform to the appropriate standards in Sentence 9.33.5.2.(1).

2) Where the plenum clearance required in Sentence (1) is 75 mm or less, the clearance between a supply duct and combustible material shall
   a) be equal to the required plenum clearance within 450 mm of the plenum, and
   b) be not less than 12 mm at a distance of 450 mm or more from the plenum, except that this clearance may be reduced to zero beyond a bend or offset in the duct sufficiently large to shield the remainder of the supply duct from direct radiation from the furnace heat exchanger. (See Note A-3.6.5.6.(2).)

3) Where the plenum clearance required in Sentence (1) is more than 75 mm but not more than 150 mm, the clearance between a supply duct and combustible material shall be
   a) equal to the required plenum clearance within a horizontal distance of 1.8 m of the plenum, and
   b) not less than 12 mm at a horizontal distance of 1.8 m or more from the plenum, except that this distance may be reduced to zero beyond a bend or offset in the duct sufficiently large to shield the
remainder of the duct from direct radiation from the furnace heat exchanger. (See Note A-3.6.5.6.(3).)

4) Where the plenum clearance required in Sentence (1) is more than 150 mm, the clearance between a supply duct and combustible material shall be
   a) equal to the required plenum clearance within a horizontal distance of 1 m of the plenum,
   b) not less than 150 mm within a horizontal distance between 1 m and 1.8 m from the plenum, and
   c) not less than 25 mm at a horizontal distance of 1.8 m or more from the plenum, except that this distance may be reduced to 8 mm beyond a bend or offset in the duct sufficiently large to shield the remainder of the supply duct from direct radiation from the furnace heat exchanger. (See Note A-3.6.5.6.(4).)

5) Where a register is installed in a floor directly over a pipeless furnace, a double-walled register box with not less than 100 mm between walls, or a register box with the warm-air passage completely surrounded by the cold-air passage, shall be permitted in lieu of the clearances listed in Sentences (2), (3) and (4).

9.33.6.9. Adjustable Dampers and Balance Stops
1) All branch supply ducts that are not fitted with diffusers with adjustable balance stops shall be supplied with adjustable dampers and fitted with devices to indicate the positions of the dampers.

9.33.6.10. Warm-Air Supply Outlets and Return Inlets – General
1) Supply outlets and return openings in the dwelling unit, when located less than 2 m above the floor, shall be protected by grilles having openings of a size that will not allow the passage of a 15 mm diam sphere.
2) Combustible grilles, diffusers and other devices for the supply and return air openings installed in walls and ceilings shall have a flame-spread rating of
   a) not more than 200 in bathrooms, and
   b) not more than 150 in rooms or spaces other than bathrooms.

9.33.6.11. Warm-Air Supply Outlets
1) In a dwelling unit, a warm-air supply outlet shall be provided in each finished room that is located adjacent to unheated space.
2) Except as provided in Sentence (3), when a room described in Sentence (1) is located adjacent to exterior walls, such outlet shall be located so as to bathe at least one exterior wall or window with warm air, except in bathrooms, utility rooms or kitchens, where this may not be practical.
3) Where the heating system is also designed to provide ventilation air, ceiling outlets or outlets located high on interior walls are permitted to be installed, provided the outlets are designed for this purpose and are installed with diffusers.
4) At least one warm-air supply outlet shall be provided for each 40 m² of floor surface area in unfinished basements serving dwelling units, and it shall be located so as to provide adequate distribution of warm air throughout the basement.
5) At least one warm-air supply outlet shall be provided for each 80 m² of floor surface area in heated crawl spaces serving dwelling units, and it shall be located so as to provide adequate distribution of warm air throughout the crawl space.
6) Except for pipeless furnaces, the capacity of warm-air supply outlets serving dwelling units shall be not less than the design heat loss from the area served and shall not exceed 3 kW per outlet.
7) In basements and heated crawl spaces, the calculated heat gain from the supply ducts and plenum surfaces is permitted to be considered in calculating the design heat loss.
8) The temperature of supply air at warm-air supply outlets shall not exceed 70°C.
9) Warm-air supply outlets located in finished areas shall be provided with diffusers and adjustable openings and shall not be located on a furnace plenum.

9.33.6.12. Return-Air Inlets
1) Return-air inlets shall not be installed in an enclosed room or crawl space that provides combustion air to a furnace.

2) Except for unfinished areas and floor levels which are less than 900 mm above or below an adjacent floor level which is provided with a return-air inlet, at least one return-air inlet shall be provided in each floor level in a dwelling unit.

3) Provision shall be made for the return of air from all rooms by leaving gaps beneath doors, using louvred doors or installing return duct inlets.

9.33.6.13. Return-Air System

(See Note A-9.33.6.13.)

1) The return-air system shall be designed to handle the entire air supply.

2) Where any part of a return duct will be exposed to radiation from the furnace heat exchanger or other radiating part within the furnace, such part of a return duct directly above or within 600 mm of the outside furnace casing shall be noncombustible.

3) Return ducts serving solid-fuel-burning furnaces shall be constructed of noncombustible material.

4) Combustible return ducts shall be lined with noncombustible material
   a) below floor registers,
   b) at the bottom of vertical ducts, and
   c) under furnaces having a bottom return.

5) Spaces between studs or joists used as return ducts shall be separated from the unused portions of such spaces by tight-fitting metal stops or wood blocking.

6) A vertical return duct shall have openings to return air on not more than one floor.

7) The return-air system shall be designed so that the negative pressure from the circulating fan cannot
   a) affect the furnace combustion air supply, nor
   b) draw combustion products from joints or openings in the furnace or flue pipe.

9.33.6.14. Filters and Odour Removal Equipment

1) Air filters for air duct systems shall conform to the requirements for Class 2 air filter units as described in CAN/ULC-S111, “Fire Tests for Air Filter Units.”

2) When electrostatic-type filters are used, they shall be installed so as to ensure that the electric circuit is automatically de-energized when filter access doors are opened or, in dwelling units, when the furnace circulation fan is not operating.

3) When odour removal equipment of the adsorption type is used it shall be
   a) installed to provide access so that adsorption material can be reactivated or renewed, and
   b) protected from dust accumulation by air filters installed on the inlet side.

9.33.7. Radiators and Convectors

9.33.7.1. Recessed Radiators and Convectors

1) Every steam or hot water radiator and convector located in a recess or concealed space or attached to the face of a wall of combustible construction shall be provided with a noncombustible lining or backing.

9.33.7.2. Surface Temperature

1) The exposed surface temperature of a steam or hot water radiator shall not exceed 70°C unless precautions are taken to prevent human contact.

9.33.8. Piping for Heating and Cooling Systems

9.33.8.1. Piping Materials and Installation

1) Piping shall be made from materials designed to withstand the effects of temperatures and pressures that may occur in the system. (See Articles 3.1.5.19., 3.1.9.1. and 9.10.9.6. for fire safety requirements.)
2) Every pipe used in a heating or air-conditioning system shall be installed to allow for expansion and contraction due to temperature changes.
3) Supports and anchors for piping in a heating or air-conditioning system shall be designed and installed to ensure that undue stress is not placed on the supporting structure.

9.33.8.2. Insulation and Coverings
1) Insulation and coverings on pipes shall be composed of material suitable for the operating temperature of the system to withstand deterioration from softening, melting, mildew and mould.
2) Insulation and coverings on pipes in which the temperature of the fluid exceeds 120°C
   a) shall be made of noncombustible material, or
   b) shall not flame, glow, smoulder or smoke when tested in accordance with ASTM C 411, “Hot-Surface Performance of High-Temperature Thermal Insulation,” at the maximum temperature to which such insulation or covering is to be exposed in service.
3) Except as provided in Sentence (6), where combustible insulation is used on piping in a horizontal or vertical service space, the insulation and coverings on such pipes shall have a flame-spread rating throughout the material of not more than
   a) 25 in buildings of noncombustible construction, and
   b) 75 in buildings of combustible construction.
4) Except as provided in Sentence (6), insulation and coverings on piping located in rooms and spaces other than the service spaces described in Sentence (3) shall have a flame-spread rating not more than that required for the interior finish for the ceiling of the room or space.
5) Pipes that are exposed to human contact shall be insulated so that the exposed surface does not exceed 70°C. (See Note A-6.5.1.1.(3).)
6) No flame-spread rating or smoke developed classification limitations are required where combustible insulation and coverings are used on piping when such piping is
   a) located within a concealed space in a wall,
   b) located in a floor slab, or
   c) enclosed in a noncombustible raceway or conduit.

9.33.8.3. Clearances
1) Clearances between combustible material and bare pipes carrying steam or hot water shall conform to Table 9.33.8.3.

Table 9.33.8.3.
Clearance between Steam or Hot Water Pipes and Combustible Material

<td>25</td>
</tr>
</tbody>
</table>

9.33.8.4. Protection
1) Where a pipe carrying steam or hot water at a temperature above 120°C passes through a combustible floor, ceiling or wall, the construction shall be protected by a sleeve of metal or other noncombustible material not less than 50 mm larger in diameter than the pipe.
2) Unprotected steam or hot water pipes that pass through a storage space shall be covered with not less than 25 mm thickness of noncombustible insulation to prevent direct contact with the material stored.
9.33.9. Refrigerating Systems and Equipment for Air-conditioning

9.33.9.1. Cooling Units
   1) Where a cooling unit is combined with a fuel-fired furnace in the same duct system, the cooling unit shall be installed
      a) in parallel with the heating furnace,
      b) upstream of the furnace, provided the furnace is designed for such application, or
      c) downstream of the furnace, provided the cooling unit is designed to prevent excessive temperature or pressure in the refrigeration system.

9.33.10. Chimneys and Venting Equipment

9.33.10.1. Requirement for Venting
   1) Except as provided in Articles 9.33.10.2. and 9.33.10.3., the products of combustion from oil-, gas- and solid-fuel-burning appliances, including stoves, cooktops, ovens and space heaters, shall be vented in conformance with the applicable appliance installation standard listed in Sentences 9.33.5.2.(1) and 9.33.5.3.(1).

9.33.10.2. Factory-Built Chimneys
   1) Factory-built chimneys serving solid-fuel-burning appliances, and their installation, shall conform to CAN/ULC-S629-M, “650°C Factory-Built Chimneys.” (See Note A-9.33.10.2.(1).)

9.33.10.3. Masonry or Concrete Chimneys
   1) Masonry or concrete chimneys shall conform to Section 9.21.

9.33.10.4. Location of Exhaust Vents Serving Buildings Containing Not More than Two Principal Dwelling Units
   1) Exhaust Vents from heating and air conditioning equipment and similar appliances, other than direct vented fireplaces, shall be directed
      a) vertically through the roof of a building, with the discharge located at least 1.5 m away from any property line, or
      b) horizontally through an exterior wall which faces a street or a lane, with the discharge located at least 3 m away from any property line.

Section 9.34. Electrical Facilities

9.34.1. General

9.34.1.1. Standard for Electrical Installations
   1) Electrical installations, including the service capacity of the installation and the number and distribution of circuits and receptacles, shall conform to the Electrical Safety Regulation."

   2) In addition to the requirements of Sentence (1), electrical installations in a principal dwelling unit containing an ancillary residential unit in a residential suite in an apartment building required to conform to Section 9.37 shall also comply with the following:
      a) the electrical service size shall be based on the demand load calculated on the total area of the principal dwelling unit including any associated ancillary residential unit, provided that
         i) for each electrical range additional to the first range, 6 kW demand shall be added for a rating of 12 kW or less, plus 40% of the amount by which the rating of the range exceeds 12 kW, and
iii) except for the first electrical range referred to in Subclause (2)(a)(i), any electrical equipment loads provided for shall be calculated in conformance with Sentence (1), and

b) a single panel board may supply electrical loads of the dwelling units referred to in Clause (2)(a) except for the residential suite containing an ancillary residential unit in an apartment building, provided that it is located within the building in a common area accessible to all occupants of the building.

3) Circuit breakers of panel boards installed in the dwelling units
   a) shall be positioned not less than 600 mm above the finished floor level, and
   b) notwithstanding the requirements of Sentence (1) and 3.8.5.7.(2), shall be positioned as high as feasible with the branch circuit breakers not more than 1500 mm above the finished floor level.

9.34.1.2. Required Facilities
   1) Where electrical services are available, electrical facilities shall be provided for every building in conformance with this Section.

9.34.1.3. Location of Equipment in Public Areas
   1) Entrance switches, meters, panel boxes, splitter boxes, time clocks and other similar equipment shall not be located in any public area unless adequate precautions are taken to prevent interference with the equipment.

9.34.1.4. Recessed Lighting Fixtures
   1) Recessed lighting fixtures shall not be located in insulated ceilings unless the fixtures are designed for such installations.

9.34.1.5. Wiring and Cables
   1) Except as required in Sentence (2), optical fibre cables and electrical wires and cables installed in buildings permitted to be of combustible construction shall
      a) not convey flame or continue to burn for more than 1 min when tested in conformance with the Vertical Flame Test (FT1 rating) in CSA C22.2 No. 0.3, “Test Methods for Electrical Wires and Cables,” or
      b) be located in
         i) totally enclosed noncombustible raceways (See Note A-3.1.4.3.(1)(b)(i)),
         ii) masonry walls,
         iii) concrete slabs, or
         iv) totally enclosed non-metallic raceways conforming to Clause 3.1.5.23.(1)(b).
   2) Except as permitted in Sentence (3), where a concealed space in a floor or ceiling assembly is used as a plenum, electrical wires and cables with combustible insulation, jackets or sheathes that are used for the transmission of voice, sound or data and optical fibre cables installed within the plenum shall conform to Clause 3.6.4.3.(1)(a).
   3) Wires or cables within plenum spaces that are used for the transmission of signals in fire alarm, security, radio, and television broadcasting, closed circuit television or community television systems need not meet the requirements of Sentence (2).

9.34.2. Lighting Outlets
   (See Note A-9.34.2.)

9.34.2.1. Lighting of Entrances
   1) An exterior lighting outlet with fixture controlled by a wall switch located within the building shall be provided at every entrance to buildings of residential occupancy.
9.34.2.2. Outlets in Dwelling Units
1) Except as provided in Sentence (2), a lighting outlet with fixture controlled by a wall switch shall be provided in kitchens, bedrooms, living rooms, utility rooms, laundry rooms, dining rooms, bathrooms, water-closet rooms, vestibules and hallways in dwelling units.
2) Where a receptacle controlled by a wall switch is provided in bedrooms or living rooms, such rooms need not conform to the requirements in Sentence (1).

9.34.2.3. Stairways
1) Every stairway shall be lighted.
2) Except as provided in Sentence (3), 3-way wall switches located at the head and foot of every stairway shall be provided to control at least one lighting outlet with fixture for stairways with 4 or more risers in dwelling units.
3) The stairway lighting for basements that do not contain finished space or lead to an outside entrance or built-in garage and which serve not more than one dwelling unit is permitted to be controlled by a single switch located at the head of the stairs.

9.34.2.4. Basements
1) A lighting outlet with fixture shall be provided for each 30 m² or fraction thereof of floor area in unfinished basements.
2) The outlet required in Sentence (1) nearest the stairs shall be controlled by a wall switch located at the head of the stairs.

9.34.2.5. Storage Rooms
1) A lighting outlet with fixture shall be provided in storage rooms.

9.34.2.6. Garages and Carports
1) A lighting outlet with fixture shall be provided for an attached, built-in or detached garage or carport.
2) Except as provided in Sentence (3), outlets required in Sentence (1) shall be controlled by a wall switch near the doorway.
3) Where the outlet and fixture required in Sentence (1) are ceiling mounted above an area not normally occupied by a parked car, or are wall mounted, a fixture with a built-in switch accessible to an adult of average height is permitted to be used.
4) Where a carport is lighted by a light at the entrance to a dwelling unit, additional carport lighting is not required.

9.34.2.7. Public and Service Areas
1) Every public or service area in buildings shall be provided with lighting outlets with fixtures controlled by a wall switch or panel to illuminate every portion of such areas.
2) When provided by incandescent lighting, illumination required in Sentence (1) shall conform to Table 9.34.2.7. (See Article 9.9.12.2. for lighting in means of egress.)
3) When other types of lighting are used, illumination equivalent to that shown in Table 9.34.2.7. shall be provided.
### 9.34.3. Emergency Lighting

#### 9.34.3.1. Criteria for Emergency Lighting

1) Emergency lighting shall conform to Subsection 9.9.12.

### Section 9.35. Garages and Carports

#### 9.35.1. Scope

#### 9.35.1.1. Application

1) This Section applies to garages and carports serving not more than one dwelling unit.

#### 9.35.1.2. Construction Requirements

1) The construction of a garage or carport shall conform to the requirements for other buildings in this Part except as provided in this Section.

#### 9.35.2. General

#### 9.35.2.1. Carport Considered to be Garage

1) Where a roofed enclosure used for the storage or parking of motor vehicles has more than 60% of the total perimeter enclosed by walls, doors or windows, the enclosure shall be considered a garage.

#### 9.35.2.2. Garage Floor

1) Where an attached or built-in garage is provided and where adjacent spaces in the building are less than 50 mm above the garage floor,

   a) the garage floor shall be sloped to the outdoors, or

   b) where the garage can accommodate not more than 3 vehicles, an airtight curb or partition not less than 50 mm high shall be installed at the edges of the garage floor adjacent to interior space.

(See Note A-9.35.2.2.(1).)

#### 9.35.3. Foundations

9.35.3.1. Foundation Required
1) Except as permitted in this Subsection, foundations conforming to Sections 9.12. and 9.15. shall be provided for the support of carport and garage super-structures, including that portion beneath garage doors.
2) Detached garages of less than 55 m² floor area and not more than 1 storey in height that are not of masonry or masonry veneer construction are permitted to be supported on
   a) wood mud sills, or
   b) a 100 mm thick concrete floor slab.

9.35.3.2. Protection from Damage due to Soil Movement
1) In clay-type soils subject to significant movement with a change in soil moisture content, the foundation depth of carports or garages connected to a dwelling unit directly or by a breezeway shall be approximately the same depth as the main building foundation.
2) Where slab-on-ground construction is used, a construction joint shall be provided between the main building slab and a slab serving an attached garage, breezeway or carport.
3) Except as provided in Section 9.12., foundations for attached unheated garages or carports shall be below frost level.

9.35.3.3. Drainage
1) Detached garages of less than 55 m² floor area and not more than 1 storey in height that are not of masonry or masonry veneer construction need not conform with the foundation drainage requirements stated in Section 9.14., where the finished ground level is at or near the elevation of the garage’s floor and where the ground slopes away from the building.

9.35.3.4. Column Piers
1) Piers for the support of carport columns shall extend not less than 150 mm above ground level.
2) Piers referred to in Sentence (1) shall project not less than 25 mm beyond the base of the column but in no case be less than 190 mm by 190 mm in size.

9.35.4. Walls and Columns

9.35.4.1. Interior Finish
1) Interior finish need not be applied to garage and carport walls.

9.35.4.2. Columns
1) Columns for garages and carports shall conform to Section 9.17., except that 89 mm by 89 mm wood columns may be used.

9.35.4.3. Anchorage
1) Garage or carport walls and columns shall be anchored to the foundation to resist wind uplift in conformance with Subsection 9.23.6., except that where a garage is supported on the surface of the ground, ground anchors shall be provided to resist wind uplift.

Section 9.36. Energy Efficiency

9.36.1. General

9.36.1.1. Application
1) All Part 9 buildings shall conform to the energy requirements of Part 10.
Section 9.37 Ancillary Residential Units

9.37.1. General

9.37.1.1. Application
(See Note 9.37.1.1)
1) This Section applies to the construction of an ancillary residential unit in a building containing not more than 2 principal dwelling units or a row house. (See Note A-9.37.1.1.(1).)

9.37.1.2. Construction Requirements
1) An ancillary residential unit, and those parts of a building serving only the principal dwelling unit and its ancillary residential unit, shall conform to the requirements in this Part except as provided in this Section. (See Note A-9.37.1.2.)

9.37.2. Specific Requirements

9.37.2.1. Heights of Rooms or Spaces
1) The minimum height of rooms or spaces in an ancillary residential unit over the required minimum area as indicated in Table 9.5.3.1. shall be not less than 2.0 m.
2) It shall be possible to travel from the required area of one room to the required areas of all other rooms within an ancillary residential unit without reduction of the room height as required in Sentence (1).

9.37.2.2. Deleted.

9.37.2.3. Exit Stairs
1) Exit stairs serving a principal dwelling unit and its ancillary residential unit shall have a minimum width, measured between wall faces or guards, of not less than 860 mm. (See Note A-9.37.2.3.(1).)

9.37.2.4. Dimensions of Landings
1) Landings for exterior stairs serving an ancillary residential unit need not exceed 900 mm in length.

9.37.2.5. Handrails and Guards
1) Handrails and guards shall conform to the requirements of Subsections 9.8.7. and 9.8.8. as if serving only one dwelling unit.

9.37.2.6. Means of Egress
1) The width of every public corridor and exit corridor that serves a principal dwelling unit and its ancillary residential unit shall be not less than 860 mm. (See Note A-9.37.2.6.(1).)

9.37.2.7. Fire Separations for Exits
1) Except as permitted by Sentence (2), every exit other than an exit doorway shall be separated from adjacent floor areas by a fire separation
   a) having a fire-resistance rating of 45 min, or
   b) having a fire-resistance rating of not less than 30 min where the dwelling units are equipped with smoke alarms as referenced in Article 9.37.2.19.
2) A fire-resistance rating is not required for a fire separation that separates an exit from adjacent floor areas where the building is sprinklered.
9.37.2.8. Openings Near Unenclosed Exit Stairs and Ramps
1) Where an unenclosed exterior exit stair or ramp provides the only means of egress from a dwelling unit in a building that contains an ancillary residential unit and the stair is exposed to the hazards of fire from unprotected openings in the exterior wall of another fire compartment, the openings shall be protected in conformance with Articles 9.10.13.5. to 9.10.13.7. and 3.2.5.13.(5) (See Note A-9.37.2.8.(1).)

9.37.2.9. Doors in a Means of Egress
1) Every exit door or door that opens into or is located within a public corridor or other facility that provides access to exit from a principal dwelling unit and its ancillary residential unit shall
   a) be not less than 1980 mm high,
   b) have a clear opening width of not less than 800 mm, and
   c) be permitted to swing inward.

9.37.2.10. Travel Limit to Exits or Egress Doors
1) In an ancillary residential unit, the travel limit from a floor level in the dwelling unit to an exit or egress door may exceed 1 storey provided the floor level within the dwelling unit is served by an operable window conforming to Article 9.9.10.1. and is located so that the window could provide egress from the ancillary residential unit if the other dwelling unit becomes inaccessible to the occupants due to a fire which originates in the dwelling unit.

9.37.2.11. Shared Egress Facilities
1) Except as provided in Article 9.9.7.3., where an egress door from a dwelling unit opens onto a public corridor or exterior passageway, it shall be possible from the location where the egress door opens onto the public corridor or exterior passageway to go in opposite directions to 2 separate exits unless the dwelling unit is served by a second and separate means of egress or an opening window conforming to Article 9.9.10.1.
2) Each dwelling unit shall be provided with a second and separate means of egress or an opening window conforming to Article 9.9.10.1. where the egress door from either dwelling unit opens onto
   a) an exit stairway that serves both suites,
   b) a public corridor serving both suites and served by a single exit stairway,
   c) an exterior passageway serving both suites and served by a single exit stairway, or
   d) a balcony serving both suites and served by a single exit stairway.

9.37.2.12. Exit Signs
1) Exit signs are not required within an ancillary residential suite.

9.37.2.13. Structural Fire Resistance
1) Table 9.10.8.1., Fire-Resistance Ratings for Structural Members and Assemblies, does not apply to an ancillary residential unit. (See Note A-9.37.2.13.)

(See Note A-9.37.2.14.)
1) Combustible drain, waste and vent piping is permitted to be located within or penetrate a fire separation required to have a fire-resistance rating provided
   a) except for the permitted penetration in Clause (b), the combustible piping is located within an assembly protected by a membrane of a minimum 12.7 mm gypsum board,
   b) piping and tubing is tightly fitted, cast in place, or firestopped to ensure the integrity of the fire separation, and
   c) the combustible piping does not penetrate the gypsum board protection membrane on the underside of a horizontal assembly.
2) Combustible drain, waste and vent piping enclosed in an assembly or protected as described in Sentence (1) is permitted on both sides of a fire separation.

9.37.2.15. Separation of Ancillary Residential Units

(See Note A-9.37.2.15.)

1) A principal dwelling unit and its ancillary residential unit shall be separated from each other by
   a) wall or partition assemblies consisting of
      i) not less than one layer of 1/2" type C or 5/8" type X wall board on wood or steel studs on each side,
      ii) resilient channel installed on at least one side, and
      iii) noncombustible insulation of at least 3-1/2" depth throughout, and
   b) floor assemblies consisting of
      i) not less than one layer of 1/2" type C or 5/8" type X wall board,
      ii) with resilient channel, and
      iii) at least 3-1/2" of noncombustible insulation.

2) Openings in a fire separation required by Sentence (1) shall be protected by closures with a minimum 20 min fire-protection rating, or 45 mm thick solid core wood doors in accordance with 9.10.13.2.

9.37.2.16. Separation of Public Corridors

1) A public corridor serving only a principal dwelling unit and its ancillary residential unit shall be separated from the dwelling units by
   a) wall or partition assemblies consisting of
      i) not less than one layer of 1/2" type C or 5/8" type X wall board on wood or steel studs on each side, and
      ii) noncombustible insulation of at least 3-1/2" depth throughout, and
   b) floor assemblies consisting of
      i) not less than one layer of 1/2" type C or 5/8" type X wall board, and
      ii) at least 3-1/2" of noncombustible insulation.

2) Openings in a fire separation required by Sentence (1) shall be protected by closures with a minimum 20 min fire-protection rating, or 45 mm thick solid core wood doors in accordance with 9.10.13.2.

9.37.2.17. Air Ducts and Fire Dampers

(See Note A-9.37.2.17.)

1) Except as provided in Sentences (2) and (3), and notwithstanding Sentences 9.32.1.1.(1) and 9.33.1.1.(1), Sections 9.32 and 9.33 applies to a building that contains an ancillary residential suite.

2) Where a heating or ventilation duct system serves more than one dwelling unit, the system shall be designed and installed to prevent the circulation of smoke to adjacent dwelling units upon a signal from a duct-type smoke detector or smoke alarm.

3) Ducts penetrating fire separations need not be equipped with fire dampers in conformance with Article 3.1.8.9. provided they are noncombustible with all openings in the duct system serving only one fire compartment.

9.37.2.18. Spatial Separation

1) Spatial separation shall conform to the applicable requirements of Subsection 9.10.14 or 9.10.15.

9.37.2.19. Smoke Alarms

(See Note A-9.37.2.19.)

1) The installation of smoke alarms shall conform to Subsection 9.10.19.

2) Smoke alarms shall be installed in each principal dwelling unit and each ancillary residential unit, and shall be of the photo-electric type hard-wired so that the activation of any smoke alarm will cause the smoke alarms in the principal dwelling unit and its ancillary residential unit to sound.
9.37.2.20. Sound Control
1) The assemblies separating the primary dwelling unit and its contained ancillary residential suites need not comply with the sound control requirements of Section 9.11. (See Note A-9.37.2.20.(1).)

9.37.2.21. Attic Space Access
1) An attic space access hatchway not less than 0.32 m² in an area with no dimension less than 500 mm may serve a principle dwelling unit and its contained ancillary residential suites.

9.37.2.22. Garages and Carports
1) Section 9.35 is applicable to garages and carports serving a building that contains an ancillary residential suite.

9.37.2.23. Accessibility and Adaptability
1) Ancillary residential units shall be designed in conformance with Section 3.8.

9.37.2.24. Fire Sprinklers
1) Where the building is permitted to be sprinklered to NFPA 13D by Article 3.2.5.12., the sprinkler system serving an ancillary residential unit is permitted to be designed in accordance with NFPA 13D.
2) The sprinkler system referred to in Sentence (1) shall be supplied from the Principal Dwelling Unit.

Section 9.38. Objectives and Functional Statements

9.38.1. Objectives and Functional Statements

9.38.1.1. Attributions to Acceptable Solutions
1) For the purpose of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 9.38.1.1. (See Note A-1.1.2.1.(1.).)

Table 9.38.1.1.
Objectives and Functional Statements Attributed to the Acceptable Solutions in Part 9

### 9.3.3.2. Galvanized Sheet Steel

(1) [F80-OS2.3]
    [F80-OP2.3,OP2.4]
    [F80-OH1.1,OH1.2,OH1.3] Applies where sheet metal is used in an environmental separator.
    [F80-OS3.1] Applies where sheet metal is used in assemblies that support floors.
    [F80-OH4] Applies where sheet metal is used in assemblies that support floors.

(2) [F80-OS2.3]
    [F80-OP2.3]
    [F80-OH1.1,OH1.2,OH1.3]

### 9.4.2.2. Specified Snow Loads

(1) [F20-OS2.1,OS2.3] [F22-OS2.3]
    [F20-OP2.1,OP2.3] [F22-OP2.3]
    [F22-OH1.1,OH1.2,OH1.3]

(2) [F20-OS2.1]
    [F20-OP2.1]

### 9.4.2.3. Platforms Subject to Snow and Occupancy Loads

(1) [F20-OS2.1]
    [F20-OP2.1]

### 9.4.2.4. Attics and Roof Spaces

(1) [F20-OS2.1]
    [F20-OP2.1]

### 9.4.3.1. Deflections

(1) [F22-OS2.3] Applies to elements that support or are part of an environmental separator.
### 9.4.4.1. Allowable Bearing Pressures

1. Applies to elements that support or are part of an environmental separator.

### 9.4.4.2. Foundation Capacity in Weaker Soil and Rock

1. Applies to elements that support or are part of an environmental separator.
### 9.4.4.3. High Water Table

(1)  
[F20-OS2.2]  
[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

[F20-OP2.2,OP2.4]  
[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

[F20-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

[F20-OH4] Applies to floors and elements that support floors.

[F20-OS3.1] Applies to floors and elements that support floors.

### 9.4.4.4. Soil Movement

(1)  
[F21-OS2.1]  
[F21-OS2.3] Applies to elements that support or are part of an environmental separator.

[F21-OP2.1,OP2.4]  
[F21-OP2.3] Applies to elements that support or are part of an environmental separator.

[F21-OH1.1,OH1.2,OH1.3] Applies to walls that support or are part of an environmental separator.

[F21-OH4] Applies to *foundations* that support floors and other elements that support floors.

[F21-OS3.1] Applies to footings that support floors and other elements that support floors.

[F21-OS3.7] Applies to footings that support walls that contain doors or windows required for emergency egress.

### 9.4.4.5. Retaining Walls

(1)  
[F20-OS2.1,OS2.3]

[F20-OP2.1,OP2.3,OP2.4]

[F20-OH1.1,OH1.2,OH1.3]

[F20-OH4] Applies to floors and elements that support floors.

[F20-OS3.1] Applies to floors and elements that support floors.

### 9.4.4.6. Walls Supporting Drained Earth

(1)  
[F20-OS2.1,OS2.3]

[F20-OP2.1,OP2.3,OP2.4]

[F20-OH1.1,OH1.2,OH1.3]

[F20-OH4] Applies to floors and elements that support floors.
9.5.1.2. Combination Rooms

(2) [F10-OS3.7]

9.5.3.1. Ceiling Heights of Rooms or Spaces

(1) [F30-OS3.1] [F10-OS3.7]
(2) [F30-OS3.1] [F10-OS3.7]
(3) [F30-OS3.1] [F10-OS3.7]
(4) [F30-OS3.1] [F10-OS3.7]

9.5.3.2. Mezzanines

(1) [F30-OS3.1] [F10-OS3.7]

9.5.3.3. Storage Garages

(1) [F30-OS3.1] [F10-OS3.7]

9.5.4.1. Hallway Width

(1) [F10-OS3.7]

9.5.5.1. Doorway Opening Sizes

(1) [F30-OS3.1] [F10-OS3.7]
(2) [F10-OS3.7] [F30-OS3.1]

9.5.5.2. Doorways to Public Water-Closet Rooms

(1) [F30-OS3.1] [F10-OS3.7]

**9.10.17.2. Ceilings in Exits or Public Corridors**

(1) [F05-OS1.5]

**9.10.17.3. Walls in Exits**

(1) [F05-OS1.5]

(2) [F05-OS1.5]

**9.10.17.4. Exterior Exit Passageways**

(1) [F05-OS1.5]

**9.10.17.5. Walls in Public Corridors**

(1) [F05-OS1.5]

**9.10.17.9. Combustible Skylights**

(1) [F02,F05-OS1.5]

**9.10.17.10. Protection of Foamed Plastics**

(1) (a),(b),(c) [F01,F02,F05-OS1.5]

(2) [F01-OS1.1] [F02-OS1.2]

[F01-OP1.1] [F02-OP1.2]

(3) [F01,F02-OS1.2]

**9.10.18.1. Access Provided through a Firewall**

(1) [F11-OS1.5]

**9.10.18.2. Fire Alarm System Required**

(1) [F11-OS1.5] [F13-OS1.2,OS1.5] [F03-OS1.2]

[F13-OP1.2]

(2) [F11-OS1.5]

**9.10.18.4. Rooms and Spaces Requiring Heat Detectors or Smoke Detectors**

(1) [F11-OS1.5]

(2) [F11-OS1.5]

(3) [F02-OS1.2] Applies to *sprinklered buildings*. [F11-OS1.5] Applies to the supervision of the system and the flow alarm.
### 9.10.18.5. Smoke Detectors in Recirculating Air-Handling Systems

- **(1)** [F03-OS1.2]

### 9.10.18.6. Portions of Buildings Considered as Separate Buildings

- **(1)** [F03-OS1.2]
- **(2)** [F11-OS1.2]

### 9.10.18.7. Central Vacuum Systems

- **(1)** [F03-OS1.2]

### 9.10.19.1. Required Smoke Alarms

- **(1)** [F81,F11-OS1.5]
- **(2)** [F11-OS1.5]

### 9.10.19.2. Sound Patterns of Smoke Alarms

- **(1)** [F11-OS1.5]

### 9.10.19.3. Location of Smoke Alarms

- **(1)** [F11-OS1.5]
- **(2)** [F81,F11-OS1.5]
- **(3)** [F11-OS1.5]

### 9.10.19.4. Power Supply

- **(1)** [F11,F81-OS1.5]
- **(3)** [F11,F81-OS1.5]

### 9.10.19.5. Interconnection of Smoke Alarms

- **(1)** [F11-OS1.5]
- **(2)** [F11-OS1.5]

### 9.10.19.6. Silencing of Smoke Alarms

- **(1)** [F11,F81-OS1.5]

### 9.10.19.7. Instructions for Maintenance and Care

### 9.12.4.1. Support of Footings

**(1)**

[F21-OH1.1,OH1.2,OH1.3]

[F21-OS2.1]

[F21-OS2.3] Applies to elements that support or are part of an environmental separator.

[F21-OP2.2]

[F21-OP2.3] Applies to elements that support or are part of an environmental separator.

[F21-OH2.1] Applies to sewer-line locations beneath footings.

[F21-OS3.1] Applies to floors and elements that support floors.

### 9.13.2.1. Required Dampproofing

**(1)**

[F61-OH1.1,OH1.2,OH1.3]

[F61-OS2.3]

**(2)**

[F61-OH1.1,OH1.2,OH1.3]

[F61-OS2.3]

### 9.13.2.2. Dampproofing Materials

**(1)**

[F40-OH1.1]

[F61-OH1.1,OH1.2,OH1.3]

[F61-OS2.3]

**(2)**

[F40-OH1.1] Applies to materials installed to control the ingress of soil gas.
**9.13.2.3. Preparation of Surface**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>

[F60-OS2.1,OS2.2,OS2.3]  
[F60-OP2.1,OP2.2,OP2.3]

9.14.4.1. Type of Granular Material

(1) (a) [F60-OS2.3] [F21-OS2.2]  
(a) [F60-OP2.3] [F21-OP2.6]  
(a) [F60-OH1.1,OH1.2,OH1.3]  
(b) [F21-OS2.1]  
(b) [F21-OS2.3] Applies to elements that support or are part of an environmental separator.  
(b) [F21-OP2.1,OP2.4]  
(b) [F21-OP2.3] Applies to elements that support or are part of an environmental separator.  
(b) [F21-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.  
(b) [F21-OH4] Applies to floors and elements that support floors.  
(b) [F21-OS3.1] Applies to floors and elements that support floors.

9.14.4.2. Installation

(1) [F60-OH1.1,OH1.2,OH1.3]
9.14.4.3. Grading

(1) [F60-OH1.1, OH1.2, OH1.3]

9.14.4.4. Wet Site Conditions

(1) [F60-OH1.1, OH1.2, OH1.3]

9.14.5.1. Drainage Disposal

(1) [F60-OH1.1, OH1.2, OH1.3]

9.14.5.2. Sump Pits

(1) (a), (b) [F60, F61-OH1.1, OH1.3] (c) [F40-OH1.1] [F52-OH1.2]

9.14.5.3. Dry Wells
(1) [F60-OH1.1, OH1.2, OH1.3]  
[F60-OS2.1, OS2.2, OS2.3]  
[F60-OP2.1, OP2.2, OP2.3]  

(2) [F60-OH1.1, OH1.2, OH1.3]  
[F60-OS2.1, OS2.2, OS2.3]  
[F60-OP2.1, OP2.2, OP2.3]  

9.14.6.1. Surface Drainage

(1) [F60-OH1.1, OH1.2, OH1.3]  
[F60-OS2.1, OS2.2, OS2.3]  
[F60-OP2.1, OP2.2, OP2.3]  

9.14.6.2. Drainage away from Wells or Septic Disposal Beds

(1) [F46-OH2.2] Applies to directing drainage away from the location of a water supply.  
[F44-OH2.1] Applies to directing drainage away from a septic tank disposal system.  

9.14.6.3. Window Wells

(1) [F60-OH1.1, OH1.2, OH1.3]  
[F60-OS2.1, OS2.3]  
[F60-OP2.1, OP2.3]  

(1) [F61-OH1.1, OH1.2, OH1.3]  
[F61-OS2.3]  
[F61-OP2.3]  

9.15.1.3. Foundations for Deformation-Resistant Buildings

(1) [F20-OS2.2]  
[F20,F22-OS2.3] Applies to elements that support or are part of an environmental separator.  
[F20-OP2.2]  
[F22-OP2.4]  
[F20,F22-OP2.3] Applies to elements that support or are part of an environmental separator.
### 9.15.2.2. Unit Masonry Construction

1. 
   - [F20-OS2.1]
   - [F20,F21,F61-OS2.3] Applies to elements that support or are part of an environmental separator.
   - [F20,F21,F61-OS3.1] Applies to floors and elements that support floors.
   - [F20,F21,F61-OH4] Applies to floors and elements that support floors.
   - [F20,F21,F61-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.
   - [F20-OP2.1]
   - [F21,F61-OP2.4]
   - [F20,F21,F61-OP2.3] Applies to elements that support or are part of an environmental separator.

3. 
   - (a) [F20-OS2.1]
     - (a) [F20,F80-OS2.3] Applies to elements that support or are part of an environmental separator.
     - (a) [F20-OP2.1]
     - (a) [F80-OP2.4]
     - (a) [F20,F80-OP2.3] Applies to elements that support or are part of an environmental separator.
     - (a) [F20,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.
   - (a) [F20,F80-OH4] Applies to floors and elements that support floors.
   - (a) [F20,F80-OS3.1] Applies to floors and elements that support floors.
   - (b) [F20-OS2.1]
     - (b) [F20,F80-OS2.3] Applies to elements that support or are part of an environmental separator.
     - (b) [F20-OP2.1]
     - (b) [F80-OP2.4]
     - (b) [F20,F80-OP2.3] Applies to elements that support or are part of an environmental separator.
     - (b) [F20,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.
   - (b) [F20,F80-OH4] Applies to floors and elements that support floors.
   - (b) [F20,F80-OS3.1] Applies to floors and elements that support floors.
   - (c) [F20-OS2.1]
     - (c) [F20,F61-OS2.3] Applies to elements that support or are part of an environmental separator.
### 9.15.2.3. Pier-Type Foundations

|     | (a) [F20,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator. |
|     | (a) [F20,F80-OH4] Applies to floors and elements that support floors. |
|     | (a) [F20,F80-OS3.1] Applies to floors and elements that support floors. |

### 9.15.3.1. Footings Required

| (1) | [F20-OS2.2]  
     | [F20,F21-OS2.3] Applies to elements that support or are part of an environmental separator. |
|     | [F20-OP2.2]  
     | [F20,F21-OP2.4]  
     | [F20,F21-OP2.3] Applies to elements that support or are part of an environmental separator. |
|     | [F20,F21-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator. |
|     | [F20,F21-OH4] Applies to floors and elements that support floors. |
|     | [F20,F21-OS3.1] Applies to floors and elements that support floors. |

### 9.15.3.2. Support of Footings

| (1) | [F21-OS2.4]  
     | [F21-OS2.3] Applies to elements that support or are part of an environmental separator. |
|     | [F21-OP2.4]  
     | [F21-OP2.3] Applies to elements that support or are part of an environmental separator. |
|     | [F21-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator. |
|     | [F21-OH4] Applies to floors and elements that support floors. |
|     | [F21-OS3.1] Applies to floors and elements that support floors. |

| (2) | [F21-OS2.1]  
     | [F21-OS2.3] Applies to elements that support or are part of an environmental separator. |
|     | [F21-OP2.1,OP2.4]  
     | [F21-OP2.3] Applies to elements that support or are part of an environmental separator. |
|     | [F21-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator. |
|     | [F21-OH4] Applies to floors and elements that support floors. |
### Basic Footing Widths and Areas

#### (1)
- [F20-OS2.2]
- [F20,F21-OS2.3] Applies to elements that support or are part of an environmental separator.
- [F20-OP2.2]
- [F21-OP2.4]
- [F20,F21-OP2.3] Applies to elements that support or are part of an environmental separator.
- [F20,F21-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.
- [F20,F21-OH4] Applies to floors and elements that support floors.
- [F20,F21-OS3.1] Applies to floors and elements that support floors.

#### (2)
- [F20-OS2.2]
- [F20,F21-OS2.3] Applies to elements that support or are part of an environmental separator.
- [F20-OP2.2]
- [F21-OP2.4]
- [F20,F21-OP2.3] Applies to elements that support or are part of an environmental separator.
- [F20,F21-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.
- [F20,F21-OH4] Applies to floors and elements that support floors.
- [F20,F21-OS3.1] Applies to floors and elements that support floors.

#### (3)
- [F20-OS2.2]
- [F20,F21-OS2.3] Applies to elements that support or are part of an environmental separator.
- [F20-OP2.2]
- [F21-OP2.4]
- [F20,F21-OP2.3] Applies to elements that support or are part of an environmental separator.
- [F20,F21-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.
- [F20,F21-OH4] Applies to floors and elements that support floors.
- [F20,F21-OS3.1] Applies to floors and elements that support floors.

### Adjustments to Footing Widths for Exterior Walls

#### (1)
- [F20-OS2.2,OS2.3] [F21-OS2.3]
- [F20-OP2.2,OP2.3] [F21-OP2.3,OP2.4]
- [F20,F21-OH1.1,OH1.2,OH1.3]
- [F20,F21-OH4] Applies to floors and elements that support floors.

**Part 9 – Housing and Small Buildings**

9.15.5.2. **Support of Beams**

1. [F20, F40, F61-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.
   
   [F20, F61-OH4] Applies to floors and elements that support floors.
   
   [F20, F61-OS3.1] Applies to floors and elements that support floors.

2. [F20-OS2.1] Applies to elements that support or are part of an environmental separator.
   
   [F20-OP2.1, OP2.4] Applies to elements that support or are part of an environmental separator.
   
   [F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.
   
   [F20-OH4] Applies to floors and elements that support floors.
   
   [F20-OS3.1] Applies to floors and elements that support floors.

9.15.5.3. **Pilasters**

1. [F20-OS2.1] Applies to elements that support or are part of an environmental separator.
   
   [F20-OP2.1, OP2.4] Applies to elements that support or are part of an environmental separator.
   
   [F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.
   
   [F20-OH4] Applies to floors and elements that support floors.
   
   [F20-OS3.1] Applies to floors and elements that support floors.

2. [F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.
   
   [F20-OS2.1] Applies to elements that support or are part of an environmental separator.
   
   [F20-OP2.1, OP2.4] Applies to elements that support or are part of an environmental separator.
[F20-OH4] Applies to floors and elements that support floors.

[F20-OS3.1] Applies to floors and elements that support floors.

(3) [F20-OS2.1] [F20-OS2.3] Applies to elements that support or are part of an environmental separator.

[F20-OP2.1,OP2.4] [F20-OP2.3] Applies to elements that support or are part of an environmental separator.

[F20-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

[F20-OH4] Applies to floors and elements that support floors.

[F20-OS3.1] Applies to floors and elements that support floors.

9.15.6.2. Foundation Walls above Ground

(1) [F61-OH1.1,OH1.2,OH1.3]

[F61-OS2.3]

[F61-OP2.3]

9.15.6.3. Form Ties

(1) [F61-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

[F30-OS3.1]

[F61-OS2.3] Applies to elements that support or are part of an environmental separator.

[F61-OP2.3] Applies to elements that support or are part of an environmental separator.

9.16.1.3. Required Floors-on-Ground

(1) (a),(b) [F30-OS3.1]

(a),(b) [F40-OH2.4]

9.16.2.1. Required Installation of Granular Material

(1) [F40,F61-OH1.1] [F60,F61-OH1.2,OH1.3]

[F60-OS2.3]

9.16.2.2. Support of Floors

(1) [F21-OS2.1,OS2.3]

[F21-OP2.1,OP2.3,OP2.4]

### 9.17.2.2. Lateral Support
(1) [F22-OS2.4,OS2.5]
[F22-OS2.3] Applies to elements that support or are part of an environmental separator.

[F22-OP2.4,OP2.5]
[F22-OP2.3] Applies to elements that support or are part of an environmental separator.

[F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

[F22-OH4] Applies to floors and elements that support floors.

[F22-OS3.1] Applies to floors and elements that support floors.
[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

(2) [F22-OS2.4,OS2.5]
[F22-OS2.3] Applies to elements that support or are part of an environmental separator.

[F22-OP2.4,OP2.5]
[F22-OP2.3] Applies to elements that support or are part of an environmental separator.

[F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

[F22-OH4] Applies to floors and elements that support floors.

[F22-OS3.1] Applies to floors and elements that support floors.
[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

9.17.3.1. Size and Thickness

(1) [F20-OS2.1]
[F20,F22-OS2.3] Applies to elements that support or are part of an environmental separator.

[F20-OP2.1]
[F20,F22-OP2.4]
[F20,F22-OP2.3] Applies to elements that support or are part of an environmental separator.

[F20,F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

[F20,F22-OH4] Applies to floors and elements that support floors.

[F20,F22-OS3.1] Applies to floors and elements that support floors.

(2) [F20-OS2.1]
[F20,F22-OS2.3] Applies to elements that support or are part of an environmental separator.

[F20-OP2.1]
[F20,F22-OP2.4]
[F20,F22-OP2.3] Applies to elements that support or are part of an environmental separator.

[F20,F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

### 9.20.2.2. Used Brick

1. [F20,F80-OS2.1] [F20,F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

2. [F20,F80-OP2.1,OP2.4] [F20,F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

3. [F20,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in chimneys and fireplaces.

4. [F20,F80-OS1.2] Applies to assemblies required to provide fire resistance.

5. [F01-OS1.1,OS1.2] Applies to masonry used in chimneys and fireplaces.

6. [F20,F80-OH4] Applies to floors and elements that support floors.

7. [F20,F80-OP1.2] Applies to assemblies required to provide fire resistance.

8. [F01,F20,F80-OP1.2] Applies to masonry used in chimneys and fireplaces.

### 9.20.2.3. Glass Blocks

1. [F20-OS2.1] [F20-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

2. [F20-OP2.1,OP2.4] [F20-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

3. [F20-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in chimneys and fireplaces.

4. [F20-OS1.2] Applies to assemblies required to provide fire resistance.

5. [F01-OS1.1,OS1.2] Applies to masonry used in chimneys and fireplaces.

6. [F20-OS3.1] Applies to floors and elements that support floors.

7. [F20-OS3.4] Applies to masonry used in chimneys and fireplaces.

8. [F20-OH4] Applies to floors and elements that support floors.

9. [F20-OP1.2] Applies to assemblies required to provide fire resistance.

10. [F01-OP1.2] Applies to masonry used in chimneys and fireplaces.

9.20.2.4. Cellular Concrete

(1) [F80-OS2.1] [F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

[F80-OP2.1,OP2.4] [F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

[F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in chimneys and fireplaces.

[F80-OH4] Applies to floors and elements that support floors.

[F80-OS3.1] Applies to floors and elements that support floors.

[F80-OS3.4] Applies to masonry used in chimneys and fireplaces.

[F01,F20-OP1.1] [F20-OP1.2] Applies to assemblies required to provide fire resistance.

9.20.2.5. Stone

(1) [F20,F80-OS2.1] [F20,F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

[F20,F80-OP2.1,OP2.4] [F20,F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

[F20,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in chimneys and fireplaces.

[F20,F80-OS1.2] Applies to assemblies required to provide fire resistance.

[F01-OS1.1,OS1.2] Applies to masonry used in chimneys and fireplaces.
### 9.20.2.6. Concrete Blocks Exposed to the Weather

1. [F20,F80-OH4] Applies to floors and elements that support floors.
2. [F20,F80-OP1.2] Applies to assemblies required to provide fire resistance.
3. [F01,F20,F80-OP1.2] Applies to masonry used in chimneys and fireplaces.

### 9.20.2.7. Compressive Strength

1. [F20,F80-OS2.1] [F20,F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.
2. [F20,F80-OP2.1,OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.
3. [F20,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in chimneys and fireplaces.
4. [F20,F80-OS1.2] Applies to assemblies required to provide fire resistance.
5. [F01-OS1.1,OS1.2] Applies to masonry used in chimneys and fireplaces.
6. [F20,F80-OH4] Applies to floors and elements that support floors.
7. [F20,F80-OS3.1] Applies to floors and elements that support floors.
8. [F20,F80-OS3.4] Applies to masonry used in chimneys and fireplaces.
9. [F20,F80-OP1.2] Applies to assemblies required to provide fire resistance.
10. [F01,F20,F80-OP1.2] Applies to masonry used in chimneys and fireplaces.

### 9.20.3.1. Mortar Materials

1. [F20,F80-OS2.1] [F20,F80-OS2.3] Applies to elements that support or are part of an environmental separator.
2. [F20,F80-OP2.1,OP2.4] [F20,F80-OP2.3] Applies to elements that support or are part of an environmental separator.

### 9.20.9.5. Ties for Masonry Veneer

1. [F20,F22,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F80-OS2.1]
   - [F20,F22,F80-OS2.5]
   - [F20,F22,F80-OS2.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F80-OP2.1]
   - [F20,F22,F80-OP2.5]
   - [F20,F22,F80-OP2.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F22,F80-OS1.2] Applies to assemblies required to provide fire resistance.

2. [F20,F80-OS2.1]

   - [F20,F80-OS2.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F80-OP2.1]
   - [F20,F80-OP2.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F80-OS1.2] Applies to assemblies required to provide fire resistance.

### 9.20.9.6. Reinforcing for Glass Block

1. [F20-OH1.1,OH1.2,OH1.3] Applies to elements that are part of an environmental separator.

   - [F20-OS2.1]
   - [F20-OS2.3] Applies to elements that are part of an environmental separator.

   - [F20-OP2.1]
   - [F20-OP2.3] Applies to elements that are part of an environmental separator.

   - [F20-OS1.2] Applies to assemblies required to provide fire resistance.

2. [F20-OH1.1,OH1.2,OH1.3] Applies to elements that are part of an environmental separator.

   - [F20-OS2.1]
   - [F20-OS2.3] Applies to elements that are part of an environmental separator.

   - [F20-OP2.1]
   - [F20-OP2.3] Applies to elements that are part of an environmental separator.

   - [F20-OS1.2] Applies to assemblies required to provide fire resistance.

|     | [F61,F62-OP2.1,OP2.3] |
|     | [F61,F62-OS1.2] Applies to assemblies required to provide fire resistance. |

### 9.20.14.1. Laying Temperature of Mortar and Masonry

| (1) | [F20,F80-OS2.1] |
|     | [F20,F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture. |
|     | [F20,F80-OP2.1,OP2.4] |
|     | [F20,F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture. |
|     | [F20,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator. |
|     | [F20,F80-OS1.2] Applies to assemblies required to provide fire resistance. |
|     | [F20,F80-OH4] Applies to floors and elements that support floors. |
|     | [F20,F80-OS3.1] Applies to floors and elements that support floors. |
|     | [F20,F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress. |
| (2) | [F20,F80-OS2.1] |
|     | [F20,F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture. |
|     | [F20,F80-OP2.1,OP2.4] |
|     | [F20,F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture. |
|     | [F20,F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator. |
|     | [F20,F80-OS1.2] Applies to assemblies required to provide fire resistance. |
### 9.20.14.2. Protection from Weather

(1)  
[F80-OS2.1,OS2.3]  
[F80-OP2.1,OP2.3]

### 9.20.15.1. Amount of Reinforcement

(1)  
[F20-OS2.1,OS2.3]  
[F20-OP2.1,OP2.3]

### 9.20.15.2. Installation Standard

(1)  
[F20-OS2.1,OS2.3]  
[F20-OP2.1,OP2.3]

(1)  
[F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.  
[F80-OS2.1]  
[F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.  
[F80-OP2.1,OP2.4]  
[F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.  
[F80-OS1.2] Applies to assemblies required to provide fire resistance.  
[F80-OH4] Applies to floors and elements that support floors.  
[F80-OS3.1] Applies to floors and elements that support floors.  
[F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### 9.20.17.1. Thickness of Flat Insulating Concrete Form Walls

(1)  
[F20-OS2.1]  
[F22-OS2.4]  
[F20,F22-OS2.3] Applies to elements that support or are part of an environmental separator.  
[F20-OP2.1]  
[F22-OP2.4]
### Reinforcement for Flat Insulating Concrete Form Walls

#### (1)
- [F20, F22-OS2.1]
- [F22-OS2.4]
- [F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

#### (2)
- [F20-OS2.1]
- [F22-OS2.4]
- [F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

#### (3)
- [F20-OS2.1]
- [F22-OS2.4]
- [F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

- [F20,F22-OP2.3] Applies to elements that support or are part of an environmental separator.

- [F20,F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

- [F22-OH4] Applies to floors and elements that support floors.

- [F22-OS3.1] Applies to floors and elements that support floors.
- [F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.
### 9.23.7.2. Levelling and Sealing of Sill Plates

1. **Applicability**
   - [F20-OS2.1,OS2.5]
   - [F22-OS2.4,OS2.5]
   - [F20,F22-OS2.3] Applies to elements that support or are part of an environmental separator.

   - [F20-OP2.1,OP2.5]
   - [F22-OP2.4,OP2.5]
   - [F20,F22-OP2.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F22-OH4] Applies to floors and elements that support floors.

   - [F20,F22-OS3.1] Applies to floors and elements that support floors.

### 9.23.8.1. Bearing for Beams

1. **Applicability**
   - [F20-OS2.1,OS2.5]
   - [F22-OS2.5]
   - [F20,F22-OS2.3] Applies to elements that support or are part of an environmental separator.

   - [F20-OP2.1,OP2.5]
   - [F22-OP2.5]
   - [F20,F22-OP2.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

   - [F20,F22-OH4] Applies to floors and elements that support floors.

   - [F20,F22-OS3.1] Applies to floors and elements that support floors.

   - [F20,F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

   - [F20,F22-OS1.2] Applies to assemblies required to provide fire resistance.

### 9.23.8.2. Priming of Steel Beams

1. **Applicability**
   - [F80-OS2.1]
   - [F80-OS2.3] Applies to elements that support or are part of an environmental separator.

   - [F80-OP2.1,OP2.4]
   - [F80-OP2.3] Applies to elements that support or are part of an environmental separator.

   - [F80-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

   - [F80-OS1.2] Applies to assemblies required to provide fire resistance.

   - [F80-OS3.1] Applies to floors and elements that support floors.
[F80-OH4] Applies to floors and elements that support floors.

|     | [F22-OH4] Applies to floors and elements that support floors.  
|     | [F20,F22-OS1.2] Applies to assemblies required to provide fire resistance.  

Vancouver Building Bylaw 2019 Division B 9-378
## 9.23.11.4. Joints in Top Plates

(1)

[F20-OS2.1,OS2.5]
[F22-OS2.5]
[F20,F22-OS2.3] Applies to elements that support or are part of an environmental separator.

[F20-OP2.1,OP2.5]
[F22-OP2.4,OP2.5]
[F20,F22-OP2.3] Applies to elements that support or are part of an environmental separator.

[F20,F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

[F22-OH4] Applies to floors and elements that support floors.

[F22-OS1.2] Applies to assemblies required to provide fire resistance.

[F22-OS3.1] Applies to floors and elements that support floors.
[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

(2)

[F20-OS2.1,OS2.5]
[F22-OS2.5]
[F20,F22-OS2.3] Applies to elements that support or are part of an environmental separator.

[F20-OP2.1,OP2.5]
[F22-OP2.4,OP2.5]
[F20,F22-OP2.3] Applies to elements that support or are part of an environmental separator.

[F20,F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

[F22-OH4] Applies to floors and elements that support floors.

[F20,F22-OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

(3)

[F20-OS2.1,OS2.5]
[F22-OS2.5]
[F20,F22-OS2.3] Applies to elements that support or are part of an environmental separator.

[F20-OP2.1,OP2.5]
[F22-OP2.4,OP2.5]
[F20,F22-OP2.3] Applies to elements that support or are part of an environmental separator.

[F20,F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

### 9.24.1.4. Screws

1. Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

#### (1)

- [F20, F80-OP2.1, OP2.4]
- [F22, F80-OP2.4]
- [F20, F22, F80-OP2.3] Applies to elements that support or are part of an environmental separator.
- [F20, F22, F80-OS2.1]
- [F20, F22, F80-OS2.3] Applies to elements that support or are part of an environmental separator.
- [F20, F22, F80-OH1.1, OH1.2, OH1.3]
- [F20, F22, F80-OS1.2] Applies to assemblies required to provide fire resistance.
- [F22, F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### 9.24.1.5. Cladding, Sheathing and Interior Finish Required

1. [F20, F22, F80-OH1.1, OH1.2, OH1.3]

#### (1)

- [F20, F22, F80-OS2.1]
- [F20, F22, F80-OS2.3] Applies to elements that support or are part of an environmental separator.
- [F20, F22, F80-OP2.1, OP2.4]
- [F20, F22, F80-OP2.3] Applies to elements that support or are part of an environmental separator.
- [F20, F22, F80-OS1.2] Applies to assemblies required to provide fire resistance.
- [F22, F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### 9.24.2.1. Size and Spacing of Studs in Interior Walls

1. [F20-OP2.1, OP2.4] [F22-OP2.4]

#### (1)

- [F20-OS2.1, OS2.4] [F22-OS2.4]
- [F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### 9.24.2.2. Thickness of Studs

1. [F20-OP2.1, OP2.4] [F22-OP2.4]

#### (1)

- [F20-OS2.1, OS2.4] [F22-OS2.4]
- [F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

9.28.4.2. No Sheathing Required

(1) [F20-OH1.1,OH1.2,OH1.3]
[F20-OS2.3]

9.28.4.3. Stucco Lath Specifications

(1) [F20-OH1.1,OH1.2,OH1.3]
[F20-OS2.3]
[F20-OS1.1] Applies where stucco is applied to masonry chimneys.
[F20-OS3.4] Applies where stucco is applied to masonry chimneys.
[F20-OP1.1] Applies where stucco is applied to masonry chimneys.

9.28.4.4. Self-Furring Devices

(1) [F20,F80-OH1.1,OH1.2,OH1.3]
[F20,F80-OS2.3]
[F20,F80-OS1.1] Applies where stucco is applied to masonry chimneys.
[F20,F80-OS3.4] Applies where stucco is applied to masonry chimneys.
[F20,F80-OP1.1] Applies where stucco is applied to masonry chimneys.

9.28.4.5. Application of Stucco Lath

(1) [F20-OH1.1,OH1.2,OH1.3]
[F20-OS2.3]
[F20-OS1.1] Applies where stucco is applied to masonry chimneys.
[F20-OS3.4] Applies where stucco is applied to masonry chimneys.
[F20-OP1.1] Applies where stucco is applied to masonry chimneys.

(2) [F20-OH1.1,OH1.2,OH1.3]
### 9.28.4.6. Fastening

(2)  
[F20-OH1.1,OH1.2,OH1.3]  
[F20-OS2.3]  
[F20-OS1.1] Applies where stucco is applied to masonry chimneys.  
[F20-OS3.4] Applies where stucco is applied to masonry chimneys.  
[F20-OP1.1] Applies where stucco is applied to masonry chimneys.

(3)  
[F20-OH1.1,OH1.2,OH1.3]  
[F20-OS2.3]  
[F20-OS1.1] Applies where stucco is applied to masonry chimneys.  
[F20-OS3.4] Applies where stucco is applied to masonry chimneys.  
[F20-OP1.1] Applies where stucco is applied to masonry chimneys.

(4)  
[F20-OS2.1]

### 9.28.5.1. Mixes

(1)  
[F20,F61,F80-OH1.1,OH1.2,OH1.3]  
[F20,F61,F80-OS2.3]
9.28.5.2. Pigments

(1) [F20,F80-OH1.1,OH1.2,OH1.3]
[F20,F80-OS2.3]
[F20,F80-OS1.1] Applies where stucco is applied to masonry chimneys.
[F20,F80-OS3.4] Applies where stucco is applied to masonry chimneys.
[F20,F80-OP1.1] Applies where stucco is applied to masonry chimneys.

(2) [F20,F80-OH1.1,OH1.2,OH1.3]
[F20,F80-OS2.3]

9.28.5.3. Mixing

(1) [F20,F80-OH1.1,OH1.2,OH1.3]
[F20,F80-OS2.3]
[F20,F80-OS1.1] Applies where stucco is applied to masonry chimneys.
[F20,F80-OS3.4] Applies where stucco is applied to masonry chimneys.
[F20,F80-OP1.1] Applies where stucco is applied to masonry chimneys.

(2) [F20,F80-OH1.1,OH1.2,OH1.3]
[F20,F80-OS2.3]
[F20,F80-OS1.1] Applies where stucco is applied to masonry chimneys.
[F20,F80-OS3.4] Applies where stucco is applied to masonry chimneys.
[F20,F80-OP1.1] Applies where stucco is applied to masonry chimneys.

9.28.6.1. Low Temperature Conditions

(1) [F20,F80-OH1.1,OH1.2,OH1.3]
[F20,F80-OS2.3]
[F20,F80-OS1.1] Applies where stucco is applied to masonry chimneys.
9.28.6.2. Number of Coats and Total Thickness

1. [F20-OH1.1,OH1.2,OH1.3]
   - [F20-OS2.3]
   - [F20-OS1.1] Applies where stucco is applied to masonry chimneys.
   - [F20-OS3.4] Applies where stucco is applied to masonry chimneys.
   - [F20-OP1.1] Applies where stucco is applied to masonry chimneys.

9.28.6.3. First Coat

1. [F20,F80-OH1.1,OH1.2,OH1.3]
   - [F20,F80-OS2.3]
   - [F20,F80-OS1.1] Applies where stucco is applied to masonry chimneys.
   - [F20,F80-OS3.4] Applies where stucco is applied to masonry chimneys.
   - [F20,F80-OP1.1] Applies where stucco is applied to masonry chimneys.

2. [F20-OH1.1,OH1.2,OH1.3]
   - [F20-OS2.3]
   - [F20-OS1.1] Applies where stucco is applied to masonry chimneys.
   - [F20-OS3.4] Applies where stucco is applied to masonry chimneys.
   - [F20-OP1.1] Applies where stucco is applied to masonry chimneys.

9.28.6.4. Second Coat

1. [F20-OH1.1,OH1.2,OH1.3]

- lateral support for studs or where interior finishes support or serve as required environmental separation elements.

[F20-OP1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

[F20-OP3.1] Applies where interior finishes are installed to contribute to the required fire resistance of exterior walls.

### 9.29.5.10. Low Temperature Conditions

(1) [F81-OS1.2] Applies where the finishing of joints is required to maintain required fire-resistance ratings.

### 9.29.6.1. Thickness

(1) [F20-OS2.1]

[F20,F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

[F20,F22-OH1.1,OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

[F20-OP2.1] [F20,F22-OP2.4]

### 9.29.6.2. Grooved Plywood

(1) [F20-OS2.1]

[F20,F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

[F20,F22-OH1.1,OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

[F20-OP2.1] [F20,F22-OP2.4]

### 9.29.6.3. Nails and Staples

(1) [F20-OS2.1]

[F20,F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

[F20,F22-OH1.1,OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

[F20-OP2.1] [F20,F22-OP2.4]

(2) [F20-OS2.1,OS2.3,OS2.5] [F22-OS2.3,OS2.4,OS2.5]

[F20-OP2.1,OP2.3,OP2.5] [F22-OP2.3,OP2.4,OP2.5]
[F20,F22-OS1.2] Applies to assemblies required to provide fire resistance.

[F22-OS3.1] Applies to walls that support floors.
[F22-OS3.7] Applies to walls that contain doors or windows required for emergency egress.

[F20,F22-OH4] Applies to walls that support floors.

[F20,F22-OH1.1,OH1.2,OH1.3] Applies to elements that support or are part of an environmental separator.

9.29.6.4. Edge Support

(1) [F20-OS2.1]

[F20,F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

[F20,F22-OH1.1,OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

[F20-OP2.1] [F20,F22-OP2.4]

9.29.7.1. Material Standard

(1) [F20,F80-OS2.1,OS2.3]

[F20,F22,F80-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

[F20,F22,F80,F81-OH1.1,OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

[F20,F80-OP2.1,OP2.3] [F22,F80-OP2.4]

9.29.7.2. Thickness

(1) [F20-OS2.1]

[F20,F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

[F20,F22-OH1.1,OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

[F20-OP2.1] [F20,F22-OP2.4]

9.29.7.3. Nails

(1) [F20-OS2.1]

[F20,F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.
### 9.29.7.4. Edge Support

(1) **[F20,OS2.1]**

- **[F20,F22-OH1.1,OH1.2]** Applies where interior finishes support or serve as required environmental separation elements.

- **[F20,F22,OS1.2]** Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

- **[F20,OP2.1] [F20,F22-OP2.4]**

### 9.29.8.1. Material Standard

(1) **[F20,F80-OS2.1,OS2.3]**

- **[F20,F22,F80,OS1.2]** Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

- **[F20,F22,F80,F81-OH1.1,OH1.2]** Applies where interior finishes support or serve as required environmental separation elements.

- **[F20,F80-OP2.1,OP2.3]**

### 9.29.8.2. Thickness

(1) **[F20,OS2.1]**

- **[F20,F22-OS1.2]** Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

- **[F20,F22-OH1.1,OH1.2]** Applies where interior finishes support or serve as required environmental separation elements.

- **[F20,OP2.1] [F20,F22-OP2.4]**

(2) **[F20,OS2.1]**

- **[F20,F22-OS1.2]** Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

- **[F20,F22-OH1.1,OH1.2]** Applies where interior finishes support or serve as required environmental separation elements.

- **[F20,OP2.1] [F20,F22-OP2.4]**

Notes to Part 9
Housing and Small Buildings

A-9.1.1.1.(1) Application of Part 9 to Seasonally and Intermittently Occupied Buildings. The Building By-law does not provide separate requirements which would apply to seasonally or intermittently occupied buildings. Without compromising the basic health and safety provisions, however, various requirements in Part 9 recognize that leniency may be appropriate in some circumstances. With greater use of “cottages” through the winter months, the proliferation of seasonally occupied multiple-dwelling buildings and the increasing installation of modern conveniences in these buildings, the number and extent of possible exceptions is reduced.

Thermal Insulation
Article 9.25.2.1. specifies that insulation is to be installed in walls, ceilings and floors which separate heated space from unheated space. Cottages intended for use only in the summer and which, therefore, have no space heating appliances, would not be required to be insulated. Should a heating system be installed at some later date, insulation should also be installed at that time in accordance with Article 9.25.1.1. and the insulation requirements of Part 10. However, if the building were not intended for continuous or regular winter use, it may still be exempted from the remainder of the energy efficiency requirements in Part 10.

Air Barrier Systems and Vapour Barriers
Articles 9.25.3.1. and 9.25.4.1. require the installation of air barrier systems and vapour barriers only where insulation is installed. Dwellings with no heating system would thus be exempt from these requirements. In some cases, seasonally occupied buildings that are conditioned may be required to conform to the air and vapour barrier requirements of Section 9.25, but not to the air barrier and other requirements of Part 10.

Interior Wall and Ceiling Finishes
The choice of interior wall and ceiling finishes has implications for fire safety. Where a dwelling is a detached building, there are no fire resistance requirements for the walls or ceilings within the dwelling. The exposed surfaces of walls and ceilings are required to have a flame-spread rating not greater than 150 (Subsection 9.10.17.). There is, therefore, considerable flexibility, even in continuously occupied dwellings, with respect to the materials used to finish these walls. Except where waterproof finishes are required (Subsection 9.29.2.), ceilings and walls may be left unfinished. Where two units adjoin, however, additional fire resistance requirements may apply to interior loadbearing walls, floors and the shared wall (Article 9.10.8.3., and Subsections 9.10.9. and 9.10.11.).

Plumbing and Electrical Facilities
Plumbing fixtures are required only where a piped water supply is available (Subsection 9.31.4.), and electrical facilities only where electrical services are available (Article 9.34.1.2.).

A-9.3.1.7. Ratio of Water to Cementing Material. While adding water to concrete on site may facilitate its distribution through formwork, this practice can have several undesirable results, such as reduced strength, greater porosity, and more propensity to shrinkage cracking. The ratio of water to cementing material is determined according to weight. For example, using Table 9.3.1.7., the maximum water-cement ratio of 0.45 for a 20 mm coarse aggregate would require 18 kg (or 18 L) of water (1 L of water weighs 1 kg).

A-9.3.2.1.(1) Grade Marking of Lumber. Lumber is generally grouped for marketing into the species combinations contained in Table A-9.3.2.1.(1)-A. The maximum allowable spans for those combinations are listed in the span tables for joists, rafters and beams. Some species of lumber are also marketed individually. Since the allowable span
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

for the northern species combination is based on the weakest species in the combination, the use of the span for this combination is permitted for any individual species not included in the Spruce-Pine-Fir, Douglas Fir-Larch and Hemlock-Fir combinations.

Facsimiles of typical grade marks of lumber associations and grading agencies accredited by the Canadian Lumber Standards (CLS) Accreditation Board to grade mark lumber in Canada are shown in Table A-9.3.2.1.(1)-B. Accreditation by the CLS Accreditation Board applies to the inspection, grading and grade marking of lumber, including mill supervisory service, in accordance with CSA O141, “Softwood Lumber.”

The grade mark of a CLS accredited agency on a piece of lumber indicates its assigned grade, species or species combination, moisture condition at the time of surfacing, the responsible grader or mill of origin and the CLS accredited agency under whose supervision the grading and marking was done.

</table>

Canadian lumber is graded to the “Standard Grading Rules for Canadian Lumber,” published by the National Lumber Grades Authority. These rules specify standard grade names and grade name abbreviations for use in grade marks to provide positive identification of lumber grades. In a similar fashion, standard species names or standard species abbreviations, symbols or marks are provided in the rules for use in grade marks.

Grade marks denote the moisture content of lumber at the time of surfacing. “S-Dry” in the mark indicates the lumber was surfaced at a moisture content not exceeding 19%. “MC 15” indicates a moisture content not exceeding 15%. “S-GRN” in the grade mark signifies that the lumber was surfaced at a moisture content higher than 19% at a size to allow for natural shrinkage during seasoning.

Each mill or grader is assigned a permanent number. The point of origin of lumber is identified in the grade mark by use of a mill or grader number or by the mill name or abbreviation. The CLS certified agency under whose supervision the lumber was grade marked is identified in the mark by the registered symbol of the agency.

A-Table 9.3.2.1. Lumber Grading. To identify board grades, the paragraph number of the NLGA “Standard Grading Rules for Canadian Lumber” under which the lumber is graded must be shown in the grade mark. Paragraph 113 is equivalent to the WWPA “Western Lumber Grading Rules” and paragraph 114 is equivalent to the WCLIB “Standard Grading Rules.” When graded in accordance with WWPA or WCLIB rules, the grade mark will not contain a paragraph number.

A-9.3.2.8.(1) Non-Standard Lumber. NLGA 2014, “Standard Grading Rules for Canadian Lumber,” permits lumber to be dressed to sizes below the standard sizes (38 × 89, 38 × 140, 38 × 184, etc.) provided the grade stamp shows the reduced size. This sentence permits the use of the span tables for such lumber, provided the size indicated on the stamp is not less than 95% of the corresponding standard size. Allowable spans in the tables must be reduced a full 5% even if the undersize is less than the 5% permitted.

A-9.3.2.9.(1) Protection from Termites
Figure A-9.3.2.9.(1)-A
Known termite locations

Note to Figure A-9.3.2.9.(1)-A:

Figure A-9.3.2.9.(1)-B
Clearances under structural wood elements and visibility of supporting elements where required to permit inspection for termite infestation

Note to Figure A-9.3.2.9.(1)-B:
(1) For the height of structural wood elements not directly above finished ground, see Article 9.23.2.3.

A-9.3.2.9.(3) Protection of Structural Wood Elements from Moisture and Decay. There are many above-ground, structural wood systems where precipitation is readily trapped or drying is slow, creating conditions conducive to decay. Beams extending beyond roof decks, junctions between deck members, and connections between balcony
guards and walls are three examples of elements that can accumulate water when exposed to precipitation if they are not detailed to allow drainage.

**A-9.3.2.9.(4) Protection of Retaining Walls and Cribbing from Decay.** Retaining walls supporting soil are considered to be structural elements of the building if a line drawn from the outer edge of the footing to the bottom of the exposed face of the retaining wall is greater than 45° to the horizontal. Retaining walls supporting soil may be structural elements of the building if the line described above has a lower slope.

![Diagram of retaining wall](image)

**Figure A-9.3.2.9.(4)**
Identifying retaining walls that require preservative treatment

Retaining walls that are not critical to the support of building foundations but are greater than 1.2 m in height may pose a danger of sudden collapse to persons adjacent to the wall if the wood is not adequately protected from decay. The height of the retaining wall or cribbing is measured as the vertical difference between the ground levels on each side of the wall.

**A-9.4.1.1. Structural Design.** Article 9.4.1.1. establishes the principle that the structural members of Part 9 buildings must

- comply with the prescriptive requirements provided in Part 9,
- be designed in accordance with accepted good practice, or
- be designed in accordance with Part 4 using the loads and limits on deflection and vibration specified in Part 9 or Part 4.

Usually a combination of approaches is used. For example, even if the snow load calculation on a wood roof truss is based on Subsection 9.4.2., the joints must be designed in accordance with Part 4. Wall framing may comply with the prescriptive requirements in Subsections 9.23.3., 9.23.10., 9.23.11. and 9.23.12., while the floor framing may be engineered.

Wood Frame Construction," requires engineering expertise. The CWC Guide contains alternative solutions and provides information on the applicability of the Part 9 prescriptive structural requirements to further assist designers and building officials to identify the appropriate design approach. The need for professional involvement in the structural design of a building, whether to Part 4 or Part 9 requirements or accepted good practice, is defined by provincial and territorial legislation.

**A-9.4.2.1.(1) Soft Conversion from Imperial Units.** The conversion table at the end of the By-law provides factors for the conversion of millimeters to inches. However, not all metric measurements stated in the By-law are exact conversions. For example, while the dimensions given for wood framing members are the exact dimensions of the milled product – i.e., what is commonly referred to as a “2 × 4” is actually 1.5 in. × 3.5 in., which, in mm, is 38 × 89 – the metric dimensions given for spacing between framing elements are actually soft conversions:
**Table A-9.4.2.1.(1)**

<table>
<thead>
<tr>
<th>Imperial Unit</th>
<th>Exact Metric Conversion</th>
<th>Soft Metric Conversion Used in Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 in.</td>
<td>305 mm</td>
<td>300 mm</td>
</tr>
<tr>
<td>16 in.</td>
<td>406 mm</td>
<td>400 mm</td>
</tr>
<tr>
<td>24 in.</td>
<td>610 mm</td>
<td>600 mm</td>
</tr>
</tbody>
</table>

It remains common construction practice to arrange joists, rafters and studs in 12, 16 or 24 in. increments so as to properly align them with the edges of sheathing materials. It is therefore assumed that structural elements will be spaced according to the actual metric equivalents.

**A-9.4.2.2. Application of Simplified Part 9 Snow Loads.** The simplified specified snow loads described in Article 9.4.2.2. may be used where the structure is of the configuration that is typical of traditional wood-frame residential construction and its performance. This places limits on the spacing of joists, rafters and trusses, the spans of these members and supporting members, deflection under load, overall dimensions of the roof and the configuration of the roof. It assumes considerable redundancy in the structure.

Because very large buildings may be constructed under Part 9 by constructing firewalls to break up the building area, it is possible to have Part 9 buildings with very large roofs. The simplified specified snow loads may not be used when the total roof area of the overall structure exceeds 4550 m². Thus, the simplified specified snow load calculation may be used for typical townhouse construction but would not be appropriate for much larger commercial or industrial buildings, for example.

The simplified specified snow loads are also not designed to take into account roof configurations that seriously exacerbate snow accumulation. This does not pertain to typical projections above a sloped roof, such as dormers, nor does it pertain to buildings with higher and lower roofs. Although two-level roofs generally lead to drift loading, smaller light-frame buildings constructed according to Part 9 have not failed under these loads. Consequently, the simplified calculation may be used in these cases. Rather, this limitation on application of the simplified calculation pertains to roofs with high parapets or significant other projections above the roof, such as elevator penthouses, mechanical rooms or larger equipment that would effectively collect snow and preclude its blowing off the roof.

The reference to Article 9.4.3.1. invokes, for roof assemblies other than common lumber trusses, the same performance criteria for deflection.

The specific weight of snow on roofs, \( \gamma \), obtained from measurements at a number of weather stations across Canada varied from about 1.0 to 4.5 kN/m³. An average value for use in design in lieu of better local data is \( \gamma = 3.0 \) kN/m³. In some locations the specific weight of snow may be considerably greater than 3.0 kN/m³. Such locations include regions where the maximum snow load on the roof is reached only after contributions from many snowstorms, coastal regions, and regions where winter rains are considerable and where a unit weight as high as 4.0 kN/m³ may be appropriate.

**A-9.4.2.3.(1) Accessible Platforms Subject to Snow and Occupancy Loads.** Many platforms are subject to both occupancy loads and snow loads. These include balconies, decks, verandas, flat roofs over garages and carports. Where such a platform, or a segregated area of such a platform, serves a single dwelling unit, it must be designed for the greater of either the specified snow load or an occupancy load of 1.9 kPa. Where the platform serves more than one single dwelling unit or an occupancy other than a residential occupancy, higher occupancy loads will apply as specified in Table 4.1.5.3.

**A-9.4.2.4.(1) Specified Loads for Attics or Roof Spaces with Limited Accessibility.** Typical residential roofs are framed with roof trusses and the ceiling is insulated.
Residential trusses are placed at 600 mm on centre with web members joining top and bottom chords. Lateral web bracing is installed perpendicular to the span of the trusses. As a result, there is limited room for movement inside the attic or roof space or for storage of material. Access hatches are generally built to the minimum acceptable dimensions, further limiting the size of material that can be moved into the attic or roof space.

With exposed insulation in the attic or roof space, access is not recommended unless protective clothing and breathing apparatus are worn.

Thus the attic or roof space is recognized as uninhabitable and loading can be based on actual dead load. In emergency situations or for the purpose of inspection, it is possible for a person to access the attic or roof space without over-stressing the truss or causing damaging deflections.

A-Table 9.4.4.1. Classification of Soils. Sand or gravel may be classified by means of a picket test in which a 38 mm by 38 mm picket beveled at the end at 45° to a point is pushed into the soil. Such material is classified as “dense or compact” if a man of average weight cannot push the picket more than 200 mm into the soil and “loose” if the picket penetrates 200 mm or more.

Clay and silt may be classified as “stiff” if it is difficult to indent by thumb pressure, “firm” if it can be indented by moderate thumb pressure, “soft” if it can be easily penetrated by thumb pressure, where this test is carried out on undisturbed soil in the wall of a test pit.

A-9.4.4.4.(1) Soil Movement. In susceptible soils, changes in temperature or moisture content can cause significant expansion and contraction. Soils containing pyrites can expand simply on exposure to air.

Expansion and Contraction due to Moisture
Clay soils are most prone to expansion and contraction due to moisture. Particularly wet seasons can sufficiently increase the volume of the soil under and around the structure to cause heaving of foundations and floors-on-ground, or cracking of foundation walls. Particularly dry seasons or draw-down of water by fast-growing trees can decrease the volume of the soil supporting foundations and floors-on-ground, thus causing settling.

Frost Heave
Frost heave is probably the most commonly recognized phenomenon related to freezing soil. Frost heave results when moisture in frost-susceptible soil (clay and silt) under the footings freezes and expands. This mechanism is addressed by requirements in Section 9.12. regarding the depth of excavations.

Ice Lenses
When moisture in frost-susceptible soils freezes, it forms an ice lens and reduces the vapour pressure in the soil in the area immediately around the lens. Moisture in the ground redistributes to rebalance the vapour pressures providing more moisture in the area of the ice lens. This moisture freezes to the lens and the cycle repeats itself. As the ice lens grows, it exerts pressure in the direction of heat flow. When lenses form close to foundations and heat flow is toward the foundation – as may be the case with unheated crawl spaces or open concrete block foundations insulated on the interior – the forces may be sufficient to crack the foundation.

Adfreezing
Ice lenses can adhere themselves to cold foundations. Where heat flow is essentially upward, parallel to the foundation, the pressures exerted will tend to lift the foundation. This may cause differential movement or cracking of the foundation. Heat loss through basement foundations of cast-in-place concrete or concrete block insulated on the exterior appears to be sufficient to prevent adfreezing. Care must be taken where the foundation does not enclose heated space or where open block foundations are insulated on the interior.
The installation of semi-rigid glass fibre insulation has demonstrated some effectiveness as a separation layer to absorb the adfreezing forces.

**Pyrites**

Pyrite is the most common iron disulphide mineral in rock and has been identified in rock of all types and ages. It is most commonly found in metamorphic and sedimentary rock, and especially in coal and shale deposits.

Weathering of pyritic shale is a chemical-microbiological oxidation process that results in volume increases that can heave foundations and floors-on-ground. Concentrations of as little as 0.1% by weight have caused heaving. Weathering can be initiated simply by exposing the pyritic material to air. Thus, building on soils that contain pyrites in concentrations that will cause damage to the building should be avoided, or measures should be taken to remove the material or seal it. Material containing pyrites should not be used for backfill at foundations or for supporting foundations or floors-on-ground.

Where it is not known if the soil or backfill contains pyritic material in a deleterious concentration, a test is available to identify its presence and concentration.

**References:**

**A-9.4.4.6. and 9.15.1.1. Loads on Foundations.** The prescriptive solutions provided in Part 9 relating to footings and foundation walls only account for the loads imposed by drained earth. Drained earth is assumed to exert a load equivalent to the load that would be exerted by a fluid with a density of 480 kg/m³. The prescriptive solutions do not account for surcharges from saturated soil or additional loads from heavy objects located adjacent to the building. Where such surcharges are expected, the footings and foundation walls must be designed and constructed according to Part 4.

**A-9.5.1.2. Combination Rooms.** If a room draws natural light and natural ventilation from another area, the opening between the two areas must be large enough to effectively provide sufficient light and air. This is why a minimum opening of 3 m² is required, or the equivalent of a set of double doors. The effectiveness of the transfer of light and air also depends on the size of the transfer opening in relation to the size of the dependent room; in measuring the area of the wall separating the two areas, the whole wall on the side of the dependent room should be considered, not taking into account offsets that may be in the surface of the wall.

The opening does not necessarily have to be in the form of a doorway; it may be an opening at eye level. However, if the dependent area is a bedroom, provision must be made for the escape window required by Article 9.9.10.1. to fulfill its safety function. This is why a direct passage is required between the bedroom and the other area; the equivalent of at least a doorway is therefore required for direct passage between the two areas.
**A-9.5.5.3. Doorways to Rooms with a Bathtub, Shower or Water Closet.** If the minimum 860 mm hallway serves more than one room with identical facilities, only one of the rooms is required to have a door not less than 760 mm wide.

If a number of rooms have different facilities, for example, one room has a shower, lavatory and water closet, and another room has a lavatory and water closet, the room with the shower, lavatory and water closet must have the minimum 760 mm wide door.

Where multiple rooms provide the same or similar facilities, one of these rooms must comply with the requirement to have at least one bathtub or shower, one lavatory and one water closet. Where the fixtures are located in two separate rooms served by the same hallway, the requirement for the minimum doorway width would apply to both rooms.

If the minimum 860 mm hallway does not serve any room containing a bathtub, shower and water closet, additional fixtures do not need to be installed.

**A-9.6.1.1.(1) Application.** The scope of this Section includes glass installed on the interior or on the exterior of a building.

**A-9.6.1.2.(2) Mirrored Glass Doors.** CAN/CGSB-82.6-M, “Doors, Mirrored Glass, Sliding or Folding, Wardrobe,” covers mirrored glass doors for use on reach-in closets. It specifies that such doors are not to be used for walk-in closets.

**A-9.7. Windows, Doors and Skylights.** This section applies only to windows, doors and skylights as defined in the scope of the standards referenced in Article 9.7.4.2. Other glazed products, such as site-built windows, curtain walls or sloped glazing, are required to conform to Part 5. It is also permitted for fenestration products within the scope of the NAFS standard to conform to Part 5. This option is typically used for windows and doors that are impractical to subject to the testing requirements of NAFS due to their size or for custom configurations.

**A-9.7.3.2.(1)(a) Minimizing Condensation.** The total prevention of condensation on the surfaces of fenestration products is difficult to achieve and, depending on the design and construction of the window or door, may not be absolutely necessary.

Clause 9.7.3.2.(1)(a) therefore requires that condensation be minimized, which means that the amount of moisture that condenses on the inside surface of a window, door or skylight, and the frequency at which this occurs, must be limited. The occurrence of such condensation must be sufficiently rare, the accumulation of any water must be sufficiently small, and drying must be sufficiently rapid to prevent the deterioration of moisture-susceptible materials and the growth of fungi.

**A-9.7.4. Design and Construction.** Garage doors, sloped glazing, curtain walls, storefronts, commercial entrance systems, site-built or site-glazed products, revolving doors, interior windows and doors, storm windows, storm doors, sunrooms and commercial steel doors are not in the scope of NAFS.

All windows, doors and skylights installed to separate conditioned space from unconditioned space or the exterior must also conform to Part 10.

**A-9.7.4.2.(1) Standards Referenced for Windows, Doors and Skylights.**

**General**

Doors between an unconditioned garage and a dwelling unit are considered to be in scope of the standard referenced in this Sentence. Although the standard refers to windows in “exterior building envelopes”, a note
to the definition of “building envelope” clarifies that for the purpose of application of the standard, in some cases a building envelope may consist of two separate walls (such as a wall between garage and dwelling unit as well as the exterior wall of the garage itself).

A door leading to the exterior from an unconditioned garage is also within scope of the referenced standard, as it is also part of the exterior building envelope. However, because the scope of the Building By-law takes precedence, these doors are not required to conform to “NAFS”. This Subsection of the By-law does not apply to a door separating two unconditioned spaces.

**Canadian Requirements in the Harmonized Standard**

**Standards Referenced for Excluded Products**

Clause 1.1, General, of the Harmonized Standard defines the limits to the application of the standard with respect to various types of fenestration products. A list of exceptions to the application statement identifies a number of standards that apply to excluded products. Compliance with those standards is not required by the By-law; the references are provided for information purposes only.

**Label Indicating Performance and Compliance with Standard**

The Canadian Supplement requires that a product’s performance ratings be indicated on a label according to the designation requirements in the Harmonized Standard and that the label include

- design pressure, where applicable,
- negative design pressure, where applicable,
- water penetration test pressure, and
- the Canadian air infiltration and exfiltration levels.

It should be noted that, for a product to carry a label in Canada, it must meet all of the applicable requirements of both the Harmonized Standard and the Canadian Supplement, including the forced entry requirements.

**Water Penetration Resistance**

For the various performance grades listed in the Harmonized Standard, the corresponding water penetration resistance test pressures are a percentage of the design pressure. For R-class products, water penetration resistance test pressures are 15% of design pressure. In Vancouver, driving rain wind pressures (DRWP) have been determined for the locations listed in Appendix C.

These are listed in the Canadian Supplement. The DRWP given in the Canadian Supplement must be used for all products covered in the scope of the Harmonized Standard when used in buildings within the scope of Part 9.

To achieve equivalent levels of water penetration resistance for all locations, the Canadian Supplement includes a provision for calculating specified DRWP at the building site considering building exposure. Specified DRWP values are, in some cases, greater than 15% of design pressure and, in other cases, less than 15% of design pressure. For a fenestration product to comply with the By-law, it must be able to resist the structural and water penetration loads at the building site. Reliance on a percentage of design pressure for water penetration resistance in the selection of an acceptable fenestration product will not always be adequate.
Design pressure values are reported on a secondary designator, which is required by the Canadian Supplement to be affixed to the window.

As an alternative to the above noted provision in the Canadian Supplement for calculating specified DRWP, the Water Resistance values listed in Table C-4 of Appendix C may be used.

Uniform Load Structural Test
The Harmonized Standard specifies that fenestration products be tested at 150% of design pressure for wind (specified wind load) and that skylights and roof windows be tested at 200% of design pressure for snow (specified snow load). With the change in the British Columbia Building Code 2006 to a 1-in-50 return period for wind load, a factor of 1.4 rather than 1.5 is now applied for wind. The Building By-law has traditionally applied a factor of 1.5 rather than 2.0 for snow. Incorporating these lower load factors into the By-law requirements for fenestration would better reflect acceptable minimum performance levels; however, this has not been done in order to avoid adding complexity to the By-law, to recognize the benefits of Canada-US harmonization, and to recognize that differentiation of products that meet the Canadian versus the US requirements would add complexity for manufacturers, designers, specifiers and regulatory officials.

The required design pressure and Performance Grade (PG) rating of doors and windows has been listed for each of the geographic locations found in the Code in Table C-4. These may be used as an alternative to the specified wind load calculations in the Canadian Supplement.

Condensation Resistance
The Harmonized Standard identifies three test procedures that can be used to determine the condensation resistance of windows and doors. Only the physical test procedure given in CSA A440.2, “Fenestration Energy Performance”, can be used to establish Temperature Index (I) values. Computer simulation tools can also be used to estimate the relative condensation resistance of windows, but these methods employ different expressions of performance known as Condensation Resistance Factors (CR). I and CR values are not interchangeable.

Where removable multiple glazing panels (RMGP) are installed on the inside of a window, care should be taken to hermetically seal the RMGP against the leakage of moisture-laden air from the interior into the cavity on the exterior of the RMGP because the moisture transported by the air could lead to significant condensation on the interior surface of the outside glazing.

Basement Windows
Clause 12.4.2, Basement Windows, of the Harmonized Standard refers to products that are intended to meet By-law requirements for ventilation and emergency egress. The minimum test size of 800 mm × 360 mm (total area of 0.288 m²) specified in the standard will not provide the minimum openable area required by the By-law for bedrooms (i.e. 0.35 m² with no dimension less than 380 mm) and the means to provide minimum open area identified in the standard is inconsistent with the requirements of the By-law (See Subsection 9.9.10. for bedroom windows). The minimum test size specified in the standard will also not provide the minimum ventilation area of 0.28 m² required for non-heating-season natural ventilation (See Article 9.32.2.2.).

Performance of Doors: Limited Water Ingress Control
While the control of precipitation ingress is a performance requirement for exterior doors, side-hinged doors can comply with the referenced standard, AAMA/WDMA/CSA 101/I.S.2/A440, “NAFS – North American Fenestration Standard/Specification for Windows, Doors, and Skylights,” when tested at a pressure differential of 0 Pa (0.0 psf) or higher, but less than the minimum test pressure required for the indicated performance class and performance grade. Such doors are identified with a “Limited Water” (LW) rating on the product label.
Conditions suitable for the installation of an LW rated door are identified in Sentence 9.7.4.2.(2).

A-9.7.4.3.(2) Performance Requirements. If the option of calculating design pressure performance grade and water resistance values using the Canadian Supplement is chosen, the DRWP values in Table A.1 of that standard must be used for all buildings within the scope of Part 9 of the Building By-law. This requirement applies whether the windows, doors and skylights are designed to conform to Article 9.7.4.2. or to Part 5.

A-9.7.5.2.(1) Forced Entry Via Glazing in Doors and Sidelights. There is no mandatory requirement that special glass be used in doors or sidelights, primarily because of cost. It is, however, a common method of forced entry to break glass in doors and sidelights to gain access to door hardware and unlock the door from the inside. Although insulated glass provides increased resistance over single glazing, the highest resistance is provided by laminated glass. Tempered glass, while stronger against static loads, is prone to shattering under high, concentrated impact loads.

Laminated glass is more expensive than annealed glass and must be used in greater thicknesses. Figure A-9.7.5.2.(1) shows an insulated sidelight made of one pane of laminated glass and one pane of annealed glass. This method reduces the cost premium that would result if both panes were laminated.

Consideration should be given to using laminated glazing in doors and accompanying sidelights regulated by Article 9.6.1.3., in windows located within 900 mm of locks in such doors, and in basement windows.

Underwriters' Laboratories of Canada have produced ULC-S332, “Burglary Resisting Glazing Material,” which provides a test procedure to evaluate the resistance of glazing to attacks by thieves. While it is principally intended for plate glass show windows, it may be of value for residential purposes.

A-9.7.5.2.(6) Door Fasteners. The purpose of the requirement for 30 mm screw penetration into solid wood is to prevent the door from being dislodged from the jamb due to impact forces. It is not the intent to prohibit other types of hinges or strikeplates that are specially designed to provide equal or greater protection.

A-9.7.5.2.(8) Hinged Doors. Methods of satisfying this Sentence include either using non-removable pin hinges or modifying standard hinges by screw fastening a metal pin in a screw hole in one half of the top and bottom hinges. When the door is closed, the projecting portion of the pin engages in the corresponding screw hole in the other half of the hinge and then, even if the hinge pin is taken out, the door cannot be removed.

A-9.7.5.2.(10) & (11) Resistance to Forced Entry  Statistical evidence by Vancouver Police has identified that a frequently exploited point of entry in break-ins exists at the residential entry doors due to inherent weaknesses in wood door frame materials, and the location of strikeplate screws located along the grain and near to the deadbolt throw, which contribute to inability for the frame to resist forced entry.
The installation of a metal frame reinforcement plate (See Figures A-9.7.5.2.(10)-A & -B below) directly attached to the backside of a door frame before installation with increased spacing for the points of attachment would significantly increase the resistance of the door to forced entry. This will result reduced incidence of crime and significantly reduce potential costs to owners.

Figure A-9.7.5.2.(10)-A
Typical Location of Door Frame Reinforcement

Figure A-9.7.5.2.(10)-B
Frame Reinforcement (Example)

A-9.7.5.3.(1) Resistance of Windows to Forced Entry. Although this Sentence only applies to windows within 2 m of adjacent ground level, certain house and site features, such as balconies or canopy roofs, allow for easy access to windows at higher elevations. Consideration should be given to specifying break-in resistant windows in such locations.

This Sentence does not apply to windows that do not serve the interior of the dwelling unit, such as windows to garages, sun rooms or greenhouses, provided connections between these spaces and the dwelling unit are secure. One method that is often used to improve the resistance of windows to forced entry is the installation of metal “security bars.”

However, while many such installations are effective in increasing resistance to forced entry, they may also reduce or eliminate the usefulness of the window as an exit in case of fire or other emergency that prevents use of the normal building exits. Indeed, unless such devices are easily openable from the inside, their installation in some cases would contravene the requirements of Article 9.9.10.1., which requires every bedroom that does not have an exterior door to
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

have at least one window that is large enough and easy enough to open that it can be used as an exit in case of emergency. Thus an acceptable security bar system should be easy to open from the inside while still providing increased resistance to entry from the outside.

A-9.8.4. Tread Configurations. The By-law distinguishes four principal types of stair treads:
• rectangular treads, which are found in straight flights;
• tapered treads, which are found in curved flights, (the term tapered tread also includes winders); and
• winders are described in Note A-9.8.4.6.
See Figure A-9.8.4.-A.

Figure A-9.8.4.-A
Types of treads

Articles 9.8.4.1. to 9.8.4.8. specify various dimensional limits for steps. Figure A-9.8.4.-B illustrates the elements of a step and how these are to be measured.

Figure A-9.8.4.-B
Elements of steps and their measurement

A-9.8.4.6. Winders. Where a stair must turn, the safest method of incorporating the turn is to use a landing. Within a dwelling unit, however, where occupants are familiar with their environment, winders are an acceptable method of reducing the amount of floor area devoted to the stair and have not been shown to be more hazardous than a straight run of steps. Nevertheless, care is required to ensure that winders are as safe as possible. Experience has shown that 30° winders are the best compromise and require the least change in the natural gait of the stair user; 45° winders are also acceptable, as they are wider. The By-law permits only these two angles. Although it is normal By-law practice to specify upper and lower limits, in this case it is necessary to limit the winders to specific angles with no tolerance above or below these angles other than normal construction tolerances. One result of this requirement
is that winder-type turns in stairs are limited to 30° or 45° (1 winder), 60° (2 winders), or 90° (2 or 3 winders). See Figure A-9.8.4.6.

Figure A-9.8.4.6.
Winders

A-9.8.4.8. Tread Nosings. A sloped or beveled edge on tread nosings will make the tread more visible through light modeling. The sloped portion of the nosing must not be too wide so as to reduce the risk of slipping of the foot. See Figure A-9.8.4.-B.

A-9.8.7.1.(2) Wider Stairs than Required. The intent of Sentence 9.8.7.1.(2) is that handrails be installed in relation to the required stair width only, regardless of the actual width of the stair and ramp. The required handrails are provided along the assumed natural path of travel to, from and within the building.

A-9.8.7.2. Continuity of Handrails. The guidance and support provided by handrails is particularly important at the beginning and end of ramps and flights of stairs and at changes in direction such as at landings and winders. The intent of the requirement in Sentence (2) for handrails to be continuous throughout the length of the stair is that the handrail be continuous from the bottom riser to the top riser of the stair. (See Figure A-9.8.7.2.)

For stairs or ramps serving a single dwelling unit, the intent of the requirement for handrails to be continuous throughout the flight is that the handrail be continuous from the bottom riser to the top riser of the flight. The required handrail may start back from the bottom riser only if it is supported by a newel post or volute installed on the bottom tread. (See Figure A-9.8.7.2.) With regard to stairs serving a single dwelling unit, the handrail may terminate at landings.

In the case of stairs within dwelling units that incorporate winders, the handrail should be configured so that it will in fact provide guidance and support to the stair user throughout the turn through the winder.
Figure A-9.8.7.2.
Continuity of handrails at the top and bottom of stairs and flights

Note to Figure A-9.8.7.2.:  
(1) See Article 9.8.7.1. to determine the number of handrails required. Some stairs will require only one, while some will require two or more.

To achieve this end, the rail should not extend so far into a hallway as to reduce the clear width of the hallway to less than the required width. Where the stair terminates in a room or other space, likely paths of travel through that room or space should be assessed to ensure that any projection of the handrail beyond the end of the stair will not interfere with pedestrian travel. As extensions of handrails beyond the first and last riser are not required in dwelling units (See Sentence 9.8.7.3.(2)) and as occupants of dwellings are generally familiar with their surroundings, the design of dwellings would not generally be affected by this requirement.

Handrails are also required to terminate in a manner that will not create a safety hazard to blind or visually impaired persons, children whose heads may be at the same height as the end of the rail, or persons wearing loose clothing or carrying items that might catch on the end of the rail. One approach to reducing potential hazards is returning the handrail to a wall, floor or post. Again, within dwelling units, where occupants are generally familiar with their surroundings, returning the handrail to a wall, floor or post may not be necessary. For example, where the handrail is fastened to a wall and does not project past the wall into a hallway or other space, a reasonable degree of safety is assumed to be provided; other alternatives may provide an equivalent level of protection.

A-9.8.7.3.(2) Handrail Extensions. As noted in Note A-9.8.7.2., the guidance and support provided by handrails is particularly important at the beginning and end of ramps and flights of stairs and at changes in direction. The extended handrail provides guidance and allows users to steady themselves upon entering or leaving a ramp or flight of stairs. Such extensions are particularly useful to visually-impaired persons, and persons with physical disabilities or who are encumbered in their use of the stairs or ramp.
A-9.8.7.4. Height of Handrails. Figure A-9.8.7.4. illustrates how to measure handrail height.

Figure A-9.8.7.4.
Measuring handrail height

A-9.8.7.5.(2) Handrail Sections. Handrails are intended to provide guidance and support to stair users. To fulfil this intent, handrails must be “graspable.”

The graspable portion of a handrail should allow a person to comfortably and firmly grab hold by allowing their fingers and thumb to curl under part or all of the handrail. Where the configuration or dimensions of the handrail do not allow a person’s fingers and thumb to reach the bottom of it, recesses that are sufficiently wide and deep to accommodate a person’s fingers and thumb must be provided on both sides of the handrail, at the bottom of the graspable portion, which must not have any sharp edges.

A-9.8.7.6.(1) Construction Below Handrails. The By-law allowance for projections below a handrail are intended to accommodate structural supports for the handrails, guards, or other ancillary safety features such as intermediate handrails for children. Such construction may project into the required stair width, but shall not extend more than 100 mm from the top surface of the handrail.

Figure A-9.8.7.6.(1)
Construction below handrails

A-9.8.7.7. Attachment of Handrails. Handrails are intended to provide guidance and support to the stair user and to arrest falls. The loads on handrails may therefore be considerable. The attachment of handrails serving a single dwelling unit may be accepted on the basis of experience or structural design.
A-9.8.8.1. Required Guards. The requirements relating to guards stated in Part 9 are based on the premise that, wherever there is a difference in elevation of 600 mm or more between two floors, or between a floor or other surface to which access is provided for other than maintenance purposes and the next lower surface, the risk of injury in a fall from the higher surface is sufficient to warrant the installation of some kind of barrier to reduce the chances of such a fall. A wall along the edge of the higher surface will obviously prevent such a fall, provided the wall is sufficiently strong that a person cannot fall through it. Where there is no wall, a guard must be installed. Because guards clearly provide less protection than walls, additional requirements apply to guards to ensure that a minimum level of protection is provided. These relate to the characteristics described in Notes A-9.8.8.3., A-9.8.8.5.(1) and (2), A-9.8.8.5.(3) and A-9.8.8.6.(1).

Examples of such surfaces where the difference in elevation could exceed 600 mm and consequently where guards would be required include, but are not limited to, landings, porches, balconies, mezzanines, galleries, and raised walkways. Especially in exterior settings, surfaces adjacent to walking surfaces, stairs or ramps often are not parallel to the walking surface or the surface of the treads or ramps.

Consequently, the walking surface, stair or ramp may need protection in some locations but not in others. (See Figure A-9.8.8.1.) In some instances, grades are artificially raised close to walking surfaces, stairs or ramps to avoid installing guards. This provides little or no protection for the users. That is why the requirements specify differences in elevation not only immediately adjacent to the construction but also for a distance of 1200 mm from it by requiring that the slope of the ground be within certain limits. (See Figure A-9.8.8.1.)

Figure A-9.8.8.1. Required locations of guards

A-9.8.8.1.(4) Height of Window Sills above Floors or Ground. The primary intent of the requirement is to minimize the likelihood of small children falling significant heights from open windows. Reflecting reported cases, the requirement applies only to dwelling units and generally those located on the second floor or higher of residential or mixed use buildings where the windows are essentially free-swinging or free-sliding.

Free-swinging or free-sliding means that a window that has been cracked open can be opened further by simply pushing on the openable part of the window. Care must be taken in selecting windows, as some with special operating hardware can still be opened further by simply pushing on the window.

Casement windows with crank operators would be considered to conform to Clause (4)(b). To provide additional safety, where slightly older children are involved, occupants can easily remove the crank handles from these windows. Awning windows with scissor hardware, however, may not keep the window from swinging open once it is unlatched. Hopper windows would be affected only if an opening is created at the bottom as well as at the top of the window. The requirement will impact primarily on the use of sliding windows which do not incorporate devices in their construction that can be used to limit the openable area of the window.

The 100 mm opening limit is consistent with widths of openings that small children can fall through. It is only invoked, however, where the other dimension of the opening is more than 380 mm. Again, care must be taken in selecting a
window. At some position, scissor hardware on an awning window may break up the open area such that there is no unobstructed opening with dimensions greater than 380 mm and 100 mm. At another position, however, though the window is not open much more, the hardware may not adequately break up the opening. The 450 mm height off the floor recognizes that furniture is often placed under windows and small children are often good climbers.

**A-9.8.8.1.(9) and (10) Protection Around Swimming Pools.** Fences and gates enclosing swimming pools are intended to prevent unsupervised people and especially children from gaining access to a pool. The protective barrier may be located at the property boundary and may comprise building walls, gates and other barriers that meet guard requirements.

**A-9.8.8.2. Loads on Guards.** Guards must be constructed so as to be strong enough to protect persons from falling under normal use. Many guards installed in dwelling units or on exterior stairs serving one or two dwelling units have demonstrated acceptable performance over time. The loading described in the first row of Table 9.8.8.2. is intended to be consistent with the performance provided by these guards. Examples of guard construction presented in the “2012 Building Code Compendium, Volume 2, Supplementary Standard SB-7, Guards for Housing and Small Buildings” meet the criteria set in the National Building Code for loads on guards, including the more stringent requirements of Sentences 9.8.8.2.(1) and (2).

The load on guards within dwelling units, or on exterior guards serving not more than two dwelling units, is to be imposed over an area of the guard such that, where standard balusters are used and installed at the maximum 100 mm spacing permitted for required guards, 3 balusters will be engaged. Where the balusters are wider, only two may be engaged unless they are spaced closer together. Where the guard is not required, and balusters are installed more than 100 mm apart, fewer balusters may be required to carry the imposed load.

**A-9.8.8.3. Minimum Heights.** Guard heights are generally based on the waist heights of average persons. Generally, lower heights are permitted in dwelling units because the occupants become familiar with the potential hazards, and situations which lead to pushing and jostling under crowded conditions are less likely to arise.

**A-9.8.8.5.(1) and (2) Risk of Falling through Guards.** The risk of falling through a guard is especially prevalent for children. Therefore the requirements are stringent for guards in all buildings except industrial buildings, where children are unlikely to be present except under strict supervision.

**A-9.8.8.5.(3) Risk of Children Getting Their Head Stuck between Balusters.** The requirements to prevent children falling through guards also serve to provide adequate protection against this problem. However, guards are often installed where they are not required by the By-law; i.e., in places where the difference in elevation is less than 600 mm. In these cases, there is no need to require the openings between balusters to be less than 100 mm. However, there is a range of openings between 100 mm and 200 mm in which children can get their head stuck. Therefore, openings in this range are not permitted except in buildings of industrial occupancy, where children are unlikely to be present except under strict supervision.

**A-9.8.8.6.(1) Configuration of Members, Attachments or Openings in Guards so as to not Facilitate Climbing.** Some configurations of members, attachments or openings may be part of a guard design and still comply with Sentence 9.8.8.6.(1). Figures A-9.8.8.6.(1)-A to A-9.8.8.6.(1)-D present a few examples of designs that are considered to not facilitate climbing.

Protrusions that are greater than 450 mm apart horizontally and vertically are considered sufficiently far apart to reduce the likelihood that young children will be able to get a handhold or toehold on the protrusions and climb the guard.
Protrusions that present a horizontal offset of 15 mm or less are considered to not provide a sufficient foot purchase to facilitate climbing.

A guard incorporating spaces that are not more than 45 mm wide by 20 mm high is considered to not facilitate climbing because the spaces are too small to provide a toehold.
Figure A-9.8.8.6.(1)-C
Example of a guard with spaces created by the protruding elements that are not more than 45 mm wide and 20 mm high

Protrusions that present more than a 2-in-1 slope on the offset are considered to not facilitate climbing because such a slope is considered too steep to provide adequate footing.

Figure A-9.8.8.6.(1)-D
Example of guard protrusions with a slope greater than 2 in 1

A-9.9.4.5.(1) Openings in Exterior Walls of Exits.
A-9.9.8.4.(1) Independent and Remote Exits. Subsection 9.9.8. requires that some floor areas have more than one exit.

The intent is to ensure that, if one exit is made untenable or inaccessible by a fire, or its exterior door is blocked by an exterior incident, one or more other exits will be available to permit the occupants to escape. However, if the exits are close together, all exits might be made untenable or inaccessible by the same fire. Sentence 9.9.8.4.(1) therefore requires at least two of the exits to be located remotely from each other. This is not a problem in many buildings falling under Part 9. For instance, apartment buildings usually have exits located at either end of long corridors. However, in other types of buildings (e.g. dormitory and college residence buildings) this is often difficult to accomplish and problems arise in interpreting the meaning of the word “remote.” Article 3.4.2.3. is more specific, generally requiring the distance between exits to be one half the diagonal dimension of the floor area or at least 9 m. However, it is felt that such criteria would be too restrictive to impose on the design of all the smaller buildings which come under Part 9.

Nevertheless, the exits should be placed as far apart as possible and the Part 3 criteria should be used as a target. Designs in which the exits are so close together that they will obviously both become contaminated in the event of a fire are not acceptable.

A-9.9.10.1.(1) Escape Windows from Bedrooms. Sentence 9.9.10.1.(1) generally requires every bedroom in an unsprinklered suite to have at least one window or door opening to the outside that is large enough and easy enough to open so that it can be used as an exit in the event that a fire prevents use of the building’s normal exits. The minimum unobstructed opening specified for escape windows must be achievable using only the normal window operating procedure. The escape path must not go through nor open onto another room, floor or space. Where a bedroom is located in an unsprinklered suite in a basement, an escape window or door must be located in the bedroom. It is not sufficient to rely on egress through other basement space to another escape window or door.

Window Height
The Article does not set a maximum sill height for escape windows; it is therefore possible to install a window or skylight that satisfies the requirements of the Article but defeats the Article’s intent by virtue of
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

being so high that it cannot be reached for exit purposes. It is recommended that the sills of windows intended for use as emergency exits be not higher than 1.5 m above the floor. However, it is sometimes difficult to avoid having a higher sill: on skylights and windows in basement bedrooms for example. In these cases, it is recommended that access to the window be improved by some means such as built-in furniture installed below the window.

Figure A-9.9.10.1.(1)
Built-in furniture to improve access to a window

A-9.9.10.1.(2) Bedroom Window Opening Areas and Dimensions. Although the minimum opening dimensions required for height and width are 380 mm, a window opening that is 380 mm by 380 mm would not comply with the minimum area requirements. (See Figure A-9.9.10.1.(2))

Figure A-9.9.10.1.(2)
Window opening areas and dimensions

A-9.9.10.1.(3) Window Opening into a Window Well. Sentence 9.9.10.1.(3) specifies that there must be a minimum clearance of 760 mm in front of designated escape windows to allow persons to escape a basement bedroom in an emergency.

This specified minimum clearance is consistent with the minimum required width for means of egress from a floor area (See Article 9.9.5.5.) and the minimum required width for path of travel on exit stairs (See Article 9.9.6.1.). It is considered the smallest acceptable clearance between the escape window and the facing wall of the window well that can accommodate persons trying to escape a bedroom in an emergency given that they are not moving straight through the window but must move outward and up, and must have sufficient space to change body orientation. Once this clearance is provided, no additional clearance is needed for windows with sliders, casements, or inward-opening awnings.

However, for windows with outward-opening awnings, additional clearance is needed to provide the required 760 mm beyond the outer edge of the sash. (See Figure A-9.9.10.1.(3).)
Depending on the likelihood of snow accumulation in the window well, it could be difficult – if not impossible – to escape in an emergency. The window well should be designed to provide sufficient clear space for a person to get out the window and then out the well, taking into account potential snow accumulation.

Hopper windows (bottom-hinged operators) should not be used as escape windows in cases where the occupants would be required to climb over the glass.

Figure A-9.9.10.1.(3)
Windows providing a means of escape that open into a window well

A-9.10.1.4.(1) Commercial Cooking Equipment. Part 6 refers to NFPA 96, “Ventilation Control and Fire Protection of Commercial Cooking Operations,” which in turn references “Commercial Cooking Equipment.” However, the deciding factor as to whether or not NFPA 96 applies is the potential for production of grease-laden vapours and smoke, rather than the type of equipment used. While NFPA 96 does not apply to domestic equipment for normal residential family use, it should apply to domestic equipment used in commercial, industrial, institutional and similar cooking applications where the potential for the production of smoke and grease-laden vapours exceeds that for normal residential family use.

A-9.10.3.1. Fire and Sound Resistance of Building Assemblies. Tables 9.10.3.1.-A and 9.10.3.1.-B have been developed from information gathered from tests. While a large number of the assemblies listed were tested, the fire-resistance and acoustical ratings for others were assigned on the basis of extrapolation of information from tests of similar assemblies. Where there was enough confidence relative to the fire performance of an assembly, the fire-resistance ratings were assigned relative to the commonly used minimum ratings of 30 min, 45 min and 1 h, including a designation of “< 30 min” for assemblies that are known not to meet the minimum 30-minute rating. Where there was not enough comparative information on an assembly to assign to it a rating with confidence, its value in the tables has been left blank (hyphen), indicating that its rating remains to be assessed through another means. Future work is planned to develop much of this additional information.

These tables are provided only for the convenience of By-law users and do not limit the number of assemblies permitted to those in the tables. Assemblies not listed or not given a rating in these tables are equally acceptable provided their fire and sound resistance can be demonstrated to meet the above-noted requirements either on the basis of tests referred to in Article 9.10.3.1. and Subsection 9.11.1. or by using the data in Appendix D, Fire-Performance Ratings. It should be noted, however, that Tables 9.10.3.1.-A and 9.10.3.1.-B are not based on the same assumptions as those used in Appendix D. Assemblies in Tables 9.10.3.1.-A and 9.10.3.1.-B are described through their generic descriptions and variants and include details given in the notes to the tables. Assumptions for Appendix D include different construction details that must be followed rigorously for the calculated ratings to be expected. These are two different methods of choosing assemblies that meet required fire ratings.
Table 9.10.3.1.-B presents fire-resistance and acoustical ratings for floor, ceiling and roof assemblies. The fire-resistance ratings are appropriate for all assemblies conforming to the construction specifications given in Table 9.10.3.1.-B, including applicable table notes. Acoustical ratings for assemblies decrease with decreasing depth and decreasing separation of the structural members; the values listed for sound transmission class and impact insulation class are suitable for the minimum depth of structural members identified in the description, including applicable table notes, and for structural member spacing of 305 mm o.c., unless other values are explicitly listed for the assembly. Adjustments to the acoustical ratings to allow for the benefit of deeper or more widely spaced structural members are given in Table Notes (9) and (10).

**Figure A-9.10.3.1.-A**
Single layer butt joint details
**Notes to Figure A-9.10.3.1.-A:**
(1) Figure is for illustrative purposes only and is not to scale.
(2) The structural member can be any one of the types described in the Table.
(3) Adjacent gypsum board butt ends are attached to separate resilient channels using regular Type S screws, located a minimum of 38 mm from the butt end.

**Figure A-9.10.3.1.-B**
Double layer butt joint details
**Notes to Figure A-9.10.3.1.-B:**
(1) Figure is for illustrative purposes only and is not to scale.
(2) The structural member can be any one of the types described in the Table.
(3) Base layer butt ends can be attached to a single resilient channel using regular Type S screws.
(4) Type G screws measuring a minimum of 32 mm in length and located a minimum of 38 mm from the butt end are used to fasten the butt ends of the face layer to the base layer.

**Figure A-9.10.3.1.-C**
Example of steel furring channel
**Note to Figure A-9.10.3.1.-C:**
(1) Figure is for illustrative purposes only and is not to scale.

**Figure A-9.10.3.1.-D**
Example of resilient metal channel
Note to Figure A-9.10.3.1.-D:
(1) Figure is for illustrative purposes only and is not to scale.

A-9.10.4.1.(4) Mezzanines Not Considered as Storeys. Mezzanines increase the occupant load and the fire load of the storey of which they are part. To take the added occupant load into account for the purpose of evaluating other requirements that are dependent on this criteria, their floor area is added to the floor area of the storey.

A-9.10.9.6.(1) Penetration of Fire-Rated Assemblies by Service Equipment. This Sentence, together with Article 3.1.9.1., is intended to ensure that the integrity of fire-rated assemblies is maintained where they are penetrated by various types of service equipment.

For buildings regulated by the requirements in Part 3, fire stop materials used to seal openings around building services, such as pipes, ducts and electrical outlet boxes, must meet a minimum level of performance demonstrated by standard test criteria.

This is different from the approach in Part 9. Because of the type of construction normally used for buildings regulated by the requirements in Part 9, it is assumed that this requirement is satisfied by the use of generic fire stop materials such as mineral wool, gypsum plaster or Portland cement mortar.

A-9.10.9.16.(4) Separation between Dwelling Units and Storage or Repair Garages. The gas-tight barrier between a dwelling unit and an attached garage is intended to provide protection against the entry of carbon monoxide and gasoline fumes into the dwelling unit. Building assemblies incorporating an air barrier system will perform adequately with respect to gas tightness, provided all joints in the airtight material are sealed and reasonable care is exercised where the wall or ceiling is pierced by building services. Where a garage is open to the adjacent attic space above the dwelling unit it serves, a gas-tight barrier in the ceiling of the dwelling unit will also provide protection. Unit masonry walls forming the separation between a dwelling unit and an adjacent garage should be provided with two coats of sealer or plaster, or covered with gypsum board on the side of the wall exposed to the garage. All joints must be sealed to ensure continuity of the barrier. (See also Sentences 9.25.3.3.(3) to (8).)

A-9.10.12.4.(3) Protection at Soffits. The materials required by this Sentence to be used as protection for soffit spaces in certain locations do not necessarily have to be the finish materials. They can be installed either behind the finishes chosen for the soffits or in lieu of these.

Required by CAN/ULC-S104 for Twenty Minute Fire Rated Closure Assemblies, provides construction details to enable manufacturers to build wood core doors that will provide a 20 min fire-protection rating without the need for testing. The standard requires each door to be marked with
1. the manufacturer’s or vendor’s name or identifying symbol,
2. the words “Fire Door,” and
3. a reference to the fire-protection rating of 20 min.

A-9.10.14.5.(1) Minor Combustible Cladding Elements. Minor elements of cladding that is required to be noncombustible are permitted to be of combustible material, provided they are distributed over the building face and not concentrated in one area. Examples of minor combustible cladding elements include door and window trim and some decorative elements.

A-9.10.14.5.(7) Permitted Projections. The definition of exposing building face provided in Sentence 1.4.1.2.(1) of Division A refers to “that part of the exterior wall of a building … or, where a building is divided into fire compartments, the exterior wall of a fire compartment …” Because the exposing building face is defined with respect to the exterior wall, projections from exposing building faces are elements that do not incorporate exterior walls. Depending on their specific configurations, examples of constructions that would normally be permitted by Sentence 9.10.14.5.(7) are balconies, platforms, canopies, eave projections and stairs. However, if a balcony, platform or stair is enclosed, its exterior wall would become part of an exposing building face and the construction could not be considered to be a projection from the exposing building face.

A-9.10.14.5.(8) Protection at Projections. Sentence 9.10.14.5.(7) permits certain projections from exposing building faces where the projections do not have exterior walls and thus clearly do not constitute part of the exposing building face.

Sentence 9.10.14.5.(8) refers to other types of projections from the exposing building face, such as those for fireplaces and chimneys.
It is recognized that these types present more vertical surface area compared to platforms, canopies and eave projections, and may be enclosed by constructions that are essentially the same as exterior walls. These constructions, however, do not enclose habitable space, are of limited width and may not extend a full storey in height. Consequently, Sentence (8) allows these projections beyond the exposing building face of buildings identified in Sentence (6), provided additional fire protection is installed on the projection.

Figure A-9.10.14.5.(8) illustrates projections that extend within 1.2 m of the property line where additional protection must be provided. Where a projection extends within 0.6 m of the property line, it must be protected to the same degree as an exposing building face that has a limiting distance of less than 0.6 m. Where a projection extends to less than 1.2 m but not less than 0.6 m of the property line, it must be protected to the same degree as an exposing building face that has a limiting distance of less than 1.2 m.

Protection is also required on the underside of the projection where the projection is more than 0.6 m above finished ground level, measured at the exposing building face.
A-9.10.14.5. (11) and 9.10.15.5. (10) Roof Soffit Projections.

A-9.10.15. Application of Subsection Subsection 9.10.15. applies to the spatial separation between buildings of residential occupancy where there is no principal dwelling unit, including its ancillary residential unit, above another dwelling unit. Such buildings include detached houses, semi-detached houses (doubles) and row houses, where there is no dwelling unit above another dwelling unit. The general intent of Vancouver's expanded spatial separation provisions in Subsection 9.10.15. is that each legal entity is self-contained and should not overlap (and therefore impact) on an adjacent legal entity and creating complex spatial arrangements that are no longer reflective of a traditional house.
A-9.10.15.4.(2) Staggered or Skewed Exposing Building Faces of Houses. Studies at the National Fire Laboratory of the National Research Council have shown that, where an exposing building face is stepped back from the property line or is at an angle to the property line, it is possible to increase the percentage of glazing in those portions of the exposing building face further from the property line without increasing the amount of radiated energy that would reach the property line in the event of a fire in such a building. Figures A-9.10.15.4.(2)-A, A-9.10.15.4.(2)-B and A-9.10.15.4.(2)-C show how Sentences 9.10.15.4.(1) and (2), and 9.10.15.5.(2) and (3) can be applied to exposing building faces that are stepped back from or not parallel to the property line.

The following procedure can be used to establish the maximum permitted area of glazed openings for such facades:

1. Calculate the total area of the exposing building face, i.e. facade of the fire compartment, as described in the definition of exposing building face.
2. Identify the portions into which the exposing building face is to be divided. It can be divided in any number of portions, not necessarily of equal size.
3. Measure the limiting distance for each portion. The limiting distance is measured along a line perpendicular to the wall surface from the point closest to the property line.
4. Establish the line in Table 9.10.15.4. from which the maximum permitted percentage area of unprotected openings will be read. The selection of the line depends on the maximum area of exposing building face for the whole fire compartment, including all portions, as determined in Step 1.
5. On that line, read the maximum percentage area of unprotected openings permitted in each portion of the exposing building face according to the limiting distance for that portion.
6. Calculate the maximum area of unprotected openings permitted in each portion. The area is calculated from the percentage found applied to the area of that portion.

Table 9.10.15.4. is used to read the maximum area of unprotected openings: this means that the opaque portion of doors does not have to be counted as for other types of buildings.

Note that this Note and the Figures do not describe or illustrate maximum permitted concentrated area or spacing of individual unprotected openings, or limits on the location of dividing lines between portions of the exposing building face depending on the location of these openings with respect to interior rooms or spaces. See Sentences 9.10.15.2.(2) and 9.10.15.4.(2) to (4) for the applicable requirements.
Figure A-9.10.15.4.(2)-A
Example of determination of criteria for the exposing building face of a staggered wall of a house

Notes to Figure A-9.10.15.4.(2)-A:
(1) See Sentence 9.10.15.5.(2).
(2) See Sentence 9.10.15.5.(3).
(3) See Table 9.10.15., Subclause 9.10.15.2.(1)(b)(iii) and Sentence 9.10.15.4.(2).

Figure A-9.10.15.4.(2)-B
Example of determination of criteria for the exposing building face of a skewed wall of a house with some arbitrary division of the wall
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

Notes to Figure A-9.10.15.4.(2)-B:
(1) See Sentence 9.10.15.5.(2).
(2) See Sentence 9.10.15.5.(3).
(3) See Table 9.10.15.4., Subclause 9.10.15.2.(1)(b)(iii) and Sentence 9.10.15.4.(2).
(4) To simplify the calculations, choose the column for the lesser limiting distance nearest to the actual limiting distance. Interpolation for limiting distance is also acceptable and may result in a slightly larger permitted area of glazed openings. Interpolation can only be used for limiting distances greater than 1.2 m.

Figure A-9.10.15.4.(2)-C
Example of determination of criteria for the exposing building face of a skewed wall of a house with a different arbitrary division of the wall

Notes to Figure A-9.10.15.4.(2)-C:
(1) See Sentence 9.10.15.5.(2).
(2) See Sentence 9.10.15.5.(3).
(3) See Table 9.10.15.4., Subclause 9.10.15.2.(1)(b)(iii) and Sentence 9.10.15.4.(2).
(4) To simplify the calculations, choose the column for the lesser limiting distance nearest to the actual limiting distance. Interpolation for limiting distance is also acceptable and may result in a slightly larger permitted area of unprotected openings. Interpolation can only be used for limiting distances greater than 1.2 m.

A-9.10.19.3.(1) Location of Smoke Alarms. There are two important points to bear in mind when considering where to locate smoke alarms in dwelling units:
• The most frequent point of origin for fires in dwelling units is the living area.
• The main concern in locating smoke alarms is to provide warning to people asleep in bedrooms.
A smoke alarm located in the living area and wired so as to sound another smoke alarm located near the bedrooms is the ideal solution. However, it is difficult to define exactly what is meant by “living area.” It is felt to be too stringent to require a smoke alarm in every part of a dwelling unit that could conceivably be considered a “living area” (living room, family room, study, etc.). Sentence 9.10.19.3.(1) addresses these issues by requiring at least one smoke alarm on every storey containing a sleeping room. Thus, in a dwelling unit complying with Sentence 9.10.19.3.(1), every living area will probably be located within a reasonable distance of a smoke alarm. Nevertheless, where a choice arises as to where on a storey to locate the required smoke alarm or alarms, one should be located as close as possible to a living area, provided the requirements related to proximity to bedrooms are also satisfied.
A smoke alarm is not required on each level in a split-level dwelling unit as each level does not count as a separate storey. Determine the number of storeys in a split-level dwelling unit and which levels are part of which storey as follows:

1. establish grade, which is the lowest of the average levels of finished ground adjoining each exterior wall of a building;
2. identify the first storey, which is the uppermost storey having its floor level not more than 2 m above grade;
3. identify the basement, which is the storey or storeys located below the first storey;
4. identify the second storey and, where applicable, the third storey.

As a minimum, one smoke alarm is required to be installed in each storey, preferably on the upper level of each one. As noted above, however, when the dwelling unit contains more than one sleeping area, an alarm must be installed to serve each area. Where the sleeping areas are on two levels of a single storey in a split-level dwelling unit, an additional smoke alarm must be installed so that both areas are protected. See Figure A-9.10.19.3.(1).

Figure A-9.10.19.3.(1)
Two-storey split-level building

Notes to Figure A-9.10.19.3.(1):
1. One smoke alarm required for each of the basement, first storey and second storey.
2. An additional smoke alarm is required on the lower level of the second storey outside the sleeping rooms.

A-9.10.20.3.(1) Fire Department Access Route Modification. In addition to other considerations taken into account in the planning of fire department access routes, special variations could be permitted for a house or residential building that is protected with an automatic sprinkler system. The sprinkler system must be designed in accordance with the appropriate NFPA standard and there must be assurance that water supply pressure and quantity are unlikely to fail. These considerations could apply to buildings that are located on the sides of hills and are not conveniently accessible by roads designed for firefighting equipment and also to infill housing units that are located behind other buildings on a given property.

A-9.10.22. Clearances from Gas, Propane and Electric Cooktops. CSA C22.1, “Canadian Electrical Code, Part I,” which is adopted by the Electrical Safety Regulation referenced in Article 9.34.1.1., and CSA B149.1, “Natural Gas and Propane Installation Code,” which is adopted by the Gas Safety Regulation referenced in Article 9.10.22.1., address clearances directly above, in front of, behind and beside the appliance. Where side clearances are zero, the standards do not address clearances to building elements located both above the level of the cooktop elements or burners and to the side of the appliance. Through reference to the above noted regulations and their adopted standards, and the requirements in Articles 9.10.22.2. and 9.10.22.3., the British Columbia Building Code addresses all clearances. Where clearances are addressed by the British Columbia Building Code and the above noted
regulations and their adopted standards, conformance with all relevant criteria is achieved by compliance with the most stringent criteria.

**Installation of Microwave Ovens Over Cooktops**

The minimum vertical clearances stated in Article 9.10.22.2 apply only to combustible framing, finishes and cabinets. They do not apply to microwave ovens installed over cooktops nor to range hoods. The “Canadian Electrical Code, Part I” requires that microwave ovens comply with CAN/CSA-C22.2 No. 150, “Microwave Ovens.” This standard includes tests to confirm that the appliance will not present a hazard when installed according to the manufacturer’s instructions.

![Figure A-9.10.22. Clearances from cooktops to walls and cabinetry](image)

**Figure A-9.10.22.**
Clearances from cooktops to walls and cabinetry

**A-9.11. Sound Transmission.**

**Airborne Sound**

Airborne sound is transmitted between adjoining spaces directly through the separating wall, floor and ceiling assemblies and via the junctions between these separating assemblies and the flanking assemblies. The Sound Transmission Class (STC) rating describes the performance of the separating wall or floor/ceiling assembly, whereas the Apparent Sound Transmission Class (ASTC) takes into consideration the performance of the separating element as well as the flanking transmission paths. Therefore, from the occupants’ point of view, the best indicator of noise protection between two spaces is the ASTC rating.
As a key principle, it is important to follow a “whole-system” approach when designing or constructing assemblies that separate dwelling units because the overall sound performance of walls and floors is also influenced by fire protection measures and the structural design of the assemblies. Likewise, changes to the construction of assemblies to meet sound transmission requirements may have fire and structural implications. Another key principle is that enhancing the performance of the separating element does not automatically enhance the system’s performance.

For horizontally adjoining spaces, the separating assembly is the intervening wall and the pertinent flanking surfaces include those of the floor, ceiling, and side wall assemblies that have junctions with the separating wall assembly, normally at its four edges. For each of these junctions, there is a set of sound transmission paths. Figure A-9.11.-A illustrates the horizontal sound transmission paths at the junction of a separating wall with flanking floor assemblies.

For vertically adjoining spaces, the separating assembly is the intervening floor/ceiling and the pertinent flanking surfaces include those of the side wall assemblies in the upper and lower rooms that have junctions with the separating floor/ceiling assembly at its edges, of which there are normally four. For each of these junctions, there is a set of sound transmission paths. Figure A-9.11.-B illustrates the vertical sound transmission paths at the junction of a separating floor/ceiling assembly with two flanking wall assemblies.
Control of Sound Leaks
The metrics used to characterize the sound transmission performance of assemblies separating dwelling units do not account for the adverse effects of air leaks in those assemblies, which can transfer sound. Sound leaks can occur where a wall meets another wall, the floor, or the ceiling. They can also occur where wall finishes are cut to allow the installation of equipment or services. The following are examples of measures for controlling sound leaks:
• avoid back-to-back electrical outlets or medicine cabinets;
• carefully seal cracks or openings so structures are effectively airtight;
• apply sealant below the plates in stud walls, between the bottom of gypsum board and the structure behind, around all penetrations for services and, in general, wherever there is a crack, a hole or the possibility of one developing;
• include sound-absorbing material inside the wall if not already required

The reduction of air leakage is also addressed to some extent by the smoke tightness requirements in the By-law.

The calculation of and laboratory testing for STC and ASTC ratings are performed on intact assemblies having no penetrations or doors. When measuring ASTC ratings in the field, openings can be blocked with insulation and drywall.

To verify that the required acoustical performance is being achieved, a field test can be done at an early stage of construction. ASTM E 336, “Measurement of Airborne Sound Attenuation between Rooms in Buildings,” gives a complete measurement. A simpler and less expensive method is presented in ASTM E 597, “Determining a Single Number Rating of Airborne Sound Insulation for Use in Multi-Unit Building Specifications.” The rating derived from this test is usually within 2 points of the STC obtained from ASTM E 336. It is useful for verifying performance and finding problems during construction. Alterations can then be made prior to project completion.
Impact Noise
Section 9.11. has no requirements for the control of impact noise transmission. However, footsteps and other impacts can cause severe annoyance in multifamily residences. Builders concerned about quality and reducing occupant complaints will ensure that floors are designed to minimize impact transmission. A recommended criterion is that bare floors (tested without a carpet) should achieve an impact insulation class (IIC) of 55. Some lightweight floors that satisfy this requirement may still elicit complaints about low frequency impact noise transmission. Adding carpet to a floor will always increase the IIC rating but will not necessarily reduce low frequency noise transmission. Good footstep noise rejection requires fairly heavy floor slabs or floating floors.

Machinery Noise
Elevators, garbage chutes, plumbing, fans, and heat pumps are common sources of noise in buildings. To reduce annoyance from these, they should be placed as far as possible from sensitive areas. Vibrating parts should be isolated from the building structure using resilient materials such as neoprene or rubber.

A-9.11.1.3.(2)(b) Control of Airborne Noise in Buildings. Tables 9.10.3.1.-A and 9.10.3.1.-B present separating assemblies that comply with Section 9.11. However, selecting an appropriate separating assembly is only one part of the solution for reducing airborne sound transmission between adjoining spaces: to fully address the sound performance of the whole system, flanking assemblies must be connected to the separating assembly in accordance with Article 9.11.1.4.

A-9.11.1.4. Adjoining Constructions. Tables A-9.11.1.4.-A to A-9.11.1.4.-D present generic options for the design and construction of junctions between separating and flanking assemblies. Constructing according to these options is likely to meet or exceed an ASTC rating of 47. Other designs may be equally acceptable if their sound resistance can be demonstrated to meet the minimum ASTC rating or better on the basis of tests referred to in Article 9.11.1.2., or if they comply with Subsection 5.8.1. However, some caution should be applied when designing solutions that go beyond the options provided in these Tables: for example, adding more material to a wall could negatively impact its sound performance or have no effect at all.

Table A-9.11.1.4.-A presents compliance options for the construction of separating wall assemblies with flanking floor, ceiling and wall assemblies in horizontally adjoining spaces.

| Type of Separating Wall Assembly with STC ≥ 50 from Table 9.10.3.1.-A | Options for Design and Construction of Junctions and Flanking Surfaces(1) to Address Horizontal Sound Transmission Paths |
|---|---|---|
| Bottom Junction (between separating wall and flanking floors) | Top Junction (between separating wall and flanking ceiling) | Side Junctions (between separating wall and flanking walls) |
| Example Showing Side View of Bottom and Top Junctions | Example Showing Plan View of Side Junctions |
| W13, W14, W15 | for additional material layer and finished flooring, see Table 9.11.1.4.  
• subfloor on both sides of wall is plywood, OSB, waferboard (15.5 mm thick) or tongue and groove lumber (≥ 17 mm thick)  
• floor is framed with wood joists, wood I-joists or wood trusses spaced ≥ 400 mm o.c., with or without absorptive material(2) in cavities  
• floor joists or trusses are oriented parallel to separating wall (non-loadbearing case) or perpendicular to separating wall but are not continuous across junction (loadbearing case)  
• near leaf of separating wall is supported on “designated” joist  
| wood joists, wood I-joists or wood trusses are oriented perpendicular or parallel to separating wall, with or without absorptive material(2) in cavities  
• joist framing at junction is supported on near leaf of separating wall  
• gypsum board ceiling panels end at wall framing and are fastened directly to bottom of ceiling framing or  
| flanking wall framing is fastened to adjacent leaf of separating wall  
• flanking wall is framed with single row of wood studs, staggered studs on a single 38 mm × 140 mm plate, or 2 rows of 38 mm × 89 mm wood studs on separate 38 mm × 89 mm plates, with or without absorptive material(2) in cavities  
• gypsum board panels on flanking walls ends or is cut at framing of separating wall and is fastened on resilient metal channels(3) or directly to framing of flanking wall if that framing and any sheathing are not continuous across the junction

</table>
Notes to Table A-9.11.1.4.-A:
(1) See also Table A-9.11.1.4.-B.
(2) Sound absorptive material is porous (closed-cell foam was not tested) and includes fibre processed from rock, slag, glass or cellulose fibre with a maximum density of 32 kg/m³. See Notes (5) and (8) of Table 9.10.3.1.-A and Note (5) of Table 9.10.3.1.-B for additional information.
(3) Resilient metal channels are formed from steel having a maximum thickness of 0.46 mm (25 gauge) with slits or holes in the single “leg” between the faces fastened to the framing and to the gypsum board (See Figure A-9.10.3.1.-D). ASTM C 754, “Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products,” describes the installation of resilient metal channels.
(4) Normal-weight concrete block units conforming to CSA A165.1, “Concrete Block Masonry Units,” have aggregate with a density not less than 2 000 kg/m³; 190 mm hollow core units are 53% solid, providing a wall mass per area over 200 kg/m²; 140 mm hollow core units are 75% solid, providing a wall mass per area over 200 kg/m².

Table A-9.11.1.4.-B presents options for improving the sound performance of separating wall systems beyond that achieved by implementing the options presented in Table A-9.11.1.4.-A. The suggested performance improvement options are listed in order of approximate acoustic priority and are interdependent, i.e., if options at the top of the list are not implemented, then options at the bottom of the list will have much lesser effect.

</tbody>
</table>
of the separating wall (e.g. subfloor not continuous across junction and semi-rigid fibre insulation board filling the gap in accordance with Article 9.10.16.3.). In this case, an additional material layer would not be necessary. Also, choose separating wall assembly with higher STC rating (e.g. more absorptive material(2) in cavities and/or more gypsum board).

- If having a rigid structural connection at the floor/wall junction (such as subfloor continuous across the junction) is required for seismic or other structural reasons, obtain a higher ASTC rating as follows:
  - Increase combined mass per area of additional material layer over subfloor and finished flooring (e.g. concrete or gypsum concrete topping)
  - Choose separating wall assembly with higher STC rating (e.g. more absorptive material(2) and/or more gypsum board)
  - Support gypsum board panels of ceiling on resilient metal channels(1)
  - Support gypsum board panels of flanking walls on resilient metal channels(1)
  - Add resilient layer under additional material layer over subfloor or between additional material layer and finished flooring

| S1 to S15 | • Choose separating wall assembly with higher STC rating
• Increase thickness of concrete floor slab and/or add material layer and finished flooring over subfloor
• Add gypsum board ceiling on framing supported under the floor above, with cavity not less than 100 mm deep
• Add resilient layer under additional material layer over subfloor or between additional material layer and finished flooring
• Support gypsum board panels of flanking walls on resilient metal channels(1) if steel studs are loadbearing type |
| B1 to B10 | • Choose separating wall assembly with higher STC rating
• Add gypsum board ceiling supported below concrete floor with cavity not less than 100 mm deep and sound absorptive material(2) in cavity
• Increase thickness of concrete floor slab and/or add material layer and finished flooring over subfloor
• Add resilient layer under additional material layer over subfloor or between additional material layer and finished flooring and increase mass per area of additional material layer and finished flooring (e.g. floating concrete or gypsum concrete topping)
• Support gypsum board panels of flanking walls on resilient metal channels(1) if steel studs are loadbearing type |

Notes to Table A-9.11.1.4.-B:
(1) Resilient metal channels are formed from steel having a maximum thickness of 0.46 mm (25 gauge) with slits or holes in the single “leg” between the faces fastened to the framing and to the gypsum board (See Figure A-9.10.3.1.-D). ASTM C 754, “Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products,” describes the installation of resilient metal channels.

(2) Sound absorptive material is porous (closed-cell foam was not tested) and includes fibre processed from rock, slag, glass or cellulose fibre with a maximum density of 32 kg/m³. See Notes (5) and (8) of Table 9.10.3.1.-A and Note (5) of Table 9.10.3.1.-B for additional information.
Table A-9.11.1.4.-C presents compliance options for the construction of separating floor/ceiling assemblies with flanking wall assemblies in vertically adjoining spaces.

Junctions with Flanking Loadbearing or Non-Loadbearing Walls

- wood studs of flanking wall are 38 mm × 89 mm or 38 mm × 140 mm and spaced 400 mm or 600 mm o.c.
- flanking wall framing consists of single row of wood studs, staggered studs on a single 38 mm × 140 mm plate, or 2 rows of 38 mm × 89 mm wood studs on separate 38 mm × 89 mm plates, with or without absorptive material(2) in wall cavities
- gypsum board on flanking walls ends or is cut near floor framing and is fastened directly to wall framing or supported on resilient metal channels(3)

Example Showing Side View of Junctions in Flanking Loadbearing Wall

Example Showing Side View of Junctions in Flanking Non-Loadbearing Wall
### Notes to Table A-9.11.1.4.-C:

1. See also Table A-9.11.1.4.-D.
2. Sound absorptive material is porous (closed-cell foam was not tested) and includes fibre processed from rock, slag, glass or cellulose fibre with a maximum density of 32 kg/m³. See Notes (5) and (8) of Table 9.10.3.1.-A and Note (5) of Table 9.10.3.1.-B for additional information.
3. Resilient metal channels are formed from steel having a maximum thickness of 0.46 mm (25 gauge) with slits or holes in the single “leg” between the faces fastened to the framing and to the gypsum board (See Figure A-9.10.3.1.-D). ASTM C 754, “Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products,” describes the installation of resilient metal channels.
4. Normal-weight concrete block units conforming to CSA A165.1, “Concrete Block Masonry Units,” have aggregate with a density not less than 2000 kg/m³; 190 mm hollow core units are 53% solid, providing a wall mass per area over 200 kg/m²; 140 mm hollow core units are 75% solid, providing a wall mass per area over 200 kg/m².

Table A-9.11.1.4.-D presents options for improving the sound performance of separating floor/ceiling assemblies beyond that achieved by implementing the options presented in Table A-9.11.1.4.-C. The suggested performance improvement options are listed in order of approximate acoustic priority and are interdependent, i.e., if options at the top of the list are not implemented, then options at the bottom of the list will have much lesser effect.

#### Options for the Construction of a Separating Floor System to Further Improve the Sound Insulation Performance Achieved with the Options in Table A-9.11.1.4.C.

  • Add more/heavier gypsum board to ceiling and increase spacing of resilient metal channels(2) to 600 mm o.c.  
  • Support gypsum board of flanking loadbearing walls of lower room on resilient metal channels(2)  
  • Support gypsum board on flanking non-loadbearing walls of lower room on resilient metal |
Notes to Table A-9.11.1.4-D:
(1) Sound absorptive material is porous (closed-cell foam was not tested) and includes fibre processed from rock, slag, glass or cellulose fibre with a maximum density of 32 kg/m³. See Notes (5) and (8) of Table 9.10.3.1.-A and Note (5) of Table 9.10.3.1.-B for additional information.
(2) Resilient metal channels are formed from steel having a maximum thickness of 0.46 mm (25 gauge) with slits or holes in the single "leg" between the faces fastened to the framing and to the gypsum board (See Figure A-9.10.3.1.-D). ASTM C 754, “Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products,” describes the installation of resilient metal channels.

A-Table 9.11.1.4. Floor Treatments. The sound insulation performance of lightweight framed floors can be improved by adding floor treatments, i.e., additional layers of material over the subfloor (e.g., concrete topping, OSB or plywood) and finished flooring or coverings (e.g., carpet, engineered wood). Table A-Table 9.11.1.4. presents the mass per area values based on thickness and density of a number of generic floor treatment materials (the values for proprietary products may be different; consult the manufacturer’s current data sheets for their products’ values).

A-Table 9.12.2.2. Minimum Depths of Foundations. The requirements for clay soils or soils not clearly defined are intended to apply to those soils that are subject to significant volume changes with changes in moisture content.

A-9.12.3.3. (1) Deleterious Material in Backfill. The deleterious debris referred to in this provision includes, but is not limited to:

- organic material and other material subject to decomposition and compaction, which could have an adverse effect on grading around the building,
- materials that will off-gas and have the potential to pose a health hazard, and
- materials that are incompatible with materials used in the foundations, footings, drainage materials or components, or other elements of the building whose required performance would be adversely affected.

A-9.13.2.5. Protection of Interior Finishes against Moisture. Excess water from cast-in-place concrete and ground moisture tends to migrate toward interior spaces, particularly in the spring and summer. Where moisture-susceptible materials, such as finishes or wood members, are in contact with the foundation wall, the moisture needs to be controlled by installing a moisture barrier on the interior surface of the foundation wall that extends from the underside of the interior finish up the face of the wall to a point just above the level of the ground outside.

The reason the moisture barrier on the interior surface of the foundation wall must be stopped near ground level is to allow any moisture that finds its way into the finished wall cavity from the interior space (through leaks in the air or vapour barrier) to diffuse to the exterior. If the vapour permeance of dampproofing membranes or coatings exceeds 170 ng/(Pa·s·m²), such moisture barriers may be carried full height; if their vapour permeance is less than that, this moisture risks being trapped on the interior surface of the moisture barriers. The permeance limit corresponds to the lower limit for breather-type membranes, such as asphalt-impregnated sheathing paper.
Some insulation products can also be used to protect interior finishes from the effects of moisture. They have shown acceptable performance when applied over the entire foundation wall because, in this case, they also provide vapour barrier and moisture barrier functions and possibly also the air barrier function. Where a single product provides all these functions, there is no risk of trapping moisture between two functional barriers with low water vapour permeance.

A-9.13.4. Soil Gas Control. Outdoor air entering a dwelling through above-grade leaks in the building envelope normally improves the indoor air quality in the dwelling by reducing the concentrations of pollutants and water vapour. It is only undesirable because it cannot be controlled. On the other hand, air entering a dwelling through below-grade leaks in the envelope may increase the water vapour content of the indoor air and may also bring in a number of pollutants picked up from the soil. This mixture of air, water vapour and pollutants is sometimes referred to as "soil gas." One pollutant often found in soil gas is radon.

Sentence 9.13.4.2.(1), which requires the installation of an air barrier system, addresses the protection from all soil gases, while the remainder of Article 9.13.4.2, along with Article 9.13.4.3., which require the provision of the means to depressurize the space between the air barrier system and the ground, specifically address the capability to mitigate high radon concentrations in the future, should this become necessary.

Radon is a colourless, odourless, radioactive gas that occurs naturally as a result of the decay of radium. It is found to varying degrees as a component of soil gas in all regions of Canada and is known to enter dwelling units by infiltration into basements and crawl spaces.

The presence of radon in sufficient quantity can lead to an increased risk of lung cancer.

The potential for high levels of radon infiltration is very difficult to evaluate prior to construction and thus a radon problem may only become apparent once the building is completed and occupied. Therefore various sections of Part 9 require the application of certain radon exclusion measures in all dwellings. These measures are

• low in cost,
• difficult to retrofit, and
• desirable for other benefits they provide.

The principal method of resisting the ingress of all soil gases, a resistance which is required for all buildings (See Sentence 9.13.4.2.(1)), is to seal the interface between the soil and the occupied space, so far as is reasonably practicable. Sections 9.18. and 9.25. contain requirements for air and soil gas barriers in assemblies in contact with ground, including those in crawl spaces. Providing control joints to reduce cracking of foundation walls and airtight covers for sump pits (See Section 9.14.) are other measures that can help achieve this objective. The requirements provided in Subsection 9.25.3. are explained in Notes A-9.25.3.4. and 9.25.3.6. and A-9.25.3.6.(2) and (3).

The principal method of excluding radon is to ensure that the pressure difference across the ground/space interface is positive (i.e., towards the outside) so that the inward flow of radon through any remaining leaks will be minimized. The requirements provided in Article 9.13.4.3. are explained in Note A-9.13.4.3.

A-9.13.4.2.(3) Exception for Buildings Occupied for a Few Hours a Day. The criterion used by Health Canada to establish the guideline for acceptable radon concentration is the time that occupants spend inside buildings. Health Canada recommends installing a means for the future removal of radon in buildings that are occupied by persons for more than 4 hours per day. Sentence 9.13.4.2.(3) therefore does not apply to buildings or portions of buildings that are intended to be occupied for less than 4 hours a day. Addressing a radon problem in such buildings in the future, should that become necessary, can also be achieved by providing a means for increased ventilation at times when these buildings are occupied.

A-9.13.4.3.
Providing Performance Criteria for the Depressurization of the Space Between the Air Barrier System and the Ground

Article 9.13.4.3. contains two sets of requirements: Sentence (2) describes the criteria for subfloor depressurization systems using performance-oriented language, while Sentence (3) describes one particular acceptable solution using more prescriptive language. In some cases, subfloor depressurization requires a solution other than the one described in Sentence (3), for example, where compactable fill is installed under slab-on-grade construction.

Completion of a Subfloor Depressurization System

The completion of a subfloor depressurization system may be necessary to reduce the radon concentration to a level below the guideline specified by Health Canada. In this case, to complete the system, the radon vent pipe is mechanically assisted to enable effective depressurization of the space between the air barrier system and the ground. An electrically powered fan is typically installed somewhere along the radon vent pipe.

Further information on protection from radon ingress can be found in the following Health Canada publications:

• “Radon: A Guide for Canadian Homeowners” (CMHC/HC), and
• “Guide for Radon Measurements in Residential Dwellings (Homes).”

A-9.13.4.3. Vent Terminals. To prevent soil gases from entering a building through air intakes, windows, and other openings in the building envelope, radon vent pipe terminations should be installed in a similar manner to plumbing vent terminals.

(See A-2.5.6.5.(4) in Appendix A of Division B to Book II of the Code.)

A-9.13.4.3.(2)(b)(i) and (3)(b)(i) Effective Depressurization. To allow effective depressurization of the space between the air barrier system and the ground, the extraction opening (the pipe) should not be blocked and should be arranged such that air can be extracted from the entire space between the air barrier system and the ground. This will ensure that the extraction system can maintain negative pressure underneath the entire floor (or in heated crawl spaces underneath the air barrier system). The arrangement and location of the extraction system inlet(s) may have design implications where the footing layout separates part of the space underneath the floor.

A-9.14.2.1.(2)(a) Insulation Applied to the Exterior of Foundation Walls. In addition to the prevention of heat loss, some types of mineral fibre insulation, such as rigid glass fibre, are installed on the exterior of basement walls for the purpose of moisture control. This is sometimes used instead of crushed rock as a drainage layer between the basement wall and the surrounding soil in order to facilitate the drainage of soil moisture. Water drained by this drainage layer must be carried away from the foundation by the footing drains or the granular drainage layer in order to prevent it from developing hydro-static pressure against the wall. Provision must be made to permit the drainage of this water either by extending the insulation or crushed rock to the drain or by the installation of granular material connecting the two. The installation of such drainage layer does not eliminate the need for normal waterproofing or dampproofing of walls as specified in Section 9.13.

A-9.15.1.1. Application of Footing and Foundation Requirements to Decks and Similar Constructions. Because decks, balconies, verandas and similar platforms support occupancies, they are, by definition, considered as buildings or parts of buildings. Consequently, the requirements in Section 9.15. regarding footings and foundations apply to these constructions.

A-9.15.1.1.(1)(c) and 9.20.1.1.(1)(b) Flat Insulating Concrete Form Walls. Insulating concrete form (ICF) walls are concrete walls that are cast into polystyrene forms, which remain in place after the concrete has cured. Flat ICF walls are solid ICF walls where the concrete is of uniform thickness over the height and width of the wall.
A-9.15.2.4.(1) Preserved Wood Foundations – Design Assumptions. Tabular data and figures in CSA S406, “Permanent Wood Foundations for Housing and Small Buildings,” are based upon the general principles provided in CSA O86, “Engineering Design in Wood,” with the following assumptions:

- soil bearing capacity: 75 kPa or more,
- clear spans for floors: 5 000 mm or less,
- floor loadings: 1.9 kPa for first floor and suspended floor, and 1.4 kPa for second storey floor,
- foundation wall heights: 2 400 mm for slab floor, 3 000 mm for suspended wood floor,
- top of granular layer to top of suspended wood floor: 600 mm,
- lateral load from soil pressure: equivalent to fluid pressure of 4.7 kPa per metre of depth,
- ground snow load: 3 kPa,
- basic snow load coefficient: 0.6,
- roof loads are carried to the exterior wall,
- dead loads:

<table>
<thead>

</tbody>
</table>

A-9.15.3.4.(2) Footing Sizes. The footing sizes in Table 9.15.3.4. are based on typical construction consisting of a roof, not more than 3 storeys, and centre bearing walls or beams. For this reason, Clause 9.15.3.3.(1)(b) stipulates a maximum supported joist span of 4.9 m.

It has become common to use flat wood trusses or wood I-joists to span greater distances in floors of small buildings. Where these spans exceed 4.9 m, minimum footing sizes may be based on the following method:

(a) Determine for each storey the span of joists that will be supported on a given footing. Sum these lengths (sum₁).
(b) Determine the product of the number of storeys times 4.9 m (sum₂).
(c) Determine the ratio of sum₁ to sum₂.
(d) Multiply this ratio by the minimum footing sizes in Table 9.15.3.4. to get the required minimum footing size.

Example: A 2-storey house is built using wood I-joists spanning 6 m.

(a) sum₁ = 6 + 6 = 12 m
(b) sum₂ = 4.9 × 2 = 9.8 m
(c) ratio sum₁/sum₂ = 12/9.8 = 1.22
(d) required minimum footing size = 1.22 × 350 mm (minimum footing size provided in Table 9.15.3.4.) = 427 mm.

A-9.16.2.1.(1) Drainage Layer Beneath Floors-on-Ground. A drainage layer required by Sentence 9.16.2.1.(1) shall also be gas-permeable and conform to Article 9.13.4.3. in buildings to which that Article applies.

A-9.17.2.2.(2) Lateral Support of Columns. Because the By-law does not provide prescriptive criteria to describe the minimum required lateral support, constructions are limited to those that have demonstrated effective performance over time and those that are designed according to Part 4. Verandas on early 20th century homes provide one example of constructions whose floor and roof are typically tied to the rest of the building to provide effective lateral support. Large decks set on tall columns, however, are likely to require additional lateral support even where they are connected to the building on one side.

A-9.17.3.4. Design of Steel Columns. The permitted live floor loads of 2.4 kPa and the spans described for steel beams, wood beams and floor joists are such that the load on columns could exceed 36 kN, the maximum allowable load on columns prescribed in CAN/CGSB-7.2, “Adjustable Steel Columns.” In the context of Part 9, loads on columns are calculated from the supported area times the live load per unit area, using the supported length of joists and beams. The supported length is half of the joist spans on each side of the beam and half the beam span on each side of the column.
Dead load is not included based on the assumption that the maximum live load will not be applied over the whole floor. Designs according to Part 4 must consider all applied loads.

**A-9.18.7.1.(4) Protection of Ground Cover in Warm Air Plenums.** The purpose of the requirement is to protect combustible ground cover from smouldering cigarette butts that may drop through air registers. The protective material should extend beyond the opening of the register and have up-turned edges, as a butt may be deflected sideways as it falls.

**A-9.19.1.1.(1) Venting of Attic or Roof Spaces.** Controlling the flow of moisture by air leakage and vapour diffusion into attic or roof spaces is necessary to limit moisture-induced deterioration. Given that imperfections normally exist in the vapour barriers and air barrier systems, recent research indicates that venting of attic or roof spaces is generally still required. The exception provided in Article 9.19.1.1. recognizes that some specialized ceiling-roof assemblies, such as those used in some factory-built buildings, have, over time, demonstrated that their construction is sufficiently tight to prevent excessive moisture accumulation. In these cases, ventilation would not be required.

Further, the use of spray-in-place foam (SPF) insulation may also be considered sufficiently tight to prevent excessive moisture accumulation provided that acceptable procedures, material requirements, location restraints, installation requirements and inspection documentation has been met. The exception for SPF is for a ‘typical’ indoor environment. The exception shall not be used for high humidity interior environments such as ceilings above indoor hot tubs, etc. Caution should also be given to the use of SPF in ceilings above kitchens and bathrooms, where the incorrect use of venting equipment could create high humidity conditions for extended periods of time. For installations where the ceiling-roof assembly has a slope of less than 2-in-12, additional attention should be given to the roof membrane. More frequent monitoring and maintenance is recommended. Where possible, it is recommended that the vapour be allowed to transfer to the top side of the assembly, in other words, consideration should be given for cross ventilation above the roof sheathing.

**A-9.19.2.1.(1) Access to Attic or Roof Space.** The term “open space” refers to the space between the insulation and the roof sheathing. Sentence 9.19.2.1.(1) requires the installation of an access hatch where the open space in the attic or roof is large enough to allow visual inspection. Although the dimensions of an uninsulated attic or roof space may meet the size that triggers the requirement for an access hatch to be installed, most of that space will actually be filled with insulation and may therefore not be easily inspected, particularly in smaller buildings or under low-sloped roofs.

**A-9.20.1.2. Seismic Information.** Information on spectral response acceleration values for various locations can be found in Appendix C.

**A-9.20.5.1.(1) Masonry Support.** Masonry veneer must be supported on a stable structure in order to avoid cracking of the masonry due to differential movement relative to parts of the support. Wood framing is not normally used as a support for the weight of masonry veneer because of its shrinkage characteristics. Where the weight of masonry veneer is supported on a wood structure, as is the case for the preserved wood foundations referred to in Sentence 9.20.5.1.(1) for example, measures must be taken to ensure that any differential movement that may be harmful to the performance of masonry is minimized or accommodated. The general principle stated in Article 9.4.1.1., however, makes it possible to support the weight of masonry veneer on wood framing, provided that engineering design principles prescribed in Part 4 are followed to ensure that the rigidity of the support is compatible with the stiffness of the masonry being supported and that differential movements between the support and masonry are accommodated.

**A-9.20.8.5.(1) Projection of Masonry Beyond Supporting Members.**
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

Maximum projection of masonry veneer beyond its support

Figure A-9.20.12.2.(2)
Maximum corbel dimensions

A-9.20.13.9.(3) Dampproofing of Masonry Walls. The reason for installing a sheathing membrane behind masonry walls is to prevent rainwater from reaching the interior finish if it should leak past the masonry. The sheathing membrane intercepts the rainwater and leads it to the bottom of the wall where the flashing directs it to the exterior via weep holes. If the insulation is a type that effectively resists the penetration of water, and is installed so that water will not collect behind it, then there is no need for a sheathing membrane. If water that runs down between the masonry and the insulation is able to leak out at the joints in the insulation, such insulation will not act as a substitute for a sheathing membrane. If water cannot leak through the joints in the insulation but collects in cavities between the masonry and insulation, subsequent freezing could damage the wall. Where a sheathing membrane is not used, the adhesive or mortar should therefore be applied to form a continuous bond between the masonry and the insulation. If this is not practicable because of an irregular masonry surface, then a sheathing membrane is necessary.
A-9.21.3.6.(2) Metal Chimney Liners. Under the provisions of Article 1.2.1.1. of Division A, masonry chimneys with metal liners may be permitted to serve solid-fuel-burning appliances if tests show that such liners will provide an equivalent level of safety.

A-9.21.4.4.(1) Location of Chimney Top. 

![Figure A-9.21.4.4.(1)]

Vertical and horizontal distances from chimney top to roof

A-9.21.4.5.(2) Lateral Support for Chimneys. Where a chimney is fastened to the house framing with metal anchors, in accordance with CSA A370, “Connectors for Masonry,” it is considered to have adequate lateral support. The portion of the chimney stack above the roof is considered as free standing and may require additional lateral support.

A-9.21.5.1.(1) Clearance from Combustible Materials. For purposes of this Sentence, an exterior chimney can be considered to be one which has at least one surface exposed to the outside atmosphere or unheated space over the majority of its height. All other chimneys should be considered to be interior.

A-9.23.1.1. Constructions Other than Light Wood-Frame Constructions. The prescriptive requirements in Section 9.23. apply only to standard light wood-frame construction. Other constructions, such as post, beam and plank construction, plank frame wall construction, and log construction must be designed in accordance with Part 4.

A-9.23.1.1.(1) Application of Section 9.23. In previous editions of the By-law, Sentence 9.23.1.1. referred to “conventional” wood-frame construction. Over time, conventions have changed and the application of Part 9 has expanded.

The prescriptive requirements provided in Section 9.23. still focus on lumber beams, joists, studs and rafters as the main structural elements of “wood-frame construction.” The requirements recognize – and have recognized for some time – that walls and floors may be supported by components made of material other than lumber; for example, by foundations described in Section 9.15. or by steel beams described in Article 9.23.4.3. These constructions still fall within the general category of wood-frame construction.
With more recent innovations, alternative structural components are being incorporated into wood-frame buildings. Wood I-joists, for example, are very common. Where these components are used in lieu of lumber, the requirements in Section 9.23. that specifically apply to lumber joists do not apply to these components: for example, limits on spans and acceptable locations for notches and holes. However, requirements regarding the fastening of floor sheathing to floor joists still apply, and the use of wood I-joists does not affect the requirements for wall or roof framing. Similarly, if steel floor joists are used in lieu of lumber joists, the requirements regarding wall or roof framing are not affected.

Conversely, Sentence 9.23.1.1.(1) precludes the installation of precast concrete floors on wood-frame walls since these are not “generally comprised of … small repetitive structural members … spaced not more than 600 mm o.c.” Thus, the reference to “engineered components” in Sentence 9.23.1.1.(1) is intended to indicate that, where an engineered product is used in lieu of lumber for one part of the building, this does not preclude the application of the remainder of Section 9.23. to the structure, provided the limits to application with respect to cladding, sheathing or bracing, spacing of framing members, supported loads and maximum spans are respected.

A-9.23.3.1.(2) Alternative Nail Sizes. Where power nails or nails with smaller diameters than that required by Table 9.23.3.4. are used to connect framing, the following equations can be used to determine the required spacing or required number of nails. The maximum spacing can be reduced using the following equation:

\[ S_{adj} = S_{table} \cdot \left(\frac{D_{red}}{D_{table}}\right)^2 \]

where
- \( S_{adj} \) = adjusted nail spacing \( \geq 20 \times \) nail diameter,
- \( S_{table} \) = nail spacing required by Table 9.23.3.4.,
- \( D_{red} \) = smaller nail diameter than that required by Table 9.23.3.1., and
- \( D_{table} \) = nail diameter required by Table 9.23.3.1.

The number of nails can be increased using the following equation:

\[ N_{adj} = N_{table} \cdot \left(\frac{D_{table}}{D_{red}}\right)^2 \]

where
- \( N_{adj} \) = adjusted number of nails,
- \( N_{table} \) = number of nails required by Table 9.23.3.4.,
- \( D_{table} \) = nail diameter required by Table 9.23.3.1., and
- \( D_{red} \) = smaller nail diameter than required by Table 9.23.3.1.

Note that nails should be spaced sufficiently far apart – preferably no less than 55 mm apart – to avoid splitting of framing lumber.

A-9.23.3.1.(3) Standard for Screws. The requirement that wood screws conform to ASME B18.6.1, “Wood Screws (Inch Series),” is not intended to preclude the use of Robertson head screws. The requirement is intended to specify the mechanical properties of the fastener, not to restrict the means of driving the fastener.

A-9.23.3.3.(1) Prevention of Splitting. Figure A-9.23.3.3.(1) illustrates the intent of the phrase “staggering the nails in the direction of the grain.”

![Staggered nailing](image)

A-9.23.4.2. Span Tables for Wood Joists, Rafters and Beams. In these span tables the term “rafter” refers to a sloping wood framing member which supports the roof sheathing and encloses an attic space but does not support a ceiling. The term “roof joist” refers to a horizontal or sloping wood framing member that supports the roof sheathing and the ceiling finish but does not enclose an attic space.

Where rafters or roof joists are intended for use in a locality having a higher specified roof snow load than shown in the tables, the maximum member spacing may be calculated as the product of the member spacing and specified snow load shown in the span tables divided by the specified snow load for the locality being considered. The following examples show how this principle can be applied:

(a) For a 3.5 kPa specified snow load, use spans for 2.5 kPa and 600 mm o.c. spacing but space members 400 mm o.c.

(b) For a 4.0 kPa specified snow load, use spans for 2.0 kPa and 600 mm o.c. spacing but space members 300 mm o.c.

The maximum spans in the span tables are measured from the inside face or edge of support to the inside face or edge of support.

In the case of sloping roof framing members, the spans are expressed in terms of the horizontal distance between supports rather than the length of the sloping member. The snow loads are also expressed in terms of the horizontal projection of the sloping roof. Spans for odd size lumber may be estimated by straight line interpolation in the tables.

These span tables may be used where members support a uniform live load only. Where the members are required to be designed to support a concentrated load, they must be designed in conformance with Subsection 4.3.1.

Supported joist length in Span Tables 9.23.4.2.-H, 9.23.4.2.-I and 9.23.4.2.-J means half the sum of the joist spans on both sides of the beam. For supported joist lengths between those shown in the tables, straight line interpolation may be used in determining the maximum beam span.

Span Tables 9.23.4.2.-A to 9.23.12.3.-D cover only the most common configurations. Especially in the area of floors, a wide variety of other configurations is possible: glued subfloors, concrete toppings, machine stress rated lumber, etc. The Canadian Wood Council publishes “The Span Book,” a compilation of span tables covering many of these alternative configurations. Although these tables have not been subject to the formal committee review process, the Canadian Wood Council generates, for the CCBFC, all of the By-law's span tables for wood structural components; thus By-law users can be confident that the alternative span tables in “The Span Book” are consistent with the span tables in the By-law and with relevant By-law requirements.

Spans for wood joists, rafters and beams which fall outside the scope of these tables, including those for U.S. species and individual species not marketed in the commercial species combinations described in the span tables, can be calculated in conformance with CSA O86, “Engineering Design in Wood.”
A-9.23.4.2.(2) Numerical Method to Establish Vibration-Controlled Spans for Wood-Frame Floors. In addition to the normal strength and deflection analyses, the calculations on which the floor joist span tables are based include a method of ensuring that the spans are not so long that floor vibrations could lead to occupants perceiving the floors as too "bouncy" or "springy.

Limiting deflection under the normal uniformly distributed loads to 1/360 of the span does not provide this assurance. Normally, vibration analysis requires detailed dynamic modelling. However, the calculations for the span tables use the following simplified static analysis method of estimating vibration-acceptable spans:

- The span which will result in a 2 mm deflection of a single joist supporting a 1 kN concentrated midpoint load is calculated.
- This span is multiplied by a factor, K, to determine the "vibration-controlled" span for the entire floor system. If this span is less than the strength- or deflection-controlled span under uniformly distributed load, the vibration-controlled span becomes the maximum span.
- The K factor is determined from the following relationship:

\[
\ln(K) = A - B \cdot \ln\left(\frac{S_i}{S_{184}}\right) + G
\]

where

- A, B = constants, the values of which are determined from Tables A-9.23.4.2.(2)-A or A-9.23.4.2.(2)-B,
- G = constant, the value of which is determined from Table A-9.23.4.2.(2)-C,
- Si = span which results in a 2 mm deflection of the joist in question under a 1 kN concentrated midpoint load,
- S184 = span which results in a 2 mm deflection of a 38 × 184 mm joist of same species and grade as the joist in question under a 1 kN concentrated midpoint load.

For a given joist species and grade, the value of K shall not be greater than K3, the value which results in a vibration-controlled span of exactly 3 m. This means that for vibration-controlled spans 3 m or less, K always equals K3, and for vibration-controlled spans greater than 3 m, K is as calculated.

Note that, for a sawn lumber joist, the ratio Si/S184 is equivalent to its depth (mm) divided by 184.

Due to rounding differences, the method, as presented here, might produce results slightly different from those produced by the computer program used to generate the span tables.

<td>0.15</td>
</tr>
</tbody>
</table>

**Notes to Table A-9.23.4.2.(2)-C:**
\(^{(1)}\) Common wire nails, spiral nails or wood screws can be considered equivalent for this purpose.
\(^{(2)}\) Subfloor field-glued to floor joists with elastomeric adhesive complying with CAN/CGSB-71.26-M, "Adhesive for Field-Gluing Plywood to Lumber Framing for Floor Systems."

Additional background information on this method can be found in the following publications:

**A-9.23.4.3.(1) Maximum Spans for Steel Beams Supporting Floors in Dwellings.** A beam may be considered to be laterally supported if wood joists bear on its top flange at intervals of 600 mm or less over its entire length, if all the load being applied to this beam is transmitted through the joists and if 19 mm by 38 mm wood strips in contact with the top flange are nailed on both sides of the beam to the bottom of the joists supported. Other additional methods of positive lateral support are acceptable.

For supported joist lengths intermediate between those in the table, straight line interpolation may be used in determining the maximum beam span.

**A-Table 9.23.4.3. Spans for Steel Beams.** The spans provided in Table 9.23.4.3. reflect a balance of engineering and acceptable proven performance. The spans have been calculated based on the following assumptions:
- simply supported beam spans
- laterally supported top flange
• yield strength 350 MPa
• deflection limit L/360
• live load: first floor = 1.9 kPa; second floor = 1.4 kPa
• dead load: 1.5 kPa (0.5 kPa floor + 1.0 kPa partition)

The calculation used to establish the specified maximum beam spans also applies a revised live load reduction factor to account for the lower probability of a full live load being applied over the supported area in Part 9 buildings.

A-9.23.4.4. Concrete Topping. Vibration-controlled spans given in Span Table 9.23.4.2.-B for concrete topping are based on a partial composite action between the concrete, subflooring and joists. Normal weight concrete having a compressive strength of not less than 20 MPa, placed directly on the subflooring, provides extra stiffness and results in increased capacity. The use of a bond breaker between the topping and the subflooring, or the use of lightweight concrete topping limits the composite effects.

Where either a bond breaker or lightweight topping is used, Span Table 9.23.4.2.-A may be used but the additional dead load imposed by the concrete must be considered. The addition of 51 mm of concrete topping can impose an added load of 0.8 to 1.2 kPa, depending on the density of the concrete.

Example
Assumptions:
– basic dead load = 0.5 kPa
– topping dead load = 0.8 kPa
– total dead load = 1.3 kPa
– live load = 1.9 kPa
– vibration limit per Note A-9.23.4.2.(2)
– deflection limit = 1/360
– ceiling attached directly to joists, no bridging

The spacing of joists in the span tables can be conservatively adjusted to allow for the increased load by using the spans in Span Table 9.23.4.2.-A for 600 mm spacing, but spacing the joists 400 mm apart. Similarly, floor beam span tables can be adjusted by using 4.8 m supported length spans for cases where the supported length equals 3.6 m.

Figure A-9.23.8.3.
Joint location in built-up beams

Article 9.3.2.1., refers to two special product standards, SPS-1, “Fingerjoined Structural Lumber,” and SPS-3, “Fingerjoined “Vertical Stud Use Only” Lumber,” produced by NLGA. Material identified as conforming to these standards is considered to meet the requirements in this Sentence for joining with a structural adhesive. Lumber fingerjointed in accordance with SPS-3 should be used as a vertical end-loaded member in compression only, where sustained bending or tension-loading conditions are not present, and where the moisture content of the wood will not exceed 19%. Fingerjoined lumber may not be visually regraded or remanufactured into a higher stress grade even if the quality of the lumber containing fingerjoints would otherwise warrant such regrading.

X = requirements are applicable

Notes to Table A-9.23.13.:
(1) See Note A-9.23.13.2.(1)(a)(i).
(2) Requirements apply to exterior walls only.
(3) Requirements apply where lowest exterior frame walls support not more than one floor.
(4) All constructions may include the support of a roof in addition to the stated number of floors.
(5) Requirements apply where lowest exterior frame walls support not more than two floors.

**Bracing to Resist Lateral Loads in Low Load Locations**

Of the 109 locations identified in Appendix C, 68 are locations where the seismic spectral response acceleration, Sa(0.2), is less than or equal to 0.70 and the 1-in-50 hourly wind pressure is less than 0.80 kPa. For buildings in these locations, Sentence 9.23.13.1.(2) requires only that exterior walls be braced using the acceptable materials and fastening specified. There are no spacing or dimension requirements for braced wall panels in these buildings.

**Structural Design for Lateral Wind and Earthquake Loads**

In cases where lateral load design is required, CWC 2014, “Engineering Guide for Wood Frame Construction,” provides acceptable engineering solutions as an alternative to Part 4. The CWC Guide also contains alternative solutions and provides information on the applicability of the Part 9 prescriptive structural requirements to further assist designers and building officials to identify the appropriate design approach.

A-9.23.13.2.(1)(a)(i) **Heavy Construction.** “Heavy construction” refers to buildings with tile roofs, stucco walls or floors with concrete topping, or that are clad with directly-applied heavyweight materials.

Heavyweight construction assemblies increase the lateral load on the structure during an earthquake. Assemblies should be considered as heavyweight where their average dead weight is as follows (an additional partition weight of 0.5 kPa per floor is assumed):
- floor: 0.5 to 1.5 kPa
- roof: 0.5 to 1.0 kPa
- wall (vertical area): 0.32 to 1.2 kPa
Figure A-9.23.13.4.-C
Braced wall band at change in floor level in split-level buildings [Sentence 9.23.13.4.(3)]

A-Table 9.23.13.5. Spacing of Braced Wall Bands and Braced Wall Panels. Identifying adjacent braced wall bands and determining the spacing of braced wall panels and braced wall bands is not complicated where the building plan is orthogonal or there are parallel braced wall bands: the adjacent braced wall band is the nearest parallel band. Figure Table A-9.23.13.5.-A illustrates spacing.

Figure Table A-9.23.13.5.-A
Spacing of parallel braced wall bands and spacing of braced wall panels

Identifying and Spacing Adjacent Non-Parallel Braced Wall Bands
Identifying the adjacent braced wall band and the spacing between braced wall bands is more complicated where the building plan is not orthogonal.

Where the plan is triangular, all braced wall bands intersect with the subject braced wall band. The prescriptive requirements in Part 9 do not apply to these cases and the building must be designed according to Part 4 with respect to lateral load resistance.
Where the braced wall bands are not parallel, the adjacent band is identified as follows using Figure Table A-9.23.13.5.-B as an example:

1. Determine the mid-point of the centre line of the subject braced wall band (A);
2. Project a perpendicular line from this mid-point (B);
3. The first braced wall band encountered is the adjacent braced wall band (C);
4. Where the projected line encounters an intersection point between two braced wall bands, either wall band may be identified as the adjacent braced wall band (complex cases).

The spacing of non-parallel braced wall bands is measured as the greatest distance between the centre lines of the bands.

**Figure Table A-9.23.13.5.-B**
Identification and spacing of adjacent non-parallel braced wall bands

**A-9.23.13.5.(2) Perimeter Foundation Walls.** Where the perimeter foundation walls in basements and crawl spaces extend from the footings to the underside of the supported floor, these walls perform the same function as braced wall bands with braced wall panels. All other braced wall bands in the basement or crawl space that align with bands with a wood-based bracing material on the upper floors need to be constructed with braced wall panels, which must be made of a wood-based bracing material, masonry or concrete. See Figure A-9.23.13.5.(2).
Figure A-9.23.13.5.(2)
Braced wall bands in basements or crawl spaces with optional and required braced wall panels

A-9.23.13.5.(3) Attachment of a Porch Roof to Exterior Wall Framing.
Figure A-9.23.13.5.(3)-A
Framing perpendicular to plane of wall (balloon construction)

Figure A-9.23.13.6.(5) and (6)
Use of Gypsum Board Interior Finish to Provide Required Bracing. Braced wall panels
constructed with gypsum board provide less resistance to lateral loads than panels constructed with OSB, waferboard, plywood or diagonal lumber; Sentence (5) therefore limits the use of gypsum board to interior walls. Sentence (6) further limits its use to provide the required lateral resistance by requiring that walls not more than 15 m apart be constructed with panels made of wood or wood-based sheathing. See Figure A-9.23.13.6.(5) and (6).

A-9.23.14.11.(2) Wood Roof Truss Connections. Sentence 9.23.14.11.(2) requires that the connections used in wood roof trusses be designed in conformance with Subsection 4.3.1. and Sentence 2.2.1.2.(1) of Division C, which applies to all of Part 4, requires that the designer be a professional engineer or architect skilled in the work concerned. This has the effect of requiring that the trusses themselves be designed by professional engineers or architects. Although this is a departure from the usual practice in Part 9, it is appropriate, since wood roof trusses are complex structures which depend on a number of components (chord members, web members, cross-bracing, connectors) working together to function safely. This complexity precludes the standardization of truss design into tables comprehensive enough to satisfy the variety of roof designs required by the housing industry.

A-9.23.15.2.(4) Water Absorption Test. A method for determining water absorption is described in ASTM D 1037, “Evaluating Properties of Wood-Base Fiber and Particle Panel Materials.” The treatment to reduce water absorption may be considered to be acceptable if a 300 mm × 300 mm sample when treated on all sides and edges does not increase in weight by more than 6% when tested in the horizontal position.

A-9.23.15.4.(2) OSB. CSA O437.0, “OSB and Waferboard,” requires that Type O (aligned or oriented) panels be marked to show the grade and the direction of face alignment.

A-9.24.3.2.(3) Framing Above Doors in Steel Stud Fire Separations.
**A-9.25.2.2.(2) Flame-Spread Ratings of Insulating Materials.** Part 9 has no requirements for flame-spread ratings of insulation materials since these are seldom exposed in parts of buildings where fires are likely to start. Certain of the insulating material standards referenced in Sentence 9.25.2.2.(1) do include flame-spread rating criteria. These are included either because the industry producing the product wishes to demonstrate that their product does not constitute a fire hazard or because the product is regulated by authorities other than building authorities (e.g., “Hazardous Products Act”). However, the Code cannot apply such requirements to some materials and not to others. Hence, these flame-spread rating requirements are excepted in referencing these standards.

**A-9.25.2.3.(3) Position of Insulation.** For thermal insulation to be effective, it must not be short-circuited by convective airflow through or around the material. If low-density fibrous insulation is installed with an air space on both sides of the insulation, the temperature differential between the warm and cold sides will drive convective airflow around the insulation. If foamed plastic insulation is spot-adhered to a backing wall or adhered in a grid pattern to an air-permeable substrate, and is not sealed at the joints and around the perimeter, air spaces between the insulation and the substrate will interconnect with spaces behind the cladding. Any temperature or air pressure differential across the insulation will again lead to short circuiting of the insulation by airflow. Thermal insulation must therefore be installed in full and continuous contact with the air barrier or another continuous component with low air permeance. (See Note A-9.25.5.1.(1) for examples of low-air-permeance materials.)

**A-9.25.2.4.(3) Loose-Fill Insulation in Existing Wood-Frame Walls.** The addition of insulation into exterior walls of existing wood-frame buildings increases the likelihood of damage to framing and cladding components as a result of moisture accumulation. Many older homes were constructed with little or no regard for protection from vapour transmission or air leakage from the interior. Adding thermal insulation will substantially reduce the temperature of the siding or sheathing in winter months, possibly leading to condensation of moisture at this location.

Defects in exterior cladding, flashing and caulking could result in rain entering the wall cavity. This moisture, if retained by the added insulation, could initiate the process of decay.

Steps should be taken therefore, to minimize these effects prior to the retrofit of any insulation. Any openings in walls that could permit leakage of interior heated air into the wall cavity should be sealed. The inside surface should be coated with a low-permeability paint to reduce moisture transfer by diffusion. Finally, the exterior siding, flashing and caulking should be checked and repaired if necessary to prevent rain penetration.

**A-9.25.2.4.(5) Loose-Fill Insulation in Masonry Walls.** Typical masonry cavity wall construction techniques do not lend themselves to the prevention of entry of rainwater into the wall space. For this reason, loose-fill insulation used in such space must be of the water repellent type. A test for water-repellency of loose-fill insulation suitable for installation in masonry cavity walls can be found in ASTM C 516, “Vermiculite Loose Fill Thermal Insulation.”

**A-9.25.3.1.(1) Air Barrier Systems for Control of Condensation.** The majority of moisture problems resulting from condensation of water vapour in walls and ceiling/attic spaces are caused by the leakage of moist interior heated air into these spaces rather than by the diffusion of water vapour through the building envelope.

Protection against such air leakage must be provided by a system of air-impermeable materials joined with leak-free joints. Generally, air leakage protection can be provided by the use of air-impermeable sheet materials, such as gypsum board or polyethylene of sufficient thickness, when installed with appropriate structural support. However, the integrity of the airtight elements in the air barrier system can be compromised at the joints and here special care must be taken in design and construction to achieve an effective air barrier system.

Although Section 9.25. refers separately to vapour barriers and airtight elements in the air barrier system, these functions in a wall or ceiling assembly of conventional wood-frame construction are often combined as a single membrane that acts as a barrier against moisture diffusion and the movement of interior air into insulated wall or roof.
cavities. Openings cut through this membrane, such as for electrical boxes, provide opportunities for air leakage into concealed spaces, and special measures must be taken to make such openings as airtight as possible. Attention must also be paid to less obvious leakage paths, such as holes for electric wiring, plumbing installations, wall-ceiling and wall-floor intersections, and gaps created by shrinkage of framing members.

In any case, air leakage must be controlled to a level where the occurrence of condensation will be sufficiently rare, or the quantities accumulated sufficiently small, and drying sufficiently rapid, to avoid material deterioration and the growth of mould and fungi.

Generally the location in a building assembly of the airtight element of the air barrier system is not critical; it can restrict air leakage whether it is located near the outer surface of the assembly, near the inner surface or at some intermediate location. However, if a material chosen to act as an airtight element in the air barrier system also has the characteristics of a vapour barrier (i.e., low permeability to water vapour), its location must be chosen more carefully in order to avoid moisture problems. (See Notes A-9.25.5.1.(1) and A-9.25.4.3.(2).)

In some constructions, an airtight element in the air barrier system is the interior finish, such as gypsum board, which is sealed to framing members and adjacent components by gaskets, caulking, tape or other methods to complete the air barrier system. In such cases, special care in sealing joints in a separate vapour barrier is not critical. This approach often uses no separate vapour barrier but relies on appropriate paint coatings to give the interior finish sufficient resistance to water vapour diffusion that it can provide the required vapour diffusion protection.

The wording in Section 9.25. allows for such innovative techniques, as well as the more traditional approach of using a continuous sheet, such as polyethylene, to act as an “air/vapour barrier.”

Further information can be found in CBD 231, “Moisture Problems in Houses” (Canadian Building Digest 231), by A.T. Hansen, which is available from NRC.

A-9.25.3.4. and 9.25.3.6. Air Leakage and Soil Gas Control in Floors-on-ground. The requirement in Sentence 9.25.3.3.(6) regarding the sealing of penetrations of the air barrier also applies to hollow metal and masonry columns penetrating the floor slab. Not only the perimeters but also the centres of such columns must be sealed or blocked.

The requirement in Sentence 9.25.3.6.(6) regarding drainage openings in slabs can be satisfied with any of a number of proprietary devices that prevent the entry of radon and other soil gases through floor drains. Some types of floor drains incorporate a trap that is connected to a nearby tap so that the trap is filled every time the tap is used. This is intended to prevent the entry of sewer gas but would be equally effective against the entry of radon and other soil gases.
Figure A-9.25.3.4. and 9.25.3.6.-B
Dampproofing and soil gas control at foundation wall/floor junctions with hollow walls

A-9.25.3.6.(2) and (3) Polyethylene Air Barriers under Floors-on-Ground. Floors-on-ground separating conditioned space from the ground must be constructed to reduce the potential for the entry of air, radon or other soil gases. In most cases, this will be accomplished by placing 0.15 mm polyethylene under the floor.

Finishing a concrete slab placed directly on polyethylene can, in many cases, cause problems for the inexperienced finisher. A rule of finishing, whether concrete is placed on polyethylene or not, is to never finish or “work” the surface of the slab while bleed water is present or before all the bleed water has risen to the surface and evaporated. If finishing operations are performed before all the bleed water has risen and evaporated, surface defects such as blisters, crazing, scaling and dusting can result. In the case of slabs placed directly on polyethylene, the amount of bleed water that may rise to the surface and the time required for it to do so are increased compared to a slab placed on a compacted granular base. Because of the polyethylene, the excess water in the mix from the bottom portion of the slab cannot bleed downward and out of the slab and be absorbed into the granular material below. Therefore, all bleed water, including that from the bottom of the slab, must now rise through the slab to the surface. Quite often in such cases, finishing operations are begun too soon and surface defects result.

One solution that is often suggested is to place a layer of sand between the polyethylene and the concrete. However, this is not an acceptable solution for the following reason: it is unlikely that the polyethylene will survive the slab pouring process entirely intact.

Nevertheless, the polyethylene will still be effective in retarding the flow of soil gas if it is in intimate contact with the concrete; soil gas will only be able to penetrate where a break in the polyethylene coincides with a crack in the concrete. The majority of concrete cracks will probably be untold by intact polyethylene. On the other hand, if there is an intervening layer of a porous medium, such as sand, soil gas will be able to travel laterally from a break in the polyethylene to the nearest crack in the concrete and the total system will be much less resistant to soil gas penetration.

To reduce and/or control the cracking of concrete slabs, it is necessary to understand the nature and causes of volume changes of concrete and in particular those relating to drying shrinkage. The total amount of water in a mix is by far the largest contributor to the amount of drying shrinkage and resulting potential cracking that may be expected from a given concrete. The less total amount of water in the mix, the less volume change (due to evaporation of water), which means the less drying shrinkage that will occur. To lessen the volume change and potential cracking due to drying shrinkage, a mix with the lowest total amount of water that is practicable should always be used. To lower the water content of a mix, superplasticizers are often added to provide the needed workability of the concrete during the placing operation. Concretes with a high water-to-cementing-materials ratio usually have high water content mixes. They should be avoided to minimize drying shrinkage and cracking of the slab. The water-to-cementing-materials ratio for slabs-on-ground should be no higher than 0.55.

A-9.25.4.2.(2) Normal Conditions. The requirement for a 60 ng/Pa·s·m² vapour barrier stated in Sentence 9.25.4.2.(1) is based on the assumption that the building assembly is subjected to conditions that are considered normal for typical residential occupancies, and business and personal services occupancies. However, where the intended use of an occupancy includes facilities or activities that will generate a substantial amount of moisture indoors during the heating season, such as swimming pools, greenhouses, laundromats, and any...
Division B: Acceptable Solutions

Part 9 – Housing and Small Buildings

continuous operation of hot tubs and saunas, the building envelope assemblies would have to demonstrate acceptable performance levels in accordance with the requirements in Part 5.

A-9.25.4.3.(2) Location of Vapour Barriers. Assemblies in which the vapour barrier is located partway through the insulation meet the intent of this Article provided it can be shown that the temperature of the vapour barrier will not fall below the dew point of the heated interior air.

A-9.25.5.1. Location of Low Permeance Materials.

Low Air- and Vapour-Permeance Materials and Implications for Moisture Accumulation

The location in a building assembly of a material with low air permeance is generally not critical; the material can restrict outward movement of indoor air whether it is located near the outer surface of the assembly, near the inner surface, or at some intermediate location, and such restriction of air movement is generally beneficial, whether or not the particular material is designated as part of the air barrier system. However, if such a material also has the characteristics of a vapour barrier (i.e. low permeability to water vapour), its location must be chosen more carefully in order to avoid moisture accumulation.

Any moisture from the indoor air that diffuses through the inner layers of the assembly or is carried by air leakage through those layers may be prevented from diffusing or being transferred through the assembly by a low air- and vapour-permeance material.

This moisture transfer will usually not cause a problem if the material is located where the temperature is above the dew point of the indoor air: the water vapour will remain as vapour, the humidity level in the assembly will come to equilibrium with that of the indoor air, further accumulation of moisture will cease or stabilize at a low rate, and no harm will be done.

But if the low air- and vapour-permeance material is located where the temperature is below the dew point of the air at that location, water vapour will condense and accumulate as water or ice, which will reduce the humidity level and encourage the movement of more water vapour into the assembly. If the temperature remains below the dew point for any length of time, significant moisture could accumulate. When warmer weather returns, the presence of a material with low water vapour permeance can retard drying of the accumulated moisture. Moisture that remains into warmer weather can support the growth of decay organisms.

Due consideration should be given to the properties and location of any material in the building envelope, including paints, liquid-applied or sprayed-on and trowelled-on materials. It is recognized that constructions that include low air- and vapour-permeance materials are acceptable, but only where these materials are not susceptible to damage from moisture or where they can accommodate moisture, for example insulated concrete walls. Further information on the construction of basement walls may be found in “Performance Guidelines for Basement Envelope Systems and Materials,” published by NRC-IRC.

Cladding

Different cladding materials have different vapour permeances and different degrees of susceptibility to moisture deterioration. They are each installed in different ways that are more or less conducive to the release of moisture that may accumulate on the inner surface. Sheet or panel-type cladding materials, such as metal sheet, have a vapour permeance less than 60 ng/(Pa·s·m²).

Sheet metal cladding that has lock seams also has a low air leakage characteristic and so must be installed outboard of a drained and vented air space. Assemblies clad with standard residential vinyl or metal strip siding do not require additional protection as the joints are not so tight as to prevent the dissipation of moisture.
Sheathing
Like cladding, sheathing materials have different vapour permeances and different degrees of susceptibility to moisture deterioration.

Low-permeance sheathing may serve as the vapour barrier if it can be shown that the temperature of the interior surface of the sheathing will not fall below that at which saturation will occur. This may be the case where insulating sheathing is used.

Thermal Insulation
Where low-permeance foamed plastic is the sole thermal insulation in a building assembly, the temperature of the inner surface of this element will be close to the interior temperature. If the foamed plastic insulation has a permeance below 60 ng/Pa·s·m², it can fulfill the function of a vapour barrier to control condensation within the assembly due to vapour diffusion. However, where low-permeance thermal insulating sheathing is installed on the outside of an insulated frame wall, the temperature of the inner surface of the insulating sheathing may fall below the dew point; in this case, the function of vapour barrier has to be provided by a separate building element installed on the warm side of the assembly.

Normal Conditions
The required minimum ratios given in Table 9.25.5.2. are based on the assumption that the building assembly is subjected to conditions that are considered normal for typical residential occupancies, and business and personal services occupancies.

However, where the intended use of an occupancy includes facilities or activities that will generate a substantial amount of moisture indoors during the heating season, such as swimming pools, greenhouses, the operation of a laundromat or any continuous operation of hot tubs and saunas, the building envelope assemblies would have to demonstrate acceptable performance levels in accordance with the requirements in Part 5.

A-9.25.5.1.(1) Air and Vapour Permeance Values. The air leakage characteristics and water vapour permeance values for a number of common materials are given in Table A-9.25.5.1.(1). These values are provided on a generic basis; proprietary products may have values differing somewhat from those in the Table (consult the manufacturers’ current data sheets for their products’ values).

The values quoted are for the material thickness listed. Water vapour permeance is inversely proportional to thickness: therefore, greater thicknesses will have lower water vapour permeance values.

**Notes to Table A-9.25.5.1.(1):**

1. Air leakage and vapour permeance values derived from:

2. This water vapour permeance value is for a 25-mm-thick core layer of medium-density polyurethane spray foam. When installed in the field, a low permeance resin layer forms where the foam is in contact with the substrate. The water vapour permeance of the installed foam, were it measured including the resin layer, would therefore likely be lower than the value listed in the Table.

**A-9.25.5.1.(1)(a)(ii) Reduced Potential for Condensation in the Building Envelope.** The requirements in Article 9.25.5.2. aim to reduce the risk of condensation being introduced into wall assemblies due to the water vapour permeance of the outboard materials. Research has confirmed that the reduced condensation potential of exterior continuous insulation with a thermal resistance of at least 0.7 (m$^2$·K)/W and a water vapour permeance between 30 and 1800 ng/(Pa·s·m$^2$) compares to reference assemblies without exterior insulation in a given geographic location and climatic exposure.
A-9.25.5.1.(3) Wood-based Sheathing Materials. Wood-based sheathing materials, such as plywood and OSB, that are not more than 12.5 mm thick are exempt from complying with Sentence 9.25.5.1.(1) because wood has an adaptive vapour permeance based on relative humidity: it has a low vapour permeance in an environment with low relative humidity and a higher vapour permeance in an environment with high relative humidity (See Figure A-9.25.5.1.(3)). This adaptive vapour permeance means that wood-based materials located on the outboard side of an assembly in winter, where the RH is typically 75% or higher, are relatively vapour-open, thus allowing greater vapour movement. The same wood-based material located on the inboard side of an assembly, where the RH is typically much lower in winter, has a low vapour permeance, thus mitigating the movement of vapour.

Figure A-9.25.5.1.(3)
Adaptive water vapour permeance of wood-based sheathing materials

A-9.25.5.2. Assumptions Followed in Developing Table 9.25.5.2. Article 9.25.5.2. specifies that a low air- and vapour-permeance material must be located on the warm face of the assembly, outboard of a vented air space, or within the assembly at a position where its inner surface is likely to be warm enough for most of the heating season such that no significant accumulation of moisture will occur. This last position is defined by the ratio of the thermal resistance values outboard and inboard of the innermost impermeable surface of the material in question.

The design values given in Table 9.25.5.2. are based on the assumption that the building includes a mechanical ventilation system (between 0.3 and 0.5 air changes per hour), a 60 ng/Pa·s·m² vapour barrier, and an air barrier (values between 0.024 and 0.1 L/sm² through the assembly were used). The moisture generated by occupants and their use of bathrooms, cleaning, laundry and kitchen appliances was assumed to fall between 7.5 and 11.5 L per day.

It has been demonstrated through modelling under these conditions that assemblies constructed according to the requirements in Table 9.25.5.2. do not lead to moisture accumulation levels that may lead to deterioration as long as the average monthly vapour pressure difference between the exterior and interior sides over the heating season does...
not increase above 750 Pa, which would translate into an interior relative humidity of 35% in colder climates and 60% in mild climates.

Health Canada recommends an indoor relative humidity between 35% and 50% for healthy conditions. ASHRAE accepts a 30% to 60% range. Environments that are much drier tend to exacerbate respiratory problems and allergies; more humid environments tend to support the spread of microbes, moulds and dust mites, which can adversely affect health.

In most of Canada in the winter, indoor RH is limited by the exterior temperature and the corresponding temperature on the inside of windows. During colder periods, indoor RH higher than 35% will cause significant condensation on windows. When this occurs, occupants are likely to increase the ventilation to remove excess moisture. Although indoor RH may exceed 35% for short periods when the outside temperature is warmer, the criteria provided in Table 9.25.5.2. will still apply. Where higher relative humidities are maintained for extended periods in these colder climates, the ratios listed in the Table may not provide adequate protection.

Some occupancies require that RH be maintained above 35% throughout the year, and some interior spaces support activities such as swimming that create high relative humidities. In these cases, Table 9.25.5.2. cannot be used and the position of the materials must be determined according to Part 5.

It should be noted that Part 9 building envelopes in regions with colder winters have historically performed acceptably when the interior RH does not exceed 35% over most of the heating season. With tighter building envelopes, it is possible to raise interior RH levels above 35%. There is no information, however, on how Part 9 building envelopes will perform when exposed to these higher indoor RH levels for extended periods during the heating season over many years. Operation of the ventilation system, as intended to remove indoor pollutants, will maintain the lower RH levels as necessary.
Figure A-9.25.5.2.
Example of a wall section showing thermal resistance inboard and outboard of a plane of low air and vapour permeance

The method of calculating the inboard to outboard thermal resistance ratio is illustrated in Figure A-9.25.5.2. The example wall section shows three planes where low air- and vapour-permeance materials have been installed. A vapour barrier, installed to meet the requirements of Subsection 9.25.4., is on the warm side of the insulation consistent with Clause 9.25.5.2.(1)(a) and Sentences 9.25.4.1.(1) and 9.25.4.3.(2). The vinyl siding has an integral drained and vented air space consistent with Clause 9.25.5.2.(1)(c). The position of the interior face of the low-permeance insulating sheathing, however, must be reviewed in terms of its thermal resistance relative to the overall thermal resistance of the wall, and the climate where the building is located.

Comparing the RSI ratio from the example wall section with those in Table 9.25.5.2. indicates that this wall would be acceptable in areas with Celsius degree-day values up to 7999, which includes, for example, Whitehorse, Fort McMurray, Yorkton, Flin Flon, Geraldton, Val-d’Or and Wabush. (Degree-day values for various locations in Canada are provided in Appendix C.)

A similar calculation would indicate that, for a similar assembly with a 140 mm stud cavity filled with an RSI 3.52 batt, the ratio would be 0.28. Thus such a wall could be used in areas with Celsius degree-day values up to 4999, which includes, for example, Cranbrook, Lethbridge, Ottawa, Montreal, Fredericton, Sydney, Charlottetown and St. John's.
Similarly, if half the thickness of the same low-permeance sheathing were used, the ratio with an 89 mm cavity would be 0.25, permitting its use in areas with Celsius degree-day values up to 4999. The ratio with a 140 mm cavity would be 0.16; thus this assembly could not be used anywhere, since this ratio is below the minimum permitted in Table 9.25.5.2.

Table A-9.25.5.2. shows the minimum thicknesses of low-permeance insulating sheathing necessary to satisfy Article 9.25.5.2. in various degree-day zones for a range of resistivity values of insulating sheathing. These thicknesses are based on the detail shown in Figure A-9.25.5.2. but could also be used with cladding details, such as brick veneer or wood siding, which provide equal or greater outboard thermal resistance.

References
(2) ANSI/ASHRAE 62, “Ventilation for Acceptable Indoor Air Quality.”

A-9.26.1.1.(1) Platforms that Effectively Serve as Roofs. Decks, balconies, exterior walkways and similar exterior surfaces effectively serve as roofs where these platforms do not permit the free drainage of water through the deck. When water is driven by wind across the deck (roof) surface, it can be driven upward when it encounters an interruption.

A-9.26.2.3.(4) Fasteners for Treated Shingles. Where shingles or shakes have been chemically treated with a preservative or a fire retardant, the fastener should be of a material known to be compatible with the chemicals used in the treatment.

A-9.26.4.1. Junctions between Roofs and Walls or Guards. Drainage of water from decks and other platforms that effectively serve as roofs will be blocked by walls, and blocked or restricted by guards where significant lengths and heights of material are connected to the deck. Without proper flashing at such roof-wall junctions or roof-guard
junctons, water will generally leak into the adjoining constructions and can penetrate into supporting constructions below. Exceptions include platforms where waterproof curbs of sufficient height are cast-in or where the deck and wall or guard are unit-formed. In these cases, the monolithic deck-wall or deck-guard junctions will minimize the likelihood of water ingress. (See also Note A-9.26.1.1.(1).)

A-9.26.17.1.(1) Installation of Concrete Roof Tiles. Where concrete roof tiles are to be installed, the dead load imposed by this material should be considered in determining the minimum sizes and maximum spans of the supporting roof members.

A-9.26.18.3.(1) Overflow Outlets. Where a roof or balcony is entirely enclosed by parapet walls there is a likelihood of drains becoming obstructed with materials such as leaves falling during heavy autumn rains. It is recommended that a secondary means of drainage such as scuppers be provided. Overflow outlets should be installed in the parapet walls in sufficient number and at an appropriate height to drain the roof or balcony, to avoid water backing up into moisture sensitive assemblies, and to prevent structural collapse from ponding.

A-9.27.1.1.(5) EIFS on Walls with Cold-Formed Steel Stud Framing. While Part 9 permits the installation of exterior insulation finish systems on walls with cold-formed steel stud framing, the design of loadbearing steel walls is outside the scope of Part 9 and is addressed in Part 4 (See Sentence 9.24.1.1.(2)).

A-9.27.2. Required Protection from Precipitation. Part 5 and Part 9 of the NBC recognize that mass walls and face-sealed, concealed barrier and rainscreen assemblies have their place in the Canadian context.

Mass walls are generally constructed of cast-in-place concrete or masonry. Without cladding or surface finish, they can be exposed to precipitation for a significant period before moisture will penetrate from the exterior to the interior. The critical characteristics of these walls are related to thickness, mass, and moisture transfer properties, such as shedding, absorption and moisture diffusivity.

Face-sealed assemblies have only a single plane of protection. Sealant installed between cladding elements and other envelope components is part of the air barrier system and is exposed to the weather. Face-sealed assemblies are appropriate where it can be demonstrated that they will provide acceptable performance with respect to the health and safety of the occupants, the operation of building services and the provision of conditions suitable for the intended occupancy. These assemblies, however, require more intensive, regular and ongoing maintenance, and should only be selected on the basis of life-cycle costing considering the risk of failure and all implications should failure occur. Climate loads such as wind-driven rain, for example, should be considered. Face-sealed assemblies are not recommended where the building owner may not be aware of the maintenance issue or where regular maintenance may be problematic.

Concealed barrier assemblies include both a first and second plane of protection. The first plane comprises the cladding, which is intended to handle the majority of the precipitation load. The second plane of protection is intended to handle any water that penetrates the cladding plane. It allows for the dissipation of this water, primarily by gravity drainage, and provides a barrier to further ingress.

Like concealed barrier assemblies, rainscreen assemblies include both a first and second plane of protection. The first plane comprises the cladding, which is designed and constructed to handle virtually all of the precipitation load. The second plane of protection is designed and constructed to handle only very small quantities of incidental water; composition of the second plane is described in Note A-9.27.3.1. In these assemblies, the air barrier system, which plays a role in controlling precipitation ingress due to air pressure difference, is protected from the elements. (See Figure A-9.27.2.)
Figure A-9.27.2.
Generic rainscreen assemblies

The cladding assembly described in Sentence 9.27.2.2.(4) is a basic rainscreen assembly. This approach is required for residential buildings where a higher level of ongoing performance is expected without significant maintenance. This approach, however, is recommended in all cases.

The cladding assemblies described in Sentence 9.27.2.2.(5) are also rainscreen assemblies. The assembly described in Clause 9.27.2.2.(1)(c) is again a basic rainscreen assembly. A wall with a capillary break as described in Clause 9.27.2.2.(1)(a) is an open rainscreen assembly. Walls with a capillary break as described in Clause 9.27.2.2.(1)(b) have been referred to as drainscreen assemblies.

A-9.27.2.1.(1) Minimizing Precipitation Ingress. The total prevention of precipitation ingress into wall assemblies is difficult to achieve and, depending on the wall design and construction, may not be absolutely necessary. The amount of moisture that enters a wall, and the frequency with which this occurs, must be limited. The occurrence of ingress must be sufficiently rare, accumulation sufficiently small and drying sufficiently rapid to prevent the deterioration of moisture-susceptible materials and the growth of fungi.

A-9.27.2.2. Required Levels of Protection from Precipitation. Precursors to Part 9 and all editions of the By-law containing a Part 9 applying to housing and small buildings included a performance-based provision requiring that cladding provide protection from the weather for inboard materials. Industry requested that Part 9 provide additional guidance to assist in determining the minimum levels of protection from precipitation to be provided by cladding assemblies. As with all requirements in the By-law, the new requirements in Article 9.27.2.2. describe the minimum cladding assembly configuration. Designers must still consider local accepted good practice, demonstrated performance and the specific conditions to which a particular wall will be exposed when designing or selecting a cladding assembly.

Capillary Breaks
The properties that are necessary for a material or assembly to provide a capillary break, and quantitative values for those properties, have not been defined. Among the material properties that need to be addressed are water absorption and susceptibility to moisture-related deterioration. Among the assembly characteristics to be considered are bridging of spaces by water droplets, venting and drainage.

Clause 9.27.2.2.(1)(a) describes the capillary break configuration typical of open rainscreen construction. The minimum 9.5 mm will avoid bridging of the space by water droplets and allow some construction tolerance.

Clause 9.27.2.2.(1)(b) describes a variation on the typical open rainscreen configuration. Products used to provide the capillary break include a variety of non-moisture-susceptible, open-mesh materials.

Clause 9.27.2.2.(1)(c) describes a configuration that is typical of that provided by horizontal vinyl and metal siding, without contoured insulating backing. The air space behind the cladding components and the loose installation reduce the likelihood of moisture becoming trapped and promote drying by airflow.

Clause 9.27.2.2.(1)(d) recognizes the demonstrated performance of masonry cavity walls and masonry veneer walls.

**Moisture Index**

The moisture index (MI) for a particular location reflects both the wetting and drying characteristics of the climate and depends on:

- annual rainfall, and
- the temperature and relative humidity of the outdoor ambient air.

MI values are derived from detailed research and calculations. Due to a lack of definitive data, the MI values identified in Sentence 9.27.2.2.(5), which trigger exceptions to or additional precipitation protection, are based on expert opinion. Designers should consider local experience and demonstrated performance when selecting materials and assemblies for protection from precipitation. For further information on MI, see Appendix C.

A-9.27.3.1. **Second Plane of Protection.** As specified in Sentence 9.27.3.1.(1), the second plane of protection consists of a drainage plane with an appropriate material serving as the inner boundary and flashing to dissipate rainwater or meltwater to the exterior.

**Drainage Plane**

Except for masonry walls, the simplest configuration of a drainage plane is merely a vertical interface between materials that will allow gravity to draw the moisture down to the flashing to allow it to dissipate to the exterior. It does not necessarily need to be constructed as a clear drainage space (air space).

For masonry walls, an open rainscreen assembly is required; that is, an assembly with first and second planes of protection where the drainage plane is constructed as a drained and vented air space. Such construction also constitutes best practice for walls other than masonry walls.

Section 9.20. requires drainage spaces of 25 mm for masonry veneer walls and 50 mm for cavity walls. In other than masonry walls, the drainage space in an open rainscreen assembly should be at least 10 mm deep. Drainage holes must be designed in conjunction with the flashing.

**Sheathing Membrane**

The sheathing membrane described in Article 9.27.3.2. is not a waterproof material. When installed to serve as the inner boundary of the second plane of protection, and when that plane of protection includes a drainage space at least 9.5 mm deep, the performance of the identified sheathing membrane has been demonstrated to be adequate. This is because the material is expected to have to handle only a very small quantity of water that penetrates the first plane of protection.
If the 9.5 mm drainage space is reduced or interrupted, the drainage capacity and the capillary break provided by the space will be reduced. In these cases, the material selected to serve as the inner boundary may need to be upgraded to provide greater water resistance in order to protect moisture-susceptible materials in the backing wall.

**Appropriate Level of Protection**

It is recognized that many cladding assemblies with no space or with discontinuous space behind the cladding, and with the sheathing membrane material identified in Article 9.27.3.2., have provided acceptable performance with a range of precipitation loads imposed on them. Vinyl and metal strip siding, and shake and shingle cladding, for example, are installed with discontinuous drained spaces, and have demonstrated acceptable performance in most conditions. Lapped wood and composite strip sidings, depending on their profiles, may or may not provide discontinuous spaces, and generally provide little drainage. Cladding assemblies with limited drainage capability that use a sheathing membrane meeting the minimum requirements are not recommended where they may be exposed to high precipitation loads or where the level of protection provided by the cladding is unknown or questionable. Local practice with demonstrated performance should be considered. (See also Article 9.27.2.2. and Note A-9.27.2.2.)

**A-9.27.3.4.(2) Detailing of Joints in Exterior Insulating Sheathing.** The shape of a joint is critical to its ability to shed water. Tongue and groove, and lapped joints can shed water if oriented correctly. Butt joints can drain to either side and so should not be used unless they are sealed. However, detailing of joints requires attention not just to the shape of the joint but also to the materials that form the joint. For example, even if properly shaped, the joints in insulating sheathing with an integral sheathing membrane could not be expected to shed water if the insulating material absorbs water, unless the membrane extends through the joints.

**A-9.27.3.5.(1) Sheathing Membranes in lieu of Sheathing.** Article 9.23.17.1., Required Sheathing, indicates that sheathing must be installed only where the cladding requires intermediate fastening between supports (studs) or where the cladding requires a solid backing. Cladding such as brick or panels would be exempt from this requirement and in these cases a double layer of sheathing membrane would generally be needed. The exception (Article 9.27.3.6.) applies only to those types of cladding that provide a face seal to the weather.

**A-9.27.3.6. Sheathing Membrane under Face Sealed Cladding.** The purpose of sheathing membrane on walls is to reduce air infiltration and to control the entry of wind-driven rain. Certain types of cladding consisting of very large sheets or panels with well-sealed joints will perform this function, eliminating the need for sheathing membrane. This is true of the metal cladding with lock-seamed joints sometimes used on mobile homes. However, it does not apply to metal or plastic siding applied in narrow strips which is intended to simulate the appearance of lapped wood siding. Such material does not act as a substitute for sheathing membrane since it incorporates provision for venting the wall cavity and has many loosely-fitted joints which cannot be counted on to prevent the entry of wind and rain.

Furthermore, certain types of sheathing systems can perform the function of the sheathing membrane. Where it can be demonstrated that a sheathing material is at least as impervious to air and water penetration as sheathing membrane and that its jointing system results in joints that are at least as impervious to air and water penetration as the material itself, sheathing membrane may be omitted.

**A-9.27.3.8.(1) Required Flashing.**

**Horizontal Offsets**

Where a horizontal offset in the cladding is provided by a single cladding element, there is no joint between the offset and the cladding above. In this case, and provided the cladding material on the offset provides effective protection for the construction below, flashing is not required.
In certain situations, flashing should be installed at a change of substrate: for example, where stucco cladding is installed on a wood-frame assembly, extending down over a masonry or cast-in-place concrete foundation and applied directly to it. Such an application does not take into account the potential for shrinkage of the wood frame and cuts off the drainage route for moisture that may accumulate behind the stucco on the frame construction.

**Figure A-9.27.3.8.(1)**
Flashing at change in substrate

**A-9.27.3.8.(3) Flashing over Curved-Head Openings.** The requirement for flashing over openings depends on the vertical distance from the top of the trim over the opening to the bottom of the eave compared to the horizontal projection of the eave. In the case of curved-head openings, the vertical distance from the top of the trim increases as one moves away from the centre of the opening. For these openings, the top of the trim must be taken as the lowest height before the trim becomes vertical.
(See Figure A-9.27.3.8.(3).)

**Figure A-9.27.3.8.(3)**
Flashing over curved-head openings

**A-9.27.3.8.(4) Flashing Configuration and Positive Drainage.**

**Flashing Configuration**

A 6% slope is recognized as the minimum that will provide effective flashing drainage. The 10 mm vertical lap over the building element below and the 5 mm offset are prescribed to reduce transfer by capillarity and surface tension.

Figure A-9.27.3.8.(4) illustrates two examples of flashing configurations.
Figure A-9.27.3.8.(4)
Examples of flashing configurations showing upstands, horizontal offsets and vertical laps

Maintaining Positive Slope
Sentence 9.27.3.8.(4) requires that the minimum 6% flashing slope remain after expected shrinkage of the building frame. Similarly, Sentence 9.26.3.1.(4) requires that a positive slope remain on roofs and similar constructions after expected shrinkage of the building frame.

For Part 9 wood-frame constructions, expected wood shrinkage can be determined based on the average equilibrium moisture content (MC) of wood, within the building envelope assembly, in various regions of the City (See Table A-9.27.3.8.(4)).

<table>
<thead>
<tr>
<th>Regions</th>
<th>Equilibrium MC, %(1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>British Columbia and Atlantic Canada</td>
<td>10</td>
</tr>
<tr>
<td>Ontario and Quebec</td>
<td>8</td>
</tr>
<tr>
<td>Prairies and the North</td>
<td>7</td>
</tr>
</tbody>
</table>

Notes to Table A-9.27.3.8.(4):

For three-storey constructions to which Part 9 applies, cumulative longitudinal shrinkage is negligible. Shrinkage need only be calculated for horizontal framing members using the following formula (from CWC 1997, “Introduction to Wood Building Technology”):
Shrinkage = (total horizontal member height) × (initial MC – equilibrium MC) × (.002)

A-9.27.3.8.(5) Protection against Precipitation Ingress at the Sill-to-Cladding Joint. Many windows are configured in such a way that a line of sealant is the only protection against water ingress at the sill-to-cladding joint – a location that is exposed to all of the water that flows down the window. In the past, many windows were constructed with self-flashing sills – sills that extend beyond the face of the cladding and have a drip on the underside to divert water away from the sill-to-cladding joint. This sill configuration was considered to be accepted good practice and is recognized today as providing a degree of redundancy in precipitation protection.

Self-flashing sills are sills that
• slope toward the exterior where the sills have an upward facing surface that extends beyond the jambs,
• where installed over a masonry sill, extend not less than 25 mm beyond the inner face of that sill,
• incorporate a drip positioned not less than 5 mm outward from the outer face of the cladding below or not less than 15 mm beyond the inner edge of a masonry sill, and
• terminate at the jambs or, where the face of the jambs is not at least flush with the face of the cladding and the sills extend beyond the jambs, incorporate end dams sufficiently high to protect against overflow in wind-driven rain conditions.

A wind pressure of 10 Pa can raise water 1 mm. Thus, for example, if a window is exposed to a driving rain wind pressure of 200 Pa, end dams should be at least 20 mm high.

Figure A-9.27.3.8.(5)
Examples of configurations of self-flashing sills

A-9.27.4.2.(1) Selection and Installation of Sealants. Analysis of many sealant joint failures indicates that the majority of failures can be attributed to improper joint preparation and deficient installation of the sealant and various joint components.
The following ASTM guidelines describe several aspects that should be considered when applying sealants in unprotected environments to achieve a durable application:
• ASTM C 1193, “Use of Joint Sealants,”
• ASTM C 1299, “Selection of Liquid-Applied Sealants,” and
• ASTM C 1472, “Calculating Movement and Other Effects When Establishing Sealant Joint Width.”
The sealant manufacturer’s literature should always be consulted for recommended procedures and materials.

A-9.27.9.2.(3) Grooves in Hardboard Cladding. Grooves deeper than that specified may be used in thicker cladding providing they do not reduce the thickness to less than the required thickness minus 1.5 mm. Thus for type 1 or 2 cladding, grooves must not reduce the thickness to less than 4.5 mm or 6 mm depending on method of support, or to less than 7.5 mm for type 5 material.

A-9.27.10.2.(2) Thickness of Grade O-2 OSB. In using Table 9.27.8.2. to determine the thickness of Grade O-2 OSB cladding, substitute “face orientation” for “face grain” in the column headings.

A-9.27.11.1.(3) and (4) Material Standards for Aluminum Cladding. Compliance with Sentence 9.27.11.1.(3) and CAN/CGSB-93.2-M, “Prefinished Aluminum Siding, Soffits, and Fascia, for Residential Use,” is required for aluminum siding that is installed in horizontal or vertical strips. Compliance with Sentence 9.27.11.1.(4) and CAN/CGSB-93.1-M, “Sheet, Aluminum Alloy, Prefinished, Residential,” is required for aluminum cladding that is installed in large sheets.

A-9.27.13.1.(1) Geometrically Defined Drainage Cavity. “Geometrically defined drainage cavity” (GDDC) refers to the channels, grooves or profiles cut into the insulation backing of an EIFS panel for the purpose of providing a way for water that gets behind the system to drain out. The channels, grooves or profiles of one panel need to connect to the channels, grooves or profiles of adjacent panels in order for drainage to occur consistently and uniformly across the entire EIFS. While the size of a channel, groove or profile can be verified by inspecting a single panel, the intent of Sentence 9.27.13.1.(1) is that the required drainage capacity be achieved across the entire system.
Additional information on the design and installation of EIFS can be found in
• the “EIFS Practice Manual,” published by the EIFS Council of Canada, and
• the manufacturer’s literature.

A-9.27.13.2.(a) Substrates for Exterior Insulation Finish Systems. The list of acceptable substrates for each
type of EIFS can be found in a system’s respective test report to CAN/ULC-S716.1, “Exterior Insulation and Finish
Systems (EIFS) – Materials and Systems”; however, the following substrates are generally considered acceptable:
• minimum 11 mm thick exposure 1 OSB classified as PS2 exterior wall sheathing
• minimum 11 mm thick exterior-rated plywood sheathing
• minimum 12.7 mm thick exterior gypsum sheathing conforming to ASTM C 1177/C 1177M, “Glass Mat Gypsum
Substrate for Use as Sheathing”
• cementitious panels
• fibre-cement panels
• concrete block
• clay masonry
• cast-in-place concrete
Note that, in some cases, the list of acceptable substrates may be limited by the EIFS manufacturer.

A-Table 9.28.4.3. Stucco Lath. Paper-backed welded wire lath may also be used on horizontal surfaces provided its
characteristics are suitable for such application.

A-9.30.1.2.(1) Water Resistance. In some areas of buildings, water and other substances may frequently be
splashed or spilled onto the floor. It is preferable, in such areas, that the finish flooring be a type that will not absorb
moisture or permit it to pass through; otherwise, both the flooring itself and the subfloor beneath it may deteriorate.
Also, particularly in food preparation areas and bathrooms, unsanitary conditions may be created by the absorbed
moisture. Where absorbent or permeable flooring materials are used in these areas, they should be installed in such
a way that they can be conveniently removed periodically for cleaning or replacement, i.e., they should not be glued
or nailed down. Also, if the subfloor is a type that is susceptible to moisture damage (this includes virtually all of the
wood-based subfloor materials used in wood-frame construction), it should be protected by an impermeable
membrane placed between the finish flooring and the subfloor. The minimum degree of impermeability required by
Sentence 9.30.1.2.(1) would be provided by such materials as polyethylene, aluminum foil, and most single-ply
roofing membranes (EPDM, PVC).

A-9.31.6.2.(3) Securement of Service Water Heaters.
Figure A-9.31.6.2.(3)
Securement of service water heater

Seismic Bracing of Hot Water Tank
“Guidelines for Earthquake Bracing of Residential Water Heaters” is available from the California Office of the State Architect and provides more detail and alternate methods of bracing hot water tanks to resist earthquakes.

A-9.32.1.3.(2) Venting of Laundry-Drying Equipment. Sentence 9.32.1.3.(2) applies to the piping and ducting located within the wall assembly and not to the often flexible duct used to connect the appliance to the rigid exhaust vent duct.

A-9.32.3. Heating-Season Mechanical Ventilation. While ventilation strategies can have a significant impact on energy performance, ventilation is primarily a health and safety issue. Inadequate ventilation can lead to mold, high concentrations of CO₂, and other indoor air pollutants, which can lead to adverse health outcomes. Previous editions of the Building By-law relied on ventilation through the building envelope in combination with a principal exhaust fan. However, with the increased attention on the continuity of the air barrier system in buildings, builders can no longer rely on uncontrolled ventilation through the building envelope. In most buildings, mechanical systems will be required to provide adequate ventilation for occupants.

As described in Article 9.32.3.3., every dwelling unit must include a principal ventilation system. A principal ventilation system is the combination of an exhaust fan and a supply fan (or passive supply in some instances: see Sentence 9.32.3.4.(6)).

The principal ventilation system exhaust fan is separate from the requirements for a fan in every bathroom and kitchen. While a bathroom fan may be used to satisfy both the requirements for the principal ventilation exhaust fan and the requirements for a bathroom fan, the requirements for each must be met. If the fan provides this combined function of the principal ventilation exhaust fan and the bathroom fan, it will also need to have controls that conform to Sentences 9.32.3.5.(3) and (4). Unlike other bathroom fans, the principal ventilation exhaust fan is required to run continuously and should not have a control switch in a location where it may be turned off inadvertently.

A-9.32.3.4. System Supply Air.

Central Recirculation System Supply Air Distribution
Passive Supply Air Distribution

A-9.32.3.4.(6)(a)(ii) Floor Area Calculation for Passive Supply Air Distribution. The floor area to be calculated for Subclause 9.32.3.4.(6)(a)(ii) does not include sun porches, enclosed verandas, vestibules, attached garages, or other spaces that are outside the building envelope and do not require ventilation supply air.

A-9.32.4.1. Naturally Aspirating Fuel-Fired Vented Appliance (NAFFVA). NAFFVA, typically appliances with draft hoods, are subject to back drafting when a negative pressure condition occurs in the dwelling. The following tables describe the conditions under which Sentence 9.32.4.1.(1) applies:

<table>
<thead>
<tr>
<th>Fuel Type</th>
<th>Natural Gas and Propane</th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Notes to Table A-9.32.4.1.(1)A.**:

1. Mechanical room must be air-barriered from remainder of house with no access from within house. Room must be lined with panel products with sealed joints and all pipe and wire penetrations sealed. Effectively, the room must be finished before equipment is installed and holes drilled for pipes and wires. This option is not available for forced air furnaces as it is not possible to effectively seal the ducts.

2. Thermal buoyancy chimneys must be within the heated envelope of the house to provide acceptable venting performance.

3. Any power vented appliance with pressurized vent (1 pipe) or sealed combustion (2 pipe) or direct vent appliance (fireplace, heater or HWT) are non-NAFFVA.

4. Mid-efficient (draft induced) appliances are considered NAFFVA with the exception of a boiler or HWT located in an air-barriered room.

5. This category applies only to:
   - a) mid-efficient forced air furnaces equipped with induced draft fans and exhaust proving switch, and
   - b) boilers equipped with induced draft fans and exhaust proving switch.

**Notes to Table A-9.32.4.1.(1)B.**:

1. Mechanical room must be air-barriered from remainder of house with no access from within house. Room must be lined with panel products with sealed joints and all pipe and wire penetrations sealed. Effectively, the room must be finished before equipment is installed and holes drilled for pipes and wires. This option is not available for forced air furnaces as it is not possible to effectively seal the ducts.

2. Thermal buoyancy chimneys must be within the heated envelope of the house to provide acceptable venting performance.

3. Oil-fired HWT, boilers and furnaces equipped with blocked vent switches.

4. Sealed combustion kits can be added to oil-fired appliances but they switch to interior combustion air if intake is blocked and rely on barometrically dampered thermal buoyancy chimneys so they are considered NAFFVA.

5. Wood-burning appliances certified for use in mobile homes and installed to mobile home installation standards are considered non-NAFFVA and Sentence 9.32.4.1.(1) does not apply to them.

### A-9.32.4.2. Carbon Monoxide Alarms

Carbon monoxide (CO) is a colourless, odourless gas that can build up to lethal concentrations in an enclosed space without the occupants being aware of it. Thus, where an enclosed space incorporates or is near a potential source of CO, it is prudent to provide some means of detecting its presence.

Dwelling units have two common potential sources of CO:

- fuel-fired space- or water-heating equipment within the dwelling unit or in adjacent spaces within the building, and
- attached storage garages.

Most fuel-fired heating appliances do not normally produce CO and, even if they do, it is normally conveyed outside the building by the appliance’s venting system. Nevertheless, appliances can malfunction and venting systems can fail. Therefore, the provision of appropriately placed CO alarms in the dwelling unit is a relatively low-cost back-up safety measure.
Similarly, although Article 9.10.9.16. requires that the walls and floor/ceiling assemblies separating attached garages from dwelling units incorporate an air barrier system, there have been several instances of CO from garages being drawn into houses, which indicates that a fully gas-tight barrier is difficult to achieve.

When the attached storage garage is located at or below the elevation of the living space, winter season stack action will generate a continuous pressure between the garage and the dwelling unit. This pressure is capable of transferring potentially contaminated air into the house. The use of exhaust fans in the dwelling unit may further increase this risk.

A-9.33.5.3. Design, Construction and Installation Standard for Solid-Fuel-Burning Appliances. CSA B365, “Installation Code for Solid-Fuel-Burning Appliances and Equipment,” is essentially an installation standard, and covers such issues as accessibility, air for combustion and ventilation, chimney and venting, mounting and floor protection, wall and ceiling clearances, installation of ducts, pipes, thimbles and manifolds, and control and safety devices. But the standard also includes a requirement that solid-fuel-burning appliances and equipment satisfy the requirements of one of a series of standards, depending on the appliance or equipment, therefore also making it a design and construction standard. It is required that cooktops and ovens as well as stoves, central furnaces and other space heaters be designed and built in conformity with the relevant referenced standard.

A-9.33.6.13. Return Air System. It is a common practice to introduce outdoor air to the house by means of an outdoor air duct connected to the return air plenum of a forced air furnace. This is an effective method and is a component of one method of satisfying the mechanical ventilation requirements of Subsection 9.32.3. However, some caution is required. If the proportion of cold outside to warm return air is too high, the resulting mixed air temperature could lead to excessive condensation in the furnace heat exchanger and possible premature failure of the heat exchanger. CAN/CSA-F326-M, “Residential Mechanical Ventilation Systems,” requires that this mixed air temperature not be below 15.5°C when the outdoor temperature is at the January 2.5% value. It is also important that the outdoor air and the return air mix thoroughly before reaching the heat exchanger. Note A-9.32.3. provides some guidance on this.

A-9.33.10.2.(1) Factory-Built Chimneys. Under the provisions of Article 1.2.1.1. of Division A, certain solid-fuel-burning appliances may be connected to factory-built chimneys other than those specified in Sentence 9.33.10.2.(1) if tests show that the use of such a chimney will provide an equivalent level of safety.

A-9.34.2. Lighting Outlets. The “Canadian Electrical Code, Part I” which is adopted by the Electrical Safety Regulation, contains requirements relating to lighting that are similar to those in the Building By-law. However, the Electrical Code requirements apply only to residential occupancies, whereas many of the requirements in the Building By-law apply to all Part 9 buildings. Code users must therefore be careful to ensure that all applicable provisions of the Building By-law are followed, irrespective of the limitations in the Electrical Code.

A-9.35.2.2.(1) Garage Floor. Sources of ignition, such as electrical wiring and appliances, can set off an explosion if exposed to gases or vapours such as those that can be released in garages. This provision applies where the frequency and concentration of such releases are low. Where the garage can accommodate more than 3 vehicles, and where wiring is installed within 50 mm of the garage floor, the “Canadian Electrical Code, Part I”, which is adopted by the Electrical Safety Regulation, should be consulted as it specifies more stringent criteria for wiring.

The capacity of the garage is based on standard-size passenger vehicles such as cars, mini-vans and sport utility vehicles, and half-ton trucks. In a typical configuration, the capacity of the garage is defined by the width of the garage doors – generally single or double width – which correlates to the number of parking bays.

In many constructions, floor areas adjacent to the garage are either above the garage floor level or separated from it by a foundation wall. Where the foundation wall is cast-in-place concrete and rises at least 50 mm above the garage floor, it can serve as the airtight curb. Where the foundation wall is block or preserved wood, extra measures may be
needed to provide airtightness. In many instances, the construction will be required to be airtight to conform with Sentence 9.25.3.1.(1), and in any case, must comply with Sentences 9.10.9.16.(4) and (5).
Where the space adjacent to the garage is at the same level as the garage, a 50 mm curb or partition is not needed if the wall complies with Sentences 9.10.9.16.(4) and (5), and there is no connecting door. Where there is a connecting door, if the garage is not sloped towards the exterior, it must be raised at least 50 mm off the floor or be installed so it closes against the curb. This requirement does not preclude the installation of a ramp leading from the garage floor up to the door.

In some instances, access to the basement is via a stair from the garage. In such cases, a curb must be installed at the edge of the stair well and must be sealed to the foundation wall, curb or partition between the garage and adjacent spaces.

See Figure A-9.35.2.2.(1).

Figure A-9.35.2.2.(1)
Curb around garage floor at stairs
A-9.37.1.1. Application. The provisions of the Building By-law addressing ancillary residential units are intended to align with Provincial requirements, with minor modification to accommodate the Vancouver development context. Secondary suites, lock-off units, or other forms of housing ancillary to a primary dwelling, are intended to be treated in a uniform fashion, and rely upon a single ownership model in which the principal dwelling unit and ancillary residential unit form a single legal parcel, for which the owner bears the responsibility for the maintenance and safe function of all the contained units. As such, separation requirements normally required between separate suites of residential occupancy are relaxed due to this single ownership relationship.

It is intended that the definition reflects that an ancillary residential unit is an additional dwelling unit of limited size located within a house or row house. Many of the changes in Section 9.37. are premised on the condition of the limited size of the ancillary residential unit, which may directly or indirectly relate to issues such as occupant load, travel distance and egress dimensions.

The provisions of this By-law address only ancillary residential units in lower density forms of housing which include houses (one and two family dwellings) and row houses in which egress is non-complex, being generally direct to the exterior and at or near grade. Dwelling units that would otherwise meet the definition of ancillary dwelling unit but are in denser or more complex arrangements (such as lock-off units in apartment buildings or strata titled arrangements) should be treated as separate suites of residential occupancy, and therefore comply with the general provisions of Part 3 or Part 9 as applicable.

A-9.37.1.2. Construction Requirements. The requirements of Part 9 of the Building By-law apply to the construction of an ancillary residential unit and the alterations to a building to incorporate an ancillary residential unit, except those specifically referenced in Subsection 9.37.2.

An ancillary residential unit may be constructed in a building that has been in existence for many years that may not comply with current code requirements.

It is not the intent to retroactively apply the current By-law to all existing features in order to permit the construction of an ancillary residential unit in an existing building and the requirements of Part 11 of this By-law may facilitate the construction of such projects.

A-9.37.2.3.(1) Exit Stairs. Existing internal and external stairs that formerly served one dwelling unit may now serve both the existing dwelling unit and the new ancillary residential unit. It is not the intent to apply all current By-law exit stair requirements in order to permit the construction of an ancillary residential unit in an existing building.

A-9.37.2.6. Means of Egress. The additional occupant load created by an ancillary residential unit does not warrant increasing the width of a public corridor, common exit stair or landing used by both dwelling units. The stairs, corridors and landings formerly serving one dwelling unit are likely to be of adequate size to accommodate the occupant load of both suites.

A-9.37.2.8. Openings Near Unenclosed Exit Stairs and Ramps. Unprotected door or window openings in other fire compartments adjacent to exit stairs, ramps and confined paths of travel should be protected from the other suite to provide safe passage to a safe area.

Normally such protection as required by Part 9 would extend both vertically and horizontally beyond the adjacent openings. This is considered excessive due to required fire safety measures and the relatively short travel distances in this type of building. The application of current Part 9 requirements would in many cases require the protection of all openings in entire faces of dwelling units, which could be very restrictive. Authorities should exercise judgment with regard to deciding which openings are close enough to the exit facility to pose a problem during the early stages
of a fire and require appropriate opening protection. Those openings that directly pass the means of egress are required to be protected.

**A-9.37.2.13. Structural Fire Resistance of Ancillary Residential Units.** The provisions of 9.37.2.13. address only the fire-resistive requirements of construction within the ancillary residential unit. The remainder of the requirements of a building, including the need for fire separations that support or separate other floor areas or portions of a building, or of the principal dwelling unit itself, continue to apply.

**A-9.37.2.14. Combustible Drain, Waste and Vent Piping.** Exposed combustible drain, waste and vent piping that penetrates a fire separation is required to be protected as described. This protection is not required for exposed fixture traps and arms serving fixtures within the suite provided they are not exposed from the underside of a horizontal assembly. The intent is not to require removal of existing combustible piping which, as a result of the creation of an ancillary residential unit, may now be on both sides of a rated fire separation. Rather, the intent is to protect this piping where it is exposed.

![](image)

**Figure A-9.37.2.14.** Combustible Drain, Waste and Vent Pipe

**A-9.37.2.15 Separation of Ancillary Residential Suites**  Separations between an ancillary residential unit and its associated principal dwelling unit are not required to be constructed as formal fire separations. Rather, these separations may be constructed with conventional techniques that incorporate low cost materials that will provide a degree of containment for fire, smoke, and sound to the dwelling unit of origin.

Likewise, openings between principal dwelling unit and its contained ancillary residential unit must meet certain minimum construction requirements, but need not be constructed as formal fire separations.

**A-9.37.2.17. Air Ducts and Fire Dampers.** In order to prevent the migration of smoke from one suite to another during a fire, heating or ventilation systems incorporating ducts that serve both suites are permitted only if there is a mechanism to prevent smoke being circulated from one unit to the other. It is preferable for the secondary suite to have its own heating system independent of the rest of the building.

**A-9.37.2.19. Smoke Alarms.** This Article requires an interconnected photoelectric smoke alarm in each suite where fire separations having a fire-resistance rating of 30 min are used. The purpose of these interconnected alarms is to provide early warning to both suites in the event of a fire in one suite. Photoelectric type alarms are required as they
are less prone to nuisance false alarms such as can occur during cooking, but careful consideration is still required as to their location.

It is important to note that these alarms are additional to the requirements of Subsection 9.10.19. and that each suite is still required to be provided with alarms in conformance with Subsection 9.10.19.

The additional smoke alarm should not be interconnected to the other smoke alarm(s) located within the same suite.

This additional smoke alarm system is not required when the fire-resistance ratings required in Articles 9.10.9.14. and 9.10.9.15. are not reduced, or when the building is sprinklered.

**A-9.37.2.20. Sound Control.** Meeting the By-law’s level of sound transmission for secondary suites may be difficult and expensive, particularly in an existing building. As there is single ownership of both dwelling units, this requirement is not mandatory, but designers are encouraged to take the subject into consideration where feasible.

<<Span Tables to be Inserted – No changes from BCBC>>
Part 10
Energy and Water Efficiency

Section 10.1. General

10.1.1. Application

10.1.1.1. Scope

1) The scope of this Part shall be as described in Subsection 1.3.3. of Division A.

10.1.1.2. Application

1) The application of this Part shall be as described in Subsection 1.3.3. of Division A.

10.1.2. Definitions

10.1.2.1. Defined Terms

1) Words that appear in italics are defined in Article 1.4.1.2. of Division A.

Section 10.2. Energy Efficiency

10.2.1. Energy Design Building Classification

10.2.1.1. Application

1) Except as permitted by Sentence (2), a building shall be designed and constructed in conformance with this Subsection for the purpose of energy efficiency.

2) A structure that cannot be identified by the characteristics of a building in this Subsection shall comply with the requirements of 10.2.1.2., or as deemed acceptable to the Chief Building Official.

3) To meet the energy efficiency requirements of Articles 10.2.1.2. to 10.2.1.5., the design requirements of Subsection 10.2.2. shall form an integral part of this Subsection.

4) For the purposes of Part 10 and the classification of applicable energy design requirements of a building, the application of these requirements are to be applied to a building or that portion of a building, which for the purposes of energy and emissions performance, is designed to function as an independent entity. (See Note A-10.2.1.1.(4).)

5) Except as permitted by Sentence (6), a balcony, including those that are enclosed, shall be designed and constructed as unconditioned ambient space, exterior to the building envelope, without the provision of heating, cooling, or gas connection.

6) A building with not more than 2 principle dwelling units may be provided with a gas connection serving a balcony that is not enclosed.

10.2.1.2. Buildings Without Residential or Commercial Components

1) All buildings, except those included in 10.2.1.3 through 10.2.1.6,

   a) shall be designed in compliance with (See Note A-10.2.1.2.(1)(a).)

   i) 10.2.2.2. or 10.2.2.3., or

   ii) 10.2.2.2. in a building required to be designed to Part 9 by Division A, 1.3.3.3.,
Division B: Acceptable Solutions

Part 10 – Energy Efficiency

10.2.1.3. Residential Buildings of 7 Storeys or More, and Commercial Buildings (with or without residential components)

1) All buildings containing Group C, D, or E Major Occupancies, except those included in 10.2.1.4 through 10.2.1.6,

a) shall be designed in compliance with energy and emissions performance per Article 10.2.2.5,

b) reserved,

c) reserved,

d) reserved,

e) shall be provided with vestibules in compliance with Article 10.2.2.8,

f) shall be provided with metering equipment in compliance with Article 10.2.2.9,

g) shall be provided with lighting in conformance with Article 10.2.2.10,

h) reserved,

i) shall comply with Article 10.2.2.15, where fire places are provided, and

j) may provide exterior heated spaces in compliance with Article 10.2.2.22.

10.2.1.4. Residential Buildings of 4 to 6 Storeys, and Mixed-Use Residential Buildings of 1 to 6 Storeys

1) Except for buildings included in 10.2.1.5 or 10.2.1.6, a building which is less than 7 storeys in building height, and which is classified as a Group C major occupancy, and containing no other occupancies (excluding Group D or E major occupancy on the first or second storeys, or Group F Division 3 (Storage Garage) occupancy subsidiary to the Group C major occupancy),

a) shall be designed in compliance with

i) energy and emissions performance per Article 10.2.2.5, or

ii) Articles 10.2.2.2. or 10.2.2.3., excluding building envelope trade-off and whole building energy modelling options, and provided with the thermal performance of Articles 10.2.2.6. and 10.2.2.7., and heat recovery ventilators in compliance with 10.2.2.17.

b) shall be provided with vestibules in compliance with Article 10.2.2.8,

c) shall be provided with metering equipment in compliance with Article 10.2.2.9,

d) shall be provided with lighting in compliance with Article 10.2.2.10,

e) shall be provided with mechanical equipment in compliance with Articles 10.2.2.11. through 10.2.2.14.,

f) shall comply with Article 10.2.2.15, where domestic gas fireplaces are provided,

g) shall provide airtightness testing in accordance with Article 10.2.2.21, and

h) may provide exterior heated spaces in compliance with Article 10.2.2.22.
### 10.2.1.5. Residential Buildings of 1 to 3 Storeys

1) Except for buildings included in 10.2.1.6, a building which is less than 4 storeys in building height, and which is entirely classified as Group C major occupancy, excluding Group F Division 3 (Storage Garage) occupancy subsidiary to the Group C major occupancy,

   a) shall be provided with thermal performance in compliance with Article 10.2.2.6.,
   b) shall be provided with exterior closures and fenestration with thermal performance in compliance with Article 10.2.2.7.,
   c) shall be provided with vestibules in compliance with Article 10.2.2.8.,
   d) shall be provided with metering equipment in compliance with Article 10.2.2.9.,
   e) shall be provided with lighting in compliance with Article 10.2.2.10.,
   f) comply with Articles 10.2.2.11. through 10.2.2.13. where domestic hot water heating is provided,
   g) shall comply with Article 10.2.2.14. where domestic gas heated furnaces or make-up air units are provided,
   h) shall comply with Article 10.2.2.15. where domestic gas fireplaces are provided,
   i) shall be provided with and heat recovery ventilators in compliance with Article 10.2.2.17.,
   j) shall be designed with a solar photovoltaic ready pipe run in compliance with Article 10.2.2.19.,
   k) shall provide documentation in compliance with Article 10.2.2.20.,
   l) shall provide airtightness testing in compliance with Article 10.2.2.21, and
   m) may provide exterior heated spaces in compliance with Article 10.2.2.22.

### 10.2.1.6. Residential Buildings with Not More Than 2 Principal Dwelling Units

1) Except as otherwise required in this Subsection, a Group C building of residential use throughout, containing not more than 2 primary dwelling units and their contained ancillary residential suites or subsidiary structures with conditioned space, shall (See Note A-10.2.1.6.(1).)

   a) be designed with thermal performance in compliance with Article 10.2.2.6.,
   b) be designed with exterior closures and fenestration with thermal performance in compliance with Article 10.2.2.7.,
   c) be provided with metering equipment in compliance with Article 10.2.2.9.,
   d) be provided with lighting in compliance with Article 10.2.2.10.,
   e) comply with Article 10.2.2.11. through 10.2.2.13. where domestic hot water heating is provided,
   f) comply with Article 10.2.2.14., where domestic gas heated furnaces or make-up air units are provided,
   g) comply with Article 10.2.2.15. and 10.2.2.16., where domestic gas fireplaces are provided,
   h) be provided with heat recovery ventilators in compliance with Article 10.2.2.17.,
   i) be designed with a solar photovoltaic ready pipe run in compliance with Article 10.2.2.18 or 10.2.2.19.,
   j) provide documentation in compliance with Article 10.2.2.20., and
   k) provide airtightness testing in compliance with Article 10.2.2.21.

### 10.2.2. Design Measures for Energy Efficiency

#### 10.2.2.1. Application

1) This Subsection applies to all buildings and parts of the buildings that are required to be energy efficient under Subsection 10.2.1.
10.2.2.2. ANSI/ASHRAE/IESNA 90.1

1) A building designed in accordance with this Article shall, be designed and constructed in accordance with ANSI/ASHRAE/IESNA 90.1, “Energy Standard for Buildings, except Low-Rise Residential Buildings”, and
2) A building is designed in accordance with Sentence (1), shall be designed with
   a) a climate zone of 4,
   b) ventilation in compliance with ASHRAE 62-2001 (except addendum n), or if applicable, 6.2.2.1.3.b) of the Building By-law,
   c) the 5% in Table 11.5.1.5. Building Envelope, Exception a., being replaced by 2 per cent, if designed in compliance with ASHRAE 90.1, Section 11,
   d) the 5% in Table G3.1.5.a. Building Envelope, Exception 1., being replaced by 2 per cent, if designed in compliance with ASHRAE 90.1, Appendix G,
   e) no requirement to comply with the Fenestration Orientation provisions of ASHRAE 90.1, Article 5.5.4.5.,
   f) no requirement to comply with Automatic Receptacle Control, per ASHRAE 90.1, Article 8.4.2.

10.2.2.3. National Energy Code of Canada for Buildings

1) A building, other than a Part 9 building, designed in accordance with this Article shall be designed and constructed in accordance with the National Energy Code of Canada for Buildings (NECB), except that the provisions of this By-law shall apply where the NECB refers to the National Building Code of Canada (NBCC), and shall be designed with
   a) a climate zone of 4,
   b) ventilation in conformance with ASHRAE 62 (except addendum n),
   c) no requirement to comply with vestibules provision of NECB Article 3.2.2.1.,
   d) window-to-wall and skylight-to-roof area ratios of the reference building identical to area ratios of the proposed building, to a maximum of 40% for windows and to a maximum of 5% for skylights, identical to area ratios of the proposed building,
   e) a vertical glazing Solar Heat Gain Coefficient which does not exceed an assembly maximum of 0.36,
   f) a skylight Solar Heat Gain Coefficient for all types, which does not exceed an assembly maximum of 0.40, where the ratio of the aggregate skylight area to roof area is less than or equal to 3.0%.

10.2.2.4. Reserved.

10.2.2.5. Zero Emissions Building Plan (ZEBP) - Performance Limits

1) Except as permitted by Sentence (4), for a building required to comply with this Article, any energy modelling shall comply with:
   a) the applicable requirements of Part 8 of the NECB, and
   b) the City of Vancouver Energy Modelling Guidelines.

2) Except as permitted in Sentence (3) and (4), a building designed with this Article shall demonstrate the performance values of the proposed building comply with the limits in Table 10.2.2.5.A.

3) Compliance with the GHGI limits in Table 10.2.2.5.A is not required where a building can demonstrate the performance values of the proposed building comply with the TEUI and TEDI limits in Table 10.2.2.5.B.

4) Buildings and major occupancies designed and constructed to conform to the certification criteria for the Passive House Standard, are deemed to comply with this Article provided the design’s energy model is
a) version 9 or newer of the Passive House Planning Package, and
b) prepared by a Certified Passive House Designer, or Certified Passive House Consultant.

(See Note A-10.2.2.5.(4).)

### 10.2.2.6. Building Envelope Opaque Elements

1) Except as otherwise required in this Subsection, a building required to comply with this Article shall be comply with the performance values in Table 10.2.2.6., between
   a) heated space and unheated space,
   b) heated space and exterior air,
   c) heated space and exterior soil,
   d) heating floor assemblies and heated space,
e) heating floor assemblies and unheated space,
f) heating floor assemblies and exterior air, and
g) heating floor assemblies and exterior soil.

Notes to Table 10.2.2.6.:

1) The thermal resistance rating of attic space insulation may be reduced to value required for frame walls for a distance of 1200 mm from the exterior wall. A minimum nominal RSI of 3.52 m²K/W is required above the top plate in the attic space (See Note A-10.2.2.6.)

2) Not applicable when heating elements or piping are located within a concrete topping on a suspended floor assembly or within an internally heated suspended slab.

3) Headers and lintels: cavities between structural members are to be fully insulated, except where a framing plan provided by the builder, architect, designer, or engineer indicates that full-depth solid headers are structurally required.

2) Insulation and the installation of insulation in a building designed to the requirements of Part 9 shall comply with Subsection 9.25.2. or Part 5.

3) The effective total “R” value of the opaque envelope area, the non-opaque envelope area, and the overall envelope area (See Note A-10.2.2.6. on calculating effective thermal resistance of building envelope assemblies), calculated by a design professional, shall be submitted as part of an application for a permit.

10.2.2.7. Building Envelope Windows, Skylights, Doors and Other Glazed Products
1) Except as otherwise required in this Subsection and as permitted by Sentence (2), a building required to comply with this Article shall comply with the performance values in Table 10.2.2.7.(1).

</tbody>
</table>

**Notes to Table 10.2.2.7.(1):**

1. Includes doors swinging on a vertical axis with or without glazing, door transoms, and sidelites.

2) A maximum of one entry door assembly consisting of one or two leafs installed in the principle entrance of a building, together with attached transoms and sidelites all within a single rough opening, need not comply with Table 10.2.2.7.(1), where constructed of thermally broken metal or wood with multiple panes of glass, which may be argon filled, or coated with a low-e coating.

3) The thermal transmittance of factory glazed products within the scope of existing certification programs shall be indicated by labels applied to the products at the manufacturing location. The thermal transmittance of site glazed products and products outside the scope of existing certification programs shall be suitably documented. (See Note A-10.2.2.7.(3).)

### 10.2.2.8. Building Envelope Vestibules

(See Note A-10.2.2.8.)

1) Except as permitted in Sentence (2), in a building required to comply with this Article there shall be an enclosed vestibule in all building entrances separating a conditioned space from the exterior, designed such that

a) all doors opening into and out of the vestibule shall be equipped with self-closing devices,

b) the interior and exterior doors of the vestibule shall be separated by no less than 2.1 m when closed, and the floor area of each vestibule shall not exceed 4.65 m² or 2% of the gross conditioned floor areas for that level of the building,

c) for spaces having a gross conditioned floor area for that level of the building of 3,716.1 m² and greater, and when the doors opening into and out of the vestibule are equipped with automatic,
Division B: Acceptable Solutions

Part 10 – Energy Efficiency

electrically driven, self-closing devices, the interior and exterior doors shall be separated by no less than 4.87m.
d) the exterior envelope of a conditioned vestibule shall comply with the design requirements for a conditioned space, and
e) the interior and exterior envelope of an unconditioned vestibule shall comply with the design requirements for a semi heated space.

2) An enclosed vestibule is not required for
a) a building entrance with revolving doors,
b) a door not intended to be used as the building entrance,
c) a door opening directly to the exterior from a dwelling unit,
d) a building entrance, in a building less than 278.7 m² in gross floor area,

2. An enclosed vestibule is not required for
a) a door that opens directly to the exterior from a space that is less than 278.7 m² and is separate from the building entrance,
f) semi-heated spaces,
g) an enclosed elevator lobby for building entrances directly from parking garages, and
h) a building pursuing certification with the Passive House (PHI) standard.

10.2.2.9 Building Services Submetering

1) Every building shall be equipped with metering equipment capable of collecting building energy performance data for the building and for every portion of the building which supports a separate use or occupancy.

2) Submetering required by this Article shall include the following
a) hot water generated by a central hot water generation system
b) natural gas used for air handling systems in common areas, and
c) natural gas used for domestic hot water in amenity spaces, pools and spas.

10.2.2.10 Lighting in Residential Buildings

(See Note A-10.2.2.10.)

1) Where a portion of a residential building or a portion of a multi-use building located above a garage or on an adjacent grade contains more than 20 residential suites, the building shall be designed with
a) occupancy based lighting sensor controls, located in all exit stair shafts and parking garages, compatible with the requirements of Sentence 3.2.7.3.(1) of Division B, and
b) a switch near the principal entrance of each residential suite that
   i) controls all lighting fixtures within the suite, except lights serving corridors, stairs, washrooms, and rooms with no exterior window.
   ii) with an override on each floor, serving that floor, of a multilevel suite

2) Except as permitted by Sentence (3), permanent ancillary exterior lighting of a building of residential occupancy or the residential portion of a multi-use building, or those parts of a building facing a lane, that is required to conform to this Article shall
a) be provided with fixtures that are appropriately shielded that
   i) utilize full cut-off optics or are fully shielded fore luminaires that emit over 600 lumens, or any luminaire installed along the side or back yard, and
Division B: Acceptable Solutions
Part 10 – Energy Efficiency

i) are partially shielded and utilize a diffusing cover for luminaires that emit 600 lumens or less.

b) be mounted no higher than 4 m above grade or the balcony surface it illuminates along the side yard, back yard, and similar outward facing courtyards or setbacks of the building,

c) be provided with dimmer and timer controls,

d) minimize lighting of adjacent exterior properties and properties across a street, lane, or public way.

3) Where exterior lighting is required by this By-law or other regulator enactments to provide illumination along paths of pedestrian or vehicular travel, fire department access, or equipment signage or lighting, it need not comply with the requirements of Sentence (2).

10.2.2.11. Hot Water Tank Piping

1) In a building required to comply with this Article, the first 3 m of non-recirculating hot water piping leading from both electrically heated and gas heated hot water tanks, and the last 1 m of piping leading to the hot water tank connection, shall have insulation with a minimum RSI value of 0.35.

10.2.2.12. Domestic Gas-Heated Hot Water Heaters

1) In a building required to comply with this Article, gas-heated appliances providing domestic hot water only shall have a uniform energy factor of not less than 0.78 or alternatively a thermal efficiency of not less than 90%, as determined by the following

   c) CSA C191-04, “Performance of electric storage tank water heaters for domestic hot water service”, or

   d) CSA 4.3/ANSI Z21.10.3, “Gas Water Heaters Volume III, Storage Water Heaters, with Input Ratings above 75,000 Btu per hour, Circulating and Instantaneous”.

10.2.2.13. Domestic Gas-Heated Boilers

1) In a building required to comply with this Article, domestic gas-heated boilers providing heat, or heat and domestic hot water, shall have an Annual Fuel Utilization Efficiency (AFUE) rating of not less than 92 per cent, as tested using CSA P.2-07, “Testing Method for Measuring the Annual Fuel Utilization Efficiency of Residential Gas-fired Furnaces and Boilers”.

10.2.2.14. Domestic Gas-Heated Furnaces or Make Up Air Units

1) In a building required to comply with this Article, domestic gas-heated furnaces or make up air units shall have an Annual Fuel Utilization Efficiency (AFUE) rating of not less than 92 per cent, as tested using CSA 2.6/ANSI Z83.8, “Gas unit heaters, gas packaged heaters, gas utility heaters and gas-fired duct furnaces”.

10.2.2.15. Domestic Gas-Fired Fireplaces

(See Note A-10.2.2.15.)

1) In a building required to comply with this Article, domestic gas-fired fireplaces in conditioned spaces shall be equipped with

   a) intermittent pilot ignition (IPI) systems,
b) on-demand ignition systems that automatically shut off within
   i) 7 days of appliance non-use in a one or two family dwelling building, or
   ii) 6 hours of appliance non-use in a multifamily dwelling, or

2) In a **building** required to comply with this Article, domestic gas-fired fireplaces shall be direct vented (Naturally Aspiring Fuel-Fired Appliances (NAFFVA) are not permitted).

3) In a **building** required to comply with this Article, domestic gas-fired fireplaces must be on a timer.

4) Where exterior gas fireplaces are provided as an ancillary equipment to a **building** required to comply with this Article, then the exterior fireplaces shall be considered as part of the **building** for the purposes of this Part.

### 10.2.2.16. Domestic Wood Burning Heating Appliances

1) In a **building** required to comply with this Article, and except for cooking stoves and ranges, a wood domestic burning heating appliance installed in a residential dwelling unit shall be tested in accordance with CAN/CSA B415.1-10 “Performance Testing of Solid-Fuel-Burning Heating Appliances” or EPA Title 40, Part 60, Subpart AAA - “Standards of Performance for New Residential Wood Heaters”, and shall
   a) produce not more than 2.5 grams per hour of particulate air contaminant emissions for catalytic appliances, or
   b) produce not more than 4.5 grams per hour of particulate air contaminant emissions for non-catalytic appliances.

2) Open masonry fireplaces and factory-built fireplaces are not permitted.

### 10.2.2.17. Domestic Heat Recovery Ventilators

1) In a **building** required to comply with this Article, each dwelling unit shall be served by a heat recovery ventilator located in
   a) each dwelling unit, or
   b) a commonly accessible location if serving multiple dwelling units.

2) In a **building** required to comply with this Article, components of mechanical ventilation systems not specifically described in this Subsection shall be designed, constructed and installed in accordance with good engineering practice and as described in the ASHRAE Handbooks and Standards, HRAI Digest, TECA Ventilation Guideline, Hydronics Institute Manuals or the SMACNA manuals.

3) In a **building** required to comply with this Article, a heat recovery ventilator (HRV) shall
   a) be sized to run at its rated speed for continuous operation while achieving a 65 per cent sensible heat recovery efficiency (65 per cent Minimum SRE at 0°C) and be designed and tested in conformance with CAN/CSA-C439,
   b) be designed and tested to meet the CSA International Standard CAN/CSA-F326-M91, “Residential Mechanical Ventilation Systems”,
   c) be installed and commissioned by persons trained by the Thermal Environmental Comfort Association (TECA) or the Heating, Refrigeration and Air Conditioning Institute of Canada (HRAI) or equivalent,
   d) supply outdoor air directly to the principal living area, to each bedroom, and to any floor area without a bedroom, including similar rooms within ancillary residential units, directly or indirectly, through a central recirculation system with a continuously operating fan,
   e) be designed to run continuously to comply with the minimum ventilation rates of Table 9.32.3.3.A of Division B,
Division B: Acceptable Solutions

Part 10 – Energy Efficiency

f) not be connected to kitchen and bathroom exhaust fans,
g) except for mechanical ducts cast into concrete structure, have exterior connected supply-air ducts and exhaust ducts insulated to not less than RSI 0.75 (R 4.25) and shall have an effective vapour barrier,
h) have balanced HRV supply and exhaust air flows within plus or minus 20 per cent of the actual normal operating exhaust capacity,
i) be labelled with tested supply and exhaust air flows for high and low settings, measured in CFM, and
j) be located in a fully serviceable space that can be readily accessed for replacement or maintenance, and

i) designed and installed to operate with an acceptable level of weather and freeze protection if not within a conditioned space, and

ii) in a building containing not more than two primary dwelling units and their contained ancillary residential units, be within a conditioned space and provided with direct access from at least one of the dwelling units that it serves.

4) In a building required to comply with this Article, the HRV system contractor or installer shall provide a completed Mechanical Ventilation Checklist to the Chief Building Official.

5) In a building required to comply with this Article, a contractor trained in the installation of energy recovery ventilators (ERV) may install an ERV in lieu of a heat recovery ventilator (HRV).

10.2.2.18. Solar Ready Pipe Run

1) In a building required to comply with this Article, a solar ready pipe chase, consisting of at least two 50 mm PVC pipes, capped at both ends and having at least a 20° angle measured above the horizontal level, shall extend from a location near the service water heater, to the attic space.

10.2.2.19. Solar Photovoltaic Ready Pipe Run

1) In a building required to comply with this Article, a solar ready pipe chase, consisting of at least one 25 mm pipe or liquid tight flexible electrical conduit or electrical metallic tubing capped at both ends and having at least a 20° angle measured above the horizontal level, shall extend from a location near the electrical panel, to the attic space.

10.2.2.20. Passive House Planning Package (PHPP), EnerGuide, or Other Energy Documentation

1) In a building required to comply with this Article, at the time of permit application, and at the time of final inspection, the owner shall provide to the Chief Building Official acceptable documentation, in the form of
   a) a PHPP file from a Certified Passive House Consultant or Designer, or
   b) an EnerGuide Rating System Audit, or
   c) for buildings ineligible for an EnerGuide Rating System Audit, a Hot2000 file modelled in general mode and using the same baseload assumptions as Energuide for New Homes mode, or equivalent energy modelling documentation, acceptable to the Chief Building Official.

2) In a building required to comply with this article, at the time of mid-construction inspection, the owner shall provide to the Chief Building Official acceptable documentation, in the form of,
   a) a mid-construction checklist
   b) a blower door test result that achieves an acceptable level of performance
In a building required to comply with this Article, and where a one family dwelling or two family dwelling, with or without ancillary residential units, contains conditioned space of more than 325 m², including suites that are not strata titled, the owner shall

a) provide a calculation utilizing the EnerGuide rating system to demonstrate that the proposed home has a greenhouse gas (GHG) footprint that is no more than the greenhouse gas (GHG) footprint of a 325 m² home built to the minimum standards in the Building Bylaw, and
b) meet the requirements of the modeling guidelines for large homes.

### 10.2.2.21. Building and Dwelling Unit Airtightness Testing

1) In a building required to comply with this Article, the building and dwelling units shall be tested for airtightness in accordance with
   a) ASTM E 779, Standard Test Method for Determining Air Leakage Rate by Fan Pressurization,
   b) USACE Version 3, Air Leakage Test Protocol for Building Envelopes, or
   c) airtightness protocol recognized by Natural Resources Canada for use in homes and buildings labeled under the EnerGuide for New Homes program.

2) A building required to comply with this Article shall have, at time of final inspection, maximum tested air leakage rates in conformance with Table 10.2.2.21., or sealed to the satisfaction of the Chief Building Official.

### 10.2.2.22. System Requirements for Heating within Exterior Spaces

(See Note A-10.2.2.22.)

1) Any space heating or occupant heating within an exterior space associated with a building shall comply with the requirements of this Article.

2) The design and/or installation of space heating or occupant heating systems within exterior spaces shall be limited to spaces directly served by licensed beverage establishments or licensed food establishments.

3) Any exterior space designed with a heating system and directly served by a licensed beverage establishment or a licensed food establishment, shall prioritize the heating system design in the following order:
   a) In-slab or in-floor radiant heat, using non fossil fuel or low-carbon system,
   b) Electric fixed infrared radiant heat with metal-sheath element,
   c) Heated seating, using non fossil fuel or low-carbon system,
d) Non-electric radiant heat using non fossil fuel system.

4) In spaces required to comply with Sentence (2), the design of exterior space heating or occupant heating systems shall comply with the following, as applicable,
   a) in-slab or in-floor radiant heat system not exceeding 15W/ft² and incorporating zone-based controls interconnected with a centralized automatic control system with independent zone management,
   b) electric radiant heat system not exceeding 18W/ft² and incorporating unit-based or zone-based controls, interconnected with a centralized automatic control system with independent unit or zone management,
   c) heated seating system not exceeding 20W per seat and incorporating zone-based controls, interconnected with
      i) individual seat shutoff, or
      ii) a centralized automatic control system with independent zone management, and
   d) non-electric and non-fossil fuel radiant heat system not exceeding 18W/ft² and incorporating unit-based controls interconnected with a centralized automatic control system with independent zone management.

5) Heating systems designed to sentence (3) shall include
   a) an automatic shut-off (ambient temperature sensor - lockout),
   b) an automatic shut-off (space temperature sensors – integral/ zone), and
   c) an automatic shut-off using programmable timeclock.

6) Heated zones within a zone-based design shall not exceed 4.8 kW per zone.

7) Heating systems designed with overhead radiant systems within a space containing a ceiling or roof of adequate height, shall be designed with circulation fans interconnected to heating mode operations, with an override for independent fan operation.

8) In a space required to comply with sentence (2), any exterior space designed with a combination of systems contained in sentence (3) shall
a) comply with the specific requirements pertaining to each system, without duplication of requirements, and
b) not contain an area where the combined heating exceeds the performance requirement of the least restrictive system.

**Section 10.3. Electric Vehicle Charging**

10.3.1. Electric Vehicle Charging for Buildings

10.3.1.1. Electrical Service and Capacity

(See Note A-10.3.1.1.)

1) The electrical installations, including the service capacity of the installation, the number and distribution of circuits and receptacles, shall meet the requirements of the “Electrical Safety Regulation.”

2) Where the requirements of section 4.14.1(a) of the Parking By-Law would cause the dwelling unit calculated load to exceed 200 A in building containing not more than 2 primary dwelling units only, with or without ancillary residential suites, the installation of an energized outlet for Level 2 charging may be omitted provided that a minimum nominal trade size of 21 raceway supplied with pull string leading from the dwelling unit panelboard to an electrical outlet box is installed in the storage garage or carport and is labelled to identify its intended use with the electric vehicle supply equipment.

3) Where an electric vehicle energy management system is implemented, Chief Building Official may specify a minimum performance standard to ensure a sufficient rate of electric vehicle charging.”
10.4. Objectives and Functional Statements

10.4.1. Objectives and Functional Statements

10.4.1.1. Attribution to Acceptable Solutions

1) For the purposes of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 10.4.1.1. (See Note A-1.1.1.2.(1) of Division A.)

Notes to Part 10

Energy and Water Efficiency

A-10.2.1.1.(4) Building or Independent Parts Thereof
The intention of sentence (4), for the purposes of Part 10, is to recognize that multiple independent structures atop a parkade, for example, can and should have their respective energy and emissions performances evaluated independently, both during design as well as operationally throughout their respective lifespans. The intention is to prevent the performance assessment of one independent structure from effecting the performance assessment of any other, thus eliminating the ability to trade-off energy and/or emissions performance(s) between independent structures.

A-10.2.1.2.(1)(a) If designing to Passive House then contact the Office of the CBO for potential recognition as being compliant with Article 10.2.1.2., where buildings and major occupancies designed and constructed to conform to the certification criteria for the Passive House Standard, may, at the discretion of the CBO, be deemed to comply with Article 10.2.1.2. provided the design’s energy model is
   a) version 9 or newer of the Passive House Planning Package, and
   b) prepared by a Certified Passive House Designer, or Certified Passive House Consultant.

A-10.2.1.6.(1) Subsidiary Structures with Conditioned Space
The intention of this wording is to allow separate ancillary structures such as garages or workshops, with conditioned space(s), to be constructed to the same requirements of a residential building with not more than 2 principal dwelling units rather than another standard such as ASHRAE 90.1, NECB, or ZEPB (10.2.2.5.) requirements that may be triggered based on use. Conditioned space is considered to be the alteration of interior space temperature, through the provision of heating or cooling.

A-10.2.2.5.(4) Passive House (PER)
Exceedances of the published Primary Energy Renewable (PER) criterion of the Passive House Standard may be accepted as complying with this Sentence where written approval has been provided by the Passive House Institute, or where additional energy efficiency measures have been included to the satisfaction of the Chief Building Official.

A-10.2.2.6.Calculating the Effective Thermal Resistance of Building Envelope Assemblies.
The general theory of heat transfer is based on the concept of the thermal transmittance through an element over a given surface area under the temperature difference across the element.

To calculate effective thermal resistance, contributions from all portions of an assembly including heat flow through studs and insulation, must be taken into account because the same insulation product (nominal insulation value) can produce different effective thermal resistance values in different framing configurations. The resulting effective thermal resistance of an assembly also depends on the thermal properties and thickness of the building materials used and their respective location.

The following paragraphs provide the calculations to determine the effective thermal resistance values for certain assemblies and the thermal characteristics of common building materials.

Calculating the Effective Thermal Resistance of an Assembly with Continuous Insulation: Isothermal-Planes Method
To calculate the effective thermal resistance of a building envelope assembly containing only continuous materials – for example, a fully insulated floor slab – simply add up the RSI values for each material. This procedure is described as the “isothermal-planes method” in the “ASHRAE Handbook – Fundamentals.”

Calculating the Effective Thermal Resistance of a Wood-frame Assembly: Isothermal-Planes and Parallel-Path Flow Methods
To calculate the effective thermal resistance of a building envelope assembly containing wood framing, RSI_{eff}, add up the results of the following calculations:

A. calculate the effective thermal resistance of all layers with continuous materials using the isothermal-planes method, and

B. calculate the effective thermal resistance of the framing portion, RSI_{parallel}, using the following equation, which is taken from the parallel-path flow method described in the “ASHRAE Handbook – Fundamentals”:

\[
RSI_{\text{parallel}} = \frac{100}{\frac{\% \text{ area of framing}}{RSI_F} + \frac{\% \text{ area of cavity}}{RSI_C}}
\]

where

- RSI_F = thermal resistance of the framing member,
- RSI_C = thermal resistance of the cavity (usually filled with insulation),
- \% area of framing = value between 0 and 100, and
- \% area of cavity = value between 0 and 100.

Calculating the Effective Thermal Resistance of a Steel-frame Assembly
The parallel-path flow method described above for wood-frame assemblies involves simple one-dimensional heat flow calculations based on two assumptions:

- that the heat flow through the thermal bridge (the stud) is parallel to the heat flow through the insulation, and
- that the temperature at each plane is constant.

Tests performed on steel-frame walls have shown that neither of these assumptions properly represents the highly two-dimensional heat flow that actually occurs. The difference between what is assumed and what actually occurs is even more significant in steel-frame assemblies. Designers should consider the potential discrepancies in such assemblies and include them as part of their evaluation and energy models.

Calculating Gross Wall Area
Where the structure of the lowest floor and rim joist assembly is above the finished ground level or where the above-grade portion of foundation walls separates conditioned space from unconditioned space, they should be included in the calculation of gross wall area. Figure A-10.2.2.6.-A shows the intended measurements for the most common type of housing construction.
Reduced Effective Thermal Resistance Near the Eaves of Sloped Roofs.
Minimum thermal resistance values for attic-type roofs are significantly higher than those for walls. The exemption in Note (1) of T-10.2.2.6. recognizes that the effective thermal resistance of a ceiling below an attic near its perimeter will be affected by roof slope, truss design and required ventilation of the attic space. It is assumed that the thickness of the insulation will be increased as the roof slope increases until there is enough space to allow for the installation of the full thickness of insulation required.

Figure A-10.2.2.6.-B
Area of ceiling assemblies in attics permitted to have reduced thermal resistance
A-10.2.2.7.(3) Building Envelope Windows, Skylights, Doors and Other Glazed Products

There are three compliance paths ('A' to 'C') available for fenestration products to comply with the energy performance requirements in Article 10.2.2.7. General guidelines are provided first, followed by the details of each compliance path.

General Requirements for Labels On Factory-Glazed Products

The U-value (either IP or SI) labeling and verification requirements for windows, doors, and skylights in British Columbia are stipulated in the Energy Efficiency Standards Regulation of the BC Energy Efficiency Act.

Labels bear the mark of a third-party verifier and follow NFRC 100-2010 or CSA A440.2-14 standards. Each product shall bear two labels: a removable "temporary" label indicating the product U-value, and a non-removable "permanent" marking or label identifying the verification entity, the product line and the manufacturer.

The organizations that verify U-values according to these standards require these labels to be applied at the factory. They do not permit labels to be applied at the jobsite without prior authorization of the verifier.

The U-value on a label is reported to two decimal places. To determine compliance, the U-value is rounded to one decimal place; for example: a USI-value of U 1.44 would be rounded to USI 1.4 and a USI-value of USI 1.45 would be rounded to USI 1.5.

General Requirements for Simulated U-value Reports
Products may comply with the By-law under a "flexibility provision" that demonstrates compliance by means of a simulated U-value report accompanied by supporting documentation. This provision provides a path by which a designer can provide “suitable documentation” of U-values for products that cannot be labeled because they are outside the scope of existing energy performance certification programs, and for imported products that do not yet have U-values determined using NFRC 100 or CSA A440.2 methods.

An electronic copy of the report and description of the chosen compliance path should be provided to the Building Official prior to sheathing inspection. A paper copy of the report must be present on-site for the Building Official at time of sheathing inspection.

Simulation reports must include the following:

1) A cover letter on the professional's letterhead that includes:

   a) the professional’s identity and contact information.
   b) the street address(s) of the building.
   c) the U-values (reported to two decimal places) for each product type, at its standard size as identified in NFRC 100 or CSA A440.2, at the actual project size, or at an average size product, depending on the compliance option.
   d) verification by the registered professional that the information provided in the energy performance certification and accompanying documentation supports the U-value of the fenestration assembly or assemblies identified in the report.
   e) the name, address and contact information of the fenestration product supplier(s).
   f) the name, address and contact information of the glass supplier(s), if different from the fenestration product supplier(s).
   g) the name, address and contact information of any individuals or firms that carried out energy performance simulations, if different from the registered professional.
   h) a complete list of the supporting documentation attached to the letter.
   i) the registered professional’s seal and signature.

2) An attached documentation package that includes:

   a) a list of each fenestration product type, quantity, size, area, description and U-value.
   b) the sizes and configurations of the simulated products as shown by frame elevations and/or shop drawings, keyed to the list.
Division B: Acceptable Solutions

Part 10 – Energy Efficiency

c) a table of the area-weighting calculations performed to determine the overall average U-value of all products using Method 1 or Method 2, of Option 2 of Compliance Path C, when applicable.

d) a description of each framing system used, including manufacturer name, series, and model numbers, as well as frame material and any internal reinforcing used.

e) a complete description of the glazing, including overall glass thickness, number of panes, pane thicknesses, gap widths, low-E coating manufacturer and type, low-E coating emissivity, and surfaces to which coatings are applied, type of gap fill with percentages of inert gas, complete description of spacer by make, series, and model, and its constituent materials, and insulating glass edge sealant materials.

f) NFRC or CSA A440.2 certified test data for each system, or isotherms for each unique framing member used in each system covered by the letter, (heads, sills, jambs, mullions) as well as all reinforcing metal in mullions and perimeter frames.

Compliance Path ‘A’ (Prescriptive U-value compliance)

Compliance is demonstrated by means of verifier labels, affixed to factory-glazed products at the manufacturing location in which each individual fenestration product has a compliant U-value. Compliance is achieved if each product meets the USI-value requirements required by Article 10.2.2.7., at its standard size as identified in NFRC 100 or CSA A440.2.

When one or more products exceed the applicable USI-value in Table 10.2.2.7.(1), compliance Paths B or C may be employed.

Compliance Path ‘B’ (Labeled / Tested U-value area-weighted average compliance)

Compliance Path ‘B’ is intended for projects in which all products have U-values simulated at NFRC standard sizes.

Compliance path B requires area-weighting calculations but does not require actual size or project-specific simulation. When one or more products within Table 10.2.2.7.(1) exceed the applicable USI-value, compliance may be demonstrated by calculating the overall average USI-value by means of a tabulated USI x A reporting format. In such a table, the USI-values for the standard size of each product are to be multiplied by the area of the product to determine the average area weighted USI-value of all the products.

Under this option, standard size U-values from test and simulation reports from accredited laboratories may be used for unlabeled products. The U-value report with area-weighting calculations shall be submitted.
under the seal of a registered professional and may be subject to independent review at the discretion of city staff.

\[
\text{Overall U value} = \frac{\sum U_1 A_1 + \cdots + U_n A_n}{\text{Total Area}}
\]

The area-weighting report shall include documentation of verified U-values by means of label reproductions or attached laboratory simulation reports. In the case of NFRC certified products, CPD numbers may be used in place of label reproductions.

**Compliance Path ‘C’ (Simulated U-value compliance)**

Compliance path ‘C’ is intended for projects that use products that cannot demonstrate compliance at standard size by means of labels or accredited laboratory test/simulation reports. Such products include:

- site glazed windows, doors,
- imported windows and doors not previously tested in Canada,
- curtainwalls and sloped glazing assemblies, and
- factory glazed curtainwalls and window wall assemblies.

Under this compliance path qualified professionals perform simulations for each Individual Product simulated in accordance with NFRC 100 procedures at the size and configuration defined in NFRC 100 Table 4-3, including the normative table footnotes. Individual Products are defined in NFRC 100 and may be grouped according to NFRC 100 Grouping Rules. Products that require metal reinforcing at project sizes shall be simulated with metal reinforcing. U-values may be reported using one of the following options:

**Option 1** - All products conform to Table 10.2.2.7.(1) at standard sizes.

If all products are found to have USI-values that conform to Table 10.2.2.7.(1) at sizes in NFRC 100 Table 4-3, the standard size USI-values may be reported to demonstrate compliance with Article 10.2.2.7.

**Option 2** - One or more products do not conform to Table 10.2.2.7.(1) at standard sizes.

Area-weighting the USI-values of products within a U-value group at actual project sizes may be employed to demonstrate compliance for that U-value group.

To comply with Option 2, area-weighted average USI-values may be computed using one of two methods:
Method 1
USI x A table of all products within a U-value group, tabulating frame size, frame area and USI-value for each individual product to compute an overall area-weighted average for all products within the U-value group.

Method 2
USI x A table of USI-values for each individual product at its average project frame size.

\[
\text{Overall } U \text{ value} = \frac{\sum U_{\text{avg}}(1)A_{\text{System 1}} + \cdots + U_{\text{avg}}(n)A_{\text{System n}}}{\text{Total Area}}
\]

Average project frame sizes shall be determined as follows:

1) Average frame sizes shall be determined for each individual product.
2) For fixed windows, the average frame size shall be based on averaging the width and height of all fixed daylight opening sizes for the fixed product type.
3) For curtain wall framing at single storey height, the average frame size shall be based on averaging the width and height of all fixed daylight opening sizes for the Window Wall product type.
4) For single panel operable windows and swinging doors, the average frame size shall be the average of all single panel operable product frame sizes of the same operator type.
5) For multiple panel side hinged products (swinging doors, folding doors), the average frame size shall be based on averaging the width and height of all panel sizes for the Swinging Door with Frame product type.
6) For sliding doors, the average frame size and number of panels will depend on the number of sliding door tracks. (The fixed lite of a sliding door shall be considered a panel.)
   a) For two-track sliding doors, a two-panel door configuration shall be simulated having a frame size shall be based on two average size panels.
   b) For three-track sliding doors, a three-track, three-panel door configuration shall be simulated having a frame size based on three average size panels.
   c) For four-track sliding doors, a four-track, four-panel door configuration shall be simulated having a frame size based on four average size panels. (Etc.)
   d) Simulations shall include two jambs, head and sill simulations with the glass in each panel position, and one interlock for each panel-panel joint of the configuration.
7) For individual unit (single lite) skylights, the average frame size shall be the average of all frame sizes of the same product type.
8) For skylights with more than one lite, the average frame size shall be based on averaging the width and height of all daylight opening sizes for the Sloped Glazing product type at the solarium-sunroom configuration in NFRC 100 Table 4-3 Note 3.

A-10.2.2.8 Vestibules
The intention of the vestibule requirements within 10.2.2.8. are to recognize that vestibules are breeches within a building’s envelope and are the last line of defense against the interaction between a building’s interior conditioned space and the ambient conditions. The vestibule design requirements are intended to minimize the transference of air and associated energy properties through the opening of these breeches, with or without the assistance of pressure differentials from internal sources such as stack effect or elevator operation, or external pressures such as wind load. Vestibules are therefore to be enclosed spaces without direct access by stairwells and elevators.

Specified distances between interior and exterior vestibule doors support typical daily operation. These specified minimum separation distances are to be deemed the vestibule’s maximum separation distances as well, however, under circumstances deemed problematic by the CBO, these maximum distances may be extended by 30cm increments until the design issue is resolved. For example, a 7 foot minimum spacing may not be possible due to interference from a structural column, in which case an application may be requested for an 8 foot separation. No request for a 9 foot separation will be considered without review of the 7 foot and 8 foot separation scenarios.

A-10.2.2.10 Exterior Lighting in Residential Buildings

10.2.2.10.(1)(b) Master Switch The objective is to require a master switch that will permit non-essential lighting to be turned off when an occupant leaves the premises. As this was only intended to consider residential portions of a building, it is considered acceptable to consider each portion of the building structure located above the parkade slab constructed to Article 3.2.1.2. on an individual basis given that the cost-effectiveness of such energy saving features would not be as significant for smaller structures with proportionally larger exterior wall and roof surface areas relative to their volume.

10.2.2.10.(2) Exterior Lighting A growing body of evidence exists that identifies that excessive amounts of nighttime lighting (frequently referred to as light pollution) may be potentially harmful to the environment and to human wellbeing. Poorly controlled night time lighting in urbanized areas has been widely documented to have significant effects on the environment, such as increased skyglow, and physiological and behavioral changes to individual organisms. Research suggests that excessive nighttime lighting may be detrimental to human health.

Consequently, Sentences 10.2.2.10.(2) attempts to limit the quantity and quality of exterior lighting of buildings to reduce the impact and consequences of external lighting. Interior lighting emitted through glazed openings is also a concern, but this is largely dependent upon human activity, and it is not presently considered as part of these requirements. Nonetheless, it can be seen that conceptually this would also have similar effect as exterior lighting, so an effort should be made to minimize the potential for lighting trespass where possible.

The key components of Sentence 10.2.2.10.(2) requirements are the requirements for appropriate lighting fixtures that eliminate the upwards emission of light, and cast more of the illumination produced across the intended surfaces. Horizontal emission of lighting across the property line is more challenging due to the varying heights of a given building, but measures should be taken to reduce the potential and extent of lighting trespass to the limits specified. Additionally, the reflectance of adjacent surfaces that may be illuminated must also be considered as these also contribute to the total lighting emitted into adjacent properties. The orientation, reflectance, and illumination of the adjacent surfaces should be evaluated to limit backscatter or unintended reflectance.

To increase the likelihood of meeting the requirements, designers opt to

- Choose light fixtures that minimize backlight, uplight, and glare (BUG). Light fixtures with a BUG rating of UO are optimal.
Choose luminaires with the lowest possible intensity for the task needed
Consider warmer tones of 2500-3000K to reduce impact. A practical maximum temperature is 4000K.

10.2.2.10.(3) External Illumination
Understanding that there may be periodic needs to provide external illumination, the requirements of 10.2.2.10.(3) serve to exempt lighting specifically intended to enhance security, safety and improve visibility for limited periods of time.

A-10.2.2.15. Gas Fireplaces
Interior and exterior fireplaces connected to building services are to be included as part of the building for the purposes of meeting the energy targets of Part 10 of the Building By-law. The building performance model is to incorporate such features per the requirements of the City of Vancouver Modelling Guidelines.

A-10.2.2.17. Heat Recovery in Dwelling Units.
Whereas Section 9.32. addresses the effectiveness of mechanical ventilation systems in dwelling units from a health and safety perspective, Article 10.2.2.17. is concerned with their functioning from an energy efficiency perspective.

The requirements of Subsection 9.32.3. can be met using one of several types of ventilation equipment, among them heat-recovery ventilators (HRVs), which are typically the system of choice in cases where heat recovery from the exhaust component of the ventilation system is required. As such, Article 10.2.2.17. should be read in conjunction with the provisions in Subsection 9.32.3. that deal with HRVs.

Efficiency of Heat-Recovery Ventilators (HRVs)
HRVs are required to be tested in conformance with CAN/CSA-C439, “Rating the Performance of Heat/Energy-Recovery Ventilators,” under different conditions to obtain a rating.

The performance of an HRV product and its compliance with Article 10.2.2.17. can be verified using the sensible heat recovery at the 0°C test station (i.e. location where the temperature is measured) published in the manufacturer’s literature or in product directories, such as HVI’s Certified Home Ventilating Products Directory. Any energy model output must also demonstrate an SRE (%) that meets or exceeds the requirement of this By-law.

The rating of HRVs also depends on the flow rate used during testing. Therefore, the minimum flow rate required in Section 9.32. needs to be taken into consideration when selecting an HRV product.

Servicability of Heat Recovery Ventilators
Clause 10.2.2.17.(3)(j) identifies that heat recovery ventilators and similar devices form an integral part of the building ventilation and requires inspection, maintenance, repair, and cleaning from time to time to ensure that the building air quality remains within the original design parameters. In order to perform such regular maintenance or more extensive maintenance in the event of the failure of an HRV or similar device, the mechanical components of an Heat Recovery Ventilator are to be located and installed so as to provide a worker with adequate space and access to unit to conduct maintenance on the unite or replace it. Unusually tight, distant, or convoluted access may lead to regular maintenance being skipped, or lead to other significant challenges or costs for services and replacement.

A-10.2.2.21. Building Airtightness Testing Requirements
The intent of this testing is to quantify the airtightness level of the air barrier system, not airtightness of the building at in-service operating conditions.
Air Barrier Assembly Testing

Air barrier assemblies are subjected to structural loading due to mechanical systems, wind pressure and stack effect. In addition, they may be affected by physical degradation resulting from thermal and structural movement. Where local climatic data and building conditions exceed these limits, the maximum building height and sustained 1-in-50 hourly wind pressure values are permitted to be extrapolated beyond the listed ranges to apply to any building height, in any location, provided the air barrier assembly in question has been tested to the specific building site and design parameters.

Air Barrier System Approaches

For an air barrier system to be effective, all critical junctions and penetrations addressed in must be sealed using either an interior or exterior air barrier approach or a combination of both.

Where the air barrier and vapour barrier functions are provided by the same layer, it must be installed toward the warm (in winter) side of the assembly or, in the case of mass walls such as those made of cast-in place concrete, provide resistance to air leakage through much of the thickness of the assembly. Where these functions are provided by separate elements, the vapour barrier is required to be installed toward the interior of the assembly while the airtight element can be installed toward the interior or exterior depending on its vapour permeance.

A-10.2.2.22 System Requirements for Heating within Exterior Spaces.

The use of the terms “licensed beverage establishment” and “licensed food establishment” are meant to clarify how the allowance of 10.2.2.22 is limited to business-licensed establishments where the primary use is the consumption of food or beverages while seated.

The intention of Article 10.2.2.22 is not to require exterior heating, rather it is meant to minimize energy use and emissions when choosing the option of providing some level of occupant heating within an exterior space. The City of Vancouver recognizes a number of options however the prioritization of these options must also take into account their viability with existing and potential site conditions. Sentence 10.2.2.22.(2) is intended to be understood as “first consider the viability of option (a), either in whole or in part, then consider the viability of option (b) in whole or in part, then consider option (c)” , and so on. If the most viable solution is a mixed system then this would be encouraged, but if the best, most viable solution is a single option then proceed with that option. Designers wishing to consider a unique system, such as using waste heat, are encouraged to do so and should contact the CBO’s office if any customized system design does not easily fall into the options provided.

The control items within sentence 10.2.2.22.(4) are meant to assist with the efficient operation of the heating system. It is important to note that exterior spaces are not intended to operate as if they are interior conditioned spaces. The maximum recommended temperature for exterior spaces with heating systems is 18C, and so the ambient and space temperature sensors should be set accordingly. The ambient sensor is intended to prevent the heating system from operating during warm weather while the space temperature sensors are meant to accommodate naturally occurring temperature variations across adjacent zones (direct sun vs shade), thus allowing independent zone control operation. The space temperature sensors may override the ambient sensor to prevent zones from either overheating or over cooling. The timeclock will satisfy the mandatory requirement of not operating exterior heating systems after the establishment’s hours of operation. At no point should the controls system automatically activate exterior space heating.
Zoned systems are most likely to be electric radiant and so are limited to 4,800 W (240V @ 20 amp). At the maximum allowable intensity of 18 W/ft² this would equate to 266 ft² per zone, however less energy intensive systems would be allowed to cover a larger area, for example, a 15 W/ft² system would allow 320 ft² per zone.

For multi-system design scenarios, sentence 10.2.2.22.(6) is intended to clarify the options and opportunities this may provide. The total energy intensity of a combined system shall not exceed the highest allowable intensity of the system types involved. Example: where an overhead electric radiant system is allowed to operate at 18 W/ft², a combined system of in-slab heating with an overhead radiant system cannot be designed to exceed a combined total operation of 18 W/ft². This scenario allows in-slab heating at 8 W/ft² while limiting the overhead heating to 10 W/ft², or the possibility of 5 W/ft² and 13 W/ft² respectively. This concept allows one system to be used during warmer weather with the option for a secondary system as a top-up during colder weather.

A-10.3.1.1. Electric Vehicle Charging for Buildings
The Canadian Electrical Code, Part I contains the requirements of electric vehicle charging systems, the requirements of Rule 86-300(2) and (3) recognize the use of load management technologies via the manual transfer or automated control in a branch circuit that supplies the electric vehicle supply equipment load and other loads. This Rule requires that, where the electric vehicle supply equipment load and other loads are installed, only one load can be operated at any one time and the branch circuit must be based on the calculated demand in accordance with Section 8.

All references to the electrical installation including receptacle, supply equipment and rating of voltage and ampere in Article 10.3.1.1. are intended to align with the requirements of SAE AC Level 2 charging requirements, whether in applying load managed solutions or separate branch circuits for each charging point. In addition to the requirements of Article 10.3.1.1., the installation of electric vehicle charging systems and electric vehicle supply equipment must meet the requirements of the Canadian Electrical Code, Part I and the manufacturer’s instructions.
PART 11
EXISTING BUILDINGS

Section 11.1. General

11.1.1. Application

11.1.1.1. Scope
1) The scope of this Part shall be as described in Subsection 1.3.3. of Division A.

11.1.1.2. Application
1) The application of this Part shall be as described in Subsection 1.3.3. of Division A.

11.1.2. DEFINITIONS

11.1.2.1. Defined Terms
1) Words that appear in italics are defined in Article 1.4.1.2. of Division A.

Section 11.2. Upgrade application

11.2.1. Upgrade requirements

11.2.1.1. Upgrade objectives
1) An alteration to an existing building shall trigger upgrading of the existing building to meet the following objectives
   a) all unsafe conditions shall be corrected to an acceptable level,
   b) all new materials and construction work shall comply with this By-law,
   c) the building shall be upgraded to an acceptable level of
      i) fire, life and health safety,
      ii) structural safety,
      iii) non-structural safety,
      iv) accessibility for persons with disabilities, and
      v) energy and water efficiency,
   d) any significant extension of the design life of an existing building beyond its original design life shall require upgrading to an acceptable level,
   e) an alteration to an individual suite within an existing building will not trigger upgrades within any other suites except where the alteration creates non-conformity with the By-law within such other suites, and
   f) the level of life safety and building performance shall not be decreased below the existing level.

11.2.1.2. General Requirements
(See Note A-11.2.1.2.)
1) Where construction of existing buildings occurred before the effective date of this By-law, reconstruction or alteration of existing buildings is not a requirement of this By-law, except as required by Articles 11.2.1.3. to 11.2.1.11. inclusive.
2) Except as permitted by Sentences (3) to (9), and Articles 11.2.1.3. to 11.2.1.11., where an alteration is made to an existing building, the alteration shall comply with this By-law and the existing building shall be
Division B: Acceptable Solutions

Part 11 – Existing Buildings

Vancouver Building Bylaw 2019

Division B

11-2

a) upgraded to an acceptable level as defined in the existing building Upgrade Mechanism Model in Division B Appendix A, except that existing lighting exceeding the Lighting Power Density of ASHRAE 90.1-2016 shall be removed within existing spaces of a suite within the scope of a project,

b) upgraded to the satisfaction of the Chief Building Official where the owner demonstrates that the design levels, as defined by the Upgrade Mechanism Model in Division B Appendix A, present a hardship for the owner, or

c) upgraded to the satisfaction of the Chief Building Official through an alternative upgrades, that demonstrate equivalent improvement where specific characteristics of the building are intended to be retained.

3) Except as required by Sentence (9) and changes of major occupancy in a small suite, where an alteration does not involve an addition or a change in major occupancy, further upgrading to an existing building is not a requirement of this By-law provided

a) construction or a full upgrade of the building occurred by means of a building permit issued on or after April 1, 2014,

b) all unsafe conditions are corrected to the satisfaction of the Chief Building Official, and

c) all new work is in compliance with this By-law.

4) Where a voluntary upgrade for fire alarm systems, sprinkler systems, exits, accessibility, seismic work, washrooms or kitchens for single room accommodations, energy efficiency or building envelope repair is carried out, no further upgrade of the building is required except that, where other work is included in the application, the upgrade requirement will only be based on the non-voluntary work proposed.

5) Where building envelope repair involves more than 60% of an opaque portion of a building face, the building envelope on the entire vertical section of that building face shall be replaced and upgraded to the thermal resistance and air-tightness requirements of Part 10, except where

a) the scope of work is limited to the replacement of windows

b) the building is two storeys in building height or less and is required to comply with Part 9 per Division A, Article 1.3.3.3., or

c) the building face has heritage merit and is required to be retained as part of an approved retention plan.

6) Where a building is altered and includes a post disaster building as defined in Table 4.1.2.1., or where there is a major addition to a post disaster building, the entire building shall be upgraded to design upgrade levels F4, S4, N4, A4 and E4 as detailed in the Upgrade Mechanism Model in Division B Appendix A.

7) Where there is a temporary change of major occupancy to an assembly occupancy for an arts and culture indoor event in a building which is classified as Group D offices, Group E retail, Group F Division 2 production or rehearsal studio, wholesale, warehouse, or factory, or Group F Division 2 artist studio without living accommodations, the upgrade requirements shall be based solely on Section 11.6.

8) Where there is a change of major occupancy in a building, and the aggregate area of the change in major occupancy within any 5 year period is greater than 50% of the building area in a one storey building or greater than 100% of the building area in a building of more than one storey, the entire building shall be upgraded to design upgrade levels F4, S4, N4, A4 and E3 as detailed in the Upgrade Mechanism Model in Division B Appendix A except where

a) the change in major occupancy is to a single suite and the work does not exceed 5% of the building area or more than 100 m² in area, or

b) such upgrades are in conflict with an approved heritage retention plan.

9) The upgrade requirements for energy efficiency to existing buildings shall conform to the upgrade mechanism model in Division B Appendix A for energy efficiency except for

a) buildings designed and constructed in conformance with ASHRAE 90.1-2007 or as deemed acceptable to the Chief Building Official,

b) buildings designed and constructed in conformance with Article 9.25.2.1. Division B of Building By-law No. 9419, and
c) buildings where the alteration is limited to the upgrade of energy related specific equipment, as listed in Table 11.2.1.2., provided the replacement equipment complies with industry standards for "high efficiency".

d) multi-family buildings not more than 3 storeys in building height may comply with the energy efficiency upgrade requirements of Table 11.2.1.4.(2)

11.2.1.3. Sprinkler Installation Requirements for the Addition of Dwelling Units in Multi-family Buildings

(See Note A-11.2.1.3.)

1) Except as provided in Sentence (2) and Sentence 11.2.1.4.(3), where an alteration to an existing building creates or adds one or more dwelling units, the building shall be sprinklered in conformance with Table 11.2.1.3.

2) Where the alteration in Sentence (1) involves the addition of existing floor space to an existing dwelling unit, and that converted space is greater than 50% of the floor area of the original dwelling unit, the altered dwelling unit shall be considered as a new dwelling unit and the building shall be sprinklered in conformance with Table 11.2.1.3.

3) If sprinklers are required by Table 11.2.1.3., they shall be installed throughout the storey on which the new dwelling unit is to be located and all storeys below the new dwelling unit.

Notes to Table 11.2.1.4.(2):
(1) An EnerGuide Assessment completed within the last 4 years must be submitted, a post-construction assessment must also be completed where the cost of construction exceeds $75,000.
(2) Where EGH>5 air changes per hour, air sealing is required.
(3) Where attic insulation <R12 (2.11RSI), increase to R28 (4.93RSI); where attic insulation ≥R12 (2.11RSI), increase to R40 (7.04RSI). Insulation in existing attics shall not exceed R43.7 (7.7RSI). All flat roof and cathedral ceiling insulation shall be upgraded to ≥R14 (2.47RSI).
(4) Reconstruction is defined in the Upgrade Mechanism Model in Appendix A Division B Part 11. A reconstruction project must meet the Part 10 energy efficiency requirements as per E6 in Table A-11.2.1.2.-C.

3) Where an alteration is made to an existing residential building containing not more than two principal dwelling units, that creates one or more new principal dwelling units or increases the size of an existing dwelling unit, a sprinkler system shall be installed
   a) throughout the building, where the value of the alteration exceeds 50% of the replacement value of the existing building. (See Note A-11.2.1.4.(3)(a).)
   b) throughout any storey on which a new principal dwelling unit is created, and all storeys below, or
   c) throughout any storey on which an alteration to the building increases the aggregate area of an existing dwelling unit and the converted space is greater than 50% of the floor area of the original dwelling unit.
4) Where building envelope repair involves more than 60% of an opaque portion of a building face, the building envelope on the entire vertical section of that building face shall be replaced and upgraded to the thermal resistance and air-tightness requirements of Part 10, except where:
   a) the scope of work is limited to the replacement of windows
   b) the building is two storeys in building height or less and is required to comply with Part 9 per Division A, Article 1.3.3., or
   c) the building face has heritage merit and is required to be retained as part of an approved heritage retention plan.

11.2.1.5. Self-contained Separated Spaces
(See Note A-11.2.1.5)
1) Where an alteration to a building is a self-contained volumetric space that is separated from the remainder of the building by a non-combustible vertical fire separation with a 2 h fire resistance rating, the upgrade requirements of this Part do not apply to the remainder of the building provided:
   a) the self-contained volumetric space is upgraded in conformance with this By-law,
   b) the self-contained volumetric space does not exit through the remainder of the building,
   c) the building area of the self-contained volumetric space is not larger than 10% of the existing building area,
   d) a non-combustible vertical fire separation with a 2h fire resistance rating is constructed as a continuous vertical fire separation from the building foundation to the underside of the roof sheathing, and
   e) the self-contained volumetric space does not reduce the existing structural capacity of the building.

11.2.1.6. Relocated Buildings
1) Where a building is relocated from another municipality to the City, from another lot within the City or within its existing lot, the building shall be upgraded to Design Upgrade Levels F4, S4, N4, A4 and E4, as determined by the Upgrade Mechanism Model in Division B Appendix A.

11.2.1.7. Relocated Property Lines
1) Where property lines are relocated closer to a building, the building shall be upgraded to conform to the spatial requirements, fire department access requirements and means of egress requirements of this By-law or the applicant shall demonstrate that the relocated property lines and the existing building configuration comply with this By-law.

11.2.1.8. Demolished Buildings
1) Where a building is being demolished in whole or in part, the demolition work shall conform to the requirements of Part 8 and any part of the building that remains after demolition shall be upgraded in conformance with Article 11.2.1.2.

11.2.1.9. Damaged Buildings
1) Where a building has been damaged, all work necessary to reconstruct the damaged portions of the building shall conform to this By-law and the Fire By-law and the remainder of the building shall be upgraded in conformance with Article 11.2.1.2.

11.2.1.10. Fire Department Order
1) Where an order issued under the Fire By-law requires upgrading of a building, the Chief Building Official may allow deviations from this By-law.

11.2.1.11. Specific Upgrade Requirements for Float Homes and Marinas
1) Except as permitted by Sentence (2), where a marina is altered, all new work shall comply with Subsection 12.2.2. and the marina shall be upgraded to an acceptable level as determined by the Upgrade Mechanism Model in Division B Appendix A.

2) Except as required by Sentence (3); Sentences 12.2.2.7.(1), and 12.2.2.8.(1) need not apply to a marina.

3) Where the total value of the alteration to a marina exceeds 50% of the value of the marina as determined at the application stage for the alteration, then the marina shall comply with Subsection 12.2.2.

4) Where a float home is altered
   a) new work shall comply with Subsection 12.2.2. of Division B and this By-law, and
   b) the float home shall be upgraded to an acceptable level in accordance with Article 11.2.1.4.

5) A marina shall have an occupancy classification as specified in Sentences 12.2.2.1.(4) and (5).

Section 11.3. Alternative Compliance Measures for Existing Conditions to Assist Rehabilitation

11.3.1. APPLICATION

11.3.1.1. Application of Alternative Compliance Measures for Existing Conditions
(See Note A-11.3.1.1.)

1) Except as permitted in Sentence (3), the alternative compliance measures provided in this Section are to be applied to existing conditions only and are not to be applied to new construction (new construction must comply with the requirements of this By-law).

2) Where the building is a heritage building, the alternative compliance measures in Section 11.5 may be applied to existing conditions.

3) The alternative compliance measures provided in Subsection 11.3.2. do not apply to newly constructed buildings.

4) Alterations to newly constructed buildings, as determined by Sentence (3), shall comply with Parts 1 to 10 of Division B in Book I and Parts 1 to 2 of Division B in Book II.

11.3.1.2. Conditions for Using Alternative Compliance Measures

1) Where a building or a portion of a building is required to comply with this By-law under Subsection 11.2.1., the provisions contained in this Section may be applied as alternative compliance measures to those requirements contained elsewhere in this By-law, under the conditions specified in Sentences (2) to (7), provided the building was originally constructed pursuant to a building permit issued prior to July 1, 1994.

2) Except for additions, and new construction, where Subsection 3.2.2. requires that the construction of a building be noncombustible, the applicable Article in Subsection 11.3.2. may be applied as an alternative provided all of the requirements of the Article have been met.

3) Except for additions and new construction, where the spatial separation and exposure protection requirements of Subsection 3.2.3. require that the exterior wall construction of a building to be noncombustible, Subsection 11.3.3. may be applied.

4) Where the fire containment measures of a building are deficient, Subsections 11.3.4. and 11.3.6. may be used as an alternative.

5) Where the exits in a building are deficient, Subsections 11.3.5. and 11.3.6. may be used as an alternative.

6) Where a building is sprinklered throughout, the applicable relaxations of Subsection 11.3.6. may be applied as an alternative.

7) Where a building is a heritage building, alternate compliance measures as detailed in Section 11.5. may be applied.

11.3.2. CONSTRUCTION AND BUILDING SAFETY ALTERNATIVES
11.3.2.1. Group A1 up to 600 Auditorium Occupants

1) A Group A, Division 1 occupancy having an occupant load of no more than 600 may be permitted within the first storey and second storey of a building provided the building conforms to Sentences (2) and (3).

2) A building referred to in Sentence (1) may be of heavy timber construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations
      i) with a fire-resistance rating not less than 1 h, or
      ii) of heavy timber construction with a fire-resistance rating not less than 1 h, and
   b) loadbearing walls, columns and arches shall
      i) have a fire-resistance rating not less than that required for the supported assembly, or
      ii) be of heavy timber construction with a fire-resistance rating not less than 1 h.

3) A building referred to in Sentence (1) shall
   a) be provided with a fire alarm and detection system conforming to Subsection 3.2.4., notwithstanding any exemptions permitted by Article 3.2.4.1.,
   b) be provided with lighting and emergency power systems conforming to Subsection 3.2.7.,
   c) be upgraded to provide all exit locations with a maximum travel distance of 22.5 m for sprinklered buildings and 15 m for unsprinklered buildings,
   d) except as permitted in Subsection 11.3.3., be upgraded to provide exterior wall and opening protection conforming to Subsection 3.2.3.,
   e) be structurally upgraded to the design upgrade level S3 as defined in the Upgrade Mechanism Model in Division B Appendix A,
   f) except as permitted in Subsections 11.3.4. and 11.3.6., be upgraded to comply with the fire containment requirements within a floor area conforming to this By-law, and
   g) except as permitted in Subsections 11.3.5. and 11.3.6. and as required by Clause (d), be upgraded to provide exit systems conforming to Section 3.4.

11.3.2.2. Group A1 up to 300 Auditorium Occupants

1) A Group A, Division 1 occupancy having an auditorium occupant load of no more than 300, may be permitted within the first storey and second storey of a building, provided the building conforms to Sentences (2) and (3).

2) A building referred to in Sentence (1) may be of combustible construction or noncombustible construction used singly, or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
   c) loadbearing walls, columns and arches supporting an assembly shall have a fire-resistance rating not less than that required for the supported assembly.

3) A building referred to in Sentence (1) shall
   a) be provided with a fire alarm and detection system conforming to Subsection 3.2.4., notwithstanding any exemptions permitted by Article 3.2.4.1.,
   b) be provided with lighting and emergency power systems conforming to Subsection 3.2.7.,
   c) be upgraded to provide all exit locations with a maximum travel distance of 22.5 m for sprinklered buildings and 15 m for unsprinklered buildings,
   d) except as permitted in Subsection 11.3.3., be upgraded to provide exterior wall and opening protection conforming to Subsection 3.2.3.,
   e) be structurally upgraded to the design upgrade level S3 as defined in the Upgrade Mechanism Model in Division B Appendix A,
   f) except as permitted in Subsections 11.3.4. and 11.3.6., be upgraded to comply with the fire containment requirements within a floor area conforming to this By-law, and
   g) except as permitted in Subsections 11.3.5. and 11.3.6. and as required by Clause (d), be upgraded to provide exit systems conforming to Section 3.4.
11.3.2.3. Group A2 in Building More Than 3 Storeys

1) A Group A, Division 2 occupancy may be permitted within the first 3 storeys of a building which is more than three storeys in building height, provided the building conforms to Sentence (2), and provided
   a) where the occupancy is located on the third storey or where the building area exceeds 400 m², the entire building shall be sprinklered or
   b) where the occupancy is located on the first storey or second storey, the building shall be sprinklered up to and including the storey containing the Group A2 occupancy.

2) A building referred to in Sentence (1) shall conform to Sentence 11.3.2.4.(2).

11.3.2.4. Group A2 Up to 3 Storeys

1) A Group A, Division 2 occupancy may be permitted in a building no more than three storeys in building height, provided
   a) the building conforms to the construction requirements of Sentences (2) and (3), and
   b) the entire building is sprinklered, where
      i) the building area exceeds 400 m², or
      ii) the occupancy is located on the third storey.

2) A building referred to in Sentence (1) may be of combustible or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
   c) roof assemblies shall have, if of combustible construction, a fire-resistance rating not less than 45 min, except that in a building not more than 1 storey in building height, the fire-resistance rating is permitted to be waived provided the roof assembly is constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1., and the building area is not more than
      i) 800 m² if facing one street,
      ii) 1 000 m² if facing 2 streets, or
      iii) 1 200 m² if facing 3 streets, and
   d) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction.

3) A building referred to in Sentence (1) shall
   a) be provided with a fire alarm and detection system conforming to Subsection 3.2.4., notwithstanding any exemptions permitted by Article 3.2.4.1.,
   b) be provided with lighting and emergency power systems conforming to Subsection 3.2.7.,
   c) except as permitted in Subsection 11.3.3., be upgraded to provide exterior wall and opening protection conforming to Subsection 3.2.3.,
   d) be structurally upgraded to the design upgrade level S3 as defined in the Upgrade Mechanism Model in Division B Appendix A,
   e) except as permitted in Subsections 11.3.4. and 11.3.6., be upgraded to comply with the fire containment requirements within a floor area conforming to this By-law, and
   f) except as permitted in Subsections 11.3.5. and 11.3.6., be upgraded to provide exit systems conforming to Section 3.4.

11.3.2.5. Group B2 Ambulatory Occupants

1) A Group B, Division 2 occupancy containing only occupants that are capable of walking up or downstairs unaided may be permitted within the first 3 storeys of a building, provided the entire building is sprinklered and conforms to Sentences (2) and (3).
2) A building referred to in Sentence (1) may be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3) A building referred to in Sentence (1) shall
   a) be provided with a fire alarm and detection system conforming to Subsection 3.2.4. where the building contains more than 2 storeys including storeys below grade or where the building area exceeds 250 m² regardless of the occupant load,
   b) be provided with lighting and emergency power systems conforming to Subsection 3.2.7.,
   c) except as permitted in Subsection 11.3.3., be upgraded to provide exterior wall and opening protection conforming to Subsection 3.2.3.,
   d) be structurally upgraded to the design upgrade level S3 as defined in the Upgrade Mechanism Model in Division B Appendix A,
   e) except as permitted in Subsections 11.3.4. and 11.3.6., be upgraded to comply with the fire containment requirements within a floor area conforming to this By-law, and
   f) except as permitted in Subsections 11.3.5. and 11.3.6., be upgraded to provide exit systems conforming to Section 3.4.

11.3.2.6. Group B2 Non-ambulatory Occupants
1) A Group B, Division 2, non-ambulatory occupancy may be permitted only within a storey of a building which has direct or ramped access to ground level, provided the entire building is sprinklered and conforms to Sentences (2) and (3).
2) A building referred to in Sentence (1) may be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.
3) A building referred to in Sentence (1) shall
   a) be provided with a fire alarm and detection system conforming to Subsection 3.2.4.,
   b) be provided with lighting and emergency power systems conforming to Subsection 3.2.7.,
   c) except as permitted in Subsection 11.3.3., be upgraded to provide exterior wall and opening protection conforming to Subsection 3.2.3.,
   d) be structurally upgraded to the design upgrade level S3 as defined in the Upgrade Mechanism Model in Division B Appendix A,
   e) except as permitted in Subsections 11.3.4. and 11.3.6., be upgraded to comply with the fire containment requirements within a floor area conforming to this By-law, and
   f) except as permitted in Subsections 11.3.5. and 11.3.6., be upgraded to provide exit systems conforming to Section 3.4.

11.3.2.7. Group C More Than 3 Storeys
1) A Group C occupancy may be permitted in a building more than 3 storeys in building height provided the entire building is sprinklered and conforms to Sentences (2) to (4).
2) A building referred to in Sentence (1) shall have a maximum height of less than 18 m measured between grade and the uppermost floor level of the top storey,
3) A building referred to in Sentence (1) may be of combustible construction or noncombustible construction used singly or in combination, and
a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 1 h, and
c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

4) A building referred to in Sentence (1) shall
   a) be provided with a fire alarm and detection system conforming to Subsection 3.2.4.,
   b) be provided with lighting and emergency power systems conforming to Subsection 3.2.7.,
   c) except as permitted in Subsection 11.3.3., be upgraded to provide exterior wall and opening protection conforming to Subsection 3.2.3.,
   d) be structurally upgraded to the design upgrade level S3 as defined in the Upgrade Mechanism Model in Division B Appendix A,
   e) except as permitted in Subsections 11.3.4. and 11.3.6., be upgraded to comply with the fire containment requirements within a floor area conforming to this By-law, and
   f) except as permitted in Subsections 11.3.5. and 11.3.6., be upgraded to provide exit systems conforming to Section 3.4.

11.3.2.8. Group D Occupancies

1) A Group D occupancy may be permitted in a building that exceeds 3 storeys in building height provided that the entire building is sprinklered and conforms to Sentence (2) to (4).

2) A building referred to in Sentence (1) may be of combustible construction or noncombustible construction used singly or in combination, and
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 1 h,
   c) roof assemblies shall have, if of combustible construction, a fire-resistance rating not less than 45 min, except that in a building not more than 1 storey in building height, the fire-resistance rating is permitted to be waived provided the roof assembly is constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1. and the building area is not more than
      i) 2 400 m² if facing one street,
      ii) 3 000 m² if facing 2 streets, or
      iii) 3 600 m² if facing 3 streets, and
   d) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

3) Notwithstanding the requirements of Sentence (2), the floor, mezzanine, and roof assemblies, are permitted to have a fire-resistance rating of 45 min provided
   a) it is not more than 6 storeys in building height, and
   b) it has a building area not more than the value in Table 11.3.2.8.

4) A building referred to in Sentence (1) shall  
   a) be provided with a fire alarm and detection system conforming to Subsection 3.2.4., notwithstanding any exemptions permitted by Article 3.2.4.1.,
   b) be provided with lighting and emergency power systems conforming to Subsection 3.2.7.,
   c) except as permitted in Subsection 11.3.3., be upgraded to provide exterior wall and opening protection conforming to Subsection 3.2.3.,
   d) be structurally upgraded to the design upgrade level S3 as defined in the Upgrade Mechanism Model in Division B Appendix A,
   e) except as permitted in Subsections 11.3.4. and 11.3.6., be upgraded to comply with the fire containment requirements within a floor area conforming to this By-law, and
   f) except as permitted in Subsections 11.3.5. and 11.3.6., be upgraded to provide exit systems conforming to Section 3.4.

11.3.2.9. Group E Occupancies

1) A Group E occupancy may be permitted in a building conforming to Sentences (2) to (5) except that where the building exceeds 1000 m² in building area or 3 storeys in building height the entire building shall be sprinklered.

2) A building referred to in Sentence (1), that is not more than 4 storeys in building height and the building area is no more than 1800 m² is permitted to be of combustible construction or noncombustible construction used singly or in combination, provided
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
   c) roof assemblies shall have a fire-resistance rating not less than 45 min, except that in a building not more than 1 storey in building height, the fire-resistance rating is permitted to be waived provided the roof assembly is of noncombustible construction or is constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1.,
   d) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction, and
   e) loadbearing walls, columns and arches supporting a fire separation shall have a fire-resistance rating not less than that required for the fire separation.

3) A building referred to in Sentence (1), that is not more than 6 storeys in building height and the building area conforms to Table 11.3.2.9., is permitted to be of combustible construction or noncombustible construction used singly or in combination, provided
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

4) A building referred to in Sentence (1), is permitted to be of noncombustible construction, provided
   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1.5 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

5) A building referred to in Sentence (1) shall be upgraded as follows
   a) where required to have a sprinkler system, the building shall be provided with a fire alarm and detection system conforming to Subsection 3.2.4.,
   b) be provided with lighting and emergency power systems conforming to Subsection 3.2.7.,
   c) except as permitted in Subsection 11.3.3., be upgraded to provide exterior wall and opening protection conforming to Subsection 3.2.3.,
d) be structurally upgraded to the design upgrade level S3 as defined in the Upgrade Mechanism Model in Division B Appendix A,

e) except as permitted in Subsections 11.3.4. and 11.3.6., be upgraded to comply with the fire containment requirements within a floor area conforming to this By-law, and

f) except as permitted in Subsections 11.3.5. and 11.3.6., be upgraded to provide exit systems conforming to Section 3.4.

11.3.2.10. Group F2 or F3 Occupancies

1) A Group F, Division 2 or 3 occupancy may be permitted in a building, provided that the building conforms to Sentences (2) to (5) except that where the building exceeds 1000 m² in building area, or 2 storeys in building height, the entire building shall be sprinklered.

2) A building referred to in Sentence (1) and in conformance with Table 11.3.2.10 is permitted to be of combustible construction or noncombustible construction used singly or in combination, provided:

   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
   b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min,
   c) roof assemblies shall be
      i) noncombustible construction, or
      ii) combustible construction with a fire-resistance rating of no less than 45 min in buildings with a building area no greater than 4800 m², and
      iii) combustible construction constructed as a fire-retardant-treated wood roof system conforming to Article 3.1.14.1 in a building of not more than 1 storey in building height,
   d) loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall
      i) have a fire-resistance rating not less than 45 min, or
      ii) be of noncombustible construction, and
   e) loadbearing walls, columns and arches supporting a fire separation shall have a fire-resistance rating not less than that required for the fire separation.

3) A building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, provided:

   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and
   c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

4) A building referred to in Sentence (1), is permitted to be of combustible construction or noncombustible construction used singly or in combination, provided:

   a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1.5 h,
   b) mezzanines shall have a fire-resistance rating not less than 1 h, and

Division B:

Acceptable Solutions

Part 11 – Existing Buildings

5) A building referred to in Sentence (1) shall be upgraded as follows
   a) Where required to have a sprinkler system, the building shall be provided with a fire alarm and
detection system conforming to Subsection 3.2.4.,
   b) Be provided with lighting and emergency power systems conforming to Subsection 3.2.7.,
   c) be upgraded to provide exterior wall and opening protection conforming to Subsection 3.2.3.,
   except as permitted in Subsection 11.3.3.,
   d) be structurally upgraded to the design upgrade level S3 as defined in the Upgrade Mechanism
      Model in Division B Appendix A,
   e) except as permitted in Subsections 11.3.4. and 11.3.6., be upgraded to comply with the fire
      containment requirements within a floor area conforming to this By-law, and
   f) except as permitted in Subsections 11.3.5. and 11.3.6., be upgraded to provide exit systems
      conforming to Section 3.4.

11.3.2.11. Combustible Construction for Minor Repairs
(See Article 1.5.2.9. of Division C.)

11.3.2.12. Open Air Repair and Storage Garages
   1) Open-air storeys of a storage garage or repair garage located below grade need not be sprinklered.

11.3.3. SPATIAL SEPARATION ALTERNATIVES
11.3.3.1. General
   1) Except for additions and new construction, where the exterior wall of a building is required by Parts 3 and
      9 to be of noncombustible construction, the provisions of this Subsection may be used as an alternative
      compliance measure to the spatial separation requirements of Parts 3 and 9.

11.3.3.2. Exterior Wall Construction
   1) In a building of Group B or C occupancy, existing combustible construction may be retained in an existing
      exterior wall provided
      a) the wall has at least a 1 h fire-resistance rating,
      b) the building is sprinklered, and
      c) all voids in the wall are completely filled with noncombustible insulation and fire stopped.
   2) In a building of other than Group B or C occupancy, existing combustible construction may be retained in
      an existing exterior wall provided the wall has at least a 1 h fire-resistance rating, and
      a) the building is sprinklered, or
      b) all voids in the wall are completely filled with noncombustible insulation and fire stopped.
3) When an existing exterior wall requires a 2 h fire-resistance rating, existing combustible construction may be retained provided
   a) the wall has at least a 1 h fire-resistance rating,
   b) the building is sprinklered, and
   c) all voids in the wall are completely filled with noncombustible insulation and fire stopped.

11.3.3.3. Exterior Cladding
   1) Existing combustible cladding may be retained provided
      a) the building is sprinklered using fast-response heads,
      b) the exterior cladding is treated with acceptable exterior quality fire retardant intumescent paint,
         (See Note A-11.3.3.3.(1)(b).) and
      c) all exterior windows contain wired or safety glass in steel frames.

11.3.3.4. Existing Unprotected Openings
   1) Where the limiting distance is less than 900 mm, existing unprotected openings may be retained, provided
      a) the openings are constructed of glass block, wired glass, tempered glass or laminated safety glass, and the building is sprinklered using fast-response heads,
      b) the openings are constructed of glass block, wired glass, tempered glass or laminated safety glass in operable frames, the building is sprinklered using fast-response and openings are protected with close spaced sprinkler in accordance with Sentence 3.2.3.13.(5).
      c) acceptable self-closing fire protection shutters are installed at the existing opening locations, where the fire shutter operation is not obstructed by the openable window, and where the opening is not required for an escape function as outlined in Article 9.9.10.1.
   2) Where a limiting distance is 900 mm or more, existing unprotected openings which have a total area exceeding the values listed in or extrapolated from Tables 3.2.3.1.B, 3.2.3.1.C, 3.2.3.1.D or 3.2.3.1.E, may be retained, provided
      a) the openings are constructed of glass blocks or wired glass in fixed frames, or
      b) the building is sprinklered with fast-response heads.
   3) Where construction on an existing building consists of renovation where the exposing building face is not being altered, the existing unprotected openings of that building face may be retained and no additional protection shall be required provided
      a) the work consists of a interior work only,
      b) no additional principal dwelling units are being added,
      c) the openings on the vertical building face are less than 10% of the entire exposing building face, and
      d) the limiting distance is greater than 600 mm.
   4) Notwithstanding the requirements of this Article, the replacement of existing windows that do not substantially alter the existing spatial separation configuration by more than 2% shall not require additional protection provided that the openings are constructed of glass block, wired glass, tempered glass or laminated safety glass. (See Note A-11.3.3.4.(4).)

11.3.4. ALTERNATIVES FOR FIRE CONTAINMENT AND SEPARATION

11.3.4.1. Public Corridors
   1) Existing public corridor walls, serving Group A Division 2, D, E, F Division 2 and F Division 3 occupancies, required to have a fire-resistance rating exceeding 45 min may be terminated at the underside of a 30 min ceiling membrane, where the public corridors are equipped with acceptable smoke detectors connected to the building fire alarm system.
11.3.4.2. Occupancy and Suite Separations

1) Existing vertical **occupancy fire separations** and **suite fire separations** in Group A Division 2, D, E, F Division 2 and F Division 3 occupancies, need not exceed a 1 h **fire-resistance rating** provided **acceptable smoke detectors** are installed on each side of such separations and are connected to the building fire alarm system.

2) Existing floor assemblies required by Sentence 3.3.1.1.(5) to be **fire separations**, need not exceed a 1 h **fire-resistance rating** provided the **suite** is sprinklered.

11.3.4.3. Alternative to 20 Minute Doors

1) An existing door assembly may be retained in place of a required door assembly with a 20 min **fire-protection rating** provided
   a) a solid core wood door has a minimum thickness of no less than 45 mm, or
   b) a hollow core or panel type suite door has a layer of gypsum wallboard on the **suite** side covered by a minimum 0.9 mm thick sheet steel which extends over the edges of the door.

11.3.5. ALTERNATIVES FOR EXITS

11.3.5.1. General

1) Except as permitted in Articles 11.3.5.2. and 11.3.5.3. and in Subsection 11.3.6., every floor area or other space shall be served with exits in conformance with Section 3.4.

11.3.5.2. Openings in an Exit Enclosure

1) A maximum of 2 **suite** doors or 2 room doors per storey may be located within an exit enclosure provided
   a) the exit enclosure is not required to have a **fire-resistance rating** of more than 1 h,
   b) the suites or rooms have a second and separate **means of egress**, and
   c) the **suite** or room doors have a **fire-protection rating** of 45 min, are self-closing and self-latching and do not lock automatically.

2) Exit stairs shall be enclosed as required in Subsection 3.4.4. except that existing exit enclosures may have
   a) wired glass set in steel frames conforming to Article 3.1.8.14. only in the portion of the enclosure which faces a **public corridor**, and
   b) in sprinklered buildings, acceptable hold-open devices actuated by **smoke detectors** and the building fire alarm system.

11.3.5.3. Group C Single Exit

1) A single **exit** is permitted from an existing non-sprinklered **dwelling unit** provided
   a) the **exit** is an exterior doorway located no more than 1.5 m above adjacent ground level,
   b) the total area served by the **exit** door does not exceed 100 m²,
   c) the maximum travel distance within the **dwelling unit** does not exceed 15 m, and
   d) it is not necessary to travel up or down more than one storey to reach the **exit** door, or the uppermost floor level opens from a common area to an unenclosed balcony or deck no more than 6 m above adjacent ground level.

11.3.6. ALTERNATIVES FOR SPRINKLERED BUILDINGS

11.3.6.1. General

1) The alternative compliance measures in Articles 11.3.6.2. to 11.3.6.9. may be used in a **building** where
   a) the **building** is sprinklered in conformance with Subsection 3.2.5., and
   b) the **building** has a fire alarm system in conformance with Subsection 3.2.4.

11.3.6.2. Group C and D Fire Containment
1) The fire separation between a Group C or D occupancy and the remainder of a building which is no more than 3 storeys in building height need not exceed a fire-resistance rating of 45 min.
2) Existing lath and plaster, properly restored to its original condition, may be accepted by the Chief Building Official as meeting the fire separation requirements in Sentence (1).

11.3.6.3. Occupancy Separations
1) The existing fire-resistance rating for an occupancy separation in a building need not exceed 1 h when the By-law requires 2 h for new construction and 45 min when the By-law requires 1 h for new construction.

11.3.6.4. Flame Spread Rating
1) The flame-spread rating for an existing wall or ceiling finish may be increased to 300 for no more than 25% of the wall or ceiling area, provided the wall or ceiling has no exposed foamed plastic.

11.3.6.5. Fire Dampers
1) Where a fire separation is permitted to have a 45 min fire-resistance rating, a fire damper is not required for existing noncombustible ducts less than 0.065 m² in cross-sectional area.

11.3.6.6. Plastic Sprinkler Piping
1) Plastic sprinkler piping may penetrate a vertical fire separation provided
   a) the piping and its installation are listed by an acceptable testing agency, and
   b) the piping is tightly fitted or fire stopped to maintain the integrity of the separation.

11.3.6.7. Smoke-Venting in High Buildings
1) Existing means of venting which are capable of removing smoke to aid firefighting may penetrate exterior openings and existing shafts in adjacent fire compartments.

11.3.6.8. Alternatives for Dead-end Public Corridors
1) In a building provided with a sprinkler system with fast-response heads, existing public corridors which have smoke detectors installed and connected to the fire alarm system may contain existing dead-end public corridors of lengths not exceeding 10 m to the nearest exit in Group C occupancies and 15 m to the nearest exit in Group D, Group E, Group F Divisions 2 and Group F Division 3 occupancies.
2) In a building containing exits conforming to Article 11.3.6.9., one existing dead-end public corridor per floor may be permitted provided
   a) the existing dead-end public corridor does not exceed the lengths specified in Sentence (1),
   b) each exit stair serving the existing dead-end public corridor contains a smoke barrier between each storey, which prevents smoke from entering stairways and allows access to other stairways, and which may have a door equipped with an acceptable hold-open device actuated by a local smoke detector circuit, and
   c) the entire building is sprinklered with fast-response heads.

11.3.6.9. Alternatives for Exits
1) Existing open exit stairways located at the ends of public corridors need not be enclosed provided
   a) the building does not exceed 3 storeys in building height,
   b) there is a smoke barrier located within each public corridor approximately midway between the exit stairways, which
      i) has a door provided with an acceptable hold-open device actuated by the fire alarm system and smoke detectors on that floor,
      ii) is constructed of tempered or wired glass, or has a fire-protection rating of no less than 20 min, and
      iii) is designed to retard the passage of smoke,
   c) the public corridor contains no dead-ends.
d) the public corridor on both sides of the smoke barrier is continuously pressurized, and
e) the entire building is sprinklered with fast-response heads.

2) Wired glass in steel frame exposure protection for exterior fire escapes need not be provided in an existing building provided
   a) there is at least one exit enclosure which conforms to this By-law and which leads directly to the exterior of the building,
   b) access to the fire escape is by means of a full-size door at each floor level,
   c) the fire escape leads directly to grade level or leads to grade level by means of an interior stair enclosure no less than 750 mm in width,
   d) a sprinkler head is located on the ceiling adjacent to and within 1500 mm of each opening requiring protection, and
   e) the entire building is sprinklered with fast-response heads.

3) Where a building is provided with a sprinkler system with fast-response heads, existing exit doors may be retained provided they do not swing over stairs or significantly impede safe egress and the Chief Building Official is satisfied that the existing exit door swing and existing exit and corridor widths substantially comply with the requirements of Section 3.4.

4) Existing egress stairs with rectangular treads in straight flights, other than those serving seating areas, may be retained provided that
   a) existing tread and riser dimensions within a flight comply with Table 11.3.6.9.(4),
Division B: Acceptable Solutions

Part 11 – Existing Buildings

ii) protected against fire in conformance with Clauses 3.2.6.5.(3)(b) or (c), and
iii) in a building over 3 storeys in building height, protected against smoke movement so that the hoistway will not contain more than 1% per cent by volume of contaminated air from a fire floor during a period of 2 h after the start of a fire, assuming an outdoor temperature equal to the January design temperature on a 2.5% per cent basis determined in conformance with Subsection 1.1.3.,
b) be divided into at least 2 zones by fire separations conforming to Sentences (2), (3) and 3.1.8.5.(6) so that (See Note A-3.3.1.7.(1)(b))
i) persons with disabilities can be accommodated in each zone, and
ii) the travel distance from any point in one zone to a doorway leading to another zone shall be not more than the value for travel distance permitted by Sentence 3.4.2.5.(1) for the occupancy classification of the zone,
(See also Sentence 3.1.8.5.(6) for requirements regarding the passage of smoke.)
c) in the case of residential occupancies, be provided with balconies conforming to Sentence (4),
d) have an accessible exterior exit at ground level, or
e) have a ramp conforming to Subsection 3.8.3. leading to ground level.
(See Note A-11.3.7.1.(1).)
2) Except as permitted by Sentence (3), the fire separations referred to in Clause (1)(b) shall have a fire-resistance rating not less than 1 h.
3) The fire-resistance rating of the fire separations referred to in Clause (1)(b) is permitted to be less than 1 h but not less than 45 min provided the fire-resistance rating required by Subsection 3.2.2. is permitted to be less than 1 h for
a) the floor assembly above the floor area, or
b) the floor assembly below the floor area, if there is no floor assembly above.
4) A balcony required by Clause (1)(c) shall
   a) have direct access from the suite or floor area,
   b) be not less than 1.5 m deep from the outside face of the exterior wall to the inside edge of the balcony, and
   c) provide not less than 2 m² of balcony space for each accessible sleeping room or bed space.
5) The floor area on either side of a horizontal exit conforming to Article 3.4.6.10. is permitted to be considered as a zone in applying the requirements of Clause (1)(b).

11.3.8. ALTERNATIVES FOR BUILDING SYSTEMS

11.3.8.1. Location of Exhaust Vents in a Building Containing not more than 2 Principal Dwelling Units
1) In a building containing not more than 2 principal dwelling units, exhaust vents serving heating and air conditioning equipment and similar appliances, other than direct vented fireplaces, shall
   a) not terminate within
      i) 1.2 m horizontally of an adjacent property line,
      ii) 1.8 m vertically of the underside of a soffit above, or
      iii) 1.2 m horizontally of any soffit vent above,
   b) be located as high as possible, and
   c) be directed upwards and away from the source building with
      i) a vertical discharge through the roof, or
      ii) a minimum 3” diameter vent in a side discharge configuration with a 45° or 60° elbow termination.
11.4.1. APPLICATION

11.4.1.1. Alternative Compliance Measures for Existing Conditions

1) The alternative compliance measures for conversions in this Section apply to existing conditions only and do not apply to new work, which must conform to the requirements for new construction in this By-law.
2) Except as required by this Section, the alternative compliance measures in Section 11.3. may be applied to existing conditions for conversions.
3) Except as required by this Section, where a building is a heritage building, the acceptable solutions in Section 11.5 may be applied to existing conditions for conversions.

11.4.2. CONVERSION OF AN EXISTING RESIDENTIAL BUILDING CONTAINING NOT MORE THAN TWO PRINCIPAL DWELLING UNITS INTO A COMMUNITY CARE FACILITY, GROUP RESIDENCE OR CHILD CARE FACILITY

11.4.2.1. General Requirements

1) An existing residential building containing not more than two principal dwelling units may be converted or partially converted into a community care facility, group residence or child care facility provided:
   a) the occupant load does not exceed
      i) 10 residents in a community care facility,
      ii) 6 residents in a group residence, or
      iii) 8 children in a child care facility,
   b) the building containing a community care facility or group residence is
      i) separated from a residential building containing not more than one principal dwelling unit by a fire separation with a fire resistance rating of 1 h,
      ii) separated from a residential building containing not more than two principal dwelling units by a fire separation with a fire resistance rating of 2 h,
      iii) completely sprinklered, and
      iv) equipped with a fire alarm system, emergency lights and smoke and heat detectors installed throughout the building.
   c) the child care facility conforms with Clauses 3.1.2.5.(3)(a) and (b),
   d) firefighter access conforms with this By-law,
   e) the building area is no more than 300 m²,
   f) all unsafe conditions are corrected to the satisfaction of the Chief Building Official, and
   g) the building shall be upgraded to conform to upgrade design levels F2, S2, N2, A2 as defined in the Upgrade Mechanism Model in Division B Appendix A and the energy upgrade requirements of Article 11.2.1.4.

11.4.2.2. Alternative Compliance Measures

1) The alternative compliance measures contained in Sentences (2) to (11) inclusive may be applied to the conversion or partial conversion of an existing residential building containing not more than two principal dwelling units into a community care facility, group residence or child care facility.
2) For the purposes of determining building height, a residential building containing not more than one principal dwelling unit constructed pursuant to a building permit issued prior to July 01, 1994 which is four storeys or less in height may be considered as 3 storeys in building height.
3) Existing exterior wood-frame walls may be retained instead of required noncombustible construction provided:
   a) a minimum 45 min fire-resistance rating is provided, and
   b) all voids are filled with mineral wool or fibreglass batts.
4) Combustible exterior cladding materials may be used instead of required noncombustible cladding provided the cladding:
   a) has a flame-spread rating of no more than 25,
b) is underlaid with a minimum layer of 12.7 mm exterior gypsum board sheathing, and
c) is composed of
   i) aluminum panels,
   ii) fire-retardant treated wood panels,
   iii) fire-retardant treated cedar shakes or shingles, or
   iv) vinyl siding.

5) Where exterior walls and openings are required by Subsections 3.2.3. or 9.10.14. to have exposure protection, existing openings need only conform to Article 11.3.3.4.

6) If one interior exit stair is no less than 900 mm wide, a second interior exit stair which is no less than 750 mm wide may be permitted.

7) The flame-spread rating of the existing interior finish of a means of egress need not exceed 150.

8) Ducts passing through fire separations need not be equipped with fire dampers if
   a) the duct opening is less than 150 cm² in cross-sectional area, or
   b) the duct work is constructed entirely of sheet steel and the duct opening is no more than 1000 cm² in cross-sectional area.

9) Manual stations are not required if the fire alarm system and the sprinkler water flow alarm are designed in accordance with Article 3.2.4.8.

10) An existing exterior wall opening adjacent to an exterior exit stair or fire escape need not conform to Article 3.2.3.13. if the opening is glazed with wired or tempered glass in an aluminum or wood frame.

11) A single exit from a dwelling unit need not conform to Sentence 3.3.4.3.(3) if
    a) the exit serves only one dwelling unit, and
    b) the vertical floor elevation from the uppermost floor level to the adjacent ground level does not exceed 6 m.

11.4.3. CONVERSION OF A PORTION OF A SUITE INTO AN ANCILLARY RESIDENTIAL UNIT

11.4.3.1. Alternative Compliance Measures

1) Except as required in Sentences (2) and (3), where an existing building containing not more than two principal dwelling units is altered to create an ancillary residential suite, the existing building shall conform to the requirements of Section 9.37, except as permitted by Table 11.4.3.1., provided the building was constructed under a building permit issued on or prior to June 22, 2004. (See Note A-11.4.3.1.(1).)

2) Where the alteration in Sentence (1) includes an addition, the addition shall conform to the requirements of this By-law.

3) Where an existing building was constructed with a building permit issued on or after June 22, 2004, the existing building and the alteration shall conform to Part 9.37 of Division B.

4) Notwithstanding the requirements of Sentence 9.34.1.1.(1), circuits and receptacles in the ancillary residential suite shall have a minimum of
   a) two kitchen counter duplex receptacles
      i) supplied by two appliance circuits, and
      ii) wired on single circuits or a split circuit,
   b) two duplex receptacles located on different walls in each bedroom, and
   c) three duplex receptacles located on different walls in the living area.

5) Notwithstanding the requirements of Sentence 9.34.1.1. (1)
   a) where a single existing panel board is located in a common area within the building accessible to all occupants of the building, the panel board may supply electrical loads for both the principal dwelling and the ancillary residential suite,
   b) any electrical range and equipment loads provided for the ancillary residential suite shall be calculated with demand factors in conformance with Sentence 9.34.1.1.(2), and
   c) general circuit branch wiring may be interconnected between outlets located in the principal dwelling and the ancillary residential suite.
### Table 11.4.3.1.
Fire Safety Requirements for Ancillary Residential Suite Conversions
Forming Part of Article 11.4.3.1.

6) For the purposes of determining building height, an existing building containing not more than two principal dwelling units constructed pursuant to a building permit issued on or prior to June 22, 2004 which is four storeys or less in height may be considered as 3 storeys in building height where the project is limited to the creation of a new ancillary residential unit.

11.4.4. ENCLOSURE OF AN EXTERIOR OPEN BALCONY IN AN EXISTING RESIDENTIAL BUILDING

11.4.4.1. Alternative Compliance Measures

1) An existing open balcony may be converted to an enclosed balcony if:
   a) required suite fire separations are provided;
   b) spatial separations conform to this By-law;
   c) travel distances conform to this By-law;
   d) guards conform to this By-law;
   e) exhaust ducts conform to this By-law;
   f) light and natural ventilation are maintained and conform to this By-law;
   g) all new structural work conforms to Part 4;
   h) high building measures (smoke-free refuge areas) are maintained;
   i) the existing door assembly separating the suite from the existing open balcony is maintained, and

   silencing devices which will silence the alarm in conformance with Article 9.10.19.6. of Division B. Carbon Monoxide detectors to be provided in accordance with the 9.32.4.2.(3)
Division B: Acceptable Solutions

Part 11 – Existing Buildings

11.4.5. CONVERSION OF SPACE IN AN EXISTING GROUP F DIVISION 2 BUILDING INTO ARTIST LIVE/WORK STUDIOS

11.4.5.1. Alternative Compliance Measures

1) Artist live/work studios are permitted in an existing building classified as a Group F, Division 2 occupancy if:

a) the building is sprinklered with fast-response heads,
b) all suites are separated from the remainder of the building by a fire separation with a 1 h fire resistance rating and all floors are separated from each other by a fire separation with a 1 h fire resistance rating, except that a 45 min fire-resistance rating or existing lath and plaster in good repair is acceptable in a building less than 4 storeys in building height,
c) the exit systems conform to Section 3.4., except as permitted in Subsections 11.3.5. and 11.3.6.,
d) all public corridors conform to Article 3.3.1.4., except as permitted in Subsections 11.3.4. and 11.3.6.,
e) the emergency lighting conforms to Subsection 3.2.7.,
f) a fire alarm and detection system conforming to Subsection 3.2.4. is installed in the building,
g) if dust or fumes are produced in a studio
   i) the building complies with the Fire By-law, and
   ii) the building is heated by hot water, electrical equipment, or elevated gas-fired forced-air heaters,
h) if flammable or combustible liquids or gases are stored or used in a studio, the building complies with the Fire By-law and the British Columbia Gas Safety Act,
i) service rooms and storage rooms located outside of a studio conform to Section 3.6.,
j) the floor assembly is designed for a minimum live load of 3.6 kPa and the building conforms to the structural upgrade level S3 as defined in the upgrade mechanism model within Division B Appendix A,
k) a studio complies with the sound transmission requirements of Section 5.9.,
l) light and ventilation for the studio sleeping area complies with Parts 5 and 6,
m) shared washroom facilities comply with the requirements of the Standards of Maintenance By-law for lodging houses, and

2) For the purpose of determining occupancy classification, artist live/work studios shall be considered to have an occupancy classification as defined in Articles 3.1.3.3. and 3.1.3.4.

11.4.6. CONVERSION OF AN EXISTING HOTEL TO SINGLE ROOM ACCOMMODATION

11.4.6.1. Alternative Compliance Measures

1) Single room accommodation is permitted in an existing building classified as a Group C major occupancy (hotel) if:

a) all suites are separated from the remainder of the building by a fire separation with a 1 h fire resistance rating and all floors are separated from each other by a fire separation with a 1 h fire resistance rating, except that a 45 min fire-resistance rating or existing lath and plaster in good repair is acceptable if the building is less than 4 storeys in building height,
b) the exit systems conform to Section 3.4., except as permitted in Subsections 11.3.5. and 11.3.6.,
c) all public corridors conform to Article 3.3.1.4., except as permitted in Subsections 11.3.4. and 11.3.6.,
d) the emergency lighting conforms to Subsection 3.2.7.,
Division B: Acceptable Solutions

Part 11 – Existing Buildings

e) a fire alarm and detection system conforming to Subsection 3.2.4. is installed throughout the building,
f) the floor assembly is designed for a minimum live load of 2.4 kPa,
g) notwithstanding Clause (j), the building conforms to the structural upgrade level S3 as defined in the upgrade mechanism model in Division B Appendix A,
h) shared washroom facilities comply with the requirements of the Standards of Maintenance By-law for lodging houses,
i) the suites comply with the sound transmission requirements of Section 5.9 of Division B, and
j) the building is upgraded to an acceptable level as defined in the upgrade mechanism model in Division B Appendix A.

11.4.7. CONVERSION OF AN EXISTING NON-STRATA BUILDING TO A STRATA PROPERTY

11.4.7.1. Alternative Compliance Measures

1) Except as permitted by Sentence (2), an existing building or parcel may be converted into 2 or more strata lots, if the entire building is
   a) upgraded to design upgrade levels F4, S4, N4, A4 and E4 as detailed in the upgrade mechanism model in Division B Appendix A, and
   b) fully sprinklered.

2) An existing parcel containing one or more buildings, may be converted into 2 or more strata lots, if the existing buildings are not otherwise altered, and
   a) upgraded to comply with the exposure requirements of Subsection 3.2.3.,
   b) upgraded to comply with the fire department access path of travel in accordance with Articles 3.2.5.5. and 3.2.5.6.,
   c) upgraded to design upgrade levels S4 and N4, as detailed in the upgrade mechanism model in Division B Note A-11.2.1.2., and
   d) fully sprinklered.

(See Note A-11.4.7.1.(2).)

Section 11.5. Alternative Compliance Measures for Heritage Buildings

11.5.1. APPLICATION

11.5.1.1. Alternative Compliance Measures

1) This Subsection provides alternative compliance measures for the restoration and rehabilitation of heritage buildings.

2) The alternative compliance measures provided in Table 11.5.1.1. apply to existing conditions only and do not apply to new work which must conform to the requirements for new construction in other Parts of this By-law.

3) Notwithstanding Article 11.2.1.6, relocation of a heritage building may conform to the upgrade requirements for spatial separation outlined in Table 11.5.1.1.

4) Site-built and custom-built replica wood doors, wood framed windows and wood framed skylights, intended to preserve the heritage look of a building that separated conditioned space and unconditioned space from the exterior, are exempt from the provisions of Subsection 9.7.4. and Article 5.10.2.2. provided the replica
   a) complies with Clause 9.7.5.1.(1)(a) or (b) as applicable,
   b) does not create an unsafe condition, and
   c) is acceptable to the Chief Building Official.

</table>
| **1** | **Fire Separations**  
Sentence 3.1.3.1.(1) and Table 3.1.3.1.; Subsection 9.10.9. | Except for F1 occupancies, 1 h fire separation is acceptable, if the building is sprinklered. |
| **2** | **Fire Separations**  
Sentence 3.1.3.1.(1) and 3.1.3.1.; Subsection 9.10.9. | 1/2 h fire separation is acceptable if the building is sprinklered. |
| **3** | **Noncombustible Construction**  
Subsection 3.1.5. and Article 9.10.6.1. | 1. Roofs may be of combustible construction provided the building is sprinklered.  
2. Up to 10% gross floor area to a maximum of 10% of any one floor area may be of combustible construction provided the building is sprinklered. |
| **4** | **Fire-resistance Rating**  
Sentence 3.1.7.1.(1); Article 9.10.3.1. | A fire-resistance rating may also be used based on:  
1. HUD No. 8 Guideline on Fire Ratings of Archaic Materials and Assemblies.  
2. Fire Endurance of Protected Steel Columns and Beams, DBR Technical Paper No. 194.  
3. Fire Endurance of Unit Masonry Walls, DBR Technical Paper No. 207.  
| **5** | **Rating of Supporting Construction**  
Article 3.1.7.5.; Article 9.10.8.3. | Heavy timber construction is permitted to have a fire resistance rating less than would be required by the By-law provided the building:  
(a) is sprinklered, and (b) does not exceed 6 storeys in building height. |
| **6** | **Continuity of Fire Separations**  
Sentence 3.1.8.3.(1) and 3.1.8.3.(2); Article 9.10.9.2. | Fire separations are not required to be continuous above the ceiling space where:  
(a) the ceiling space is non-combustible construction,  
(b) both fire compartments are sprinklered, or  
(c) the ceiling has a minimum rating of 30 minutes. |
| **7** | **Wired Glass**  
Sentences 3.1.8.5.(1) and 3.1.8.14.(2); Articles 9.10.13.1. and 9.10.13.5. | For fixed transoms or sidelights, 6 mm wired glass fixed to a wood frame of at least 50 mm thickness with steel stops is permitted in a required fire separation. |
| **8** | **Mezzanines**  
Sentences 3.2.1.1.(3) to 3.2.1.1.(6); Article 9.10.4.1. | Enclosed mezzanines may be up to 40% of the storey in which they occur and not be considered a storey in building height if the building is sprinklered. |
## Division B: Acceptable Solutions

### Part 11 – Existing Buildings

<table>
<thead>
<tr>
<th>Article</th>
<th>Description</th>
</tr>
</thead>
</table>
| 9 | **Building Height**  
   Articles 3.2.2.20. to 3.2.2.88.  
   Noncombustible construction required for buildings over 3 storeys in building height.  
   Buildings may be of combustible construction up to 6 storeys provided:  
   (a) the building is sprinklered  
   (b) the building contains Group C, D, E, F2 or F3 occupancies, and  
   (c) floor assemblies not required to exceed 1 h fire separation requirements may be of heavy timber construction. |
| 10 | **Spatial Separation**  
   Subsection 3.2.3.; Subsection 9.10.14.  
   The area of unprotected opening shall not exceed the limits in Tables 3.2.3.1.A to 3.2.3.1.E  
   The area of existing unprotected opening is not limited provided:  
   (a) the limiting distance is a minimum 1 m,  
   (b) the building has a supervised sprinkler system in conformance with Sentence 3.2.4.10.(3),  
   (c) the existing unprotected openings are protected with close spaced sprinklers per clause 11.3.3.4.(b), and  
   (d) the sprinkler system is designed to notify the fire department in conformance with Sentence 3.2.4.8.(4). |
| 11 | **Construction of Exposing Building Face**  
   Article 3.2.3.7.; Article 9.10.14.5.  
   The exposing building face is required to have a fire-resistance rating and/or be of noncombustible construction.  
   Exposing building face is not required to have a fire resistance rating if the building is sprinklered. Also, the exposing building face is not required to be of noncombustible construction if it is protected by an exterior sprinkler system conforming to NFPA 13. |
| 12 | **Roof Covering Rating**  
   Sentence 3.1.15.2.(1)  
   Class A, B or C roofing covering in conformance with CAN/ULC-S107 required.  
   For existing roofs not covered by a Class A, B or C roofing, a manually operated deluge system in accordance with NFPA 13 is permitted. |
| 13 | **Smoke Alarms**  
   Sentences 3.2.4.21.(5) and 3.2.4.21.(6); Sentence 9.10.16.3.(1)  
   Smoke alarms are required to be connected to an electric circuit.  
   Smoke alarms may be battery operated in a residential building containing not more than one principal dwelling unit. |
| 14 | **Interconnected Floor Space**  
   Subsection 3.2.8.; Sentence 9.10.1.3.(6)  
   1. Open stairs in buildings of maximum 4 storeys in building height need not comply with Subsection 3.2.8. provided:  
   (a) the building contains a Group C or D occupancy,  
   (b) the building is sprinklered with fast-response sprinklers,  
   (c) corridors opening into the interconnected floor space are separated from the interconnected floor space by a fire separation with the rating required for the corridor, and  
   (d) smoke detectors are installed in the rooms opening into the interconnected floor space and the smoke detectors are connected to the fire alarm system.  
   2. Open stairs in buildings of maximum 3 storeys in building height, or the first 2 storeys and basement, need not comply with Subsection 3.2.8. provided:  
   (a) the building contains a Group C or D occupancy,  
   (b) the building is sprinklered with fast-response sprinklers,  
   (c) smoke detectors are installed in the rooms opening into the interconnected floor space and the smoke detectors are connected to the fire alarm system, and  
   (d) at least one means of egress is not through the interconnected floor space. |

<td><strong>Separation of Suites</strong> Article 3.3.1.1.; Article 9.10.9.13., Article 9.10.9.14.</td>
<td>Suites are required to be separated from adjoining suites by 3/4 h or 1 h rated fire separations.</td>
<td>Existing fire separations of 30 min, such as wood lath and plaster in good condition, are acceptable in sprinklered buildings not exceeding 6 storeys in building height.</td>
</tr>
<tr>
<td><strong>Corridor Fire Separation</strong> Article 3.3.1.4.; Article 9.10.9.15.</td>
<td>Public corridors are required to be separated from the remainder of the building by a fire separation having a fire resistance rating of at least 3/4 h.</td>
<td>Existing corridors with 30 min fire-resistance ratings, such as wood lath and plaster in good condition, are acceptable in residential occupancies provided the building: (a) does not exceed 6 storeys in building height, and (b) is fully sprinklered with fast-response sprinklers.</td>
</tr>
<tr>
<td><strong>Corridor Width</strong> Articles 3.3.1.9. and Subsection 3.4.3.; Article 9.9.3.3. Public corridors and exit corridors are permitted to have a minimum width of 1 100 mm.</td>
<td>Public corridors and exit corridors are permitted with a minimum width of 800 mm provided: (a) the occupant load of the building is maximum 20 people, and (b) the building does not exceed 3 storeys in building height.</td>
<td></td>
</tr>
<tr>
<td><strong>Door Swing</strong> Articles 3.3.1.10. and 3.4.6.12.; Article 9.9.6.5.</td>
<td>Doors required to swing in the direction of exit travel.</td>
<td>Second egress door from a room is not required to swing in the direction of exit travel provided: (a) the building is sprinklered and the system is supervised in conformance with Sentence 3.2.4.9.(2), and (b) the occupant load of the building is a maximum of 100 people.</td>
</tr>
<tr>
<td><strong>Stairs, Ramps, Handrails and Guards</strong> Article 3.3.1.14., Article 3.3.1.16., Article 3.3.1.18., Article 3.4.6.4., Article 3.4.6.6.; Section 9.8.</td>
<td>Existing conditions that do not comply fully with the requirements are permitted if they are acceptable to the Chief Building Official.</td>
<td></td>
</tr>
<tr>
<td><strong>Transparent Doors and Panels</strong> Article 3.3.1.19.; Article 9.6.1.4.</td>
<td>Glass in doors and sidelights are required to be protected by guards and to be safety glass.</td>
<td>Existing glass or transparent panels that do not comply fully with the requirements are permitted if sufficiently discernible or guards are provided in hazardous situations.</td>
</tr>
<tr>
<td><strong>Dead-end Corridors</strong> Sentence 3.3.1.9.(7); Article 9.9.7.3.</td>
<td>Dead-end corridors are permitted to a maximum length of 6 m.</td>
<td>1. Dead-end corridors are permitted to a maximum length of 10 m in Group C occupancies provided: (a) the building is sprinklered with fast-response sprinklers, and (b) smoke detectors are installed in the corridor system. 2. Dead-end corridors are permitted to a maximum of 15 m in length in Group D, E, F2 and F3 occupancies provided: (a) the building is sprinklered with fast-response sprinklers, and (b) smoke detectors are installed in the corridor system.</td>
</tr>
<tr>
<td><strong>Exits</strong> Article 3.4.2.1.; Article 9.9.8.2.</td>
<td></td>
<td>Floor areas may be served by a single exit within the limits of Sentence 3.4.2.1.(2) provided: (a) the building does not exceed 3 storeys in building height, (b) the building is sprinklered with fast-response sprinklers, and (c) all floor areas are protected by a system of smoke detectors connected to a fire alarm system.</td>
</tr>
<tr>
<td><strong>Reduction of Exit Width</strong> Sentence 3.4.3.3.(2); Article 9.9.6.1.</td>
<td>Swinging doors in their swing shall not reduce the effective width of exit stairs and landings to a minimum of 550 mm provided: (a) they serve Group C or D occupancies,</td>
<td></td>
</tr>
<tr>
<td>Landings to less than 750 mm.</td>
<td>(b) the building does not exceed 4 storeys in building height, and (c) the building is sprinklered.</td>
<td></td>
</tr>
<tr>
<td>Fire Separation of Exits</td>
<td>1. Buildings of 3 storeys or less may have exits that are separated by a fire separation that does not have a fire-resistance rating provided: (a) the building is sprinklered with fast-response sprinklers, and (b) the sprinkler system is supervised in accordance with Sentence 3.2.4.9.(2). 2. Buildings not exceeding 6 storeys in building height may have exits that are separated by a 45 min fire separation provided the building is sprinklered.</td>
<td></td>

</table>

**Section 11.6. Temporary Buildings and Occupancies**

**11.6.1. APPLICATION**

1. **11.6.1.1. Application**
   1) The alternative compliance measures in this Section apply to
      a) arts and culture indoor events in existing buildings,
      b) temporary buildings,
      c) special event facilities in existing or temporary buildings, and
      d) temporary emergency shelters in existing buildings.
   2) Subject to the provisions of Article 1.6.7.3. of Division C, "temporary" in this Section means
      a) in relation to special event facilities, no more than two months,
      b) in relation to temporary buildings, no more than one year, and
      c) in relation to emergency shelters, no more than one year.

2. **11.6.1.2. Alternative Compliance Measures**
   1) Section 11.3. may be applied to existing conditions, except as defined in Subsections 11.6.2. and 11.6.3.
   2) The alternative compliance measures in Section 11.5 may be applied to existing conditions in a heritage building, except as defined in Subsections 11.6.2. and 11.6.3.
   3) The alternative compliance measures provided in Table 11.6.3.1. apply to existing buildings used for arts and culture indoor events and do not apply to new work, which must conform to the requirements for new construction in other Parts of this By-law.
   4) The alternative compliance measures provided in Table 11.6.3.1. apply to existing buildings used as temporary special event facilities and temporary emergency shelters and to temporary buildings and do not apply to new work, which must conform to the requirements for new construction in other Parts of this By-law.

**11.6.2. ARTS AND CULTURE INDOOR EVENT**
11.6.2.1. Alternative Compliance Measures

1) Where the occupancy of an existing building or portion of an existing building is classified as Group D offices, Group E retail, Group F Division 2 production or rehearsal studio, wholesale, warehouse, or factory, or Group F Division 2 artist studio without living accommodations, the major occupancy may be changed to a temporary Group A Division 2 major occupancy for an arts and culture indoor event if
   a) the maximum occupant load is no more than 250 persons,
   b) the arts and culture indoor event is located in the first storey or the storey below the first storey and has at least one exit that conforms to Clauses 3.8.3.19.(1)(d) or (e),
   c) emergency lighting is provided
      i) inside washrooms or, in the case of a single toilet room, immediately outside the entrance door and visible under the closed toilet room door, and
      ii) in locations leading from the arts and culture indoor event to the street as described in Sentence 3.2.7.3.(1),
   d) portable fire extinguishers are installed in accordance with the Fire By-law, with at least one extinguisher at the main entrance and at each egress door leading from the arts and culture indoor event floor area,
   e) an approved fire emergency procedures and security plan with approved maximum occupant load is posted beside each portable extinguisher at the main entrance and at each egress door leading from the arts and culture indoor event,
   f) the building is equipped with a fire alarm system, or supervisory staff are designated to monitor egress and exit doors and to carry out an emergency evacuation in accordance with approved fire emergency procedure, and
   g) the storey below the first storey used for an arts and culture indoor event is equipped with a sprinkler system,
   h) the arts and culture indoor event has at least one accessible entrance, and
   i) the arts and culture indoor event has a means of egress in accordance with Article 3.8.3.19.

2) The floor of a building used for an arts and culture indoor event shall be
   a) constructed of concrete supported by solid ground without suspended slab, or
   b) certified by a registered professional, after a structural review, to be safe for assembly occupancy and designed to a minimum specified uniformly distributed live load of 4.8 kPa.

3) Cooking which generates grease-laden vapour is not permitted at an arts and culture indoor event, unless commercial cooking and ventilation equipment, installed under permit and conforming with Article 6.2.2.7., is used.

4) An approved maximum occupant load from the Vancouver Fire and Rescue Services, and a Vancouver Police Department security assessment shall be obtained for arts and culture indoor events in accordance with Table 11.6.2.1.

5) The number of exits, designated supervisory staff, and exit signs for arts and culture indoor events shall be provided in accordance with Table 11.6.2.1.

### Notes to Table 11.6.2.1.:

1. Vancouver Fire and Rescue Services will assess and approve the maximum temporary occupant load for arts and culture indoor events.
2. Supervisory staff is required to monitor all egress/exit doors. One supervisory staff must be provided at each required exit door at all times.
3. SOL means Special Occasion License issued by the British Columbia Liquor Control and Licensing Branch.
4. Dry event means an event at which there is no liquor service.
5. VPD means Vancouver Police Department.

### 11.6.3. SPECIAL EVENT FACILITIES, EMERGENCY SHELTERS AND TEMPORARY BUILDINGS

#### 11.6.3.1. Alternative Compliance Measures

1. Table 11.6.3.1. provides alternative compliance measures for
   a) temporary use of buildings as special events facilities and emergency shelters, and
   b) temporary buildings.

</tr>
</tbody>
</table>
### Direction of Door Swing

**3.4.6.12.** Tent exit doors may be equipped with fabric flaps, tie straps, zippers, or VELCRO brand or equivalent hook and loop fasteners in lieu of doors that swing on a vertical axis provided

- a) a minimum of two *exit* doors are be provided for each tent,
- b) the *occupant load* of the tent does not exceed 60, and
- c) security personnel are trained for emergency evacuation procedures, and remain in the vicinity of the *exit* at all times.

Temporary sliding gates may be used as *exit* doors provided

- a) gates are left open during normal operating hours and always manned by security personnel,
- b) gates are closed during non-operating hours, and locked with chains and a padlock,
- c) operational procedures are in place to ensure that the chains and padlock are removed during operating hours, and
- d) security personnel are trained for emergency evacuation procedures.

### Environment Separation

**Part 5** does not apply.

### Commercial Cooking Equipment

**6.2.2.7.** 26 gauge galvanized sheet metal kitchen exhaust ducts with seams are permitted provided clean-out access panels are provided at all elbow locations and at 6 m spacing for straight runs.

### Faucets and Shower Head Efficiency

**10.3.1.1.** No restriction required.

### Water Closet Efficiency

**10.3.1.2.** No restriction required.

### Urinal Efficiency

**10.3.1.2.** All urinals shall conform to CSA B45 “Plumbing Fixtures” and shall have an average water consumption not exceeding 3.8 litres per flush cycle.

### Sanitary Connection

**2.4.2.1. Book II** Portable water closets that form part of a temporary facility need not be connected to the sanitary drainage system.

### Storm Drainage Connection

**2.4.2.4. Book II** roofs and paved areas need not be connected to the storm drainage system

### 11.6.3.2. Additional Requirements for Emergency Shelters

1) Notwithstanding the provisions of this By-law, a temporary emergency shelter is permitted in an existing *building*, except that there shall be

- a) no cooking in the *building*, other than food re-heated by microwave,
- b) no less than one staff for each 20 shelter spaces on duty at all times,
- c) no more than one shelter bed for every 3.7 m² of *floor area* or, if bunk beds are provided, no more than two shelter beds for every 3.7 m² of *floor area*,
- d) aisles no less than 900 mm wide on both sides of every shelter bed,
- e) at least 2 *means of egress*,
- f) *exit* signs on all *exit* doors,
- g) additional directional *exit* signs, in any circumstance where *exit* signs over *exit* doors are not visible from any location in the shelter,
- h) *exit* signs which comply with Subsection 3.4.5.,
- i) *smoke alarms* conforming to Article 3.2.4.20. installed throughout the entire *building*,
Division B: Acceptable Solutions

Part 11 – Existing Buildings

11.7 Alterations for Building Energy and Emissions Performance

11.7.1 Energy Retrofit Design Building Classification

11.7.1.1. Application to Existing Buildings

1) Except as permitted by Sentence (2), alterations to a building shall be in conformance with this Subsection for the purposes of energy and emissions performance.
2) A structure that cannot be identified by the characteristics of a building in this Subsection shall comply with the requirements of 11.7.1.2., or as deemed acceptable to the Chief Building Official.
3) Except as permitted in Sentences (4), (5) and 11.7.1.2 through 11.7.1.6, alterations to a building shall comply with
   a) Alterations clauses within ANSI/ASHRAE/IES 90.1, “Energy Standard for Buildings Except Low-Rise Residential Buildings” and 10.2.2.2.,
   b) 10.2.2.3. and alteration language supporting NECB 2015 (See Note A-11.7.1.1.(3).), or
   c) 10.2.2.5. and alteration language supporting NECB 2015 (See Note A-11.7.1.1.(3).).
4) Where a building contains one or more major occupancies that conform to Subsection 10.2.2.5., the remaining major occupancies shall comply with Clause (3)(a) or (b).
5) Spaces never previously occupied, shall be designed and constructed to new building requirements, in compliance with
   a) Article 10.2.2.3, if the building was designed or upgraded to NECB, or
   b) Article 10.2.2.2.,
   (See Note A-11.7.1.1.(5).)
6) The design requirements of Subsection 10.2.2. shall form an integral part of this Subsection, except where otherwise indicated.

11.7.1.2. Buildings Without Residential or Commercial Components

1) Alterations to systems or components of all buildings, except those included in 11.7.1.3 through 11.7.1.6, shall comply with
   a) Article 10.2.1.2.,
   b) Articles 10.2.2.6 through 10.2.2.22. as applicable, and
   c) the alteration requirements of
      i) Clause 11.7.1.1.(3)(a) except as required by Clause (ii), or
      ii) Clause 11.7.1.1.(3)(b) where the building was designed or upgraded to NECB.

11.7.1.3. Residential Buildings of 7 Stories or More, and Commercial Buildings (with or without residential components)

1) Alterations to systems or components of all buildings containing Group C, D, or E Major Occupancies, except those included in 11.7.1.4 through 11.7.1.6., shall comply with
   a) Article 10.2.1.3.,
   b) Articles 10.2.2.6 through 10.2.2.20. as applicable,
   c) the airtightness performance of Article 10.2.2.21. for reconstruction projects,
   d) Article 10.2.2.22. as applicable, and
   e) the alteration requirements of Clause 11.7.1.1.(3)(c).

11.7.1.4. Residential Buildings of 4 to 6 Storeys, and Mixed-Use Residential Buildings of 1 to 6 Storeys

j) at least one water closet for every 20 shelter spaces,
k) at least one lavatory for every 5 water closets, and
l) all staff shall have training in first aid and emergency evacuations.
1) Except for buildings included in 11.7.1.5 or 11.7.1.6, alterations to systems or components of a building described in Sentence 10.2.1.4.(1), shall comply with
   a) Article 10.2.1.4.,
   b) Articles 10.2.2.6 through 10.2.2.20. as applicable,
   c) the airtightness performance per Article 10.2.2.21. for reconstruction projects,
   d) Article 10.2.2.22. as applicable, and
   e) the alteration requirements of
      i) Clause 11.7.1.1.(3)(a) and the thermal performance of Articles 10.2.2.6. and 10.2.2.7.,
         and heat recovery ventilators per Article 10.2.2.17 unless the building was designed or
         upgraded to NECB,
      ii) Clause 11.7.1.1.(3)(b), and thermal performance per Articles 10.2.2.6. and 10.2.2.7.,
         and heat recovery ventilators per Article 10.2.2.17., or
      iii) Clause 11.7.1.1.(3)(c).

11.7.1.5. Residential Buildings of 1 to 3 Storeys
   1) Except as otherwise required in this Subsection, alterations to systems or components of a building,
      described in Sentence 10.2.1.5.(1), shall comply with
      a) Article 10.2.1.5.,
      b) the thermal performance per Articles 10.2.2.6., except where in a building envelope alteration
         increasing envelope thickness to achieve required RSI-value(s) is deemed prohibitive by the CBO,
         the building design may
            i) achieve a minimum nominal RSI of 2.5 W/m²K in the affected assemblies with heat
               transfer, air leakage and condensation control per Section 9.25, and
            ii) trade-off the remaining unachieved envelope performance with other building systems
               or components to achieve equivalent energy performance outcomes, acceptable to the
               CBO,
      d) 10.2.2.7. through 10.2.2.11. as applicable,
      e) domestic hot water heater per Article 10.2.2.12. except an energy factor value of greater than
         0.62 may be used,
      f) 10.2.2.13. through 10.2.2.20. as applicable,
      g) Article 10.2.2.21 except an airtightness performance of 5.0 ACH may be used for reconstruction
         projects, and
      h) Article 10.2.2.22. as applicable.

11.7.1.6. Residential Buildings with Not More Than 2 Principal Dwelling Units
   1) Except as otherwise required in this Subsection, alterations to systems or components of a building,
      described in Sentence 10.2.1.6.(1), shall comply with
      a) Article 10.2.1.6.,
      b) the thermal performance of Articles 10.2.2.6., except where in a building envelope alteration
         increasing envelope thickness to achieve required RSI-value(s) is deemed prohibitive by the CBO,
         the building design may
            i) achieve a minimum nominal RSI of 2.5 W/m²K in the affected assemblies with heat
               transfer, air leakage and condensation control per Section 9.25, and
            ii) trade-off the remaining unachieved envelope performance with other building systems
               or components to achieve equivalent energy performance outcomes, acceptable to the
               CBO,
      c) Articles 10.2.2.7. through 10.2.2.11 as applicable,
      d) Article 10.2.2.12 except with an energy factor value greater than 0.62,
      e) Articles 10.2.2.13 through 10.2.2.20. as applicable, and
      f) the maximum tested air leakage rates per Article 10.2.2.21. for reconstruction projects only.
NOTES TO PART 11
EXISTING BUILDINGS

A-11.2.1.2. EXISTING BUILDING UPGRADE MECHANISM

BACKGROUND AND INTENT. When work is carried out to an existing building, the Building By-law requires that the building be upgraded to an “acceptable” level. On April 20, 2004 Council approved a new model for determining the “acceptable” level of Building By-law upgrade for existing buildings undergoing alterations under the City’s building permit process.

Prior to April 20, 2004, the Upgrade Mechanism Model was based primarily on construction values. The new Upgrade Mechanism Model determines the required “acceptable” level of upgrade for an existing building using the concept of “Project Types and Categories of Work”.

The intent of the Upgrade Mechanism Model is to provide a road map for building owners and designers to determine the required level of Building By-law upgrade for the existing portion of a building as a function of the project types and the related categories of work.

The Upgrade Mechanism Model is not generally intended for existing residential buildings containing not more than two principal dwelling units. The general upgrade requirement for these types of buildings is defined in Article 11.2.1.4.of Division B.

VOLUNTARY BUILDING BY-LAW UPGRADES. Where a voluntary upgrade for fire alarm systems, sprinkler systems, exits, accessibility, seismic work, building envelope repair, energy efficiency, or water efficiency is performed, it is not the intent of this By-law to require the owner to further upgrade the building provided no other work is included in the project. If other work is included in the project, the upgrade requirement will only be based on the non-voluntary work proposed.

PROCEDURE FOR USING THE UPGRADE MECHANISM MODEL

The following steps outline a recommended procedure for using the Upgrade Mechanism Model.

STEP 1 – Determine Any Other Requirements that may be Applicable. Other Building By-law requirements may be applicable to the existing building project. Review the Overall Conditions for the Upgrade Mechanism Model to determine if other requirements are applicable.

STEP 2 – Determine the appropriate Project Type(s) and Related Category or Categories of Work as a function of the scope of work for the alteration.

If the renovation includes more than one category of work or project type, then the most restrictive upgrade levels from each project type would be applied.

</tr>
<tr>
<td>Major Renovation</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Reconstruction</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### STEP 3 – Determine the Required Design Upgrade Level Based on the Category of Work for the Project

The required upgrade levels for fire, life & health safety; structural safety; non-structural safety; accessibility for persons with disabilities; and energy efficiency are to be determined using each of the applicable project type flow charts and the related category of work.

For Rehabilitation Type Projects use Flow Chart No. 1.
For Change of Major Occupancy Type Projects use Flow Chart No. 2.
For Addition Type Projects use Flow Chart No. 3.

**NOTE:** Where a project involves more than one category of work, the most restrictive upgrade level, as determined from each category of work, shall determine the upgrade design level.

### STEP 4 – Determine the objective and acceptable solution for the most restrictive upgrade level for fire, life and health safety; structural safety; non-structural safety; accessibility for persons with disabilities; and energy efficiency.

The most restrictive upgrade levels are the design upgrade levels that are to be applied to the existing building.

The model is based on incremental upgrade levels for each of the fire, life and health safety (F), structural safety (S); non-structural safety (N); accessibility (A); and energy (E) objectives. For each of the upgrade levels, the model states the objective of the upgrade level as well as the corresponding acceptable solution that is deemed to meet the intended objective of the applicable upgrade level. The objective statement and acceptable solution for each F, S, N and A upgrade level is defined in Table A-11.2.1.2.-B. The objective statement and acceptable solution for each E upgrade level is defined in Table A-11.2.1.2.-C.

The alternative acceptable solution for energy efficiency requires that the determined E design upgrade level from Flow Chart No 1 is used to enter Table A-11.2.1.2.-C to determine the Objective Statement and review the list of options of alternative acceptable solutions. Within Table A-11.2.1.2.-C and the appropriate E Level section, the user selects one alternative acceptable solution from within the Building System chosen by the user to be upgraded. Only one (1) of the solutions in the Alternative acceptable solutions Options column in Table A-11.2.1.2.-C is required to meet the objective. It is up to the user to determine which system in the Building System column and corresponding upgrade solution in the Alternative acceptable solution Option column shall be chosen to satisfy the objective. Within any 5 year period, when an alternative acceptable solution has been used previously within the project area, then that option is not permitted to be used as an alternative acceptable solution.

### PROJECT TYPES AND THEIR RELATED CATEGORIES OF WORK

The Upgrade Mechanism Model is based on the following defined three Project Types and related Categories of Work as illustrated in Table A-11.2.1.2.-A. If the renovation includes more than one category of work or project type, then the most restrictive upgrade levels from *all* the applicable project types would be applied.

**REHABILITATION PROJECT TYPE** (Flow Chart No. 1)

**Voluntary Building By-law Upgrades** – Voluntary Building By-law upgrades are limited to alterations that directly contribute to the improvement of the fire alarm, sprinkler, exit, accessibility, seismic, building envelope, and energy or water efficiency systems in an existing building.

**REPAIR** – Repair pertains to a limited scope of interior or exterior renovation work to replace existing building components with functionally equivalent components. Repair work may not include work that increases the usable floor area of a building, creates an interconnected floor space, supports an addition or change of use, or the consolidation of more than one existing suite into a single tenant space. For Repairs, an E1 level of energy upgrade shall be applied.

**SMALL SUITE** – The upgrade trigger for a Small Suite pertains to limited renovation work within a small suite as defined in Division A, Article 1.4.1.2. Small Suite work may include reconfiguration of the interior space of the suite, but may not include work on more than level (storey or mezzanine), interconnected floor spaces, exterior renovations, or the consolidation of more than one existing suite into a single new tenant space. For Small suite renovations, an E2 level of energy upgrade shall be applied.

**MINOR RENOVATION** – Minor renovation means a project whose scope of work includes construction limited to the improvement, renovation, reconfiguration, or refurbishment of a single suite contained within a single tenant space and those demising walls shared with the adjoining suites, but does not include the public or common floor areas of the building.

Minor renovations may include the following:

- Reconfiguration of the interior space of the suite which may occupy multiple levels in a building,
- Retention of existing interconnected floor spaces that do not create new connections to previously unconnected floor areas,
- Retention of existing mezzanines that do not add floor area,
- Renovation in adjacent suites to the extent necessary to support the relocation of shared demising walls, and
- Exterior renovations pertaining to the subject suite.

Where the renovation includes a new interconnected floor space, this work would not be considered to be a minor renovation. New mezzanines are considered to be additions.

**MAJOR RENOVATION** – Major renovations means work within multiple tenant spaces that is not otherwise considered a minor renovation. Major renovations may include (singly or in combination): Interior re-configuration of multiple tenant spaces, creation of interconnected floor spaces, exterior alterations, or alterations that create a new tenant space. However, where such renovation includes a change of major occupancy classification or a new
mezzanine, this work would not be considered solely as a major renovation. New mezzanines are considered to be additions.

**RECONSTRUCTION** - Reconstruction means the extensive removal of the majority of construction to expose the building’s primary structure on interior and exterior walls, floors and roof with only the primary structural elements remaining in place (building skeleton). Reconstruction also includes substantial reconfiguration of the interior floor space. Where work, which might otherwise be considered as reconstruction, is undertaken solely to facilitate the repair or the abatement of a health hazard of a building, then such work need not be considered a reconstruction and would be considered a repair, minor renovation or a major renovation as defined in this By-law.

Reconstruction project typically include:
- extensive renovations throughout the entire building and the building is gutted.
- the removal of the majority of drywall and plaster from the interior walls.
- the removal of the majority of drywall, plaster, insulation and exterior cladding from the exterior walls,
- the removal of floor and roof membranes and coverings.
Change of Major Occupancy Classification – Change of major occupancy classification means a change of use within a building, a suite, or its constituent floor areas where the proposed use is outside of the currently defined uses of the existing major occupancy classification permitted for the building, the suite, or its constituent floor areas.

Small Suite Change of Major Occupancy Classification – Small suite change of major occupancy classification means a change of use within a small suite, or the constituent floor areas of a small suite, where the occupant load for the entire suite does not exceed 60 persons and the small suite is limited to a Group A, Division 2, Group D, Group E, Group F, Division 2 (wholesale showroom), or Group F, Division 3 major occupancy.

Notes to Flow Chart No. 2:
(1) Occupant load (OL) increase is based on the proposed occupant load for the entire building versus the current occupant load for the entire building. The OL change may be assessed in a comparative manner by considering only those areas undergoing a change of major occupancy, where the occupant load of the remainder of the building cannot otherwise reasonably be assessed. Occupant loads are to be determined by the acceptable solutions in Subsection 3.1.17. of Division B.
(2) The Hazard Index may be determined by the Hazard Index Table A-11.2.1.2.-D. or other methodology as deemed acceptable to the Chief Building Official.
(3) For small suites, the small suite must be separated on the suite side of the suite separation with at least two layers of gypsum wall board (GWB). Where only one layer exists, then an additional layer of GWB must be added to the suite side only. The additional layer of GWB may be any type of GWB with a minimum thickness of 13 mm.
(4) The cumulative 5 year limit is triggered when there is a change of major occupancy in an existing building and the aggregate area of the change in major occupancy including the current work within any 5 year period is greater than 50% of the building area (as defined in Article 1.4.1.2. of Division A) in a building of not more than one storey, or the aggregate area of the change in major occupancy within any 5 year period is greater than 100% of the building area (as defined in Article 1.4.1.2. of Division A) in a building of more than one storey.
(5) Where there is a change of major occupancy and the structural load paths or structural design criteria are altered then it must be demonstrated that the existing building has the structural capacity to carry the increase in load or the building shall be structurally upgraded to carry the increase in live load.

ADDITION PROJECTS (Flow Chart No. 3)

Horizontal Addition – Horizontal additions include both “minor” and “major” horizontal additions. A minor horizontal addition is any expansion of a floor area beyond the extents of the existing floor area in which it is located by not
more than 25 per cent of the existing building area, or by not more than 500 m² in aggregate floor area. A major horizontal addition is any expansion of a floor area beyond the extents of the existing floor area that exceeds the limits permitted by a minor horizontal addition. Any construction creates new floor area that in-fills existing roof or deck areas, or is superimposed over existing building structure or floor area is not considered a horizontal addition.

Vertical Addition – Vertical additions include both “minor” and “major” vertical additions. A minor vertical addition is the addition of new floor area (storey, mezzanine, decks or other roof areas intended for occupancy) that in-fills existing unoccupied roof or deck areas, or is superimposed over existing building structure or floor area, with an aggregate floor area increase of not more than 25 per cent of the building area, or by not more than 500 m² in aggregate floor area. A major vertical addition is an addition that increases the aggregate floor areas or mezzanine area increase that exceeds the limits permitted by a minor vertical addition.

<td>Entire Building — Building to be upgraded to resist 50 percent of the current By-law specified lateral force levels, where the building is evaluated as having less than 30 percent of the current required seismic resistance. Restrain falling hazards from major building components such as cantilevered walls, parapets, exterior ornaments, towers, chimneys, or other appendages, which could impact adjacent properties and public ways to resist forces due to a seismic event.</td>
</tr>
</tbody>
</table>
Division B: Acceptable Solutions

Part 11 – Existing Buildings

| N3 | Building exits and to acceptable open space to be reviewed to ensure safety from overhead falling hazards. | Entire Building Exits - Restrain interior partition walls. Restrain ceiling supporting frames, T-bars assemblies, ceiling gypsum wall boards, overhead mechanical equipment and services, overhead electrical equipment and services. Restrain falling hazards to resist forces due to a seismic event from non-structural elements including cladding, veneer, cornices, canopies, awnings, and ornaments over exit and extended to 5 m on either side of exit. |
| A3 | The existing building shall be upgraded to an acceptable level in order to ensure complete access within the project area as well as access to the remainder of the building. | Project Area — Door clearances, door hardware, accessible washrooms, and areas of refuge. Public Area — Door clearances, door hardware, areas of refuge, washrooms, ramps, and elevators. |
| F4 | Entire building to substantially meet the intent of health, fire and life safety requirements of the VBBL as well as provide protection to adjacent property. | Entire Building — Alarms & detectors, emergency lighting, access to exit, exits, exit signs, exit lights, flame spread ratings, firefighting access & water supply, floor assemblies & support, spatial separation, occupancy separation, standpipes & sprinklers, washrooms, high building requirements, lighting levels, sound transmission classifications, ventilation, building envelope review, and radio antenna systems. |
| S4 | The entire building structure shall be brought up to an acceptable level in order to meet seismic requirements of the VBBL. | Entire Building — Building to be upgraded to resist 75 percent of the current By-law specified lateral force levels, where the building is evaluated as having less than 60 percent of the current required seismic resistance. |
| N4 | Entire Building and to acceptable open space to be reviewed to ensure safety from overhead falling hazards. | Entire Building — Restrain all interior partition walls. Restrain all ceiling supporting frames, T-bars assemblies, ceiling gypsum wall boards, overhead mechanical equipment and services, overhead electrical equipment and services. Restrain exterior falling hazards to resist forces due to a seismic event from cladding, veneer, cornices, parapets, canopies, awnings, and ornaments attached to the exterior of the building. |
| A4 | The existing building shall be upgraded in order to provide the minimum accessibility requirements of the VBBL. | Entire Building — Building to meet accessibility provisions of the current VBBL. |

Notes to Table A-11.2.1.2.-B:
(1) Where there is one or more upgrade level(s) within the same category preceding the design upgrade level in Table A-11.2.1.2.-B, then the design upgrade level shall also include all of the preceding upgrade levels. For example, where the design upgrade level is F3, then all of the upgrade requirements under F2 and F1 also apply.

</table>
| **Envelope** | 1) Reduce air leakage of all Loading Dock Doors (per 5.4.3.3 of ASHRAE 90.1-2016)  
2) Upgrade all Floor Insulation (per 5.5.3.4 of ASHRAE 90.1-2016)  
3) Reduce total Skylight Fenestration/Glazing Area to 3% of gross roof area (per 5.5.4.2 of ASHRAE 90.1-2016) |
| **HVAC** | 1) Upgrade Chilled Water Plant Monitoring (per 6.4.3.11 of ASHRAE 90.1-2016)  
2) Upgrade Economizer Fault Detection and Diagnostics (per 6.4.3.12 of ASHRAE 90.1-2016)  
3) Clean and Balance all Air Systems (per 6.7.2.3.2 of ASHRAE 90.1-2016)  
4) Balance all Hydronic Systems (per 6.7.2.3.3 of ASHRAE 90.1-2016)  
5) Remove Wood-Burning Fireplace unit  
6) Replace gas fireplace pilot light with electronic ignition unit with energy rating over 50  
7) Install makeup air supply per code to balance exhaust fan(s) over 300 cfm |
| **SWH** | 1) Upgrade SWH system Temperature Controls (per 7.4.4.1 of ASHRAE 90.1-2016)  
2) Upgrade SWH system Temperature Maintenance Controls (per 7.4.4.2 of ASHRAE 90.1-2016)  
3) Upgrade SWH system Outlet Temperature Controls (per 7.4.4.3 of ASHRAE 90.1-2016)  
4) Upgrade SWH system Circulating Pump Controls (per 7.4.4.4 of ASHRAE 90.1-2016)  
5) Upgrade Pool systems (per 7.4.5 of ASHRAE 90.1-2016)  
6) Upgrade pipe risers to incorporate Heat Traps (per 7.4.6 of ASHRAE 90.1-2016) |
| **Lighting** | 1) Upgrade to Local Control (per 9.4.1.1.(a) of ASHRAE 90.1-2016)  
2) Upgrade to Restricted to Manual ON (per 9.4.1.1.(b) of ASHRAE 90.1-2016)  
3) Upgrade to Restricted to Partial Automatic ON (per 9.4.1.1.(c) of ASHRAE 90.1-2016)  
4) Upgrade to Bilevel Lighting Control (per 9.4.1.1.(d) of ASHRAE 90.1-2016)  
5) Upgrade all Automatic Daylighting Responsive Controls for Sidelighting (per
**Division B: Acceptable Solutions**

### Part 11 – Existing Buildings

- **9.4.1.1.(e) of ASHRAE 90.1-2016**
  - 6) Upgrade all Automatic Daylighting Controls for Toplighting (per 9.4.1.1.(f) of ASHRAE 90.1-2016)
  - 7) Upgrade to incorporate Automatic Partial OFF (per 9.4.1.1.(g) of ASHRAE 90.1-2016)
  - 8) Upgrade to incorporate Automatic Full OFF (per 9.4.1.1.(h) of ASHRAE 90.1-2016)
  - 9) Upgrade to incorporate Scheduled Shutoff (per 9.4.1.1.(i) of ASHRAE 90.1-2016)
  - 10) Upgrade to control Parking Garage Lighting (per 9.4.1.3 of ASHRAE 90.1-2016)
  - 11) Upgrade to incorporate Additional Controls for Special Applications (per 9.4.1.3 of ASHRAE 90.1-2016)
  - 12) Exterior Lighting Control (per 9.4.1.7 of ASHRAE 90.1-2016)
  - 13) Reduce total Skylight Fenestration/Glazing Area to 3% of gross roof area (per 5.5.4.2.2. of ASHRAE 90.1-2016)

- **Exterior or Patio Heating**
  - 1) Remove exterior space heating system
  - 2) Upgrade energy intensity (per 10.2.2.22.(3)) and system controls per 10.2.2.22.(4)

**E3 Level Objective Statement:** Review and improve energy performance of systems.

| Envelope | 1) Provide a Building Envelope Assessment Report, to be signed and sealed by a design professional, report to include: effective R-value, blower test, list of upgrades to achieve a compliance rating using COMcheck® software (latest version).
|          | 2) Reduce air leakage of all Fenestration & Doors (per 5.4.3.2 of ASHRAE 90.1-2016)
|          | 3) Upgrade all Below-Grade Wall Insulation (per 5.5.3.3 of ASHRAE 90.1-2016)
|          | 4) Inspect and remediate all ceiling space and floor space equipment and services including ductwork, plumbing, insulation, penetrations, dampers, valves, coils, pans and drains.
|          | 5) Inspect and remediate all floor/crawl space services (ducts, plumbing, insulation, penetrations, drains etc)

| HVAC(3)  | 1) Provide an HVAC System Assessment Report, to be signed and sealed by a design professional. Report to include: systems reviews, upgrade and re-commissioning options, with estimates for energy savings and cost paybacks.
|          | 2) Upgrade all ducts, plenums, and insulation (per 6.4.4 of ASHRAE 90.1-2016); inspect and remediate HVAC Insulation (per 6.4.4.1 of ASHRAE 90.1-2016); and inspect and remediate Duct and Plenum Leakage (per 6.4.4.2 of ASHRAE 90.1-2016)
|          | 3) Incorporate Exhaust Air Recovery systems (per 6.5.6.1 of ASHRAE 90.1-2016)
|          | 4) Incorporate a Service Water Heating Recovery system (per 6.5.6.2 of ASHRAE 90.1-2016)
|          | 5) Upgrade all Kitchen Exhaust and Replacement Air systems (per 6.5.7.2 of ASHRAE 90.1-2016)
|          | 6) Upgrade all Laboratory Exhaust and Replacement Air systems (per 6.5.7.3 of ASHRAE 90.1-2016)
|          | 7) Balance all systems (per 6.7.2.3 of ASHRAE 90.1-2016)

| SWH(4)   | 1) Provide an HVAC System Assessment Report, to be signed and sealed by a design professional
|          | • Report to include: systems reviews, upgrade and re-commissioning options, with estimates for energy savings and cost paybacks.
|          | 2) Upgrade SWH system Controls (per 7.4.4 of ASHRAE 90.1-2016)

| Lighting | 1) Provide a comprehensive Lighting System Assessment Report to be signed and sealed by a design professional
|          | • Report to include: systems reviews, upgrade options, with estimates for
energy savings and cost paybacks.

2) Upgrade total Exterior Lighting Power (per 9.4.2 of ASHRAE 90.1-2016) of the suite.
3) Meet the interior lighting power allowance by the Building Area Method (per 9.5 of ASHRAE 90.1-2016)
4) Meet the interior lighting power allowance by the Space-by-Space Method (per 9.6 of ASHRAE 90.1-2016)

**E4 Level Objective Statement:** Review and improve energy performance of larger systems.

- **Envelope**
  1) Reduce air leakage of entire Building Envelope (per 5.4.3 of ASHRAE 90.1-2016)
  2) For single retail/tenant spaces < 500 m²) Perform an Air Leakage / Blower test and remediate
  3) Upgrade all Roof Insulation (per 5.5.3.1 of ASHRAE 90.1-2016)
  4) Upgrade all Above-Grade Wall Insulation (per 5.5.3.2 of ASHRAE 90.1-2016)
  5) For single retail/tenant spaces < 500 m²) Replace storefront window(s) to meet the By-law.
  6) Reduce total vertical Fenestration/Glazing Area to 40% of gross wall area (per 5.5.4.2.1 of ASHRAE 90.1-2016)
  7) Upgrade all Fenestration/Glazing Performance (per 5.5.4.3 and 5.5.4.4 of ASHRAE 90.1-2016)
  8) Inspect and remediate roof systems including membrane, parapets, scuppers, drains, gutters, downspouts and drains.

- **HVAC**
  1) Upgrade all Zone Thermostatic Controls (per 6.4.3.1 of ASHRAE 90.1-2016)
  2) Upgrade HVAC to incorporate Economizers (per 6.5.1 of ASHRAE 90.1-2016)
  3) Upgrade Heat Rejection Equipment (per 6.5.5 of ASHRAE 90.1-2016)
  4) Upgrade to Air and Service Water Heating Heat Recovery systems (per 6.5.6 of ASHRAE 90.1-2016)
  5) Upgrade entire Radiant Heating system (per 6.5.8 of ASHRAE 90.1-2016)
  6) (Re-)Commission all systems (per 6.7.2.4 of ASHRAE 90.1-2016)

- **SWH**
  1) Upgrade Service Water Heating system to meet the Mandatory Provisions (per 7.4 of ASHRAE 90.1-2016)

- **Lighting**
  1) Lighting Control (per 9.4.1 of ASHRAE 90.1-2016)

**E5 Level Objective Statement:** Review and bring to present VBBL energy requirements, entire system(s) affected by vertical addition.

- **Envelope**
  1) Upgrade insulation levels of entire Building Envelope (Opaque Areas) (per 5.5.3 of ASHRAE 90.1-2016)
  2) Upgrade all Fenestration/Glazing (per 5.5.4 of ASHRAE 90.1-2016)

- **HVAC**
  1) Upgrade all HVAC Controls, Insulation and Leakage (per 6.4 of ASHRAE 90.1-2016)

- **SWH**
  1) Upgrade Service Water Heating system to meet the Mandatory Provisions (per 7.4 of ASHRAE 90.1-2016)

- **Lighting**
  1) Upgrade Lighting system to meet the Mandatory Provisions (per 9.4 of ASHRAE 90.1-2016)

**E6 Level Objective Statement:** Reconstruct entire building systems to meet energy efficiency requirements of present Vancouver Building By-Law.

- **Envelope**
  1) Upgrade all aspects of Building Envelope (per Section 5 of ASHRAE 90.1-2016)

Notes to Table A-11.2.1.2.-C:

1. References to ASHRAE 90.1 in Table A-11.2.1.2.-C can be considered guidance for determining the scope of work when applying the upgrade requirements to low-rise multi-family projects, otherwise these projects may apply the energy upgrade requirements of Table 11.2.1.4, per the options provided within Sentence 11.2.1.2.(9)(d).

2. BOMA BEST (Path 1) may be substituted as the solution for upgrade level E2. BOMA BEST (Path 2) may be substituted as the solution for upgrade levels E3, E4 or E5. BOMA BEST is a Canadian industry standard for commercial building sustainability certification. Official certification documentation produced by BOMA would be required for acceptance as an alternative acceptable solution option.

3. HVAC – Heating, Ventilating and Air Conditioning

4. SWH – Service Water Heating

5. COMcheck – software developed by the US Department of Energy for use with ASHRAE 90.1-2016 Building Envelope Trade-Off option

HAZARD INDEX TABLE

The hazard index for various building uses are indicated in Table A-11.2.1.2.-D.

The required level of Building By-law upgrade for a Change of Major Occupancy Type projects is dependent on whether or not the Hazard Index has increased for the proposed alteration. Hazard Index ratings are intended to reflect the level of fire and life safety risk to occupants for various building uses. Hazard index ratings range from 1 to 6, such that a hazard index of rating of 6 represents the highest risk to occupants.

**A-11.2.1.3 Sprinkler Installation Determination Where Dwelling Units Are Added.** Table 11.2.1.3. provides a matrix that determines sprinkler upgrades for existing unsprinklered or partially sprinklered buildings. The location of the newly created dwelling unit will determine the extent of the sprinkler coverage for the subject building.

**A-11.2.1.4.(3)(a) Replacement Value.** The term “replacement value” is used as a baseline for determining the applicability of specific upgrade requirements. The term refers to an assessed cost to replace the structure in its current state, the net asset value. This is similar to what would be considered the ‘book value’ in financial terms, in...
that it considers the depreciated cost of the asset. This is not intended to be an assessment of the construction, planning, and ancillary costs that could be incurred if the structure in question was built as new construction.

A-11.2.1.5. Self-contained Separated Spaces. The self-contained space provisions of Article 11.2.1.5. are intended to be applied to modest upgrades or minor additions to existing buildings where the normal application of the upgrade requirements Part 11 would be onerous. It is not intended that these provisions be utilized for the construction of additions of substantial size relative to the original building construction, or the conversion or substantial reconstruction of a heritage structure. Such structures should be upgraded in conformance with the general provisions of Part 11 as applicable to the intended scope of work.

A-11.3.1.1. Application of Alternative Compliance Measures for Existing Conditions
This Article is not intended to be applied to new construction. In general, it is the purpose of Sections 11.3 to 11.5 to facilitate retention of existing conditions where the existing construction is not being substantially modified and the conditions of construction of the building do not otherwise affect their compliance. If there is new construction, this is subject to the general requirements pertaining to new construction in this By-law. Furthermore, “new work” (as opposed to existing construction) may include not only new construction, but could also consist of converted floor areas that feature newly occupied areas or spaces, areas of increased occupant load or net new floor area, or the altering of existing floor space beyond its original configuration to support new uses or occupancy.

A-11.3.3.3.(1)(b) Intumescent Paint. Experience has shown that maintenance considerations of fire retardant intumescent paint are not well understood by applicants. To be effective, multiple coats are required at installation time for complete and proper application. Proper surface preparation is also a significant portion of the work and imperative to prevent pre-mature delamination. This preparation and application period could span several days based on existing surfaces and re-coat durations. Then there is the curing time needed prior to the application of any exterior finish coat. Exterior finish coat(s) will likely be necessary as most intumescent coatings are not suitable for prolonged exterior exposure. As well, there could be a detailed installation and inspection process to confirm the installation. Experienced labour is a major factor in the process.

Another consideration is exposure to weather effects; particularly water can lead to cracking and delamination of the coating systems. As well, product information has stated that fire-resistive coatings are not intended for exterior exposures or interior environments exposed to freeze/thaw conditions. This exposure can lead to severe cracking and delamination. This could lead to expensive re-application.

Ongoing maintenance and re-application due to weather degradation or mechanical damage is another significant consideration. Product and care information must be provided to new owners or tenants when there is a change of use or ownership. This must be provided in the strata information, maintenance manuals and guaranteed by restrictive covenant against the property’s deed.

A-11.3.3.4.(4) Window Replacement. The provisions of Sentence 11.3.3.4.(4) are intended to facilitate voluntary window replacements to higher energy efficient products as part of a renovation project. As modern windows may have slightly different dimensional requirements, this Sentence allows for minor variations that do not substantially affect the existing spatial condition of the existing building. This means that the location, orientation, and size of the windows may not change, excepting minor dimensional variations to the extent necessary to accommodate the new window.

A-11.3.7.1.(1) Temporary Refuge for Persons with Disabilities. These measures are intended to provide temporary refuge for persons with disabilities. It is acknowledged, however, that the measures cannot provide absolute safety for all occupants in the fire area. It may, therefore, be necessary to develop special arrangements in the fire safety plan to evacuate persons with disabilities from these areas. Details for a suitable plan are contained in the Fire By-law.
The protected elevator referred to in Clause 11.3.7.1.(1)(a) is intended to be used by firefighters as a means for evacuating persons with disabilities. It is not intended that this elevator be used by persons with disabilities as a means of egress without the assistance of firefighters.

If an estimate is to be made of the number of persons with disabilities in a floor area who can be accommodated in each zone in Clause 11.3.7.1.(1)(b), this estimate may be based on Table 3.8.2.3., which is used to determine the minimum number of spaces to be provided for wheelchair occupants in fixed seating areas. If more precise information is available, it should be used for sizing the zones.

For residential occupancies, the choices of protection include the option to provide an accessible balcony, but it is not required that balconies be the chosen means of protection.

A-11.4.3.1.(1) Interconnected Smoke Alarms and Carbon Monoxide Detectors
Concern has been expressed to the interconnection requirement of smoke alarms served by different electrical panels if the panels do not share a common ground. The concern is a current could be generated through the interconnecting wires and false alarms could result. Interconnected smoke alarms must be powered off the same (main) electrical panel so that a common ground and reliable operation is achieved.

11.4.7.1.(2) Bare Lands Strata Conversions. It is the general intent of the strata conversions requirements of this By-law to require upgrades to existing buildings where they undergo subdivision under the provincial Strata Act. In cases where the land is being subdivided, and existing buildings are not being internally subdivided into separate strata lots, then the extent of the upgrades may be limited to upgrades addressing the external where there is no other intent to alter the buildings. These upgrades could include, but are not limited to, risks associated with the partial or total collapse of the existing buildings, overhead fall hazards, and fire exposure to or from adjacent buildings and the egress and access routes. ‘S4’ and ‘N4’ are the appropriate upgrade categories, but as with all existing buildings, there may be a need to consider the impacts of site specific features which could constitute a hardship. Such cases should be evaluated by appropriately trained professionals, and alternative measures discussed with the Chief Building Official.

A-11.7.1.1.(3) Alteration Language Supporting NECB 2015
The term “alteration language” is used in Section 11.7 to describe the design upgrade requirements pertaining to the energy efficiency performance of buildings that are being altered from their existing condition. These requirements are fully described in the living document available on the City of Vancouver website and which is updated from time to time.

This document contains an introduction that clarifies Intent, Implementation, Scope, and Application and is reproduced here for convenience. By-law users are reminded of the need to keep up to date with the current requirements.

Alteration Language to Support the Application of the NECB 2015
Version: May 8, 2019

ACKNOWLEDGEMENT

The City of Vancouver would like to acknowledge the permission granted by ASHRAE for use of their alteration language, from the ASHRAE 90.1-2016 standard, as the foundation for this document.

ASHRAE’s willingness to support consistency within a jurisdiction with multiple energy standards is very much appreciated.
INTENT

The intention of this document is to provide building rehabilitation requirements to support the NECB in a manner consistent with the existing requirements pertaining to the ASHRAE 90.1-2016 standard.

With the implementation of NECB 2015 within Vancouver’s Building Bylaw on June 3, 2019, this document provides the minimum requirements for alterations to existing buildings designed and constructed to NECB 2011 and those buildings subject to this document through 11.7 of Division B.

SCOPE

This document pertains to the application of the Vancouver Building Bylaw, specifically:

- the alteration of existing buildings;
  - designed to NECB 2011,
  - designed to ZEBP (10.2.2.5), or
  - subject to 11.7.1.1(3)(c) requirements.

APPLICATION

This document applies to the alteration of any and all building components with prescriptive requirements listed within NECB 2015, with the exception of Solar Heat Gain Coefficient requirements being applicable to the City of Vancouver only.

DEFINITIONS

Alteration means a replacement or addition to a building or its systems and equipment; routine maintenance, repair, and service or a change in a building’s use classification or category shall not constitute an alteration.

Equipment means devices for comfort conditioning, electric power, lighting, transportation, or service water, including but not limited to, furnaces, boilers, air conditioners, heat pumps, chillers, water heaters, lamps, luminaires, ballasts, elevators, escalators, or other devices or installations.

Existing building means a building or portion thereof that was previously occupied or approved for occupancy by the authority having jurisdiction.

Existing system means a system or systems previously installed in an existing building.

Fenestration area means the total area of the fenestration measured using the rough opening and including the glazing, sash, and frame. For doors where the glazed vision is less than 50% of the door area, the fenestration area is the glazed vision area. For all other doors, the fenestration area is the door area.

Solar Heat Gain Coefficient (SHGC*) means the ratio of the solar heat gain entering the space through the fenestration area to the incident radiation. Solar heat gain includes directly transmitted solar heat and absorbed solar radiation, which is then reradiated, conducted, or convected into the space.

*All SHGC references within this document apply to the City of Vancouver only

Space means an enclosed space within a building.
**System** means a combination of equipment and auxiliary devices (e.g., controls, accessories, interconnecting means, and terminal elements) by which energy is transformed so it performs a specific function such as HVAC, service water, or lighting.

### 1.1 General

#### 1.1.1 Instructions

This document shall be read in conjunction with NECB 2015. Words that appear in italics are defined in this document unless already defined within NECB 2015. All references to Parts are referring to the Parts within NECB 2015.

**1.1.1.1 Additions to Existing Buildings.** An extension or increase in the floor area or height of a building outside of the existing building envelope shall be considered additions to existing buildings and shall comply with 1.2 of this document.

**1.1.1.2 Alterations of Existing Buildings.** Alterations of existing buildings shall comply with 1.2 of this document.

**1.1.1.3 Replacement of Portions of Existing Buildings.** Portions of a building envelope, heating, ventilating, air-conditioning, service water, power, lighting, and other systems and equipment that are being replaced shall be considered as alterations of existing buildings and shall comply with 1.2 of this document.

### 1.2 Compliance

#### 1.2.1 Compliance Paths

**1.2.1.1 Additions to Existing Buildings.** Additions to existing buildings shall comply with either the provisions of Parts 3, 4, 5, 6, and 7, or Part 8.

**Exception:** When an addition to an existing building cannot comply by itself, trade-offs will be allowed by modification to one or more of the existing components of the existing building. Modelling of the modified components of the existing building and addition shall employ the procedures of NECB’s Part 8; the addition shall not increase the energy consumption of the existing building plus the addition beyond the energy that would be consumed by the existing building plus the addition if the addition alone did comply.

**1.2.1.2 Alterations of Existing Buildings.** Alterations of existing buildings shall comply with the provisions of Parts 3, 4, 5, 6, and 7, or Part 8.

**Exception:**

a. A building that has been specifically designated as a Heritage building by the authority having jurisdiction, need not comply with these requirements.

### 2.1 Building Components and Systems

#### 2.1.1 Building Envelope (supports Part 3 of the NECB 2015)
2.1.1.1 Envelope Alterations. Alterations to the building envelope shall comply with the requirements of Part 3 for insulation, air leakage, and fenestration applicable to those specific portions of the building that are being altered. Fenestration must also comply with the SHGC values of 10.2.2.3 of the Vancouver Building Bylaw.

Exceptions: The following alterations need not comply with these requirements, provided such alterations will not increase the energy usage of the building:

- a. Installation of storm windows or glazing panels over existing glazing, provided the storm window or glazing panel contains a low-emissivity coating. However, a low-emissivity coating is not required where the existing glazing already has a low-emissivity coating. Installation is permitted to be either on the inside or outside of the existing glazing.
- b. Replacement of glazing in existing sash and frame provided the U-factor and SHGC (Vancouver only) will be equal to or lower than before the glass replacement.
- c. Alterations to roof, wall, or floor cavities that are insulated to full depth with insulation having a minimum nominal value of R-3.0/in.
- d. Alterations to walls and floors, where the existing structure is without framing cavities and no new framing cavities are created.
- e. Roof recovering
- f. Removal and replacement of a roof membrane where there is existing roof insulation integral to or below the roof deck.
- g. Replacement of existing doors that separate a conditioned space from the exterior shall not require the installation of a vestibule or revolving door, provided that an existing vestibule that separates a conditioned space from the exterior shall not be removed.
- h. Replacement of existing fenestration, provided that the area of the replacement fenestration does not exceed 25% of the total fenestration area of an existing building and that the U-factor and SHGC (Vancouver only) will be equal to, or lower than before the fenestration replacement.

2.1.2 Lighting (supports Part 4 of the NECB 2015)

2.1.2.1 Lighting Alterations. For the alteration of any lighting system in an interior space, that space shall comply with the lighting power density (LPD) requirements of Part 4 and the automatic shut-off requirements of 4.2.2.1.(20) as applicable to that space.

For the alteration of any lighting system for the exterior of a building application, that lighting system shall comply with the lighting power density (LPD) allowances of Part 4 applicable to the area illuminated by that lighting system and the applicable control requirements of 4.2.4.

Exceptions:

- a. Alterations that involve 20% or less of the connected lighting load in a space or area need not comply with these requirements provided that such alterations do not increase the installed lighting power.
- b. Lighting alterations that only involve replacement of lamps plus ballast/drivers or only involve one-for-one luminaire replacement need only comply with LPD requirement and 4.2.2.1(20).
- c. Routine maintenance and repair situations.

2.1.3 HVAC (supports Part 5 of the NECB 2015)
2.1.3.1 Additions to Existing Buildings. Mechanical equipment and systems serving the heating, cooling, or ventilating needs of additions to existing buildings shall comply with the requirements of Part 5.

Exception: When HVAC to an addition is provided by existing HVAC systems and equipment, such existing systems and equipment shall not be required to comply with Part 5. However, any new systems or equipment installed must comply with specific requirements applicable to those systems and equipment.

2.1.3.2 Alterations to Heating, Ventilating, and Air Conditioning in Existing Buildings

2.1.3.2.1 New HVAC equipment as a direct replacement of existing HVAC equipment shall comply with the specific minimum efficiency requirements of Part 5, applicable to that equipment.

2.1.3.2.2 New cooling systems installed to serve previously uncooled spaces shall comply with 5.1.1.3.

2.1.3.2.3 Alterations to existing cooling systems shall not decrease economizer capability unless the system complies with 5.2.2.8 and 5.2.2.9.

2.1.3.2.4 New and replacement ductwork shall comply with 5.2.2 and,

2.1.3.2.5 New and replacement piping shall comply with 5.2.5.

Exceptions: Compliance shall not be required:

a. for equipment that is being modified or repaired but not replaced, provided that such modifications and/or repairs will not result in an increase in the annual energy consumption of the equipment using the same energy type;

b. where a replacement or alteration of equipment requires extensive revisions to other systems, equipment, or elements of a building, and such replaced or altered equipment is a like-for-like replacement, or better;

c. for a refrigerant change of existing equipment;

d. for the relocation of existing equipment; or

e. for ducts and pipes where there is insufficient space or access to meet these requirements.

2.1.4 Service Water Systems (supports Part 6 of the NECB 2015)

2.1.4.1 Additions to Existing Buildings. Service water systems and equipment shall comply with the requirements of Part 6.

Exception: When the service water system to an addition is provided by existing service water systems and equipment, such systems and equipment shall not be required to comply with Part 6. However, any new systems or equipment installed must comply with specific requirements applicable to those systems and equipment.

2.1.4.2 Alterations to Existing Buildings. Building service water systems equipment installed as a direct replacement for existing building service water system equipment shall comply with the requirements of Part 6 applicable to the equipment being replaced. New and replacement piping shall comply with 6.2.3.
Exception: Compliance shall not be required where there is insufficient space or access to meet these requirements.

2.1.5 Power (supports Part 7 of the NECB 2015)

2.1.5.1 Addition to Existing Buildings. Equipment installed in addition to existing buildings shall comply with the requirements of Part 7.

2.1.5.2 Alterations to Existing Buildings.

Exception: Compliance shall not be required for the relocation or reuse of existing equipment at the same site.

2.1.5.3 Alterations to building service equipment or systems shall comply with the requirements of this section applicable to those specific portions of the building and its systems that are being altered.

2.1.5.4 Any new equipment subject to the requirements of this section that is installed in conjunction with the alterations, as a direct replacement of existing equipment shall comply with the specific requirements applicable to that equipment.

A-11.7.1.1.(5) Spaces Never Previously Occupied
Spaces “never previously occupied” shall be designed and constructed to “new building” requirements, and must comply with all applicable new construction requirements within the applicable standard/code (ASHRAE 90.1, NECB, ZEBP), rather than the alteration language supporting the applicable standard/code. No length of unoccupied period can downgrade the design requirements, for a space’s first occupancy, from full code to alteration requirements.
Part 12
Float Homes and Marinas

Section 12.1. General

12.1.1. Application

12.1.1.1. Application
1) The application of this Part shall be as described in Subsection 1.3.3. of Division A.

12.1.2. Definitions

12.1.2.1. Defined Terms
1) Words that appear in italics are defined in Article 1.4.1.2. of Division A. Section 12.2. Design and Construction

12.2. Design and Construction

12.2.1. Existing Float Homes and Marinas

12.2.1.1. Specific Upgrade Requirements
1) See Article 11.2.1.11. for alterations to existing float homes and marinas.

12.2.2. New Float Homes and Marinas

12.2.2.1. Construction Requirements
1) A marina walkway shall be protected against fire spread and collapse in accordance with NFPA 303, “Fire Protection Standard for Marinas and Boatyards”. (See Note A-12.2.2.1.(1).)
2) A float home shall be designed and constructed in accordance with the British Columbia Float Home Standard. (See Note A-12.2.2.1.(2).)
3) In addition to this Part, the requirements of Parts 3 to 9 shall apply to the design and construction of any structure or installation forming part of a marina.
4) Except as required by Sentence (5), a marina shall have an occupancy classification of Group F Division 3.
5) Despite the provisions of Sentence (4), a marina equipped with a fueling station shall have an occupancy classification of Group F Division 2.

12.2.2.2. Potable Water Supply for Marinas
1) The potable water connection at a marina shall be located not more than 300 m from any water craft.
2) Each moorage space for a liveaboard vessel or float home shall be provided with a potable water connection.
3) Where potable water is supplied to a dockside, watering point, or water craft connection, the potable water supply and each berth connection shall be protected with a backflow preventer.
4) A marina shall meet the requirements of Book II Plumbing Systems, regarding potable water supply.

12.2.2.3. Sewer Discharge for Float Homes and Marinas
1) Each moorage space for a liveaboard vessel or float home shall be provided with a sanitary sewer connection.
2) Sewage shall be discharged into an acceptable sanitary sewer.
3) Every owner or operator of a marina shall provide an easily accessible pump-out connection for visiting vessels and non liveaboard vessels.
4) Pump-out facilities shall be discharged into the sanitary sewer, and shall be designed, operated, and maintained to prevent any discharge of sewage onto docks or into the adjacent water.
5) A sewer pipe shall be located beside or underneath the surface of any marina walkway and shall not be submerged below water.
6) A marina shall meet the requirements of Book II Plumbing Systems, regarding sewage discharge.

12.2.2.4. Lighting for Marinas
1) All areas throughout a marina shall be illuminated to a minimum average level of 50 lux at the level of all marina walkways, and at angles and intersections at changes of level where there are stairs or ramps.
2) The minimum value of the illumination required by Sentence (1) shall be not less than 10 lx.

12.2.2.5. Marina Walkways and Ramps Serving Float Homes and Marinas
1) A floating marina walkway which provides access to the shore shall be at least 2 m wide.
2) A floating marina walkway which provides access to water craft shall be at least 750 mm wide.
3) An inclined marina walkway shall have a non-skid surface and handrails on both sides conforming to Article 9.8.7.4.
4) Life rings, assist poles, and ladders from docks into the water shall be provided at intervals not exceeding 30 m along the length of all marina walkways.

12.2.2.6. Washroom Facilities for Marinas
1) Separate washroom facilities shall be
   a) provided for each sex, and
   b) located within a 300 m walking distance from any watercraft moored at the marina.
2) The washroom facilities in Sentence (1) shall consist of a minimum of one water closet and one hand basin for males and one water closet and one hand basin for females for each 100 moorage spaces or part thereof, except that
   a) up to one half of the total number of water closets required for males may be substituted with urinals, and
   b) a marina with less than 10 moorage spaces shall be provided with one universal washroom having one water closet and one wash basin.

12.2.2.7. Shower Facilities for Marinas
1) A marina providing moorage space to watercraft which are not liveboard vessels or float homes shall provide separate shower facilities for each sex in accordance with Sentence (2).
2) A minimum of one shower for males and one shower for females shall be provided for each 100 moorage spaces or part thereof.

12.2.2.8. Laundry Facilities for Marinas
1) Every owner or operator of a marina providing moorage space to watercraft which are not liveboard vessels or float homes shall provide a laundry room in accordance with Sentences (2) and (3).
2) Laundry facilities in a marina shall include a washing and drying machine.
3) Laundry facilities in a marina shall not be located in a washroom.
Notes to Part 12
Float Homes and Marinas

A-12.2.2.1.(1). Reference Standards. This By-law makes reference to the NFPA 303 standard for the purposes of identifying appropriate design requirements to protect a marina or float home against the spread of fire and collapse. Under the design criteria outlined in the NFPA 303 standard, it is identified that fixed fire suppression equipment shall be provided in accordance with various standards including:
• NFPA 13, “Standard for the Installation of Sprinkler Systems”;
• NFPA 14, “Standard for the Installation of Standpipe and Hose Systems”;
• NFPA 24, “Standard for the Installation of Private Fire Service Mains and Their Appurtenances”; and
• NFPA 25, “Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems”.

Designs in accordance with NFPA 303 must therefore also consider the requirements these referenced standards as part of their design in order to be deemed compliant with the provisions of this By-law.

A-12.2.2.1.(2). Float Home Standard. The BC Float Home Standard referenced by this By-law, has references to both the NFPA 303 and NFPA 307 design standards as they pertain to marina fire protection. These standards in turn include references in their appendix material to NFPA 80A – “Recommended Practice for Protection of Buildings from Exterior Fire Exposures”. Designers may consider design solutions that satisfy NFPA 80A, which may be sufficient to address some aspects of the protection of marinas or float homes from fire exposure. Nonetheless, both marinas and float homes must still be designed to the appropriate spatial separation requirements of Part 3 or Part 9 of this By-law, as the requirements of the BC Float Homes standard require that float homes be designed to Part 9, and the permitted exceptions do not waive the spatial separation requirements of this By-law.
Appendix C

Climatic and Seismic Information for Building Design in Vancouver

This Appendix is included for explanatory purposes only and does not form part of the requirements of this By-law except as referenced from Division A, Sentence 1.1.3.1.(1).

Introduction

The great diversity of climate in British Columbia has a considerable effect on the performance of buildings; consequently, building design must reflect this diversity. This Appendix briefly describes how climatic design values are computed and provides recommended design data for a number of cities, towns, and lesser populated locations. Through the use of such data, appropriate allowances can be made for climate variations in different localities of British Columbia and the By-law can be applied regionally.

The climatic design data presented in Table C-2 are based on weather observations collected by the Atmospheric Environment Service, Environment Canada. The data were researched and analyzed by Environment Canada.

Recommended climatic design values for locations not listed can be obtained by contacting the Atmospheric Environment Service, Environment Canada, 4905 Dufferin Street, Downsview, Ontario M3H 5T4, (416) 739-4365. It should be noted, however, that these recommended values may differ from the legal requirements set by the City of Vancouver.

The information on seismic hazard in spectral format given in Table C-3 has been provided by the Geological Survey of Canada of Natural Resources Canada. Information for municipalities not listed can be obtained at www.earthquakescanada.nrcan.gc.ca or by writing to the Geological Survey of Canada at 7 Observatory Crescent, Ottawa, Ontario K1A 0Y3, or at P.O. Box 6000, Sidney, B.C. V8L 4B2.

General

The choice of climatic elements tabulated in this Appendix and the form in which they are expressed have been dictated largely by the requirements for specific values in several sections of this Code. These elements include the Ground Snow Loads, Wind Pressures, Design Temperatures, Heating Degree-Days, One-Day and 15-Minute Rainfalls, the Annual Total Precipitation values and Seismic Data. The following notes briefly explain the significance of these particular elements in building design, and indicate which weather observations were used and how they were analyzed to yield the required design values.

Table C-2 lists design weather recommendations and elevations for Vancouver. Elevations have been added to Table C-2 because of their potential to significantly influence climatic design values.

Since interpolation from the values in Table C-2 to other locations may not be valid due to local and other effects, Environment Canada will provide climatic design element recommendations where necessary. Local effects are particularly significant in mountainous areas, where the values apply only to populated valleys and not to the mountain slopes and high passes, where very different conditions are known to exist.

Changing and Variable Climates

Climate is not static. At any location, weather and climatic conditions vary from season to season, year to year, and over longer time periods (climate cycles). This has always been the case. In fact, evidence is mounting that the climates of Canada are changing and will continue to change significantly into future. When estimating climatic design loads, this variability can be considered using appropriate statistical analysis, data records spanning sufficient
periods, and meteorological judgement. The analysis generally assumes that the past climate will be representative of the future climate.

Past and ongoing modifications to atmospheric chemistry (from greenhouse gas emissions and land use changes) are expected to alter most climatic regimes in the future despite the success of the most ambitious greenhouse gas mitigation plans. Some regions could see an increase in the frequency and intensity of many weather extremes, which will accelerate weathering processes. Consequently, many buildings will need to be designed, maintained and operated to adequately withstand ever changing climatic loads.

Similar to global trends, the last decade in Canada was noted as the warmest in instrumented record. Canada has warmed, on average, at almost twice the rate of the global average increase, while the western Arctic is warming at a rate that is unprecedented over the past 400 years. Mounting evidence from Arctic communities indicates that rapid changes to climate in the North have resulted in melting permafrost and impacts from other climate changes have affected nearly every type of built structure. Furthermore, analyses of Canadian precipitation data shows that many regions of the country have, on average, also been tending towards wetter conditions. In the United States, where the density of climate monitoring stations is greater, a number of studies have found an unambiguous upward trend in the frequency of heavy to extreme precipitation events, with these increases coincident with a general upward trend in the total amount of precipitation. Climate change model results, based on an ensemble of global climate models worldwide, project that future climate warming rates will be greatest in higher latitude countries such as Canada.

In this By-law, future climatic design data projections have been provided based upon climate modelling by the Pacific Climate Impacts Consortium. Given the inherent uncertainty of making future predictions, the provided values can not necessarily be seen to be a wholly accurate prediction of future occurrences. Rather, these projections are intended to be a baseline guide for designers to wishing to consider how their building system designs will perform in the near future. It is cautioned that complete data is not presently available for all variables, and those values related to snow and wind pressures are derived from fewer data points and are therefore less reliable.

January Design Temperatures
A building and its heating system should be designed to maintain the inside temperature at some pre-determined level. To achieve this, it is necessary to know the most severe weather conditions under which the system will be expected to function satisfactorily. Failure to maintain the inside temperature at the pre-determined level will not usually be serious if the temperature drop is not great and if the duration is not long. The outside conditions used for design should, therefore, not be the most severe in many years, but should be the somewhat less severe conditions that are occasionally but not greatly exceeded.

The January design temperatures are based on an analysis of January air temperatures only. Wind and solar radiation also affect the inside temperature of most buildings and may need to be considered for energy-efficient design.

The January design temperature is defined as the lowest temperature at or below which only a certain small percentage of the hourly outside air temperatures in January occur. In the past, a total of 158 stations with records from all or part of the period 1951-66 formed the basis for calculation of the 2.5 and 1% January temperatures. Where necessary, the data were adjusted for consistency. Since most of the temperatures were observed at airports, design values for the core areas of large cities could be 1 or 2°C milder, although the values for the outlying areas are probably about the same as for the airports. No adjustments were made for this urban island heat effect. The design values for the next 20 to 30 years will probably differ from these tabulated values due to year-to-year climate variability and global climate change resulting from the impact of human activities on atmospheric chemistry.

The design temperatures were reviewed and updated using hourly temperature observations from 480 stations for a 25-year period up to 2006 with at least 8 years of complete data. These data are consistent with data shown for
Appendix C: Climatic and Seismic Information for Building Design in Vancouver

Canadian locations in the 2009 Handbook of Fundamentals(3) published by the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE). The most recent 25 years of record were used to provide a balance between accounting for trends in the climate and the sampling variation owing to year-to-year variation. The 1% and 2.5% values used for the design conditions represent percentiles of the cumulative frequency distribution of hourly temperatures and correspond to January temperatures that are colder for 8 and 19 hours, respectively, on average over the long term.

The 2.5% January design temperature is the value ordinarily used in the design of heating systems. In special cases, when the control of inside temperature is more critical, the 1% value may be used. Other temperature-dependent climatic design parameters may be considered for future issues of this document.

July Design Temperatures
A building and its cooling and dehumidifying system should be designed to maintain the inside temperature and humidity at certain pre-determined levels. To achieve this, it is necessary to know the most severe weather conditions under which the system is expected to function satisfactorily. Failure to maintain the inside temperature and humidity at the pre-determined levels will usually not be serious if the increases in temperature and humidity are not great and the duration is not long. The outside conditions used for design should, therefore, not be the most severe in many years, but should be the somewhat less severe conditions that are occasionally but not greatly exceeded.

The summer design temperatures in this Appendix are based on an analysis of July air temperatures and humidities. Wind and solar radiation also affect the inside temperature of most buildings and may, in some cases, be more important than the outside air temperature. More complete summer and winter design information can be obtained from Environment Canada.

The July design dry-bulb and wet-bulb temperatures were reviewed and updated using hourly temperature observations from 480 stations for a 25-year period up to 2006. These data are consistent with data shown for Canadian locations in the 2009 Handbook of Fundamentals(3) published by ASHRAE. As with January design temperatures, data from the most recent 25-year period were analyzed to reflect any recent climatic changes or variations. The 2.5% values used for the dry- and wet-bulb design conditions represent percentiles of the cumulative frequency distribution of hourly dry- and wet-bulb temperatures and correspond to July temperatures that are higher for 19 hours on average over the long term.

Heating Degree-Days
The rate of consumption of fuel or energy required to keep the interior of a small building at 21°C when the outside air temperature is below 18°C is roughly proportional to the difference between 18°C and the outside temperature. Wind speed, solar radiation, the extent to which the building is exposed to these elements and the internal heat sources also affect the heat required and may have to be considered for energy-efficient design. For average conditions of wind, radiation, exposure, and internal sources, however, the proportionality with the temperature difference generally still holds.

Since the fuel required is also proportional to the duration of the cold weather, a convenient method of combining these elements of temperature and time is to add the differences between 18°C and the mean temperature for every day in the year when the mean temperature is below 18°C. It is assumed that no heat is required when the mean outside air temperature for the day is 18°C or higher.

Although more sophisticated computer simulations using other forms of weather data have now almost completely replaced degree-day-based calculation methods for estimating annual heating energy consumption, degree-days remain a useful indicator of relative severity of climate and can form the basis for certain climate-related Code requirements.
Appendix C: Climatic and Seismic Information for Building Design in Vancouver

The degree-days below 18°C were compiled for 1,300 stations for the 25-year period ending in 2006. This analysis period is consistent with the one used to derive the design temperatures described above and with the approach used by ASHRAE.\(^3\)

A difference of only one Celsius degree in the mean annual temperature will cause a difference of 250 to 350 in the Celsius degree-days. Since differences of 0.5 of a Celsius degree in the mean annual temperature are quite likely to occur between two stations in the same town, heating degree-days cannot be relied on to an accuracy of less than about 100 degree-days.

Heating degree-day values for the core areas of larger cities can be 200 to 400 degree-days less (warmer) than for the surrounding fringe areas. The observed degree-days, which are based on daily temperature observations, are often most representative of rural settings or the fringe areas of cities.

Climatic Data for Energy Consumption Calculations

The climatic elements tabulated in this Appendix represent commonly used design values but do not include detailed climatic profiles, such as hourly weather data. Where hourly values of weather data are needed for the purpose of simulating the annual energy consumption of a building, they can be obtained from multiple sources, such as Environment Canada, Natural Resources Canada, the Regional Conservation Authority and other such public agencies that record this information. Hourly weather data are also available from public and private agencies that format this information for use with annual energy consumption simulation software; in some cases, these data have been incorporated into the software.

Snow Loads

The roof of a building should be able to support the greatest weight of snow that is likely to accumulate on it in many years. Some observations of snow on roofs have been made in Canada, but not enough to form the basis for estimating roof snow loads throughout the country. Similarly, observations of the weight, or water equivalent, of the snow on the ground have not been available in digital form in the past. The observations of roof loads and water equivalents are very useful, as noted below, but the measured depth of snow on the ground is used to provide the basic information for a consistent set of snow loads.

The estimation of the design snow load on a roof from snow depth observations involves the following steps:

(a) The depth of snow on the ground, which has an annual probability of exceedance of 1-in-50, is computed.
(b) The appropriate unit weight is selected and used to convert snow depth to loads, \(S_s\).
(c) The load, \(S_r\), which is due to rain falling on the snow, is computed.
(d) Because the accumulation of snow on roofs is often different from that on the ground, adjustments are applied to the ground snow load to provide a design snow load on a roof.

The annual maximum depth of snow on the ground has been assembled for 1,618 stations for which data has been recorded by the Atmospheric Environment Service (AES). The period of record used varied from station to station, ranging from 7 to 38 years. These data were analyzed using a Gumbel extreme value distribution fitted using the method of moments\(^4\) as reported by Newark et al.\(^5\) The resulting values are the snow depths, which have a probability of 1-in-50 of being exceeded in any one year.

The unit weight of old snow generally ranges from 2 to 5 kN/m\(^3\), and it is usually assumed in Canada that 1 kN/m\(^3\) is the average for new snow. Average unit weights of the seasonal snow pack have been derived for different regions across the country\(^6\) and an appropriate value has been assigned to each weather station. Typically, the values average 2.01 kN/m\(^3\) east of the continental divide (except for 2.94 kN/m\(^3\) north of the treeline), and range from 2.55 to 4.21 kN/m\(^3\) west of the divide. The product of the 1-in-50 snow depth and the average unit weight of the seasonal snow pack at a station is converted to the snow load (SL) in units of kilopascals (kPa).

Except for the mountainous areas of western Canada, the values of the ground snow load at AES stations were
normalized assuming a linear variation of the load above sea level in order to account for the effects of topography. They were then smoothed using an uncertainty-weighted moving-area average in order to minimize the uncertainty due to snow depth sampling errors and site-specific variations. Interpolation from analyzed maps of the smooth normalized values yielded a value for each location in Table C-2, which could then be converted to the listed By-law values ($S_n$) by means of an equation in the form:

\[ S_n = \text{smooth normalized} + bZ \]

where $b$ is the assumed rate of change of SL with elevation at the location and $Z$ is the location’s elevation above mean sea level (MSL). Although they are listed in Table C-2 to the nearest tenth of a kilopascal, values of $S_n$ typically have an uncertainty of about 20%. Areas of sparse data in northern Canada were an exception to this procedure. In these regions, an analysis was made of the basic SL values. The effects of topography, variations due to local climates, and smoothing were all subjectively assessed. The values derived in this fashion were used to modify those derived objectively.

For the mountainous areas of British Columbia, a more complex procedure was required to account for the variation of loads with terrain and elevation. Since the AES observational network often does not have sufficient coverage to detail this variability in mountainous areas, additional snow course observations were obtained from the provincial government of British Columbia. The additional data allowed detailed local analysis of ground snow loads on a valley-by-valley basis. Similar to other studies, the data indicated that snow loads above a critical or reference level increased according to either a linear or quadratic relation with elevation. The determination of whether the increase with elevation was linear or quadratic, the rate of the increase and the critical or reference elevation were found to be specific to the valley and mountain ranges considered. At valley levels below the critical elevation, the loads generally varied less significantly with elevation. Calculated valley- and range-specific regression relations were then used to describe the increase of load with elevation and to normalize the AES snow observations to a critical or reference level. These normalized values were smoothed using a weighted moving-average.

Tabulated values cannot be expected to indicate all the local differences in $S_n$. For this reason, especially in complex terrain areas, values should not be interpolated from Table C-2 for unlisted locations. The values of $S_n$ in the Table apply for the elevation and the latitude and longitude of the location, as defined by the Gazetteer of Canada. Values at other locations can be obtained from Environment Canada.

The heaviest loads frequently occur when the snow is wetted by rain, thus the rain load, $S_r$, was estimated to the nearest 0.1 kPa and is provided in Table C-2. When values of $S_r$ are added to $S_n$, this provides a 1-in-50-year estimate of the combined ground snow and rain load. The values of $S_r$ are based on an analysis of about 2 100 weather station values of the 1-in-50-year one-day maximum rain amount. This return period is appropriate because the rain amounts correspond approximately to the joint frequency of occurrence of the one-day rain on maximum snow packs. For the purpose of estimating rain on snow, the individual observed one-day rain amounts were constrained to be less than or equal to the snow pack water equivalent, which was estimated by a snow pack accumulation model reported by Bruce and Clark.(7)

The results from surveys of snow loads on roofs indicate that average roof loads are generally less than loads on the ground. The conditions under which the design snow load on the roof may be taken as a percentage of the ground snow load are given in Subsection 4.1.6. The By-law also permits further decreases in design snow loads for steeply sloping roofs, but requires substantial increases for roofs where snow accumulation may be more rapid due to such factors as drifting. Recommended adjustments are given in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

The ground snow load values, $S_n$, were updated for this edition of the By-law using a similar approach to the one used for the ground snow load update in the 1990 NBC, which was the basis for the 1992 British Columbia Building Code. The Gumbel extreme value distribution was fitted to the annual maxima of daily snow depth observations made at over 1 400 weather stations, which were compiled from 1990 onward – to as recently as 2012 for some
Appendix C: Climatic and Seismic Information for Building Design in Vancouver

stations – to calculate the 50-year return period snow depth. The 50-year ground snow load was then calculated for each weather station by combining the 50-year snow pack depth with the assigned snow pack density. The $S_s$ values for each location in Table C-2 were compared with the updated weather station values and revised accordingly.

**Annual Total Precipitation**
Total precipitation is the sum in millimetres of the measured depth of rainwater and the estimated or measured water equivalent of the snow (typically estimated as 0.1 of the measured depth of snow, since the average density of fresh snow is about 0.1 that of water).

The average annual total precipitation amounts in Table C-2 have been interpolated from an analysis of precipitation observations from 1 379 stations for the 30-year period from 1961 to 1990.

**Annual Rainfall**
The total amount of rain that normally falls in one year is frequently used as a general indication of the wetness of a climate, and is therefore included in this Appendix. See also Moisture Index below.

**Rainfall Intensity**
Roof drainage systems are designed to carry off rainwater from the most intense rainfall that is likely to occur. A certain amount of time is required for the rainwater to flow across and down the roof before it enters the gutter or drainage system. This results in the smoothing out of the most rapid changes in rainfall intensity. The drainage system, therefore, need only cope with the flow of rainwater produced by the average rainfall intensity over a period of a few minutes, which can be called the concentration time.

In Canada, it has been customary to use the 15-minute rainfall that will probably be exceeded on an average of once in 10 years. The concentration time for small roofs is much less than 15 minutes and hence the design intensity will be exceeded more frequently than once in 10 years. The safety factors in Book II (Plumbing Systems) of this By-law will probably reduce the frequency to a reasonable value and, in addition, the occasional failure of a roof drainage system will not be particularly serious in most cases.

The rainfall intensity values were updated for the 2014 edition of the By-law using observations of annual maximum 15-minute rainfall amounts from 485 stations with 10 or more years of record, including data up to 2007 for some stations. Ten-year return period values – the 15-minute rainfall having a probability of 1-in-10 of being exceeded in any year – were calculated by fitting the annual maximum values to the Gumbel extreme value distribution using the method of moments. The updated values are compiled from the most recent short-duration rainfall intensity-duration-frequency (IDF) graphs and tables available from Environment Canada.

It is very difficult to estimate the pattern of rainfall intensity in mountainous areas, where precipitation is extremely variable and rainfall intensity can be much greater than in other types of areas. Many of the observations for these areas were taken at locations in valley bottoms or in extensive, fairly level areas.

**One-Day Rainfall**
If for any reason a roof drainage system becomes ineffective, the accumulation of rainwater may be great enough in some cases to cause a significant increase in the load on the roof. In previous editions of this information, it had been common practice to use the maximum one-day rainfall ever observed for estimating the additional load. Since the length of record for weather stations is quite variable, the maximum one-day rainfall amounts in previous editions often reflected the variable length of record at nearby stations as much as the climatology. As a result, the maximum values often differed greatly within relatively small areas where little difference should be expected. The current values have been standardized to represent the one-day rainfall amounts that have 1 chance in 50 of being exceeded in any one year or the 1-in-50-year return value one-day rainfalls.

The one-day rainfall values were updated using daily rainfall observations from more than 3 500 stations with 10
Appendix C:  Climatic and Seismic Information for Building Design in Vancouver

years or more of record, including data up to 2008 for some stations. The 50-year return period values were calculated by fitting the annual maximum one-day rainfall observations to the Gumbel extreme value distribution using the method of moments.(4)

Rainfall frequency observations can vary considerably over time and space. This is especially true for mountainous areas, where elevation effects can be significant. In other areas, small-scale intense storms or local influences can produce significant spatial variability in the data. As a result, the analysis incorporates some spatial smoothing.

Moisture Index (MI)
Moisture index (MI) values were developed through the work of a consortium that included representatives from industry and researchers from NRC.(1) The MI is an indicator of the moisture load imposed on a building by the climate and is used in Part 9 to define the minimum levels of protection from precipitation to be provided by cladding assemblies on exterior walls.

It must be noted, in using MI values to determine the appropriate levels of protection from precipitation, that weather conditions can vary markedly within a relatively small geographical area. Although the values provided in the Table give a good indication of the average conditions within a particular region, some caution must be exercised when applying them to a locality that is outside the region where the weather station is located.

MI is calculated from a wetting index (WI) and a drying index (DI).

Wetting Index (WI)
To define, quantitatively, the rainwater load on a wall, wind speed and wind direction have to be taken into consideration in addition to rainfall, along with factors that can affect exposure, such as nearby buildings, vegetation and topography. Quantitative determination of load, including wind speed and wind direction, can be done. However, due to limited weather data, it is not currently possible to provide this information for most of the locations identified in the Table.

This lack of information, however, has been shown to be non-critical for the purpose of classifying locations in terms of severity of rain load. The results of the research indicated that simple annual rainfall is as good an indicator as any for describing rainwater load. That is to say, for Canadian locations, and especially once drying is accounted for, the additional sensitivity provided by hourly directional rainfall values does not have a significant effect on the order in which locations appear when listed from wet to dry.

Consequently, the wetting index (WI) is based on annual rainfall and is normalized based on 1 000 mm.

Drying Index (DI)
Temperature and relative humidity together define the drying capacity of ambient air. Based on simple psychrometrics, values were derived for the locations listed in the Table using annual average drying capacity normalized based on the drying capacity at Lytton, B.C. The resultant values are referred to as drying indices (DI).

Determination of Moisture Index (MI)
The relationship between WI and DI to correctly define moisture loading on a wall is not known. The MI values provided in the Table are based on the root mean square values of WI and 1-DI, with those values equally weighted. This is illustrated in Figure C-1. The resultant MI values are sufficiently consistent with industry’s understanding of climate severity with respect to moisture loading as to allow limits to be identified for the purpose of specifying where additional protection from precipitation is required.
Appendix C: Climatic and Seismic Information for Building Design in Vancouver

Figure C-1
Derivation of moisture index (MI) based on normalized values for wetting index (WI) and drying index (DI)

Note to Figure C-1:
(1) MI equals the hypotenuse of the triangle defined by WI and 1-DI

Driving Rain Wind Pressure (DRWP)
The presence of rainwater on the face of a building, with or without wind, must be addressed in the design and construction of the building envelope so as to minimize the entry of water into the assembly. Wind pressure on the windward faces of a building will promote the flow of water through any open joints or cracks in the facade.

Driving rain wind pressure (DRWP) is the wind load that is coincident with rain, measured or calculated at a height of 10 m. The values provided in the Table represent the loads for which there is 1 chance in 5 of being reached or exceeded in any one year, or a probability of 20% within any one year. Approximate adjustments for height can be made using the values for Ce given in Sentence 4.1.7.3.(5) as a multiplier.

Because of inaccuracies in developing the DRWP values related to the averaging of extreme wind pressures, the actual heights of recording anemometers, and the use of estimated rather than measured rainfall values, the values are considered to be higher than actual loads. Thus the actual probability of reaching or exceeding the DRWP in a particular location is less than 20% per year and these values can be considered to be conservative.
Appendix C: Climatic and Seismic Information for Building Design in Vancouver

DRWP can be used to determine the height to which wind will drive rainwater up enclosed vertical conduits. This provides a conservative estimate of the height needed for fins in window extrusions and end dams on flashings to control water ingress. This height can be calculated as:

\[ \text{height of water, mm} = \frac{\text{DRWP}}{10}, Pa \]

Note that the pressure difference across the building envelope may be augmented by internal pressures induced in the building interior by the wind. These additional pressures can be estimated using the information provided in the Commentary entitled Wind Load and Effects of the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

Wind Effects

All structures need to be designed to ensure that the main structural system and all secondary components, such as cladding and appurtenances, will withstand the pressures and suctions caused by the strongest wind likely to blow at that location in many years. Some flexible structures, such as tall buildings, slender towers and bridges, also need to be designed to minimize excessive wind-induced oscillations or vibrations.

At any time, the wind acting upon a structure can be treated as a mean or time-averaged component and as a gust or unsteady component. For a small structure, which is completely enveloped by wind gusts, it is only the peak gust velocity that needs to be considered. For a large structure, the wind gusts are not well correlated over its different parts and the effects of individual gusts become less significant. The “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B)” evaluates the mean pressure acting on a structure, provide appropriate adjustments for building height and exposure and for the influence of the surrounding terrain and topography (including wind speed-up for hills), and then incorporate the effects of wind gusts by means of the gust factor, which varies according to the type of structure and the size of the area over which the pressure acts.

The wind speeds and corresponding velocity pressures used in the By-law are regionally representative or reference values. The reference wind speeds are nominal one-hour averages of wind speeds representative of the 10 m height in flat open terrain corresponding to Exposure A or open terrain in the terminology of the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).” The reference wind speeds and wind velocity pressures are based on long-term wind records observed at a large number of weather stations across Canada.

Reference wind velocity pressures in previous versions of the By-law since 1961 were based mostly on records of hourly averaged wind speeds (i.e. the number of miles of wind passing an anemometer in an hour) from over 100 stations with 10 to 22 years of observations ending in the 1950s. The wind pressure values derived from these measurements represented true hourly wind pressures.

The reference wind velocity pressures were reviewed and updated for the 2014 edition of the By-law. The primary data set used for the analysis comprised wind records compiled from about 135 stations with hourly averaged wind speeds and from 465 stations with aviation (one- or two-minute average) speeds or surface weather (ten-minute average) speeds observed once per hour at the top of the hour; the periods of record used ranged from 10 to 54 years. In addition, peak wind gust records from 400 stations with periods of record ranging from 10 to 43 years were used. Peak wind gusts (gust durations of approximately 3 to 7 seconds) were used to supplement the primary once-per-hour observations in the analysis.

Several steps were involved in updating the reference wind values. Where needed, speeds were adjusted to represent the standard anemometer height above ground of 10 m. The data from years when the anemometer at a station was installed on the top of a lighthouse or building were eliminated from the analysis since it is impractical to adjust for the effects of wind flow over the structure. (Most anemometers were moved to 10 m towers by the 1960s.) Wind speeds of the various observation types – hourly averaged, aviation, surface weather and peak wind gust – were adjusted to account for different measure durations to represent a one-hour averaging period and to account for differences in the surface roughness of flat open terrain at observing stations.
Appendix C:  Climatic and Seismic Information for Building Design in Vancouver

The annual maximum wind speed data was fitted to the Gumbel distribution using the method of moments\(^{(4)}\) to calculate hourly wind speeds having the annual probability of occurrence of 1-in-10 and 1-in-50 (10-year and 50-year return periods). The values were plotted on maps, then analyzed and abstracted for the locations in Table C-2.

The wind velocity pressures, \(q\), were calculated in Pascals using the following equation:

\[
q = \frac{1}{2} \rho V^2
\]

where \(r\) is an average air density for the windy months of the year and \(V\) is wind speed in metres per second. While air density depends on both air temperature and atmospheric pressure, the density of dry air at 0°C and standard atmospheric pressure of 1.2929 kg/m\(^3\) was used as an average value for the wind pressure calculations. As explained by Boyd\(^{(10)}\), this value is within 10% of the monthly average air densities for most of Canada in the windy part of the year.

As a result of the updating procedure, the 1-in-50 reference wind velocity pressures remain unchanged for most of the locations listed in Table C-2; both increases and decreases were noted for the remaining locations. Many of the decreases resulted from the fact that anemometers at most of the stations used in the previous analysis were installed on lighthouses, airport hangers and other structures. Wind speeds on the tops of buildings are often much higher compared to those registered by a standard 10 m tower. Eliminating anemometer data recorded on the tops of buildings from the analysis resulted in lower values at several locations.

Hourly wind speeds that have 1 chance in 10 and 50\(^{(1)}\) of being exceeded in any one year were analyzed using the Gumbel extreme value distribution fitted using the method of moments with correction for sample size. Values of the 1-in-30-year wind speeds for locations in the Table were estimated from a mapping analysis of wind speeds. The 1-in-10- and 1-in-50-year speeds were then computed from the 1-in-30-year speeds using a map of the dispersion parameter that occurs in the Gumbel analysis\(^{(4)}\).

Table C-1 has been arranged to give pressures to the nearest one-hundredth of a kPa and their corresponding wind speeds. The value of “\(q\)” in kPa is assumed to be equal to 0.00064645 \(V^2\), where \(V\) is given in m/s.

\(^{(1)}\)Wind speeds that have a one-in-“n”-year chance of being exceeded in any year can be computed from the one-in-10 and one-in-50 return values in the Table using the following equation:

\[
V_{1/N} = \frac{1}{1.4565} \left[ V_{1/50} + 0.4565V_{1/10} + \frac{V_{1/50} - V_{1/10}}{1.139} \times \ln \left( \frac{-0.0339}{\ln(1 - 1/n)} \right) \right]
\]

Seismic Hazard
The parameters used to represent seismic hazard for specific geographical locations are the 5% damped horizontal spectral acceleration for 0.2, 0.5, 1.0, 2.0, 5.0 and 10.0 second periods, the horizontal Peak Ground Acceleration (PGA) and the horizontal Peak Ground Velocity (PGV), with all values given for a 2% probability of being exceeded in 50 years. The six spectral parameters are deemed sufficient to define spectra closely matching the shape of the Uniform Hazard Spectra (UHS). Hazard values are mean values based on a statistical analysis of the earthquakes that have been experienced in Canada and adjacent regions. The seismic hazard values were updated for this edition of the By-law by updating the earthquake catalogue, revising the seismic source zones, adding fault sources for the Cascadia subduction zone and certain other active faults, revising the Ground Motion Prediction Equations (GMPEs), and using a probabilistic model to combine all inputs.

For most locations, the new GMPEs are the most significant reason for changes in the hazard results from the 2014 By-law. One exception is for areas of western Canada for which adding the Cascadia subduction source contribution to the model probabilistically causes the most significant change. For locations in western Canada, the seismic...
hazard at long periods has increased significantly for areas affected by the Cascadia interface. For other areas, the explicit inclusion of fault sources, such as those in Haida Gwaii, has also affected the estimated hazard.

Further details regarding the representation of seismic hazard can be found in the Commentary on Design for Seismic Effects in the “User’s Guide – NBC 2015, Structural Commentaries (Part 4 of Division B).”

Appendix D: Fire Performance Rating

This Appendix is included for explanatory purposes only and does not form part of the requirements except as defined in Division A, Sentence 1.1.3.1.(1). The bold face reference numbers that introduce each item do not relate to specific requirements in this Division.

Section D-1 General

The content of this Appendix was prepared on the recommendations of the Standing Committee on Fire Protection, which was established by the Canadian Commission on Building and Fire Codes (CCBFC) for this purpose.

D-1.1. Introduction

D-1.1.1. Scope

1) This fire-performance information is presented in a form closely linked to the performance requirements and the minimum materials specifications of this By-law.
2) The ratings have been assigned only after careful consideration of all available literature on assemblies of common building materials, where they are adequately identified by description. The assigned values based on this information will, in most instances, be conservative when compared to the ratings determined on the basis of actual tests on individual assemblies.
3) The fire-performance information set out in this Appendix applies to materials and assemblies of materials that comply in all essential details with the minimum structural design standards described in Part 4. Additional requirements, where appropriate, are described in other Sections of this Appendix.
6) Section D-4 describes noncombustibility in building materials when tested in accordance with CAN/ULC-S114, “Test for Determination of Non-Combustibility in Building Materials.”
7) Section D-5 contains requirements for the installation of fire doors and fire dampers in fire-rated stud wall assemblies.
8) Section D-6 contains background information regarding fire test reports, obsolete materials and assemblies, assessment of archaic assemblies and the development of the component additive method.

D-1.1.2. Referenced Documents

1) Where documents are referenced in this Appendix, they shall be the editions designated in Table D-1.1.2.

Notes to Table D-1.1.2.:

1. Some documents may have been reaffirmed or reapproved. Check with the applicable issuing agency for up-to-date information.
2. Some titles have been abridged to omit superfluous wording.

D-1.1.3. Applicability of Ratings

The ratings shown in this document apply if more specific test values are not available. The construction of an assembly that is the subject of an individual test report must be followed in all essential details if the fire-resistance rating reported is to be applied for use with this By-law.

D-1.1.4. Higher Ratings

The Chief Building Official may allow higher fire-resistance ratings than those derived from this Appendix, where supporting evidence justifies a higher rating. Additional information is provided in summaries of published test information and the reports of fire tests carried out by NRC, which are included in Section D-6, Background Information.

D-1.1.5. Additional Information on Fire Rated Assemblies

Assemblies containing materials for which there is no nationally recognized standard are not included in this Appendix. Many such assemblies have been rated by Underwriters Laboratories (UL), Underwriters’ Laboratories of Canada (ULC), QAI Laboratories (QAI), or Intertek Testing Services NA Ltd. (ITS).

D-1.2. Interpretation of Test Results

D-1.2.1. Limitations

1) The fire-performance ratings set out in this Appendix are based on those that would be obtained from the standard methods of test described in the By-law. The test methods are essentially a means of comparing the performance of one building component or assembly with another in relation to its performance in fire.
Appendix D: Fire Performance Rating

2) Since it is not practicable to measure the fire resistance of constructions in situ, they must be evaluated under some agreed test conditions. A specified fire-resistance rating is not necessarily the actual time that the assembly would endure in situ in a building fire, but is that which the particular construction must meet under the specified methods of test.

3) Considerations arising from departures in use from the conditions established in the standard test methods may, in some circumstances, have to be taken into account by the designer and the Chief Building Official. Some of these conditions are covered at present by the provisions of the By-law.

4) For walls and partitions, the stud spacings previously specified as 16 or 24 inch have been converted to 400 and 600 mm, respectively, for consistency with other metric values; however, the use of equivalent imperial dimensions for stud spacing is permitted.

D-1.3. Concrete
D-1.3.1. Aggregates in Concrete
Low density aggregate concretes generally exhibit better fire performance than natural stone aggregate concretes. A series of tests on concrete masonry walls, combined with mathematical analysis of the test results, has allowed further distinctions between certain low density aggregates to be made.

D-1.4. Types of Concrete
D-1.4.1. Description
1) For purposes of this Appendix, concretes are described as Types S, N, L, L1, L2, L40S, L120S or L220S as described in Sentences (2) to (8).

2) Type S concrete is the type in which the coarse aggregate is granite, quartzite, siliceous gravel or other dense materials containing at least 30% quartz, chert or flint.

3) Type N concrete is the type in which the coarse aggregate is cinders, broken brick, blast furnace slag, limestone, calcareous gravel, trap rock, sandstone or similar dense material containing not more than 30% of quartz, chert or flint.

4) Type L concrete is the type in which all the aggregate is expanded slag, expanded clay, expanded shale or pumice.

5) Type L1 concrete is the type in which all the aggregate is expanded shale.

6) Type L2 concrete is the type in which all the aggregate is expanded slag, expanded clay or pumice.

7) Type L40S concrete is the type in which the fine portion of the aggregate is sand and low density aggregate in which the sand does not exceed 40% of the total volume of all aggregates in the concrete.

8) Type L120S and Type L220S concretes are the types in which the fine portion of the aggregate is sand and low density aggregate in which the sand does not exceed 20% of the total volume of all aggregates in the concrete.

D-1.4.2. Determination of Ratings
Where concretes are described as being of Type S, N, L, L1 or L2, the rating applies to the concrete containing the aggregate in the group that provides the least fire resistance. If the nature of an aggregate cannot be determined accurately enough to place it in one of the groups, the aggregate shall be considered as being in the group that requires a greater thickness of concrete for the required fire resistance.

D-1.4.3. Description of Aggregates
1) The descriptions of the aggregates in Type S and Type N concretes apply to the coarse aggregates only. Coarse aggregate for this purpose means that retained on a 5 mm sieve using the method of grading aggregates described in CSA A23.1/A23.2, “Concrete Materials and Methods of Concrete Construction/Test Methods and Standard Practices for Concrete.”

2) Increasing the proportion of sand as fine aggregate in low density concretes requires increased thicknesses of material to produce equivalent fire-resistance ratings. Low density aggregates for Type L and Types L-S concretes used in loadbearing components shall conform to ASTM C 330/C 330M, “Lightweight Aggregates for Structural Concrete.”
Appendix D: Fire Performance Rating

3) Non-loadbearing low density components of vermiculite and perlite concrete, in the absence of other test evidence, shall be rated on the basis of the values shown for Type L concrete.

D-1.5. Gypsum Board
D-1.5.1. Types of Gypsum Board
1) Where the term “gypsum board” is used in this Appendix, it is intended to include — in addition to gypsum board — gypsum backing board and gypsum base for veneer plaster as described in
   a) CAN/CSA-A82.27-M, “Gypsum Board,” or
   b) ASTM C 1396/C 1396M, “Gypsum Board.”
2) Where the term “Type X gypsum board” is used in this Appendix, it applies to special fire-resistant board as described in
   a) CAN/CSA-A82.27-M, “Gypsum Board,” or
   b) ASTM C 1396/C 1396M, “Gypsum Board.”

D-1.6. Equivalent Thickness
D-1.6.1. Method of Calculating
1) The thickness of solid-unit masonry and concrete described in this Appendix shall be the thickness of solid material in the unit or component thickness. For units that contain cores or voids, the Tables refer to the equivalent thickness determined in conformance with Sentences (2) to (10).
2) Where a plaster finish is used, the equivalent thickness of a wall, floor, column or beam protection shall be equal to the sum of the equivalent thicknesses of the concrete or masonry units and the plaster finish measured at the point that will give the least value of equivalent thickness.
3) Except as provided in Sentence (5), the equivalent thickness of a hollow masonry unit shall be calculated as equal to the actual overall thickness of a unit in millimetres multiplied by a factor equal to the net volume of the unit and divided by its gross volume.
4) Net volume shall be determined using a volume displacement method that is not influenced by the porous nature of the units.
5) Gross volume of a masonry unit shall be equal to the actual length of the unit multiplied by the actual height of the unit multiplied by the actual thickness of the unit.
6) Where all the core spaces in a wall of hollow concrete masonry or hollow-core precast concrete units are filled with grout, mortar, or loose fill materials such as expanded slag, burned clay or shale (rotary kiln process), vermiculite or perlite, the equivalent thickness rating of the wall shall be considered to be the same as that of a wall of solid units, or a solid wall of the same concrete type and the same overall thickness.
7) The equivalent thickness of hollow-core concrete slabs and panels having a uniform thickness and cores of constant cross section throughout their length shall be obtained by dividing the net cross-sectional area of the slab or panel by its width.
8) The equivalent thickness of concrete panels with tapered cross sections shall be the cross section determined at a distance of 2 t or 150 mm, whichever is less, from the point of minimum thickness, where t is the minimum thickness.
9) Except as permitted in Sentence (10), the equivalent thickness of concrete panels with ribbed or undulating surfaces shall be
   a) \( t_0 \) for \( s \) less than or equal to 2 t,
   b) \( t + (4t/s - 1)(t_0 - t) \) for \( s \) less than 4 t and greater than 2 t, and
   c) \( t \) for \( s \) greater than or equal to 4 t

where

\( t \) = minimum thickness of panel,

\( t_0 \) = average thickness of panel (unit cross-sectional area divided by unit width), and

\( s \) = centre to centre spacing of ribs or undulations.
Appendix D:  Fire Performance Rating

10) Where the total thickness of a panel described in Sentence (9), exceeds 2 t, only that portion of the panel which is less than 2 t from the non-ribbed surface shall be considered for the purpose of the calculations in Sentence (9).

D-1.7. Contribution of Plaster or Gypsum Board Finish to Fire Resistance of Masonry or Concrete

D-1.7.1. Determination of Contribution

1) Except as provided in Sentences (2), (3), (4) and (5), the contribution of a plaster or gypsum board finish to the fire resistance of a masonry or concrete wall, floor or roof assembly shall be determined by multiplying the actual thickness of the finish by the factor shown in Table D-1.7.1., depending on the type of masonry or concrete to which it is applied. This corrected thickness shall then be included in the equivalent thickness as described in Subsection D-1.6.

2) Where a plaster or gypsum board finish is applied to a concrete or masonry wall, the calculated fire-resistance rating of the assembly shall not exceed twice the fire-resistance rating provided by the masonry or concrete because structural collapse may occur before the limiting temperature is reached on the surface of the non-fire-exposed side of the assembly.

3) Where a plaster or gypsum board finish is applied only on the non-fire-exposed side of a hollow clay tile wall, no increase in fire resistance is permitted because structural collapse may occur before the limiting temperature is reached on the surface of the non-fire-exposed side of the assembly.

4) The contribution to fire resistance of a plaster or gypsum board finish applied to the non-fire-exposed side of a monolithic concrete or unit masonry wall shall be determined in conformance with Sentence (1), but shall not exceed 0.5 times the contribution of the concrete or masonry wall.

5) When applied to the fire-exposed side, the contribution of a gypsum lath and plaster or gypsum board finish to the fire resistance of masonry or concrete wall, floor or roof assemblies shall be determined from Table D-2.3.4.-A or D-2.3.4.-D.

D-1.7.2. Plaster

1) Gypsum plastering shall conform to CSA A82.30-M, "Interior Furring, Lathing and Gypsum Plastering."
Appendix D: Fire Performance Rating

2) Portland cement-sand plaster shall be applied in 2 coats: the first coat containing 1 part Portland cement to 2 parts sand by volume, and the second coat containing 1 part Portland cement to 3 parts sand by volume.
3) Plaster finish shall be securely bonded to the wall or ceiling.
4) The thickness of plaster finish applied directly to monolithic concrete without metal lath shall not exceed 10 mm on ceilings and 16 mm on walls.
5) Where the thickness of plaster finish on masonry or concrete exceeds 38 mm, wire mesh with 1.57 mm diam wire and openings not exceeding 50 mm by 50 mm shall be embedded midway in the plaster.

D-1.7.3. Attachment of Gypsum Board and Lath
Gypsum board and gypsum lath finishes applied to masonry or concrete walls shall be secured to wood or steel furring members in conformance with Article D-2.3.9.

D-1.7.4. Sample Calculations
The following examples are included as a guide to the method of calculating the fire resistance of concrete or hollow masonry walls with plaster or gypsum board protection:

Example (1)
A 3 h fire-resistance rating is required for a monolithic concrete wall of Type S aggregate with a 20 mm gypsum-sand plaster finish on metal lath on each face.

a) The minimum equivalent thickness of Type S monolithic concrete needed to give a 3 h fire-resistance rating = 158 mm (Table D-2.1.1.).
b) Since the gypsum-sand plaster finish is applied on metal lath, Sentence D-1.7.1.(5) does not apply. Therefore, the contribution to the equivalent thickness of the wall of 20 mm gypsum-sand plaster on each face of the concrete is 20 × 1.25 = 25 mm (see Sentences D-1.7.1.(1) to (4)).
c) The total contribution of the plaster finishes is 2 × 25 = 50 mm.
d) The minimum equivalent thickness of concrete required is 158 mm - 50 mm = 108 mm.
e) From Table D-2.1.1., the 108 mm equivalent thickness of monolithic concrete gives a contribution of less than 1.5 h. This is less than half the rating of the assembly so that the conditions in Sentence D-1.7.1.(2) are not met. Thus the equivalent thickness of monolithic concrete must be increased to 112 mm to give 1.5 h contribution.
f) The total equivalent thickness of the plaster finishes can then be reduced to 158 mm - 112 mm = 46 mm.
g) The total actual thickness of the plaster finishes required is therefore 46 mm ÷ 1.25 ÷ 37 mm (Sentences D-1.7.1.(1) to (4)) or 18.5 mm on each face.
h) Since the thickness of the plaster finish on each face exceeds 16 mm, metal lath is still required (Sentence D-1.7.2.(4)).
i) Since this wall is symmetrical with plaster on both faces, the contribution to fire resistance of the plaster finish on either face is limited to one-quarter of the wall rating by virtue of Sentence D-1.7.1.(2). Under these circumstances, the conditions in Sentence D-1.7.1.(4) are automatically met.

Example (2)
A 2 h fire-resistance rating is required for a hollow masonry wall of Type N concrete with a 12.7 mm Type X gypsum board finish on each face.

a) Since gypsum board is used, Sentence D-1.7.1.(5) applies. The 12.7 mm gypsum board finish on the fire-exposed side is, therefore, assigned 25 min by using Table D-2.3.4.-A.
b) The fire resistance required of the balance of the assembly is 120 min - 25 min = 95 min.
c) Interpolating between 1.5 h and 2 h in Table D-2.1.1., for 95 min fire resistance, the equivalent thickness for hollow masonry units required is 95 mm + (18 mm × 5/30) = 95 mm + 3 mm = 98 mm.
d) The contribution to the equivalent thickness of the wall of the 12.7 mm gypsum board finish on the non-fire-exposed side using Table D-1.7.1. = 12.7 × 1.25 = 16 mm.
e) Equivalent thickness required of concrete masonry unit = 98 - 16 = 82 mm.
Appendix D:  Fire Performance Rating

f) The fire-resistance rating of a concrete masonry wall having an equivalent thickness of 82 mm = 1 h for 73 mm + (9 mm x 30/22) = 1 h 12 min. As this is more than 1 h, the conditions of Sentence D-1.7.1.(2) are met and the rating of 2 h is justified.

Example (3)
A 2 h fire-resistance rating is required for a hollow masonry exterior wall of Type L20S concrete with a 15.9 mm Type X gypsum board finish on the non-fire-exposed side only.

a) According to Table D-2.1.1., the minimum equivalent thickness for Type L20S concrete masonry units needed to achieve a 2 h rating is 94 mm.

b) Since gypsum board is not used on the fire-exposed side, Sentence D-1.7.1.(5) does not apply. The contribution to the equivalent thickness of the wall by the 15.9 mm Type X gypsum board finish applied on the non-fire-exposed side is 15.9 x 1 = 16 mm (see Sentence D-1.7.1.(1) and Table D-1.7.1.).

c) Therefore, the equivalent thickness required of the concrete masonry unit is 94 - 16 = 78 mm.

d) The contribution to fire resistance of a 78 mm L20S concrete hollow masonry unit is 85 min. The contribution of the Type X gypsum board finish is 120 - 85 = 35 min, which does not exceed half the 85 min contribution of the masonry unit or 42.5 min, so that the conditions in Sentence D-1.7.1.(4) are met.

e) The rating of the wall (120 min) is less than twice the contribution of the masonry unit (170 min) so that the conditions in Sentence D-1.7.1.(2) are also met.

D-1.8. Tests on Floors and Roofs
D-1.8.1. Exposure to Fire
All tests relate to the performance of a floor assembly or floor-ceiling or roof-ceiling assembly above a fire. It has been assumed on the basis of experience that fire on top will take a longer time to penetrate the floor than one below, and that the fire resistance in such a situation will be at least equal to that obtained from below in the standard test.

D-1.9. Moisture Content
D-1.9.1. Effect of Moisture
1) The moisture content of building materials at the time of fire test may have a significant influence on the measured fire resistance. In general, an increase in the moisture content should result in an increase in the fire resistance, though in some materials the presence of moisture may produce disruptive effects and early collapse of the assembly.

2) Moisture content is now controlled in standard fire test methods and is generally recorded in the test reports. In earlier tests, moisture content was not always properly determined.

D-1.10. Permanence and Durability
D-1.10.1. Test Conditions
The ratings in this Appendix relate to tested assemblies and do not take into account possible changes or deterioration in use of the materials. The standard fire test measures the fire resistance of a sample building assembly erected for the test. No judgment as to the permanence or durability of the assembly is made in the test.

D-1.11. Steel Structural Members
D-1.11.1. Thermal Protection
Since the ability of a steel structural member to sustain the loading for which it was designed may be impaired because of elevated temperatures, measures shall be taken to provide thermal protection. The fire-resistance ratings, as established by the provisions of this Appendix, indicate the time periods during which the effects of heat on protected steel structural members are considered to be within acceptable limits.
Appendix D: Fire Performance Rating

D-1.12. Restraint Effects
D-1.12.1. Effect on Fire-Resistance Ratings
In fire tests of floors, roofs and beams, it is necessary to state whether the rating applies to a thermally restrained or thermally unrestrained assembly. Edge restraint of a floor or roof, structural continuity, or end restraint of a beam can significantly extend the time before collapse in a standard test. A restrained condition is one in which expansion or rotation at the supports of a load-carrying element resulting from the effects of fire is resisted by forces or moments external to the element. An unrestrained condition is one in which the load-carrying element is free to thermally expand and rotate at its supports.

Whether an assembly or structural member can be considered thermally restrained or thermally unrestrained depends on the type of construction and location in a building. Guidance on this subject can be found in Appendix A of CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials.” Different acceptance criteria also apply to thermally unrestrained and thermally restrained assemblies. These are described in CAN/ULC-S101.

The ratings for floors, roofs, and beams in this Appendix meet the conditions of CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials,” for thermally unrestrained specimens. In a thermally restrained condition, the structural element or assembly would probably have greater fire resistance, but the extent of this increase can be determined only by reference to behavior in a standard test.

Section D-2 Fire-Resistance Ratings

D-2.1. Masonry and Concrete Walls
D-2.1.1. Minimum Equivalent Thickness for Fire-Resistance Rating
The minimum thicknesses of unit masonry and monolithic concrete walls are shown in Table D-2.1.1. Hollow masonry units and hollow-core concrete panels shall be rated on the basis of equivalent thickness as described in Subsection D-1.6.

</tbody>
</table>

Notes to Table D-2.1.1:
(1) See definition of equivalent thickness in Subsection D-1.6.
(2) Hollow concrete masonry units made with Type S or N concrete shall have a minimum compressive strength of 15 MPa based on net area, as defined in CSA A165.1, “Concrete Block Masonry Units.”

D-2.1.2. Applicability of Ratings
1) Ratings obtained as described in Article D-2.1.1. apply to either loadbearing or non-loadbearing walls, except for walls described in Sentences (2) to (6).
2) Ratings for walls with a thickness less than the minimum thickness prescribed for loadbearing walls in this By-law apply to non-loadbearing walls only.
3) Masonry cavity walls (consisting of 2 wythes of masonry with an air space between) that are loaded to a maximum allowable compressive stress of 380 kPa have a fire resistance at least as great as that of a solid wall of a thickness equal to the sum of the equivalent thicknesses of the 2 wythes.
4) Masonry cavity walls that are loaded to a compressive stress exceeding 380 kPa are not considered to be within the scope of this Appendix.
5) A masonry wall consisting of 2 types of masonry units, either bonded together or in the form of a cavity wall, shall be considered to have a fire-resistance rating equal to that which would apply if the whole of the wall were of the material that gives the lesser rating.
6) A non-loadbearing cavity wall made up of 2 precast concrete panels with an air space or insulation in the cavity between them shall be considered to have a fire-resistance rating as great as that of a solid wall of a thickness equal to the sum of the thicknesses of the 2 panels.

D-2.1.3. Framed Beams and Joists
Beams and joists that are framed into a masonry or concrete fire separation shall not reduce the thickness of the fire separation to less than the equivalent thickness required for the fire separation.

D-2.1.4. Credit for Plaster Thickness
On monolithic walls and walls of unit masonry, the full plaster finish on one or both faces multiplied by the factor shown in Table D-1.7.1. shall be included in the wall thickness shown in Table D-2.1.1., under the conditions and using the methods described in Subsection D-1.7.

D-2.1.5. Walls Exposed to Fire on Both Sides
1) Except as permitted in Sentence (2), portions of loadbearing reinforced concrete walls, which do not form a complete fire separation and thus may be exposed to fire on both sides simultaneously, shall have minimum dimensions and minimum cover to steel reinforcement in conformance with Articles D-2.8.2. to D-2.8.5.
Appendix D: Fire Performance Rating

2) A concrete wall exposed to fire from both sides as described in Sentence (1) has a fire-resistance rating of 2 h if the following conditions are met:
   a) its equivalent thickness is not less than 200 mm,
   b) its aspect ratio (width/thickness) is not less than 4.0,
   c) the minimum thickness of concrete cover over the steel reinforcement specified in Clause (d) is not less than 50 mm,
   d) each face of the wall is reinforced with both vertical and horizontal steel reinforcement in conformance with either Clause 10 or Clause 14 of CSA A23.3, “Design of Concrete Structures,”
   e) the structural design of the wall is governed by the minimum eccentricity \((15 + 0.03h)\) specified in Clause 10.15.3.1 of CSA A23.3, “Design of Concrete Structures,” and
   f) the effective length of the wall, \(k_{lu}\), is not more than 3.7 m

where
\[
k = \text{effective length factor obtained from CSA A23.3, “Design of Concrete Structures,”}
\]
\[
l_u = \text{unsupported length of the wall in metres.}
\]

D-2.2. Reinforced and Prestressed Concrete Floor and Roof Slabs

D-2.2.1. Assignment of Rating

1) Floors and roofs in a fire test are assigned a fire-resistance rating which relates to the time that an average temperature rise of 140°C or a maximum temperature rise of 180 °C at any location is recorded on the unexposed side, or the time required for collapse to occur, whichever is the lesser. The thickness of concrete shown in Table D-2.2.1.-A shall be required to resist the transfer of heat during the fire resistance period shown.

| Minimum Thickness of Reinforced and Prestressed Concrete Floor or Roof Slabs, mm |
|---------------------------------|---|---|---|---|---|---|---|
| **Type of Concrete**            | **Fire-Resistance Rating** |
|                                 | 30 min | 45 min | 1 h | 1.5 h | 2 h | 3 h | 4 h |
| Type S concrete                 | 60      | 77      | 90  | 112   | 130 | 158 | 180 |
| Type N concrete                 | 59      | 74      | 87  | 108   | 124 | 150 | 171 |
| Type L40S or Type L concrete    | 49      | 62      | 72  | 89    | 103 | 124 | 140 |

2) The concrete cover over the reinforcement and steel tendons shown in Table D-2.2.1.-B shall be required to maintain the integrity of the structure and prevent collapse during the same period.

<table>
<thead>

</tbody>
</table>
Appendix D: Fire Performance Rating

D-2.2.2. Floors with Hollow Units
The fire resistance of floors containing hollow units may be determined on the basis of equivalent thickness as described in Subsection D-1.6.

D-2.2.3. Composite Slabs
1) For composite concrete floor and roof slabs consisting of one layer of Type S or N concrete and another layer of Type L40S or L concrete in which the minimum thickness of both the top and bottom layers is not less than 25 mm, the combined fire-resistance rating may be determined using the following expressions:
   a) when the base layer consists of Type S or N concrete,
      \[ R = 0.00018t^2 + \frac{8.7}{t} \]
      where
      \[ R \] = fire resistance of slab, h,
      \[ T \] = total thickness of slab, mm, and
      \[ d \] = thickness of base layer, mm.
   b) when the base layer consists of Type L40S or L concrete,
      \[ R = 0.0001t^2 + 0.0002dt - 0.0001d^2 + \frac{6.4}{t} \]
   2) If the base course described in Sentence (1) is covered by a top layer of material other than Type S, N, L40S or L concrete, the top course thickness may be converted to an equivalent concrete thickness by multiplying the actual thickness by the appropriate factor listed in Table D-2.2.3.-A. This equivalent concrete thickness may be added to the thickness of the base course and the fire-resistance rating calculated using Table D-2.2.1.-A.
   3) The minimum concrete cover under the main reinforcement for composite concrete floor and roof slabs with base slabs less than 100 mm thick shall conform to Table D-2.2.3.-B. For base slabs 100 mm or more thick, the minimum cover thickness requirements of Table D-2.2.1.-B shall apply.
   4) Where the top layer of a 2-layer slab is less than 25 mm thick, the fire-resistance rating for the slab shall be calculated as though the entire slab were made up of the type of concrete with the lesser fire resistance.

**D-2.2.4. Contribution of Plaster Finish**

1) The contribution of plaster finish securely fastened to the underside of concrete may be taken into account in floor or roof slabs under the conditions and using the methods described in Subsection D-1.7.

2) Plaster finish on the underside of concrete floors or roofs may be used in lieu of concrete cover referred to in Sentence D-2.2.1.(2) under the conditions and using the methods described in Subsection D-1.7.

**D-2.2.5. Concrete Cover**

1) In prestressed concrete slab construction, the concrete cover over an individual tendon shall be the minimum thickness of concrete between the surface of the tendon and the fire-exposed surface of the slab, except that for ungrouted ducts the assumed cover thickness shall be the minimum thickness of concrete between the surface of the duct and the bottom of the slab. For slabs in which several tendons are used, the cover is assumed to be the average of those of individual tendons, except that the cover for any individual tendon shall be not less than half of the value given in Table D-2.2.1.-B nor less than 20 mm.

2) Except as provided in Sentence (3), in post-tensioned prestressed concrete slabs, the concrete cover to the tendon at the anchor shall be not less than 15 mm greater than the minimum cover required by Sentence (1). The minimum concrete cover to the anchorage bearing plate and to the end of the tendon, if it projects beyond the bearing plate, shall be 20 mm.

3) The requirements of Sentence (2) do not apply to those portions of slabs not likely to be exposed to fire, such as the ends and tops.

**D-2.2.6. Minimum Dimensions for Cover**

Minimum dimensions and cover to steel tendons of prestressed concrete beams shall conform to Subsection D-2.10.

**D-2.3. Wood and Steel Framed Walls, Floors and Roofs**

**D-2.3.1. Maximum Fire-Resistance Rating**

The fire-resistance rating of walls constructed of wood studs or cold-formed-steel studs, of floors constructed of wood joists, wood I-joists, pre-manufactured wood trusses, cold-formed steel joists or open web steel joists, and of roofs constructed of wood joists, pre-manufactured metal-plate-connected wood trusses or open web steel joists can be determined for ratings of not more than 90 min from the information in this Subsection.

**D-2.3.2. Loadbearing Conditions**

1) The fire-resistance ratings derived from the information in this Subsection apply to loadbearing and non-loadbearing wood-framed and cold-formed-steel-framed walls, and to loadbearing floors and roofs, as specifically described in this Subsection.
2) Loadbearing conditions shall be as defined in CAN/ULC-S101, “Fire Endurance Tests of Building Construction and Materials.”

D-2.3.3. Limitations of Component Additive Method
(See Section D-6, Background Information.)

1) The fire-resistance rating of a framed assembly depends primarily on the time during which the membrane on the fire-exposed side remains in place.

2) The assigned times in Sentences D-2.3.4.(2), (3) and (4) are not intended to be construed as the fire-resistance ratings of the individual components of an assembly, nor are they intended to be construed as times that are applicable or acceptable for use beyond the method and systems described in this Subsection. These assigned times are the individual contributions of each component to the overall fire-resistance rating of an assembly, which is permitted to be derived using the component additive method described in this Subsection.

3) The fire-resistance rating calculated by the component additive method cannot be increased by installing membranes in multiple layers, other than as specified in Tables D-2.3.4.-A, D-2.3.4.-B, and D-2.3.4.-C.

D-2.3.4. Method of Calculation

1) In the component additive method, the fire-resistance rating of a framed assembly is calculated by adding the time assigned in Sentence (2) for the membrane on the fire-exposed side to the time assigned in Sentence (3) for the framing members and then adding any time assigned in Sentence (4) for additional protective measures, such as the inclusion of insulation or of reinforcement for a membrane. For loadbearing walls where resilient metal channels are installed with a single layer of gypsum board membrane in accordance with Table D-2.3.4.-A, the fire-resistance rating determined using this method of calculation must be reduced by 10 min.

2) The times to be used in the component additive method that have been assigned to membranes on the fire-exposed side of the assembly, which are partly based on their ability to remain in place during fire tests, are listed in Tables D-2.3.4.-A, D-2.3.4.-B, D-2.3.4.-C and D-2.3.4.-D. (This is not to be confused with the fire-resistance rating of the membrane, which also takes into account the rise in temperature on the unexposed side of the membrane. [See Sentence D-2.3.3.(2)].)

Notes to Table D-2.3.4.-A:
(1) Applies to stud cavities filled with mineral wool conforming to CAN/ULC-S702, “Mineral Fibre Thermal Insulation for Buildings,” and having a mass per unit area of not less than 2 kg/m², with no additional credit for insulation according to Table D-2.3.4.-G.
(2)(2) Applies only to wood-framed walls.

(2)(3) Applies only to steel-framed walls.

(2)(4) Resilient metal channels are permitted to be installed at a spacing of 400 mm o.c. with no effect on the rating of the wall assembly.

Notes to Table D-2.3.4.-D:

<sup>(1)</sup> For mixture of Portland cement-sand plaster, see Sentence D-1.7.2.(2).

<sup>(2)</sup> Applies to loadbearing and non-loadbearing wood studs or non-loadbearing cold-formed-steel studs, to floors constructed of wood joists or open-web steel joists, and to roofs constructed of wood joists, pre-manufactured metal-plate-connected wood trusses, or open-web steel joists.

<sup>(3)</sup> Values shown for these membranes have been limited to 80 min because the fire-resistance ratings of framed assemblies derived from these Tables must not exceed 1.5 h.

3) The times to be used in the component additive method that have been assigned to wall framing members and to floor and roof framing members are listed in Tables D-2.3.4.-E and D-2.3.4.-F respectively.

### Notes to Table D-2.3.4.-F:
1. Resilient metal channels are permitted to be installed with no effect on the rating of the floor assembly.
2. Applies only to floor structural members that are protected by a membrane.

4) Preformed insulation of glass, rock or slag fibre and cellulose fibre insulation provide additional protection to wood studs by shielding the studs from exposure to the fire and thus delaying the time of collapse. The use of preformed glass fibre, preformed rock or slag fibre and dry-blown cellulose insulation material does not decrease the rating of wall assemblies with the membranes identified in Table D-2.3.4.-A. Similarly, the use of preformed glass fibre, preformed rock or slag fibre and cellulose insulation material does not decrease the rating of floor assemblies constructed with wood joists, wood trusses, wood I-joists and cold-formed-steel floor joists (C-shaped joists), provided the insulation is not in direct contact with the membranes identified in Table D-2.3.4.-B. The use of reinforcement in the membrane exposed to fire also adds to the fire resistance by extending the time to failure. Table D-2.3.4.-G shows the time increments that may be added to the fire resistance if these features are incorporated in the assembly.

### Notes to Table D-2.3.4.-G:

1. Applies to wood-framed walls only.
2. Applies to wood joists, wood trusses, wood I-joists and cold-formed-steel joists (C-shaped joists).
3. Applies to cellulose fibre:
   - for wood joists, wood I-joist and wood trusses—that is spray-applied with a minimum density of 50 kg/m³, a minimum depth of 90 mm on the underside of the subfloor, and of 90 mm on the sides of the structural members;
   - for cold-formed-steel joists—that is spray-applied with a minimum density of 50 kg/m³ and a minimum thickness of 90 mm on the underside of the subfloor, of 90 mm on the sides of the structural members, and of 13 mm on the underside of the bottom flange other than at resilient metal channel locations.
4. Cellulose fibre insulation conforming to CAN/ULC-S703, “Cellulose Fibre Insulation for Buildings,” applied in conformance with CAN/CGSB-92.2-M, “Trowel or Spray Applied Acoustical Material,” does not affect the fire-resistance rating of a non-loadbearing cold-formed-steel stud wall assembly, provided that it is sprayed to either face of the wall cavity.

### D-2.3.5. Considerations for Various Types of Assemblies

1. Interior vertical fire separations are to be rated for exposure to fire on each side (see Sentence 3.1.7.3.(2)). The method described in this Subsection applies when a membrane is provided on both sides of the assembly. However, in the calculation of the fire-resistance rating of such an assembly using this method, no additional contribution to fire resistance is to be assigned for a membrane on the non-fire-exposed side, since its contribution is already accounted for in the values assigned to the other components of the assembly.

2. Exterior wall assemblies required to have a fire-resistance rating are required to be rated for exposure to fire from the interior side only (see Sentence 3.1.7.3.(3)). When deriving a fire-resistance rating for such wall assemblies using the method described in this Subsection, only wood studs with a single layer of gypsum board or non-loadbearing cold-formed-steel studs conforming to Table D-2.3.4.-E may be used. Such walls must have a membrane on the exterior side of the stud consisting of plywood, oriented strandboard or gypsum sheathing and exterior cladding. Additional materials are also permitted between the required sheathing and cladding. The spaces between the studs are to be filled with insulation conforming to CAN/ULC-S702, “Mineral Fibre Thermal Insulation for Buildings,” and having a mass per unit area of not...
Appendix D: Fire Performance Rating

less than 1.22 kg/m² of wall surface. However, in the calculation of the fire-resistance rating of such an assembly, no additional contribution to fire resistance is to be assigned for a membrane on the non-fire-exposed side, since its contribution is already accounted for in the values assigned to the other components of the assembly.

3) In the case of a floor or roof assembly, the By-law only requires testing for fire exposure from below. Floors or roofs must have an upper flooring or roofing membrane in accordance with Table D-2.3.5.

</tr>
</tbody>
</table>

Notes to Table D-2.3.5: 
(1) Applies to single layer of gypsum board membrane, and lath and plaster.

4) Insulation used in the cavities of a wood joist or metal-plate-connected wood truss floor assembly with a single layer of gypsum board will not reduce the assigned fire-resistance rating of the assembly, provided:
Appendix D: Fire Performance Rating

a) the insulation is preformed of rock, slag or glass fibre conforming to CAN/ULC-S702, “Mineral Fibre Thermal Insulation for Buildings,” and having a mass per unit area of not more than 1.1 kg/m² and is installed adjacent to the bottom edge of the framing member, directly above steel furring channels,
b) the gypsum board ceiling membrane is attached to
   i) wood trusses in conformance with Sentence D-2.3.9.(2) by way of steel furring channels spaced not more than 400 mm o.c., and the channels are secured to each bottom truss member with a double strand of 1.2 mm galvanized steel wire, or
   ii) wood joists by way of resilient metal or steel furring channels spaced not more than 400 mm o.c. in conformance with Sentences D-2.3.9.(2) and (3), and
c) a steel furring channel is installed midway between each furring channel mentioned in Clause (b) to provide additional support for the insulation.

5) Except as required in Sentence D-2.3.5.(4), resilient metal or steel furring channels may be used to attach a gypsum board ceiling membrane to a floor assembly using wood joists, metal-plate-connected wood trusses and open-web steel joists, or to a roof assembly. The channels must be made of galvanized steel not less than 0.5 mm thick spaced not more than 600 mm o.c. perpendicular to the framing members, with an overlap of not less than 100 mm at splices and a minimum end clearance between the channels and walls of 15 mm.

D-2.3.6. Framing Members

1) The values shown in Tables D-2.3.4.-A, D-2.3.4.-B, D-2.3.4.-D and D-2.3.12. apply to membranes supported on framing members installed in their conventional orientation and spaced in conformance with Tables D-2.3.4.-E and D-2.3.4.-F.

2) Wood studs and wood roof framing members are to be not less than 38 mm by 89 mm. Wood floor joists are to be not less than 38 mm by 184 mm, except where they are used in an assembly from Table D-2.3.4.-D or from Table D-2.3.5. that uses a single layer of gypsum board as the lower (ceiling) membrane, in which case, wood floor joists are to be not less than 38 mm by 89 mm.

3) Wood roof trusses are to consist of wood chord and web framing members not less than 38 mm by 89 mm and metal connector plates fabricated from galvanized steel not less than 1 mm in nominal thickness with projecting teeth not less than 8 mm long.

4) Wood floor trusses are to consist of:
   a) metal-plate-connected wood trusses that are not less than 305 mm deep with wood chord and web framing members not less than 38 mm by 64 mm and metal connector plates fabricated from galvanized steel not less than 1 mm in nominal thickness with projecting teeth not less than 8 mm long;
   b) metal-web wood trusses that are not less than 286 mm deep with wood chords not less than 38 mm by 64 mm and V-shaped webs made from galvanized steel not less than 1 mm in nominal thickness with plate areas having teeth not less than 8 mm long; or
   c) fingerjointed wood trusses that are not less than 330 mm deep with fingerjointed connections, chord members not less than 38 mm by 64 mm, and web members not less than 38 mm by 38 mm glued together with a R-14 phenol-resorcinol resin conforming to CSA O112.10, “Evaluation of Adhesives for Structural Wood Products (Limited Moisture Exposure).”

5) Wood I-joists are to be not less than 241 mm deep with flanges that are not less than 38 mm by 38 mm and an oriented strandboard or plywood web that is not less than 9.5 mm thick.

6) The dimensions for dressed lumber given in CSA O141, “Softwood Lumber,” are to be used for wood studs, joists, I-joists and trusses.

7) Cold-formed-steel studs for non-loadbearing walls are to consist of galvanized steel that is not less than 0.5 mm thick and not less than 63 mm wide, and have a flange that is not less than 31 mm wide.

8) Cold-formed-steel studs in non-loadbearing wall assemblies are to be installed with not less than a 12 mm clearance between the top of the stud and the top of the runner to allow for expansion in the event of
Appendix D: Fire Performance Rating

9) Cold-formed-steel studs for loadbearing walls are to consist of galvanized steel that is not less than 0.912 mm thick but not greater than 1.52 mm thick, with a C-shaped cross-section not less than 92 mm deep by 41 mm wide and 12.7 mm stiffening lips.

10) Cold-formed-steel studs in loadbearing wall assemblies are to be installed with diagonal cross-bracing.

11) Cold-formed-steel floor joists (C-shaped joists) are to be not less than 41 mm wide × 203 mm deep × 1.22 mm material thickness.

12) The allowable spans for wood joists listed in the Span Tables in Part 9 are provided for floors supporting specific occupancies.

D-2.3.7. Plaster Finish
The thickness of plaster finish shall be measured from the face of gypsum or metal lath.

D-2.3.8. Edge Support for Gypsum Board in Wall Assembly
Gypsum board installed over framing or furring in a wall assembly shall be installed so that all edges are supported, except that 15.9 mm Type X gypsum board may be installed horizontally with the horizontal joints unsupported when framing members are at 400 mm o.c. maximum.

D-2.3.9. Membrane Fastening

1) Except as provided in Sentences (2) to (5), Table D-2.3.4.-B and Sentence D-2.3.5.(5), the application of lath and plaster finish shall conform to CSA A82.30-M, “Interior Furring, Lathing and Gypsum Plastering,” and of gypsum board finish shall conform to ASTM C 840, “Application and Finishing of Gypsum Board.”

2) Where a membrane referred to in Table D-2.3.4.-A, D-2.3.4.-B, D-2.3.4.-C, D-2.3.4.-D or D-2.3.12. is applied to steel framing or furring, fasteners shall penetrate not less than 10 mm through the metal.

3) Except as provided in Sentence (4), where a membrane referred to in Table D-2.3.4.-A, D-2.3.4.-B, D-2.3.4.-C, D-2.3.4.-D or D-2.3.12. is applied to wood framing or furring, minimum fastener penetrations into wood members shall conform to Table D-2.3.9. for the time assigned to the membrane.

Notes to Table D-2.3.9:

(1) Assigned contributions of membranes to fire resistance are listed in Tables D-2.3.4.-A, D-2.3.4.-B, D-2.3.4.-C, D-2.3.4.-D and D-2.3.12.

4) Where a membrane is applied in 2 layers, the fastener penetrations described in Table D-2.3.9. shall apply to the base layer. Fasteners for the face layer shall penetrate not less than 20 mm into wood supports.

5) In a double layer application of gypsum board on wood supports, fastener spacing shall conform to ASTM C 840, “Application and Finishing of Gypsum Board.”
D-2.3.10. Ceiling Membrane Openings – Combustible Construction
   1) Except as permitted in Article D-2.3.12., where a floor or roof assembly of combustible construction is assigned a fire-resistance rating on the basis of this Subsection and incorporates a ceiling membrane described in Table D-2.3.4.-B, D-2.3.4.-C or D-2.3.4.-D, the ceiling membrane may be penetrated by openings leading to ducts within concealed spaces above the membrane provided:
      a) the assembly is not required to have a fire-resistance rating in excess of 1 h,
      b) the area of any openings does not exceed 930 cm² (see Sentence (2)),
      c) the aggregate area of openings does not exceed 1% of the ceiling area of the fire compartment,
      d) the depth of the concealed space above the ceiling is not less than 230 mm,
      e) no dimension of any opening exceeds 310 mm,
      f) supports are provided for openings with any dimension exceeding 150 mm where framing members are spaced greater than 400 mm o.c.,
      g) individual openings are spaced not less than 2 m apart,
      h) the ducts above the membrane are sheet steel and are supported by steel strapping firmly attached to the framing members, and
      i) the clearance between the top surface of the membrane and the bottom surface of the ducts is not less than 100 mm.
   2) Where an individual opening permitted in Sentence (1) exceeds 130 cm² in area, it shall be protected by
      a) a fire stop flap conforming to CAN/ULC-S112.2, “Fire Test of Ceiling Firestop Flap Assemblies,” that activates at a temperature approximately 30°C above the normal maximum temperature that occurs in the ducts, whether the air duct system is operating or shut down, or
      b) thermal protection above the duct consisting of the same materials as used for the ceiling membrane, mechanically fastened to the ductwork and extending 200 mm beyond the opening on all sides (see Article D-2.3.10.).

Figure D-2.3.10.
Thermal protection above a duct

D-2.3.11. Ceiling Membrane Openings – Noncombustible Construction
   1) Except as permitted in Article D-2.3.12., where a floor or roof assembly of noncombustible construction is assigned a fire-resistance rating on the basis of this Subsection and incorporates a ceiling membrane described in Table D-2.3.4.-B, D-2.3.4.-C or D-2.3.4.-D, the ceiling membrane may be penetrated by openings leading to ducts located within concealed spaces provided:
      a) the area of any opening does not exceed 930 cm² (see Sentence (2)),
      b) the aggregate area of openings does not exceed 2% of the ceiling area of the fire compartment,
Appendix D: Fire Performance Rating

c) no dimension of any opening exceeds 400 mm,
d) individual openings are spaced not less than 2 m apart,
e) openings are located not less than 200 mm from major structural members such as beams, columns or joists,
f) the ducts above the membrane are sheet steel and are supported by steel strapping firmly attached to the framing members, and

g) the clearance between the top surface of the membrane and the bottom surface of the duct is not less than 100 mm.

2) Where an individual opening permitted in Sentence (1) exceeds 130 cm² in area, it shall be protected by
   a) a fire stop flap conforming to CAN/ULC-S112.2, “Fire Test of Ceiling Firestop Flap Assemblies,”
   that activates at a temperature approximately 30°C above the normal maximum temperature that
   occurs in the ducts, whether the air duct system is operating or shut down, or
   b) thermal protection above the duct consisting of the same materials as used for the ceiling
   membrane, mechanically fastened to the ductwork and extending 200 mm beyond the opening on
   all sides (see Article D-2.3.10.).

D-2.3.12. Ceiling Membrane Rating
Where the fire-resistance rating of a ceiling assembly is to be determined on the basis of the membrane only and not
of the complete assembly, the ratings may be determined from Table D-2.3.12., provided no openings described
in Articles D-2.3.10. and D-2.3.11. are located within the ceiling membrane.

D-2.3.13. Membrane Penetrations in Combustible and Noncombustible Construction
1) Where a wall, floor or roof assembly is assigned a fire-resistance rating on the basis of this Subsection
and includes a membrane or membranes described in Table D-2.3.4.-A, D-2.3.4.-B, D-2.3.4.-C, D-2.3.4.-D
or D-2.3.12., penetrations of the membrane or membranes must be fire stopped in conformance with the
applicable requirements in Article 3.1.9.1. or Sentence 9.10.9.6.(1).

D-2.3.14. Beams
1) Where a steel beam is included with an open-web steel joist and is protected by the same continuous
   ceiling, the beam is assumed to have a fire-resistance rating equal to that assigned to the rest of the
   assembly.

2) The ratings in this Subsection assume that the construction to which the beam is related is a normal one
   and does not carry unusual loads from the floor or slab above.
D-2.3.15. Wired Glass Assembly Support

1) Openings in a vertical fire separation having a fire-resistance rating of not more than 1 h are allowed to be protected by wired glass assemblies, provided the wired glass is
   a) not less than 6 mm thick;
   b) reinforced by a steel wire mesh in the form of diamonds, squares or hexagons having dimensions of
      i) approximately 25 mm across the flats, using wire of not less than 0.45 mm diameter, or
      ii) approximately 13 mm across the flats, using wire of not less than 0.40 mm diameter, the wire to be centrally embedded during manufacture and welded or intertwined at each intersection;
   c) set in fixed steel frames with metal not less than 1.35 mm thick and providing a glazing stop of not less than 20 mm on each side of the glass; and
   d) limited in area so that
      i) individual panes are not more than 0.84 m², with neither height nor width more than 1.4 m, and
      ii) the area not structurally supported by mullions is not more than 7.5 m².

2) It is intended that the structural mullions referred to in Subclause (1)(d)(ii) will not distort or be displaced to the extent that there would be a failure of the wired glass closure during the period for which a closure in the fire separation would be expected to function. Hollow structural steel tubing not less than 100 mm square filled with a Portland cement-based grout will satisfy the intent of the Subclause.

D-2.4. Solid Wood Walls, Floors and Roofs
D-2.4.1. Minimum Thickness
The minimum thickness of solid wood walls, floors and roofs for fire-resistance ratings from 30 min to 1.5 h is shown in Table D-2.4.1.

<table>
<thead>
<tr>
<th>Type of Construction</th>
<th>Fire-Resistance Rating</th>

<tr>
<td>Solid wood walls of non-loadbearing horizontal plank[3]</td>
<td>89</td>
</tr>
</tbody>
</table>

Notes to Table D-2.4.1.:  
(2) The fire-resistance ratings and minimum dimensions for floors also apply to solid wood roof decks of comparable thickness with finish roofing material.  
(3)[3] The assembly shall consist of 38 mm thick members on edge fastened together with 101 mm common wire nails spaced not more than 400 mm o.c. and staggered in the direction of the grain.  
(4) The floor shall consist of 64 mm by 184 mm wide planks either tongued and grooved or with 19 mm by 38 mm splines set in grooves and fastened together with 88 mm common nails spaced not more than 400 mm o.c.
Appendix D: Fire Performance Rating

D-2.4.2. Increased Fire-Resistance Rating
1) The fire-resistance rating of the assemblies described in Table D-2.4.1. may be increased by 15 min if one of the following finishes is applied on the fire-exposed side:
   a) 12.7 mm thick gypsum board,
   b) 20 mm thick gypsum-sand plaster on metal lath, or
   c) 13 mm thick gypsum-sand plaster on 9.5 mm gypsum lath.
2) Fastening of the plaster to the wood structure shall conform to Subsection D-2.3.

D-2.4.3. Supplementary Ratings
Supplementary ratings based on tests are included in Table D-2.4.3. The ratings given shall apply to constructions that conform in all details with the descriptions given.

Notes to Table D-2.4.3.:
(2) Ratings for plywood faced panel are based on phenolic resin glue being used for gluing facings to wood frames. If other types of glue are used for this purpose, the ratings apply if the facings are nailed to the frames in addition to being glued.

D-2.5. Solid Plaster Partitions
D-2.5.1. Minimum Thickness
The minimum thickness of solid plaster partitions for fire-resistance ratings from 30 min to 4 h is shown in Table D-2.5.1.

### Table D-2.5.1.
Minimum Thickness of Non-Loadbearing Solid Plaster Partitions, mm

Appendix D: Fire Performance Rating

Notes to Table D-2.5.1.:
(1) Metal lath shall be expanded metal lath or welded woven wire fabric supported on 19 mm vertical light steel studs spaced not more than 600 mm o.c. Plaster shall be applied to both sides of the lath.
(2)(2) For mixture of Portland cement-sand plaster, see Sentence D-1.7.2.(2).
(2)(3) CSA A82.30-M, “Interior Furring, Lathing and Gypsum Plastering,” does not permit solid plaster partitions less than 50 mm thick.

D-2.6. Protected Steel Columns
D-2.6.1. Minimum Thickness of Protective Covering
The minimum thickness of protective covering to steel columns is shown in Tables D-2.6.1.-A to D-2.6.1.-F for fire-resistance ratings from 30 min to 4 h.

---

**Figure D-2.6.1.-A**
Column protected by sheet-steel membrane and mineral-wool insulation
Appendix D: Fire Performance Rating

Figure D-2.6.1.-B
Column protected by sheet-steel membrane and gypsum board

D-2.6.2. Hollow Unit Masonry Columns
For hollow-unit masonry column protection, the thickness shown in Tables D-2.6.1.-A to D-2.6.1.-D is the equivalent thickness as described in Subsection D-1.6.

D-2.6.3. Effect of Plaster
The effect on fire-resistance ratings of the addition of plaster to masonry and monolithic concrete column protection is described in Subsection D-1.7.

D-2.6.4. Determination of M/D Ratio
1) The ratio M/D to which reference is made in Tables D-2.6.1.-B, D-2.6.1.-C, D-2.6.1.-D and D-2.6.1.-F shall be found by dividing “M,” the mass of the column in kilograms per metre by “D,” the heated perimeter of the steel column section in metres.
2) The heated perimeter “D” of steel columns, shown as the dashed line in Figure D-2.6.4.-A, shall be equal to 2 (B+H) in Examples (1) and (2), and 3.14B in Example (3). In Figure D-2.6.4.-B, the heated perimeter “D” shall be equal to 2 (B+H).
Appendix D: Fire Performance Rating

D-2.6.5. Attachment of Gypsum Board

1) Where Type X gypsum board is used to protect a steel column without an outside sheet-steel membrane, the method of gypsum board attachment to the column shall be as shown in Figure D-2.6.4.-B and shall meet the construction details described in Sentences (2) to (7).
Appendix D: Fire Performance Rating

2) The Type X gypsum board shall be applied vertically without horizontal joints.
3) The first layer of gypsum board shall be attached to steel studs with screws spaced not more than 600 mm o.c. and other layers of gypsum board shall be attached to steel studs and steel corner beads with screws spaced at a maximum of 300 mm o.c. Where a single layer of gypsum board is used, attachment screws shall be spaced not more than 300 mm o.c.
4) Steel tie wires spaced at a maximum of 600 mm o.c. shall be used to secure the second last layer of gypsum board in 3- and 4-layer systems.
5) Studs shall be fabricated of galvanized steel not less than 0.53 mm thick and not less than 41.3 mm wide, with legs not less than 33.3 mm long and shall be 12.7 mm less than the assembly height.
6) Corner beads shall
   a) be fabricated of galvanized steel that is not less than 0.41 mm thick,
   b) have legs not less than 31 mm long,
   c) be attached to the gypsum board or stud with 25.4 mm screws spaced not more than 300 mm o.c., and
   d) have the attaching fasteners penetrate either another corner bead in multiple layer assemblies or the steel stud member.
7) In a 4-layer system, metal angles shall be fabricated of galvanized steel and shall be not less than 0.46 mm thick with legs not less than 51 mm long.

D-2.6.6. Concrete Filled Hollow Steel Columns

1) A fire-resistance rating, \( R \), is permitted to be assigned to concentrically loaded hollow steel columns that are filled with plain concrete, steel-fibre reinforced concrete or bar-reinforced concrete, that are fabricated and erected within the tolerances stipulated in CSA S16, “Design of Steel Structures,” and that comply with Sentences (2) and (3), provided:

\[
C \leq C_{\text{max}}
\]

where

\[
C = \text{axial compressive force due to dead and live loads without load factors, kN},
\]

\[
C_{\text{max}} = \left( \frac{a(f'_c + 20)D^{2.5}}{R(KL - 1000)} \right)
\]

but shall not exceed

a) \( 1.0 C'_f \) for plain concrete filling (PC),
   b) \( 1.1 C'_f \) for steel-fibre reinforced concrete filling (FC), and
   c) \( 1.7 C'_f \) for bar-reinforced concrete filling (RC),

where

\[
C'_f = 0.85\varphi_c f'_c A_c \lambda \lambda_c^{-2} \left( \sqrt{1 + 0.25 \lambda \lambda_c^{-4}} - 0.5 \lambda \lambda_c^{-2} \right)
\]

where

\( a = \text{constant obtained from Table D-2.6.6.-A}, \)
\( f'_c = \text{specified compressive strength of concrete in accordance with CSA A23.3, “Design of Concrete Structures,” MPa}, \)
\( r_c = \text{radius of gyration of the concrete area}, \)
\( A_c = \text{area of concrete, mm}^2, \)
\( D = \text{outside diameter of a round column or outside width of a square column, mm}, \)
\( E_c = \text{initial elastic modulus for concrete, considering the effects of long-term loading for normal-weight concrete} = \left( 1 + \frac{S}{T} \right) 2500 \sqrt{f'_c}, \text{where } f'_c \text{ is expressed in MPa, } S \text{ is the short-term load, and } T \text{ is the total load on the column}, \)
\( R = \text{specified fire-resistance rating, min}, \)
\( KL = \text{effective length of column as defined in CSA S16, “Design of Steel Structures,” mm}, \)
Appendix D: Fire Performance Rating

\[ \lambda_c = \frac{KL}{r_c \sqrt{\frac{f'_c}{\phi_c}}} \text{, and} \]

\[ \phi_c = 0.60 \]

subject to the validity limits stated in Table D-2.6.6.-B.

Notes to Table D-2.6.6.-A:
(1) See Subsection D-1.4.

2) A pair of steam vent holes shall be provided at each end of the hollow steel column and at each intermediate floor level, and the holes shall be
   a) not less than 13 mm in diameter,
   b) located on opposite faces, 150 mm above or below a base plate, cap plate or concrete slab,
   c) orientated so that adjacent pairs are perpendicular, and
   d) not obstructed by other building elements.

3) Load application and reaction shall be through end bearing in accordance with CSA S16, “Design of Steel Structures.”

</tbody>
</table>

Notes to Table D-2.7.1.:
(1) Where the thickness of plaster finish applied over gypsum lath is 26 mm or more, the plaster shall be reinforced with wire mesh with 1.57 mm diam wire and 50 mm by 50 mm openings placed midway in the plaster.
(2)(2) Applies to cast-in-place concrete reinforced by 5.21 mm diam wire spaced 200 mm o.c. or 1.57 mm diam wire mesh with 100 mm by 100 mm openings.
(2)(3) Lath held in place by 1.18 mm diam wire wrapped around the gypsum lath 450 mm o.c.
(2)(4) Expanded metal lath 1.63 kg/m² fastened to 9.5 mm by 19 mm steel channels held in position by 1.19 mm diam wire.
(2)(5) Plaster finish shall be reinforced with wire mesh with 1.57 mm diam wire and 50 mm by 50 mm openings placed midway in the plaster.
**D-2.7.2. Types of Concrete**
Concrete is referred to as Type S, N or L, depending on the nature of the aggregate used. This is described in Article D-1.4.1.

**D-2.7.3. Effect of Plaster**
The effect on fire-resistance ratings of the addition of plaster finish to concrete or masonry beam protection is described in Article D-1.7.1.

**D-2.7.4. Exceptions**
The fire resistance of protected steel beams depends on the means used to hold the protection in place. Because of the importance of this factor, no rating has been assigned in Table D-2.7.1. to masonry units used as protective cover to steel beams. These ratings, however, may be determined on the basis of comparison with column protection at the discretion of the Chief Building Official, if satisfactory means of fastening are provided.

**D-2.7.5. Beam Protected by a Membrane**
A steel beam or steel joist assembly that is entirely above a horizontal ceiling membrane will be protected from fire below the membrane and will resist structural collapse for a period equal to the fire-resistance rating determined in conformance with Subsection D-2.3. The support for this membrane shall be equivalent to that described in Subsection D-2.3. The rating on this basis shall not exceed 1.5 h.

**D-2.8. Reinforced Concrete Columns**

**D-2.8.1. Minimum Dimensions**
Minimum dimensions for reinforced concrete columns and minimum concrete cover for vertical steel reinforcement are obtained from Articles D-2.8.2. to D-2.8.5., taking into account the type of concrete, the effective length of the column and the area of the vertical reinforcement.

**D-2.8.2. Method**

1) The minimum dimension, t, in millimetres, of a rectangular reinforced concrete column shall be equal to
   a) 75 f (R + 1) for all Types L and L40S concrete,
   b) 80 f (R + 1) for Type S concrete when the design condition of the concrete column is defined in the second and fourth columns of Table D-2.8.2.,
   c) 80 f (R + 0.75) for Type N concrete when the design condition of the concrete column is defined in the second and fourth columns of Table D-2.8.2., and
   d) 100 f (R + 1) for Types S and N concrete when the design condition of the concrete column is defined in the third column of Table D-2.8.2.

   where
   \[ t = \text{the value shown in Table D-2.8.2.,} \]
   \[ R = \text{the required fire-resistance rating in hours,} \]
   \[ K = \text{the effective length factor obtained from CSA A23.3, “Design of Concrete Structures,”} \]
   \[ H = \text{the unsupported length of the column in metres, and} \]
   \[ P = \text{the area of vertical reinforcement in the column as a percentage of the column area.} \]

2) The diameter of a round column shall be not less than 1.2 times the value t determined in Sentence (1) for a rectangular column.

Notes to Table D-2.8.2:

\(^{(1)}\) For conditions that do not fall within the limits described in Table D-2.8.2., further information may be obtained from Reference (7) in Subsection D-6.1.

\(^{(2)}\) Overdesign factor is the ratio of the calculated load carrying capacity of the column to the column strength required to carry the specified loads determined in conformance with CSA A23.3, “Design of Concrete Structures.”

\(^{(2)}\)^{(3)} Where the factor \( f \) results in a \( t \) greater than 300 mm, the appropriate factor \( f \) for “All other cases” shall be applicable.

\(^{(2)}\)^{(4)} Where \( p \) is equal to or less than 3% and the factor \( f \) results in a \( t \) less than 300 mm, the minimum thickness shall be 300 mm.

D-2.8.3. Minimum Thickness of Concrete Cover

1) Where the required fire-resistance rating of a concrete column is 3 h or less, the minimum thickness in millimetres of concrete cover over vertical steel reinforcement shall be equal to 25 times the number of hours of fire resistance required or 50 mm, whichever is less.

2) Where the required fire-resistance rating of a concrete column is greater than 3 h, the minimum thickness in millimetres of concrete cover over vertical steel reinforcement shall be equal to 50 plus 12.5 times the required number of hours of fire resistance in excess of 3 h.

3) Where the concrete cover over vertical steel required in Sentence (2) exceeds 62.5 mm, wire mesh reinforcement with 1.57 mm diameter wire and 100 mm openings shall be incorporated midway in the concrete cover to retain the concrete in position.

D-2.8.4. Minimum Requirements

The structural design standards may require minimum column dimensions or concrete cover over vertical steel reinforcement differing from those obtained in Sentences D-2.8.2.(1) and D-2.8.2.(2). Where a difference occurs, the greater dimension shall govern.

D-2.8.5. Addition of Plaster

The addition of plaster finish to the concrete column may be taken into account in determining the cover over vertical steel reinforcement by applying the multiplying factors described in Subsection D-1.7. The addition of plaster shall not, however, justify any decrease in the minimum column sizes shown.

D-2.8.6. Built-in Columns

The fire-resistance rating of a reinforced concrete column that is built into a masonry or concrete wall so that not more than one face may be exposed to the possibility of fire at one time may be determined on the basis of cover to vertical reinforcing steel alone. In order to meet this condition, the wall shall conform to Subsection D-2.1. for the fire-resistance rating required.

D-2.9. Reinforced Concrete Beams

D-2.9.1. Minimum Cover Thickness

The minimum thickness of cover over principal steel reinforcement in reinforced concrete beams is shown in Table D-2.9.1. for fire-resistance ratings from 30 min to 4 h where the width of the beam or joist is at least 100 mm.
Appendix D: Fire Performance Rating

<td>20</td>
</tr>
</tbody>
</table>

D-2.9.2. Maximum Rating
No rating over 2 h may be assigned on the basis of Table D-2.9.1. to a beam or joist where the average width of the part that projects below the slab is less than 140 mm, and no rating over 3 h may be assigned where the average width of the part that projects below the slab is less than 165 mm.

D-2.9.3. Beam Integrated in Floor or Roof Slab
For the purposes of these ratings, a beam may be either independent of or integral with a floor or roof slab assembly.

D-2.9.4. Minimum Thickness
Where the upper extension or top flange of a joist or T-beam in a floor assembly contributes wholly or partly to the thickness of the slab above, the total thickness at any point shall be not less than the minimum thickness described in Table D-2.2.1.-A for the fire-resistance rating required.

D-2.9.5. Effect of Plaster
The addition of plaster finish to a reinforced concrete beam may be taken into account in determining the cover over principal reinforcing steel by applying the multiplying factors described in Subsection D-1.7.

D-2.10. Prestressed Concrete Beams

D-2.10.1. Minimum Cross-Sectional Area and Thickness of Cover
The minimum cross-sectional area and thickness of concrete cover over steel tendons in prestressed concrete beams for fire-resistance ratings from 30 min to 4 h are shown in Table D-2.10.1.

Table D-2.10.1.
Minimum Thickness of Concrete Cover over Steel Tendons in Prestressed Concrete Beams, mm(1)

</tbody>
</table>

Notes to Table D-2.10.1:
(1) Where the thickness of concrete cover over the tendons exceeds 64 mm, a wire mesh reinforcement with 1.57 mm diam wire and 100 mm by 100 mm openings shall be incorporated in the beams to retain the concrete in position around the tendons. The mesh reinforcement shall be located midway in the cover.
D-2.10.2. Minimum Cover Thickness
The cover for an individual tendon shall be the minimum thickness of concrete between the surface of the tendon and the fire-exposed surface of the beam, except that for ungrouted ducts the assumed cover thickness shall be the minimum thickness of concrete between the surface of the duct and the surface of the beam. For beams in which several tendons are used, the cover is assumed to be the average of the minimum cover of the individual tendons. The cover for any individual tendon shall be not less than half the value given in Table D-2.10.1. nor less than 25 mm.

D-2.10.3. Applicability of Ratings
The ratings in Table D-2.10.1. apply to a beam that is either independent of or integral with a floor or roof slab assembly. Minimum thickness of slab and minimum cover to steel tendons in prestressed concrete slabs are contained in Subsection D-2.2.

D-2.10.4. Effect of Plaster
The addition of plaster finish to a prestressed concrete beam may be taken into account in determining the cover over steel tendons by applying the multiplying factors described in Subsection D-1.7.

D-2.10.5. Minimum Cover
1) Except as provided in Sentence (2), in unbonded post-tensioned prestressed concrete beams, the concrete cover to the tendon at the anchor shall be not less than 15 mm greater than the minimum required away from the anchor. The concrete cover to the anchorage bearing plate and to the end of the tendon, if it projects beyond the bearing plate, shall be not less than 25 mm.
2) The requirements in Sentence (1) do not apply to those portions of beams not likely to be exposed to fire (such as the ends and the tops of flanges of beams immediately below slabs).

D-2.11. Glued-Laminated Timber Beams and Columns
D-2.11.1. Applicability of Information
The information in Subsection D-2.11. applies to glued-laminated timber beams and columns required to have fire-resistance ratings greater than those afforded under the provisions of Article 3.1.4.6.

D-2.11.2. Method of Calculation
1) The fire-resistance rating of glued-laminated timber beams and columns in minutes shall be equal to
   a) \(0.1 f B \left[4 - 2 \left(\frac{B}{D}\right)\right]\) for beams that may be exposed to fire on 4 sides,
   b) \(0.1 f B \left[4 - \left(\frac{B}{D}\right)\right]\) for beams that may be exposed to fire on 3 sides,
   c) \(0.1 f B \left[3 - \left(\frac{B}{D}\right)\right]\) for columns that may be exposed to fire on 4 sides, and
   d) \(0.1 f B \left[3 - \left(\frac{B}{2D}\right)\right]\) for columns that may be exposed to fire on 3 sides,
   where
   \(f = \) the load factor shown in Figure D-2.11.2.-A,
   \(B = \) the full dimension of the smaller side of a beam or column in millimetres before exposure to fire [see Figure D-2.11.2.-B],
   \(D = \) the full dimension of the larger side of a beam or column in millimetres before exposure to fire [see Figure D-2.11.2.-B],
   \(K = \) the effective length factor obtained from CSA O86, “Engineering Design in Wood,”
   \(L = \) the unsupported length of a column in millimetres.
2) The factored resistance of a beam or column shall be determined by using the specified strengths in CSA O86, “Engineering Design in Wood.”

Appendix D: Fire Performance Rating

D-2.12. Cross Laminated Timber
D-2.12.1. Applicability of Information
At this time, this By-law does not presently contain explicit provisions for the use of CLT although this may be considered as part of a design compliant with Article 3.2.1.7. As a developing technology, it is expected that designers follow best practice in the use of this material. To this end, in addition to compliance with the CSA-086-14 standard (as amended), designers should consider the information and criteria contained in published good engineering practice references such as the Canadian Wood Council Wood Design Manual (2017) and CLT handbook which are recognized to represent much of the current information related to the design of cross laminated timber (CLT) assemblies. In addition, research by the NRC, Canadian Wood Council, and other groups have shown that the type and arrangement of connections and penetrations, and the adhesive used as part of the CLT play a major role in the fire-resistive performance of these assemblies. Designers are therefore urged to carefully consider the impacts of such details as a part of their design.

Section D-3 Flame-Spread Ratings and Smoke Developed Classifications

D-3.1. Interior Finish Materials
D-3.1.1. Scope of Information
Tables D-3.1.1.-A and D-3.1.1.-B show flame-spread ratings and smoke developed classifications for combinations of some common interior finish materials. The values are based on all the evidence available at present. Many materials have not been included because of lack of test evidence or because of inability to classify or describe the material in generic terms for the purpose of assigning ratings.

Notes to Table D-3.1.1-A:

1. See Sentence D-1.1.1.(5) for standards used to assign flame-spread ratings and smoke developed classifications.
2. Flame-spread ratings and smoke developed classifications for paints and varnish are not applicable to shellac and lacquer.
3. Flame-spread ratings and smoke developed classifications for paints apply only to alkyd and latex paints.
4. The flame-spread ratings and smoke developed classifications shown are for those plywoods without a cellulose resin overlay.
5. Insufficient test information available.
Appendix D: Fire Performance Rating

| Polypropylene carpet, pile weight not less than 500 g/m² and not more than 1200 g/m², glued down to concrete | CAN/CGSB-4.129 | 300/500 |

Notes to Table D-3.1.1.-B:
(1) Tested on the floor of the tunnel in conformance with provisions of CAN/ULC-S102.2, “Test for Surface Burning Characteristics of Flooring, Floor Coverings, and Miscellaneous Materials and Assemblies.”
(2) Flame-Spread Rating/Smoke Developed Classification.
(2)(3) Type 1 or 2 underlay as described in CGSB 4-GP-36M, “Carpet Underlay, Fiber Type.”

D-3.1.2. Ratings
The ratings shown in Tables D-3.1.1.-A and D-3.1.1.-B are arranged in groups corresponding to the provisions of this By-law. The ratings apply to materials falling within the general categories indicated.

D-3.1.3. Table Entries
In Tables D-3.1.1.-A and D-3.1.1.-B, the first number of each entry relates to flame spread and the second number to smoke developed limit. For example:
- 25/50 represents a flame-spread rating of 0 to 25 and a smoke developed classification of 0 to 50,
- 150/300 represents a flame-spread rating of 75 to 150 and a smoke developed classification of 100 to 300,
- and X/X applied to walls and ceilings means a flame-spread rating over 150 and a smoke developed classification over 300.

D-3.1.4. Effect of Surface Coatings
Thin surface coatings can modify flame-spread characteristics either upward or downward. Table D-3.1.1.-A includes a number of thin coatings that increase the flame-spread rating of the base material, so that these may be considered where more precise control over flame-spread hazard is desired.

D-3.1.5. Proprietary Materials
1) Information on flame-spread rating of proprietary materials and fire-retardant treatments that cannot be described in sufficient detail to ensure reproducibility is available through the listing and labeling services of Underwriters’ Laboratories of Canada, Intertek Testing Services NA Ltd., or other recognized testing laboratory.
2) A summary of flame-spread test results published prior to 1965 has been prepared by NRC (see Item (1) in Subsection D-6.1.).

D-3.1.6. Limitations and Conditions
1) The propagation of flame along a surface in the standard test involves some finite depth of the material or materials behind the surface, and this involvement extends to the depth to which temperature variations are to be found during the course of the test; for many commonly used lining materials, such as wood, the depth involved is about 25 mm.
2) For all the combustible materials described in Table D-3.1.1.-A, a minimum dimension is shown, and this represents the thickness of the test samples on which the rating has been based; when used in greater thicknesses than that shown, these materials may have a slightly lower flame-spread rating, and thinner specimens may have higher flame-spread ratings.
3) No rating has been included for foamed plastic materials because it is not possible at this time to identify these products with sufficient accuracy on a generic basis. Materials of this type that melt when exposed to the test flame generally show an increase in flame-spread rating as the thickness of the test specimen increases.
Appendix D: Fire Performance Rating

D-3.1.7. Referenced Standards
In Tables D-3.1.1.-A and D-3.1.1.-B, the standards applicable to the materials described are noted because the ratings depend on conformance with these specifications.

Section D-4 Noncombustibility

D-4.1. Test Method
D-4.1.1. Determination of Noncombustibility
1) Noncombustibility is required of certain components of buildings by the provisions of this By-law, which specifies noncombustibility by reference to CAN/ULC-S114, “Test for Determination of Non-Combustibility in Building Materials.”
2) The test to which reference is made in Sentence (1) is severe, and it may be assumed that any building material containing even a small proportion of combustibles will itself be classified as combustible. The specimen, 38 mm by 51 mm, is exposed to a temperature of 750°C in a small furnace. The essential criteria for noncombustibility are that the specimen does not flame or contribute to temperature rise.

D-4.2. Materials Classified as Combustible
D-4.2.1. Combustible Materials
Most materials from animal or vegetable sources will be classed as combustible by CAN/ULC-S114, “Test for Determination of Non-Combustibility in Building Materials,” and wood, wood fibreboard, paper, felt made from animal or vegetable fibres, cork, plastics, asphalt and pitch would therefore be classed as combustible.

D-4.2.2. Composite Materials
Materials that consist of combustible and noncombustible elements in combination will in many cases also be classed as combustible, unless the proportion of combustibles is very small. Some mineral wool insulations with combustible binder, cinder concrete, cement and wood chips and wood-fibred gypsum plaster would also be classed as combustible.

D-4.2.3. Effect of Chemical Additives
The addition of a fire-retardant chemical is not sufficient to change a combustible product to a noncombustible product.

D-4.3. Materials Classified as Noncombustible
D-4.3.1. Typical Examples
Noncombustible materials include brick, ceramic tile, concrete made from Portland cement with noncombustible aggregate, plaster made from gypsum with noncombustible aggregate, metals commonly used in buildings, glass, granite, sandstone, slate, limestone and marble.

Section D-5 Protection of Openings in Fire-Rated Assemblies

D-5.1. Scope
D-5.1.1. Installation Information
1) The information in this Section specifies requirements for the installation of fire doors and fire dampers in gypsum-board-protected stud wall assemblies.
Appendix D: Fire Performance Rating

D-5.2. Installation of Fire Doors and Fire Dampers
D-5.2.1. References
1) Fire doors and fire dampers in gypsum-board-protected steel stud non-loadbearing walls required to have a fire-resistance rating shall be installed in conformance with Section 9.24. of this By-law and the applicable requirements of NFPA 80, “Fire Doors and Other Opening Protectives.”
2) Fire doors and fire dampers in gypsum-board-protected wood stud walls required to have a fire-resistance rating shall be installed in conformance with Section 9.23. of this By-law and the applicable requirements of NFPA 80, “Fire Doors and Other Opening Protectives.”

Section D-6 Background Information

D-6.1. Fire Test Reports
Summaries of available fire test information have been published by NRC as follows:
(8) W.W. Stanzak, Column Covers: A Practical Application of Sheet Steel as a Protective Membrane. DBR Fire Study No. 27, Division of Building Research, National Research Council Canada, Ottawa, February 1972. NRCC 12483.
(9) W.W. Stanzak, Sheet Steel as a Protective Membrane for Steel Beams and Columns. DBR Fire Study No. 23, Division of Building Research, National Research Council Canada, Ottawa, November 1969. NRCC 10865.
Appendix D: Fire Performance Rating

D-6.2. Obsolete Materials and Assemblies
Building materials, components and structural members and assemblies in buildings constructed before 1995 may have been assigned ratings based on earlier editions of the Supplement to the National Building Code of Canada or older reports of fire tests. To assist users in determining the ratings of these obsolete assemblies and structural members, the following list of reference documents has been prepared. Although some of these publications are out of print, reference copies are available through NRC.

D-6.3. Assessment of Archaic Assemblies
Information in this document applies to new construction. Please refer to early editions of the Supplement to the National Building Code of Canada for the assessment or evaluation of assemblies that do not conform to the information in this By-law. As with other documents, this By-law is revised according to the information presented to the standing committee responsible for its content, and with each update new material may be added and material that is not relevant may be deleted.

D-6.4. Development of the Component Additive Method
The component additive method was developed based upon the following observations and conclusions drawn from published as well as unpublished test information.
Appendix D: Fire Performance Rating

Study of the test data showed that structural failure preceded failure by other criteria (transmission of heat or hot gases) in most of the tests of loadbearing wood-framed assemblies. The major contributor to fire resistance was the membrane on the fire-exposed side.

Fire tests of wood joist floors without protective ceilings resulted in structural failure between 8 and 10 min. Calculation of the time for wood joists to approach breaking stress, based upon the charring rate of natural woods, suggested a time of 10 min for structural failure. This time was subtracted from the fire-resistance test results of wood joist floors and the remainder considered to be the contribution of the membrane.

The figures obtained for the contribution of membranes were then applied to the test results for open web steel joist floors and wood and steel stud walls and values of 20 min for the contribution of wood stud framing and 10 min for steel framing were derived.

The fire-resistance rating has been limited to 1.5 h as this method of developing ratings for framed assemblies was new and untried. Although this is the subject of current review, no decision has been made to extend the ratings beyond 1.5 h.

Example showing fire-resistance rating of a typical membrane assembly, calculated using the component additive method.

**1 hour Gypsum Board/Wood Stud Interior Partition**

A 1 h fire-resistance rating is required for an interior wood framed partition, using 12.7 mm Type X gypsum board.

- a) Since gypsum board is used (Sentence D-2.3.4.(2) and Table D-2.3.4.-A) time assigned to 12.7 mm Type X gypsum board membrane on the fire-exposed side of the partition = 25 min
- b) Time assigned to wood framing members at 400 mm o.c. (Sentence D-2.3.4.(3) and Table D-2.3.4.-E) = 20 min
- c) Time assigned to insulation, if the spaces between the studs are filled with preformed insulation of rock or slag fibres conforming to CAN/ULC-S702, “Mineral Fibre Thermal Insulation for Buildings,” (Sentence D-2.3.4.(4) and Table D-2.3.4.-G) = 15 min
- d) Time assigned to the membrane on the non-fire-exposed side (Sentence D-2.3.5.(1)) = 0 min

Fire-resistance rating = 25 + 20 + 15 = 60 min
Division C
Administrative Provisions
Part 1
General

Section 1.1. Application

1.1. Application

1.1.1. Application

1) This Part applies to all buildings covered in this By-law. (See Article 1.1.1.1. of Division A.)

Section 1.2. Terms and Abbreviations

1.2. Definitions of Words and Phrases

1.2.1. Non-defined Terms

1) Words and phrases used in Division C that are not included in the list of definitions in Article 1.4.1.2. of Division A shall have the meanings that are commonly assigned to them in the context in which they are used, taking into account the specialized use of terms by the various trades and professions to which the terminology applies.

2) Where objectives and functional statements are referred to in Division C, they shall be the objectives and functional statements described in Parts 2 and 3 of Division A.

3) Where acceptable solutions are referred to in Division C, they shall be the provisions stated in Parts 3 to 10 of Division B.

4) Where alternative solutions are referred to in Division C, they shall be the alternative solutions mentioned in Clause 1.2.1.1.(1)(b) of Division A.

1.2.2. Defined Terms

1) The words and terms in italics in Division C shall have the meanings assigned to them in Article 1.4.1.2. of Division A.

1.2.3. Symbols and Other Abbreviations

1.2.2.1. Symbols and Other Abbreviations

1) The symbols and other abbreviations in Division C shall have the meanings assigned to them in Article 1.4.2.1. of Division A.

Section 1.3. Interpretation, Intent and Prohibitions

1.3. General Interpretation

1.3.1. General Interpretation

1.3.1.1. Interpretation

1) This By-law shall, despite any other provision herein, be interpreted in accordance with this Section.

2) The Schedules attached to this Part form part of this By-law.

1.3.2. General Intent

1.3.2.1. Intent
1) This By-Law sets standards in the general public interest. It is enacted and retained on the understanding and specifically expressed condition that it creates no duty whatsoever on the City, the Chief Building Official or any employee of the City to enforce its provisions, and on the further condition that a failure to administer or enforce its provisions, or the incomplete or inadequate administration or enforcement of its provisions, shall not give rise to a cause of action in favour of any person whatsoever. The issuance of any permit, including an occupancy permit, is not a representation, warranty or statement that this By-Law or any other enactment has been complied with, and the issuance thereof in error shall not give rise to a cause of action. Accordingly, words in this By-law defining the responsibilities and authority of the Chief Building Official shall be construed as internal administrative directions which do not create a duty.

1.3.2.2. Reliance on Registered and Certified Professionals

1) The City and the Chief Building Official do not have the resources to deal with matters which fall within the expertise of registered professionals and the City and the Chief Building Official rely on letters of assurance, documents sealed with professional seals, and related documents received from registered professionals, and on field reviews carried out by or under the supervision of registered professionals, as evidence that the design and construction of buildings complies with the provisions of this By-law, including alternate solutions, and substantially complies with any other applicable enactments.

2) The City and the Chief Building Official do not have the resources to deal with matters which fall within the expertise of certified professionals and the City and the Chief Building Official rely on letters of assurance, documents stamped with professional stamps, and related documents received from certified professionals, on site reviews carried out by certified professionals, and on field reviews monitored by certified professionals as evidence that the design and construction of buildings complies with the provisions of this By-law, including alternate solutions and substantially complies with any other applicable enactments.

1.3.2.3. No Representation or Warranty

1) No person shall rely on a permit issued by the Chief Building Official or an inspection carried out by the Chief Building Official as establishing compliance with this By-Law or any other enactment or assume or conclude that this By-Law has been administered or enforced according to its terms.

2) All persons shall make such independent investigations as they deem necessary to determine whether a building complies with this By-law or any other enactment.

1.3.3. General Prohibitions

1.3.3.1. Contravention

1) No person shall fail to comply with an order or notice issued by the Chief Building Official.

1.3.3.2. No Work Without Permit

1) No person shall work or authorize or allow work to proceed on a project for which a permit is required unless a valid permit exists for the work to be done.

1.3.3.3. Deviation Needs Prior Approval

1) No person shall deviate from the plans and supporting documents forming part of the permit, without having first paid all necessary fees and obtained all necessary permits and approvals from the Chief Building Official.

1.3.3.4. No Occupancy Without Permission

1) No person shall occupy a building or authorize or allow the occupancy of a building without having first obtained the permission of the Chief Building Official.

1.3.3.5. Unsafe Conditions

(See Note A-1.3.3.5.)
1) No person who is an owner or who is involved in the construction, relocation or occupancy of a building shall cause, allow or maintain any unsafe condition.

1.3.3.6. Work on Public Property
(See Note A-1.3.3.6.)
1) No person shall excavate or undertake work on public property, or erect or place any construction or work or store any materials thereon without approval having first been obtained in writing from the Chief Building Official over such public property.

1.3.3.7. Changes in Ground Elevation and Limiting Distance
(See Note A-1.3.3.7.)
1) No person shall change or alter the ground elevations or grading of a building site without first obtaining the necessary permits.
2) No person shall change or alter the limiting distance of an exposing building face without first obtaining the necessary permits.

1.3.3.8. Compliance with By-law and Other Enactments
1) No person shall work, or authorize or allow work to proceed, or undertake any building, construction, work or occupancy which is in contravention of this By-law or any other enactment.

1.3.3.9. False Information
1) No person shall submit false or incorrect information to the Chief Building Official.

1.3.3.10. Tampering with a Posted Notice or Order
1) No person, except for the Chief Building Official, shall reverse, alter, deface, cover, remove or in any way tamper with any notice or order which has been posted on or affixed to a building pursuant to this By-law.

Section 1.4. Obligations of the Owner and Contractor

1.4.1. Obligations of the Owner

1.4.1.1. Right of Entry of Chief Building Official
1) The owner shall allow the Chief Building Official to enter any building or premises at any reasonable time for the purpose of administering and enforcing this By-law.

1.4.1.2. Permit Required
1) The owner shall obtain all permits or approvals prior to commencing the work to which they relate.

1.4.1.3. Compliance with Permit
1) The owner shall comply with all conditions of a permit or a staged permit.

1.4.1.4. Posting a Permit
1) The owner shall ensure that the permit authorizing the work, or a true copy of the permit, is posted conspicuously on the site or is affixed to the exterior of the building during the entire project.

1.4.1.5. Compliance with By-law and other enactments
1) The owner shall comply with this By-law and all other applicable enactments.
2) The owner shall ensure that all work, construction, or occupancy is carried out in accordance with this By-law and all other applicable enactments.
3) The owner shall ensure that the occupancy of a building or part of a building complies with the occupancy permit.

4) The issuance of a permit, the acceptance of plans and supporting documents submitted for a permit, or the making of inspections by the Chief Building Official shall not relieve the owner of a building from the full responsibility for carrying out the work or having the work carried out in accordance with this By-law and all other applicable enactments.

5) The owner shall ensure that all underground storage tanks on the subject property that are intended for the storage of heating oil but have not been used for over 2 years are removed and any associated contamination is remediated to the applicable standards as prescribed in the Contaminated Sites Regulation. All work must be completed in accordance with the requirements of the Vancouver Fire By-law.

1.4.1.6. Compliance with Stop Work Order

1) The owner shall not carry out work or construction or suffer, permit or allow work or construction to be carried out in contravention of a stop work order issued by the Chief Building Official.

1.4.1.7. Compliance with Development Permit Plans

1) The owner shall ensure that the plans and supporting documents submitted for a permit conform substantially with the approved Development Permit plans and supporting documents, except that where differences exist, the owner shall make application for a “Development Permit Amendment” as required by the Zoning and Development By-law.

1.4.1.8. Owner’s Undertaking

1) The owner shall submit a completed Owner’s Undertaking letter to the Chief Building Official in support of and prior to the issuance of a permit, in the applicable form set out in Schedules E-1 and E-2 at the end of this Part.

1.4.1.9. Letters of Assurance

1) When required by this By-law, the owner shall provide to the Chief Building Official any applicable letters of assurance in the forms set out in Schedules A, B, C-A and C-B at the end of Part 2 of Division C of Books I and II of this By-law or in the forms set out in Schedules D and C-D at the end of Part 5 of Division B of Book I (General) of this By-law.

1.4.1.10. Project Directory

(See Note A-1.4.1.10.)

1) The owner shall, prior to commencing work, give notice in writing to the Chief Building Official, of the name, address, electronic mail address and telephone number of the owner, the constructor or other person in charge of the work, the designer reviewing the work, and any inspection or testing agency engaged to monitor the work.

2) During the course of the construction, the owner shall give immediate notice in writing to the Chief Building Official, of any change in employment of persons listed in the notice given pursuant to Sentence (1).

1.4.1.11. Other Notices

1) The owner shall give such other notices to the Chief Building Official as may be required by the Chief Building Official, by this By-law, or by another enactment.

1.4.1.12. Construction Safety

1) Where a Construction Safety Plan is required by Section 8.2 of Division B of Book I (General) of this By-law, the owner shall:

a) prior to commencing work, ensure that the Construction Safety Plan has been submitted to the Chief Building Official, and
b) during construction, ensure that the Construction Safety Plan is posted at all times and is amended from time to time in accordance with the requirements of this By-law.

2) Where a building is required by Subsection 2.2.7. of Division C of Book I (General) of this By-law to be professionally designed and reviewed, the owner shall, prior to commencing work, ensure that the contractor provides a full-time construction safety officer at the worksite.

1.4.1.13. Plans Required on Site
1) The owner shall ensure that the plans and specifications on which the issuance of the permit was based are available at the worksite for inspection during working hours by the Chief Building Official.

1.4.1.14. Site Cleared of Debris
1) The owner shall ensure that upon completion of demolition procedures, all debris and fill is cleared and the site levelled or graded, to the satisfaction of the Chief Building Official.

1.4.1.15. Tests to Establish Compliance
(See Note A-1.4.1.15.)
1) Where required by the Chief Building Official the owner shall make or have made, at the owner’s expense, tests or inspections, as necessary to establish compliance with this By-law and shall promptly provide a copy of all such tests or inspection reports to the Chief Building Official.

1.4.1.16. Up-to-Date Survey
1) The owner shall provide to the Chief Building Official a survey, which has been certified by a registered land surveyor no more than 30 days before the date of delivery of the survey to the Chief Building Official
   a) in the case of an existing building and site, if required by the Chief Building Official to substantiate the building location and size, above, at and below ground level, relative to the site,
   b) in the case of an existing building and site, if required by the Chief Building Official to establish the relationship of the building to neighbouring grades, and
   c) in the case of all new buildings, upon completion of foundations and footings and before any further construction, and the survey must include the elevation of a bench mark on the front of the foundation wall, to substantiate its size, location, and elevation relative to the site and to neighbouring grades.

1.4.1.17. Covering Work Prior to Inspection, Site Review or Field Review
1) The owner shall not cover work prior to inspection, site review or field review.

1.4.1.18. Request for Inspection
1) The owner shall give at least 24 hours notice to the Chief Building Official when requesting an inspection of work that is required or ordered to be inspected.

1.4.1.19. Uncovering Work
1) The owner shall uncover any work that has been covered without inspection, when required to do so by the Chief Building Official. (See Note A-1.4.1.19.(1).)
2) An owner who is required to uncover work by the Chief Building Official shall uncover and replace such work at the owner’s expense.

1.4.1.20. Reinspection
1) If the Chief Building Official discovers faulty or incomplete work or faulty materials during an inspection, the owner shall apply for a reinspection.
2) Every applicant for a reinspection of a project shall pay the applicable reinspection fees set out in the Fee Schedule, prior to the reinspection.
1.4.1.21. Report of Building, Demolition or Excavation Failure

1) When a building, demolition or excavation failure occurs which causes or has the potential to cause injury or loss of life, the owner shall
   a) immediately report the failure to the Chief Building Official,
   b) submit a report, if required to do so by the Chief Building Official, in accordance with Article 1.5.3.1., and
   c) carry out any repairs or remedial work required by the Chief Building Official.

1.4.1.22. Removing Unsafe Conditions

1) When a building or part thereof is in an unsafe condition, the owner shall forthwith take all necessary action to put the building in a safe condition.

1.4.1.23. Damage to City Property

1) The owner is responsible for the cost of repair of any damage to City property or works located thereon that occurs as a result of undertaking work for which a permit or a street use permit was required.

1.4.1.24. Requirements Regarding Street Addresses

1) An owner shall not post any number or letter on a building or suite entry except for a street address or suite number that has been designated by the Chief Building Official.
2) Every owner shall place and maintain the designated street address on the building in a place that is easily visible from the street, and the address shall be mounted on a contrasting background and shall conform with the minimum character size requirements in Table 1.4.1.24.

Table 1.4.1.24.
Requirements Regarding Street Addresses
Forming part of Sentence 1.4.1.24.(2)

<table>
<thead>
<tr>
<th>Building Setback from Street</th>
<th>Minimum Non-illuminated Character Size</th>
<th>Minimum Illuminated Character Size</th>

</tbody>
</table>

3) Where landscaping or other structures obscure the visibility of a building from the street, the owner shall erect a sign no larger than 0.4 m² displaying the street address, on the building property within sight of the street.
4) Every owner shall place and maintain a designated suite number on a contrasting background and of a character size of no less than 25 mm at the suite entry. (See also Article 3.8.3.13. of Division B of Book I (General) of this By-law for design requirements for persons with a visual impairment.)
5) If a suite number is assigned to an exterior principal suite entry, every owner shall place and maintain the designated suite number in conformance with this Section.
6) Every owner shall ensure that designated street addresses and suite numbers are made of durable materials and are affixed securely to the building.

1.4.1.25. Requirements regarding Professional Design and Review

1) In addition to the obligations listed in this section, the owner of a building to which the provisions of Part 2 of Division C of Book I (General) of this By-law apply, shall also comply with the owner's obligations in that Part.
1.4.2. **Obligations of the Contractor**

1.4.2.1. **Construction Safety**
   1) The contractor shall ensure that all requirements of this By-law relating to construction safety are complied with, and shall ensure that every sub-contractor of the project has retained a trades safety coordinator as required by Sentence (2).
   2) Every sub-contractor shall retain a qualified trades safety coordinator whose responsibilities shall include appropriate training of all persons working for the sub-contractor at the worksite in safe construction and installation practice.
   3) The trades safety coordinator shall provide certification respecting training to the Chief Building Official upon request.

1.4.2.2. **Work on Public Property**
   1) The contractor shall ensure that no excavation or other work is undertaken on public property, and that no building is erected or materials stored thereon, without first having obtained approval in writing from the appropriate government authority.

1.4.2.3. **Compliance with By-law and Other Enactments**
   1) The contractor shall ensure that all work, building, construction, or occupancy is carried out in accordance with this By-law and with all other applicable enactments.

1.4.2.4. **Right of Entry of Chief Building Official**
   1) The contractor shall allow the Chief Building Official to enter any building or premises at any reasonable time for the purpose of administering and enforcing this By-law.

1.4.2.5. **Compliance with Stop Work Order**
   1) The contractor shall not carry out work or construction, or suffer, permit or allow work or construction to be carried out, in contravention of a stop work order issued by the Chief Building Official.

**Section 1.5. Authority of the Chief Building Official**

1.5.1. **Administration**

1.5.1.1. **Administrator**
   1) The Chief Building Official is authorized to administer this By-law.

1.5.1.2. **Filing Documents**
   1) The Chief Building Official is authorized to keep copies of applications received, permits and orders issued, inspections and tests made and papers and documents connected with the administration of this By-law, for such time as is required by law.
   2) Despite the provisions of Sentence (1), the Chief Building Official is authorized to keep copies of applications received, permits and orders issued, inspections and tests made and papers and documents connected with the administration of this By-law, for such time as is necessary, in the opinion of the Chief Building Official, to support the administration of this By-law.

1.5.1.3. **Inspection of Records**
   1) The Chief Building Official is authorized to provide plans and documents filed pursuant to the provisions of this By-law for inspection, subject to the provisions of the Freedom of Information and Protection of Privacy Act.
1.5.1.4. Fees for Inspection of Records

1) The Chief Building Official shall charge a fee as set out in the Fee Schedule, payable in advance, for the inspection of records referred to in Article 1.5.1.3.

2) No refund shall be issued for any fees or portion of fees, resulting from any outstanding costs incurred by the City for the inspection of records pursuant to Article 1.5.1.4.

1.5.2. Authorities

1.5.2.1. Power of Entry
(See Note A-1.5.2.1.)

1) The Chief Building Official, and any person authorized to act on behalf of the Chief Building Official, may enter any building or premises at any reasonable time for the purpose of administering or enforcing this By-law, or immediately if there is reason to believe an unsafe condition exists.

1.5.2.2. Review of Value of Work

1) The Chief Building Official may review the value of the proposed work in an application for a permit and may substitute a different value, in accordance with Articles 1.6.2.3. and 1.6.2.4., for the purpose of determining applicable permit fees.

1.5.2.3. Construction Safety

1) The Chief Building Official may review a Construction Safety Plan and may require that the Construction Safety Plan be changed or amended.

1.5.2.4. Permit Issuance

1) The Chief Building Official shall issue a permit when the applicable requirements of this By-law have been met.

1.5.2.5. Permit Refusal

1) The Chief Building Official may refuse to issue a permit
   a) if plans or supporting documents are incomplete or do not comply with the provisions of this By-law,
   b) if plans or supporting documents contain false or incorrect information, or
   c) for any building, construction, work or occupancy that would not be permitted by this By-law or by another enactment.

2) The Chief Building Official shall provide reasons for the refusal to issue a permit, on the request of an applicant or owner.

1.5.2.6. Permit with Incomplete Application
(See Note A-1.5.2.6.)

1) The Chief Building Official may issue a permit for a building based on an incomplete application if the incomplete information is of a secondary nature and is unavailable at the time of permit issuance.

2) If the Chief Building Official issues a permit pursuant to Sentence (1) the Chief Building Official may impose conditions requiring submission of further information by a specified date.

3) The Chief Building Official may suspend or revoke a permit issued pursuant to Sentence (1), if the holder of the permit fails to comply with the conditions imposed by the Chief Building Official.

1.5.2.7. Conditions on Permits

1) The Chief Building Official may impose conditions on permits including, but not limited to, conditions regarding
   a) notifications and notices,
b) safety,
c) health,
d) design requirements,
e) construction requirements,
f) timing of construction,
g) deadlines for completion of construction,
h) reviews and inspections,
i) responsibilities of the owner, constructor, registered professional and certified professional,
j) compliance with this By-law and other enactments,
k) use and occupancy, and
l) temporary buildings and occupancies.

1.5.2.8. Permits for Existing Buildings

1) The Chief Building Official may issue a permit for an existing building in accordance with the provisions of Part 11, Division B, Book I and may impose conditions on the permit.

2) The Chief Building Official may permit an alternative solution to the alternative acceptable solutions provided in this By-law for the conversion of an existing building if
   a) the owner demonstrates, to the satisfaction of the Chief Building Official, that the level of upgrade required presents an extraordinary hardship for the owner, and
   b) the owner proposes an alternative solution which achieves the objectives of the alternative acceptable solutions prescribed by this By-law, to the satisfaction of the Chief Building Official.

1.5.2.9. Combustible Construction for Minor Repairs in Existing Buildings

1) If additions and new work are required to be noncombustible construction pursuant to Subsection 3.2.2. of Division B, the Chief Building Official may permit minor repairs to existing floor or wall assemblies to be combustible construction provided
   a) the minor repair of the floor assembly does not exceed 5 per cent of the floor area of the room in which it is located, and
   b) the minor repair of the wall assembly does not exceed 5 per cent of the wall area of the wall plane on which it is located.

1.5.2.10. Permits for Plumbing and Sprinkler Systems

1) The Chief Building Official may issue a permit for a plumbing system or sprinkler system in accordance with the provisions of Subsection 1.6.3.

1.5.2.11. Permits in Designated Flood Plain

1) If a building is located on a designated flood plain the Chief Building Official may
   a) require plans and supporting documents to demonstrate that the elevation or design of the buildings incorporates flood construction level requirements intended to reduce the risk of flood damage,
   b) require that a covenant acknowledging the risk of flood damage be registered against the land, and
   c) withhold issuance of a permit until the requirements of the Chief Building Official have been satisfied.

2) The Chief Building Official may increase the flood construction level requirements or the setback requirements as provided in Article 2.2.9.5.

3) The Chief Building Official may relax the flood construction level requirements or the setback requirements in this By-law as provided in Article 2.2.9.6.

1.5.2.12. Permit for Staged Construction

(See Note A-1.5.2.12.)
1) Where a permit for staged construction is applied for pursuant to Subsection 1.6.5., the Chief Building Official may authorize the excavation or construction of a portion of a building, and may impose conditions to ensure compliance with this By-law, before all the plans and supporting documents for the building have been accepted, at the risk of the owner.
2) The Chief Building Official may suspend or revoke a permit issued pursuant to Subsection 1.6.5. if the holder of the permit fails to comply with the conditions imposed by the Chief Building Official.

1.5.2.13. Minor Revisions to Permit
1) The Chief Building Official may accept an application for minor revisions to an existing permit if the proposed revisions do not add or delete additional storeys or major occupancy classifications to or from the project.

1.5.2.14. Requirement for New Permit
1) The Chief Building Official may require that an applicant for revisions to an existing permit apply for a new permit, if the proposed revisions would add or delete floor area, storeys, dwelling units or major occupancy classifications to or from the project.

1.5.2.15. Permit Suspension
1) The Chief Building Official may suspend a permit by issuing an order to stop work.

1.5.2.16. Permit Revocation
1) The Chief Building Official may revoke a permit if
a) there is a contravention of any condition under which the permit was issued,
b) the permit was issued in error, or
c) the permit was issued on the basis of false or incorrect information.

1.5.2.17. Permit Extension
1) The Chief Building Official may extend a permit in accordance with Subsection 1.6.7. of this Part.

1.5.2.18. Designation of Street Addresses
1) The Chief Building Official may, at any time, number, renumber or assign a series of numbers or suite numbers to any building, or part thereof.
2) Upon the issuance of a building permit, the Chief Building Official shall designate the street address or series of suite numbers required for the building, or any portion of the building.
3) Upon registration of a parcel of land in the Land Title Office, the Chief Building Official shall designate the street address or series of numbers required for the parcel.

1.5.2.19. Renumbering of Street Addresses
1) Where an owner has requested a renumbering and has paid the applicable fees set out in the Fee Schedule, the Chief Building Official may renumber any building or suite within a building, or parcel of land.

1.5.2.20. Proof of Compliance
1) The Chief Building Official may direct that tests of materials, equipment, devices, construction methods, structural assemblies or foundations be made, or sufficient evidence or proof be submitted, at the expense of the owner, where such evidence or proof is necessary, in the opinion of the Chief Building Official, to determine whether the material, equipment, device, construction, structural assembly or foundation condition complies with this By-law.
1.5.2.21. Occupancy Permit for Building at Variance with By-law

1) The Chief Building Official may issue an occupancy permit for a building which varies in a minor respect from the requirements of this By-law if, in the opinion of the Chief Building Official, such variation will not substantially interfere with the objectives of this By-law.

1.5.2.22. Occupancy Permit Prior to Completion

1) The Chief Building Official may issue an occupancy permit to allow the occupancy of a building or a part thereof for the approved use, prior to commencement or completion of the construction or demolition work.
2) The Chief Building Official may impose conditions on an occupancy permit issued in accordance with Sentence (1).

1.5.3. Authorities Regarding Unsafe and Unsanitary Conditions

1.5.3.1. Report of Failure

1) Where any building, construction or excavation failure occurs which causes or has the potential to cause injury or loss of life, the Chief Building Official may require the owner to submit a report which includes:
   a) the name and address of the owner,
   b) the address or location of the building, demolition or excavation,
   c) the name and address of the constructor,
   d) the nature of the failure,
   e) the cause of the failure,
   f) a remedial plan to correct the failure, and
   g) a plan to prevent future failure.

1.5.3.2. Hazardous Material

1) The Chief Building Official may require that any person supervising or doing work to install or remove building materials provide evidence of their training, certification or qualifications, if the installation or removal of building materials may create an unsafe condition or affect the structural safety or fire protection of a building.

1.5.3.3. Order to Remove Unsafe Condition

1) When any building, construction or excavation or part thereof is in an unsafe condition, the Chief Building Official may issue a written order to the owner, certifying the existence of an unsafe condition and requiring correction of any unsafe condition found on a building site, within a specified time.

1.5.3.4. Order to Repair Plumbing Systems

1) The Chief Building Official, if of the opinion that the plumbing system, or any part of it, in any building is defective, unsanitary or inadequate, may notify the owner or occupant thereof of such condition and may order that such plumbing system, or part thereof, be placed in a proper, safe and sanitary condition.
2) The Chief Building Official, if of the opinion that the plumbing system, or any part of it, in any building may has become dangerous or defective on account of the settlement of the building or through abuse, accident or for any other cause whatsoever, may order the owner or occupant thereof to have a plumbing contractor conduct a smoke test on the waste and vent pipes of the building to ascertain whether any dangerous or defective condition exists.

1.5.3.5. Corrective Measures

1) If the Chief Building Official has issued an order in accordance with Article 1.5.3.3. or 1.5.3.4. and an owner has failed to comply with that order, the Chief Building Official may:
   a) authorize demolition, removal, posting of security guards or fire wardens, or enclosure of a building, construction, excavation or part thereof, at the expense of the owner,
Division C: Administrative Provisions

Part 1 – General

1.5.3.6. Immediate Measures

1) When immediate measures must be taken to avoid an imminent danger or risk of accident, the Chief Building Official may take such action as is appropriate, without prior notice and at the expense of the owner.

2) Where immediate security measures must be taken to limit the risk of damage, vandalism, theft, loss, or the creation of unsafe conditions, the Chief Building Official may board-up or otherwise secure a building against unauthorized entry without prior notice and at the expense of the owner.

1.5.3.7. Recovery of City Costs

1) The cost of the measures described in Articles 1.5.3.5. and 1.5.3.6. shall be recoverable from the owner:
   a) in any Court of competent jurisdiction, or
   b) by entry of such cost in the real property roll with respect to the property and by collection in the same manner as the taxes shown in the real property roll.

1.5.4. Notices and Orders

1.5.4.1. Notices or Orders

1) The Chief Building Official may issue in writing such notices or orders as may be necessary to inform the owner of a contravention of this By-law, in the manner set out in this By-law.

1.5.4.2. Scope of Orders

1) The Chief Building Official may order:
   a) a person to comply with the provisions of this By-law within a specified time,
   b) a person to allow the Chief Building Official to enter any building or premises at any reasonable time for the purpose of administering and enforcing this By-law,
   c) work to stop on a building or any part thereof, if such work is proceeding in contravention of a provision of this By-law or another enactment, or if there is deemed to be an unsafe condition,
   d) the removal of an unauthorized encroachment on public property,
   e) the removal of any building or part thereof constructed in contravention of a provision of this By-law,
   f) the cessation of any occupancy in contravention of a provision of this By-law,
   g) the cessation of any occupancy if an unsafe condition exists,
   h) the correction of an unsafe condition,
   i) the correction of an unsanitary condition,
   j) a person to provide a written assessment of a specified condition by a registered professional if there is deemed to be an unsafe condition, and
   k) a person to secure a building against unauthorized entry.

1.5.4.3. Contents of Notice

1) A notice shall state the nature of any contravention and specify the date or the phase of construction by which remedial measures must be completed.

1.5.4.4. Delivery of Notice

1) A notice may be posted on a building, and may be delivered by regular mail or by hand to the person listed as the owner in the records of the Assessment Authority of British Columbia or to a representative of the owner.

1.5.4.5. Contents of Order
1) An order shall specify any contraventions of this By-law or any unsafe condition or unsanitary condition and may require demolition, removal, or compliance with this By-law, by a specified phase of construction, or within a specified time after the date of mailing or posting the order.

2) Despite Sentence (1), an order to stop work, board up or cease occupancy shall state the nature of the contravention or unsafe condition, and may order the immediate suspension of construction or of occupancy and the rectification of the contravention or unsafe condition.

1.5.4.6. Delivery of Order

1) The Chief Building Official may deliver an order
   a) by mailing the order by registered mail or by regular mail to the owner at the owner’s address as it appears on a Tax Certificate or a State of Title Certificate, and posting the order on the premises which is the subject of the order,
   b) by sending the order by electronic mail to the electronic mail address of the owner or a representative of the owner, or
   c) by delivery of the order by hand to the owner or a representative of the owner.

2) When a building is at imminent or unreasonable risk of collapse which could pose a danger to building occupants or the public, the Chief Building Official may post an order to cease occupancy on the premises which is the subject of the order, which shall be deemed to comply with the requirements of Sentence (1).

3) Delivery of an order in accordance with the provisions of Sentences (1) or (2) shall be deemed to be good and sufficient service of the order.

Section 1.6. Permits, Applications and Fees

1.6.1. Permits

1.6.1.1. When a Permit is Required

1) A permit is required before any work regulated by this By-Law is undertaken.

1.6.1.2. Construction without a Permit

1) If construction for which a permit is required has been commenced before a permit has been issued, the owner shall
   a) make application for any necessary permits in accordance with Subsection 1.6.2. of this By-law, and
   b) pay to the City, a minimum of $500 or double the fee set out in the Fee Schedule to a maximum of $20,000, whichever is the lesser amount.

2) If construction for which a permit is required has been commenced before a permit has been issued, the owner shall, if ordered to do so by the Chief Building Official,
   a) provide proof that the construction complies with this By-law and any other applicable enactments,
   b) carry out tests and investigations by independent agencies, at the cost of the owner, to determine whether or not the construction complies with this By-law,
   c) carry out tests and investigations by independent agencies, at the cost of the owner, to determine appropriate remedial measures to ensure that the construction complies with this By-law,
   d) provide to the Chief Building Official, at the cost of the owner, the results of any tests and investigations ordered by the Chief Building Official, and
   e) provide documentation to the satisfaction of the Chief Building Official to establish that all remedial measures to ensure the construction complies with this By-law have been completed.

1.6.1.3. Additional Permits
1) In addition to a permit required by Article 1.6.1.1., other permits and supporting documents necessary for specific building components, services and uses, may be required by the Chief Building Official.

1.6.2. Application for Permit

1.6.2.1. Owner Requirement

1) To obtain a permit, the owner shall file an application in writing in the form prescribed by the Chief Building Official.

1.6.2.2. Application Requirements

(See Note A-1.6.2.2.)

1) Except as otherwise provided in this By-law, every application shall
   a) describe the work, building, construction or and occupancies for which the permit is required,
   b) provide a legal description and address for the land on which the work is to be done,
   c) include plans and other supporting documents which conform with Section 2.2. of Division C,
   d) state the value of the proposed work calculated in accordance with Article 1.6.2.3.,
   e) include the requisite permit fee, in accordance with the Fee Schedule at the end of this Part,
   f) include the appropriate owner’s undertaking letter in the applicable form set out in Schedule E-1 or E-2 at the end of this Part,
   g) include any other plans or supporting documents required by the Chief Building Official to establish that the work, building, construction and occupancy complies with this By-law or any other enactment, and
   h) list the names, addresses, electronic mail addresses and telephone numbers of all owners, designers and constructors.

1.6.2.3. Valuation for Permit

1) The value of the proposed work stated on the application for the permit shall reflect the total current monetary worth of all proposed materials, construction and work related to the building.

2) In addition to Sentence (1), the value of the proposed work shall include the total current monetary worth of all labour and all fees and costs incurred for design, investigative testing, consulting services, construction, construction management, contractor’s profit and overhead, sales taxes, and construction insurance related to the building.

3) The total current monetary worth referred to in Sentences (1) and (2) shall include the market value of all labour, including unpaid labour provided by an owner or volunteer, and the market value of all materials, including donated, recycled or used materials.

4) The total current monetary worth referred to in Sentences (1) and (2) shall include all components of the building, notwithstanding the fact that some components of the building may be subject to other permits and fees.

1.6.2.4. Review of Valuation by Chief Building Official

1) The Chief Building Official may review the value of the proposed work stated in an application, using the Marshall Valuation Method, and may substitute a different value for the proposed work.

1.6.2.5. Fee Schedule

1) Permit fees shall be calculated in accordance with the Fee Schedule at the end of this Part and the fees for construction without a permit are as outlined in Article 1.6.1.2.

1.6.2.6. No Refund

1) Except as permitted in Article 1.6.2.7. or Article 1.6.4.5., no permit fees or part thereof shall be refunded if
   a) construction authorized by a permit has commenced,
   b) the permit has expired pursuant to Article 1.6.7.1., or
c) the application has lapsed as outlined in Article 1.6.2.8.

1.6.2.7. Partial Refund and Set-off
1) If construction authorized by permit has not commenced and the Chief Building Official approves, the Director of Finance may refund a portion of the fees related to the permit, after deduction of any outstanding costs incurred by the City in processing the application for the permit and in carrying out any work pursuant to Article 1.5.3.4, or Article 1.5.3.5.

1.6.2.8. Lapse of Application
1) Subject to the provisions of Article 1.6.2.9., an owner shall comply with all the necessary requirements to complete an application for a permit within 6 months after the date of receipt of the application by the Chief Building Official.
2) If an owner fails to comply with the requirements of Sentence (1), the application for a permit shall lapse.
3) An application for a permit which has lapsed is expired and shall not be renewed except in accordance with Article 1.6.2.9.

1.6.2.9. Renewal of Lapsed Application
1) The Chief Building Official may renew a lapsed application for a permit if the Chief Building Official determines that
   a) no more than 3 months have passed since the date the application lapsed, and
   b) the failure to complete the requirements of the original application for a permit was reasonable in the circumstances.
2) Despite the provisions of Sentence (1), the Chief Building Official shall not renew a lapsed application for a permit more than once.
3) An application for a permit which has been renewed pursuant to Sentence (1) must comply with any amendments to this By-law made since the date of receipt of the original application by the Chief Building Official.

1.6.3. Additional Requirements for Plumbing and Sprinkler Permits

1.6.3.1. Application Requirements
1) The Chief Building Official may issue a permit for a plumbing system or sprinkler system if the applicant is authorized to obtain such a permit in accordance with the provisions of this Section.

1.6.3.2. Permit for Plumbing System
1) The Chief Building Official shall only issue a permit to construct, extend, alter, renew or repair a plumbing system to a licensed plumbing contractor.

1.6.3.3. Permit for Sprinkler System
1) The Chief Building Official shall only issue a permit to construct, extend, alter, renew or repair a sprinkler system to a licensed sprinkler contractor.

1.6.3.4. Permit for Plumbing System to Licensed Contractor
1) Despite the provisions of Article 1.6.3.2., the Chief Building Official may issue a permit to a licensed contractor
   a) to install sewers, sumps, catch basins, and water lines outside of a building, or
   b) to install backflow devices or other similar protection devices inside a building.

1.6.3.5. Permit for Plumbing System to Owner
1) Despite the provisions of Article 1.6.3.2., the Chief Building Official may issue a permit to the owner of a residential building with not more than one principal dwelling unit to do plumbing work in that building if the owner is the occupier of the building.

1.6.3.6. No Permit for Minor Repairs to Plumbing System

1) Despite the provisions of Article 1.6.3.1., no permit is required to repair or replace a valve, faucet, fixture, fixture outlet pipe or service water heater, to clear a stoppage, or to repair a leak, if there is no change to any other piping.

1.6.3.7. Requirement for Inspection

1) No person shall use a plumbing system or sprinkler system until it has been inspected by the Chief Building Official.

1.6.4. Applications by Certified Professionals

1.6.4.1. Applications for Permits by Certified Professionals

1) A Certified Professional may apply for a permit on behalf of an owner.

1.6.4.2. Requirements for Permit

1) A Certified Professional who applies for a permit on behalf of an owner must comply with the requirements of Section 1.6 of this By-law.

1.6.4.3. Application Review For Permit

1) The Chief Building Official may issue a permit based upon a modified review of the drawings and other supporting documents submitted with the application for a permit by a Certified Professional.

1.6.4.4. Site Review For Permit

1) A Certified Professional shall carry out detailed site reviews and shall be responsible for monitoring and follow-up necessary to support the construction authorized by the permit and to support the construction of the entire building.

1.6.4.5. Refund of Permit Fees

1) Except as otherwise determined in this Article, the Chief Building Official may refund a portion of the fees for a permit issued to a Certified Professional for the administrative costs assumed by the applicant that would have otherwise been incurred by the Chief Building Official.

2) An application for a refund of permit fees pursuant to Sentence (1) must be submitted to the Chief Building Official in writing, within 90 days following the issuance of a final occupancy permit.

3) Calculation of the administrative costs pursuant to Sentence (1) shall be determined from
   a) the prevailing fee rate(s) at the time of application for the refund, and
   b) as applicable and determined in
      i) the Schedule of Fees at the end of this Part, or
      ii) the Schedule of Fees in the “Zoning and Development Fee By-law” currently in force and effect.

4) No refund for permit fees or part thereof identified pursuant to Sentence (1) shall be issued for
   a) alterations to existing buildings, or
   b) the failure to make an application pursuant to the requirements of Sentence (2).

1.6.5. Applications for Staged Construction by Certified Professionals

1.6.5.1. Requirements for Staged Construction

1) The Chief Building Official may issue a permit to construct a building in stages if
a) the applicant for the staged construction is a Certified Professional,
b) the Certified Professional also applies for permission to construct the entire building,
c) the Certified Professional submits complete plans and all supporting documents for each portion of the work for which a permit for staged construction is sought, and
d) the Certified Professional submits all documents required pursuant to the Certification of Professionals By-law.

1.6.5.2. Owner’s Risk
1) The issuance of a staged permit creates no obligation on the Chief Building Official to issue any other staged permits or to issue a permit to construct the entire building.
2) An owner who commences construction of a building in accordance with a staged permit does so at the owner’s risk.

1.6.5.3. Owner’s Responsibility
1) An owner who fails to complete the work authorized by a permit for staged construction or who fails to comply with the conditions of a permit for staged construction shall restore the site to a safe condition, to the satisfaction of the Chief Building Official.

1.6.5.4. Application Review for Permit for Staged Construction
1) Where a Certified Professional complies with all application requirements for a permit for staged construction, the Chief Building Official may issue a permit for staged construction based upon a modified review of the drawings and other supporting documents submitted for the permit for staged construction.

1.6.5.5. Site Review of Staged Construction
1) Where a permit for staged construction is issued, the Certified Professional shall carry out detailed site reviews and shall be responsible for monitoring and follow-up necessary to support the construction authorized by the permit for staged construction and to support the construction of the entire building.

1.6.6. Revisions

1.6.6.1. Revisions to Applications
1) All applications for revisions to the original application shall comply with Article 1.6.2.2.
2) When revisions to the original application result in an increase in the value of the proposed work, the Chief Building Official shall review the valuation and recalculate the permit fee in accordance with this By-law.
3) When application documents are either incomplete or changed to the extent that an additional plan review is necessary, an additional revision fee shall be charged in accordance with the Fee Schedule at the end of this Part.

1.6.6.2. Minor Revisions to Permits
1) All applications for minor revisions to the original permit shall comply with Article 1.6.2.2. to the extent required by the Chief Building Official.
2) When applications for minor revisions to the original permit result in an increase in the value of the proposed work, the Chief Building Official shall review the valuation and recalculate the permit fee in accordance with this By-law.
3) An additional revision fee shall be charged for applications for minor revisions to the original permit in accordance with the Fee Schedule at the end of this Part.

1.6.7. Permit Expiry and Extension

1.6.7.1. Permit Expiry
1) Except as provided in this Subsection, a permit shall expire and the rights of the owner under the permit shall terminate if in the opinion of the Chief Building Official
   a) the work authorized by the permit is not commenced within 6 months from the date of issue of the permit,
   b) the work although commenced is not continuously and actively carried out thereafter, or
   c) the work has been substantially discontinued for a period of 6 months. (See Note A-1.6.7.1.(1).)
2) Except as provided in this Subsection 1.6.7., a permit for a temporary building or occupancy shall expire and the rights of the owner under the permit shall terminate on the expiry date noted on the permit.

1.6.7.2. Application to Chief Building Official for Extension
1) An owner who wishes to seek an extension of a permit shall make application to the Chief Building Official prior to the expiry of the permit.
2) An owner who wishes to seek an extension of a permit shall submit the application in writing accompanied by the requisite extension fee.

1.6.7.3. Extension of Permit by Chief Building Official
1) If the Chief Building Official is of the opinion that substantial completion of the work has been prevented because of exceptional circumstances, the Chief Building Official may extend the permit twice only, provided that, in the meantime, no applicable amendments have been made to this By-law.
2) If the Chief Building Official is of the opinion that a building or occupancy is temporary, the Chief Building Official may extend the permit for a temporary building or occupancy twice only, provided that, in the meantime, no applicable amendments have been made to this By-law.

1.6.7.4. Application to Council for Extension
1) An owner who has been granted an extension of a permit by the Chief Building Official may make application to Council for a further extension prior to the expiry of the permit.
2) An owner who wishes to seek an extension of a permit from Council shall submit an application in writing to the Chief Building Official accompanied by the requisite extension fee.
3) The Chief Building Official shall forward to Council any application submitted in accordance with this section, together with information and advice to assist Council in considering the application.

1.6.7.5. Extension of Permit by Council
1) Council may extend a permit for such further period or periods it deems appropriate.
2) If Council grants an extension of a permit, the Chief Building Official shall endorse the further extension or extensions on the permit.

1.6.8. Permits for Temporary Buildings, Including Tents and Air-Supported Structures

1.6.8.1. Definition of “Temporary”
1) In this Subsection, “temporary” means for a time period not exceeding twelve consecutive months.

1.6.8.2. Compliance with By-law
1) Except as otherwise provided in this Subsection or in Section 11.6, Division B, Book 1, no person shall erect a temporary building, including a tent or air-supported structure, which does not comply with this By-law.

1.6.8.3. Permit Required
1) No person shall erect, use or occupy a temporary building, including a tent or air-supported structure without a permit.

1.6.8.4. Compliance with Permit Conditions
1) No person shall erect, or use or occupy a temporary building, including a tent or air-supported structure, in contravention of the conditions of a permit.

1.6.8.5. Application Requirements

1) The application for a permit for a temporary building, including a tent or air-supported structure, shall be accompanied by
   a) plans showing the location of the temporary building, tent or air-supported structure on the site, all other existing buildings on the same property and all other buildings on adjacent property located within at least 10 feet of the property line of the site,
   b) construction details of the building, tent or air-supported structure, and
   c) a statement by the owner indicating the intended use and intended duration of such use.

2) The application for a temporary occupancy permit for a tent or air-supported structure shall be accompanied by documentation sufficient to establish that the tent or air-supported structure complies with Subsection 3.1.6. of Division B of Book I (General) of this By-law.

1.6.8.6. Time Limited Permits for Temporary Buildings

1) The Chief Building Official may issue a permit authorizing the construction, use or occupancy of a temporary building, including a tent or air-supported structure, and may attach conditions to such permit, including conditions allowing for selective compliance with the provisions of this By-law, if the Chief Building Official determines that the construction, use or occupancy will exist for a short time, and the circumstances do not warrant complete compliance with this By-law.

1.6.8.7. Permit End Date

1) A permit for a temporary building, including a tent or air-supported structure, shall state the date after which the permit is no longer valid.

1.6.8.8. Permit Extension

1) A permit for a temporary building, including a tent or air-supported structure, may only be extended if an extension is granted by the Chief Building Official prior to the expiry of the permit.

2) An owner who wishes to seek an extension of a permit for a temporary building from the Chief Building Official shall submit an application in writing to the Chief Building Official accompanied by the requisite extension fee.

3) If the Chief Building Official is of the opinion that the temporary building complies with the life safety requirements of this By-law, the Chief Building Official may extend the permit once only, and the Chief Building Official may require documentation from registered professionals to verify that the requirements of this By-law are being met.

1.6.9. Operating Permits

1.6.9.1. Operating Permit Required

1) No person shall install or retain existing equipment or systems for which an operating permit is required under this By-law, without an operating permit.

1.6.9.2. Compliance with Permit Conditions

1) No person shall install or retain existing equipment or systems for which an operating permit is required under this By-law, in contravention of the conditions of an operating permit.

1.6.9.3. Application Requirements

1) To obtain an operating permit, the owner shall file an application in writing in the form prescribed by the Chief Building Official.
2) The application for an operating permit shall be accompanied by the operating permit fees and any documentation required by the Chief Building Official to verify that the requirements of this By-law are being met.

1.6.9.4. Permit Expiry
   1) An operating permit shall expire and the rights of the owner under the operating permit shall terminate on the expiry date noted on the operating permit.

1.6.9.5. Operating Permit Fees
   1) Operating permit fees are as set out in the Schedule of Fees at the end of this Part.

Section 1.7. Permission to Occupy Buildings

1.7.1. General

1.7.1.1. Occupancy Permit Required
   1) Except as otherwise provided in this By-law, no person shall occupy or allow the occupancy of any building or part thereof unless the owner has obtained an occupancy permit from the Chief Building Official.
   2) No person shall occupy any building for a purpose other than the occupancy stipulated in an occupancy permit issued by the Chief Building Official.

1.7.1.2. Occupancy Permit
   (See Note A-1.7.1.2.)
   1) Every owner shall obtain an occupancy permit from the Chief Building Official prior to any
      a) occupancy of a building or part thereof after construction or alteration of that building,
      b) change in the major occupancy of any building or part thereof, or
      c) change in the permitted occupancy within the same Division of the major occupancy Group,
      where the occupant load or the fire load has increased.

1.7.1.3. Exemptions from Occupancy Permit
   1) Despite the requirements of Articles 1.7.1.1. and 1.7.1.2., an occupancy permit is not required for
      a) residential building with not more than two principal dwelling units, or
      b) a change in the permitted occupancy within the same major occupancy classification provided the occupant load is not increased and no construction has taken place.

1.7.1.4. Posting of Lawful Use
   1) In any building not requiring an occupancy permit, the Chief Building Official may post a notice which describes the uses to which the building may be lawfully put.

1.7.2. Occupancy Permit Process

1.7.2.1. Owner’s Obligation
   1) An owner who wishes to obtain an occupancy permit shall file an application in the form required by the Chief Building Official.

1.7.2.2. Requirements for Occupancy Permit Application
   1) The permit application requirements described in Article 1.6.2.2. do not apply to an application for an occupancy permit if the application includes
Division C: Administrative Provisions  
Part 1 – General

1.7.2.3. Scheduling of Construction, Fire and Life Safety Systems Inspection
1) Prior to the issuance of an occupancy permit, the owner of a building shall call for and coordinate a final inspection of construction, fire and life safety systems in the building.

1.7.2.4. Requirements prior to Construction, Fire and Life Safety Systems Inspection
1) At least 24 hours prior to the final inspection for an occupancy permit, every owner shall submit to the Chief Building Official:
   a) proof of compliance with the By-law for all materials, equipment and methods of construction,
   b) letters of assurance in the applicable forms attached as Schedules C-A and C-B, at the end of Part 2 of Division C,
   c) a contractor’s material and test certificate, certifying that the sprinkler systems have been flushed, inspected and tested,
   d) a certificate of verification and a manufacturer’s inspection report for the fire alarm system,
   e) a fire safety plan and record of installed fire safety systems, conforming to the Fire By-law, and
   f) a letter from a fire protection consultant verifying that the special devices or methods forming part of the alternative solution achieves the alternative solution.

1.7.2.5. Requirements during Construction, Fire and Life Safety Systems Inspection
1) During the final inspection of construction, fire and life safety systems in the building, the owner of the building shall make available:
   a) a copy of the fire safety plan,
   b) a copy of the record of installed fire safety systems, and
   c) a preventive maintenance and testing schedule and a maintenance log book for the life and fire safety systems.

1.7.2.6. Notice of Change Prior to Occupancy
1) Every owner shall give notice in writing to the Chief Building Official of any change to the owner’s address or any change in the ownership of the building which occurs:
   a) prior to the issuance of an occupancy permit, or
   b) prior to the occupancy of the building.

1.7.3. Partial Occupancy Permit for Building Under Construction
1.7.3.1. Partial Occupancy Permit
1) The Chief Building Official may issue a partial occupancy permit for part of a building which is under construction if, in the opinion of Chief Building Official, such partial occupancy would not jeopardize life or property.
2) The Chief Building Official may impose conditions on a partial occupancy permit.
3) The Chief Building Official may revoke a partial occupancy permit if the permit holder fails to comply with the conditions imposed by the Chief Building Official.
4) The Chief Building Official may revoke a partial occupancy permit if the owner fails to comply with any permit relating to the building.

1.7.3.2. Owner’s Obligation regarding Unsafe Conditions

1) The owner of a building for which a partial occupancy permit has been issued shall ensure that there are no unsafe conditions in the building.

1.7.4. Temporary Occupancy Permit

1.7.4.1. Temporary Occupancy Permit

1) The Chief Building Official may issue a temporary occupancy permit for a temporary use within an existing building, or for the limited use of a building approved according to Subsection 1.6.8. or as otherwise provided in this By-law.

1.7.5. Re-Occupancy Permit

1.7.5.1. Re-occupancy Permit

1) Every owner shall obtain a re-occupancy permit from the Chief Building Official prior to any occupancy of a building or part thereof in respect of which the Chief Building Official has issued an order to cease occupancy due to an unsafe condition.

Section 1.8. Street Regulations

1.8.1. Encroachments

1.8.1.1. Encroachment Defined

1) In this Section an encroachment means a building, or a building appurtenance or fixture, including an existing areaway, a new or existing ornamental projection, awning, canopy, mechanical apparatus, or emergency exit apparatus, projecting in a street, whether above, at or below ground level.

1.8.1.2. Measurement of Encroachment

1) An encroachment shall be measured at right angles from a theoretical vertical plane located at the property line, to the outermost point of the encroachment in the street.

1.8.1.3. No Encroachment without Permission

1) No encroachment shall project into a street, unless permission has first been granted by the City.

1.8.1.4. Maintenance and Repair of Encroachment

1) Encroachments shall be repaired and maintained to the satisfaction of the City Engineer and the Chief Building Official.

1.8.1.5. Prohibited Encroachments

1) An encroachment shall not obstruct or interfere with

   a) public utility poles or equipment,
   b) firefighting equipment or fire rescue operations,
   c) street trees or lamp standards, or
   d) street furniture.

1.8.1.6. Compliance with Encroachment By-law
1) The Chief Building Official shall not issue a permit to construct an encroachment unless the encroachment complies with this By-law and with the Encroachment By-law.

1.8.2. Existing Encroachments

1.8.2.1. Existing Encroachment

1) An existing encroachment which complies with the Encroachment By-law and does not conform with this By-law may be continued if the encroachment is not altered.

1.8.2.2. Damage to Existing Encroachment

1) Subject to the provisions in Sentence (2), an existing encroachment which is damaged may be repaired.
2) Despite the provisions of Sentence (1) if the cost of the repair to an existing encroachment is more than 50 per cent of the current replacement cost of the damaged encroachment, the repair shall constitute a new encroachment and shall comply with the provisions of this By-law and the Encroachment By-law.

1.8.2.3. Alteration to Existing Encroachment

1) Except for signs permitted by the Sign By-law, any enlargement or alteration of an existing encroachment shall constitute a new encroachment and shall comply with the provisions of this By-law and the Encroachment By-law.

1.8.2.4. Signs

1) Signs permitted by the Sign By-law which encroach in a street shall comply with this By-law.

1.8.2.5. Door Swings

1) Except as provided in Subsection 1.8.10., doors, security gates and other moveable barriers, whether open or closed, shall not encroach in a street.

1.8.3. New Encroachments

1.8.3.1. Application

1) This Section applies to
   a) new encroachments, and
   b) alterations to existing encroachments which do not comply with the provisions of Subsection 1.8.2.

1.8.3.2. Dimensions and Clearances

1) Unless otherwise provided in this By-law, all new encroachments shall comply with the applicable construction, clearance and dimension requirements in Subsections 1.8.5. to 1.8.10.

1.8.3.3. Design and Construction of New Encroachments

1) A new encroachment shall be designed and constructed so that, in the event of its removal from the building, the building will comply with the provisions of this By-law.

1.8.3.4. Compliance with By-laws

1) A new encroachment shall comply with the provisions of this By-law and the Encroachment By-law.

1.8.3.5. Encroachments in Narrow Streets

1) Unless otherwise permitted by this Section, new encroachments or encroachments which do not comply with the provisions of Subsection 1.8.2. are not permitted in a street which is 10 m or less in width.
1.8.4. Repair or Removal of Encroachment

1.8.4.1. Removal or Repair by Owner

1) The owner of a building which encroaches in a street shall repair, alter or remove the encroachment if so ordered:
   a) by the Chief Building Official, in accordance with this By-law, or
   b) by the City Engineer, in accordance with the Encroachment By-law.

1.8.4.2. Repair of Building after Removal of Encroachment

1) Upon removal of an encroachment from a building, the owner shall promptly repair the building and shall ensure that the building complies with this By-law.

1.8.4.3. Repair of Building at Owner’s Expense

1) If the Chief Building Official has issued an order in accordance with Article 1.8.4.1. and an owner has failed to comply with that order, the Chief Building Official may:
   a) authorize demolition or removal of an encroachment, posting of security guards or fire wardens, or enclosure of such encroachment, building, construction, excavation or part thereof, at the expense of the owner,
   b) recover such expense in the manner set out in this By-law, and
   c) take such other measures as may be necessary to protect the public.

1.8.5. Areaways

1.8.5.1. Areaway Defined

1) In this Subsection an areaway means an existing underground building or building appurtenance, which encroaches in a street and forms part of or serves an adjacent building.

1.8.5.2. Design and Structural Requirements

1) The Chief Building Official shall refuse to issue a permit for alteration of an areaway unless the design has been first approved by the City Engineer.
2) Areaways shall be constructed with reinforced concrete walls and roofs which are capable of supporting the street surface, any superimposed live loads, surcharge loads and seismic loads, to the satisfaction of the City Engineer.
3) Notwithstanding Sentences (1) and (2), the provisions of Part 4, Division B, Book I of this By-law apply to the construction of an areaway.

1.8.5.3. Surface Construction Requirements

1) If any part of an areaway interfaces with the street surface, the areaway shall be:
   a) noncombustible construction,
   b) constructed with solid non slip surfaces at the street surface interface, and
   c) level with the street surface at the street surface interface.

1.8.5.4. Removal of Areaway

1) A person who wishes to remove an areaway shall:
   a) apply for and obtain all necessary permits,
   b) install a cut-off wall integral to the building, to the satisfaction of the Chief Building Official,
   c) waterproof the cut-off wall, to the satisfaction of the Chief Building Official, and
   d) backfill and restore the street surface in accordance with the Encroachment By-law, to the satisfaction of the City Engineer.
1.8.6. Ornamental Projections and Existing Windows

1.8.6.1. Ornamental Projections Defined
1) In this Subsection, ornamental projections mean new and existing building appurtenances and fixtures which encroach in a street, and include
   a) cornices,
   b) copings, and
   c) belt courses and other minor architectural trim such as water tables, column capitals and bases.

1.8.6.2. Construction
1) Except as permitted in Sentence (2), all ornamental projections, including their connections and supports, which encroach in a street, shall be noncombustible construction, and if constructed of metal, shall be no less than 0.56 mm in thickness.
2) Where roof construction is permitted to be of wood, the Chief Building Official may also permit a cornice to be of combustible materials, if
   a) the cornice only consists of roof members cantilevered over the street and covered by a roof deck, and
   b) the underside of the cornice is exposed, without a boxed-in soffit.

1.8.6.3. Ornamental Projections in Streets
1) For the purposes of this Article 1.8.6.3., the height of an ornamental projection shall be determined by vertical measurement from the lowest point of the encroachment to the street level immediately below.
2) Subject to the provisions of Sentence 1.8.6.3.(3), an ornamental projection may encroach into a street which is at least 10 m wide, no more than:
   a) 75mm for a projection located below 2.75m above the street,
   b) 500mm for a projection located between 2.75m and 5.2m above the street,
   c) 915mm for a projection located between 5.2m and 7.62m above the street, and
   d) 1370mm for a projection located more than 7.62m above the street.
3) The provisions of Sentence 1.8.6.3.(2) do not apply to an existing encroaching ornamental projection which is designated by by-law as protected heritage property or is the subject of a heritage revitalization agreement.
4) An ornamental projection may encroach in a street which is less than 10 m wide, if
   a) it is located no less than 7.62 m above the street,
   b) it does not encroach more than 915 mm beyond the property line, and
   c) it does not interfere with overhead public utilities.

1.8.6.4. Existing Encroaching Windows
1) An oriel or bay window shall not encroach in a street except that alterations may be made to an existing oriel or bay window if
   a) it encroaches no more than 600 mm beyond the property line,
   b) it is located no less than 5.2 m above the street, and
   c) the street is no less than 10 m in width.
2) The provisions of Sentence (1) do not apply to an existing encroaching oriel or bay window which is designated in accordance with a heritage designation by-law or is the subject of a heritage revitalization agreement with the City.

1.8.7. Awnings

1.8.7.1. Awning Defined
1) In this Subsection, an awning means a light detachable structure which encroaches in a street and which consists of a covering of fabric, sheet metal or other relatively flexible material on a fixed or retractable structural frame attached to and entirely supported by a building.

1.8.7.2. Attachments
1) No electrical wiring, illuminated device, electrical equipment or apparatus shall be attached to or incorporated in an awning, except that drive mechanisms and attachments to the structural frame required for the operation of collapsible awnings may be permitted by the Chief Building Official.

1.8.7.3. Structural Design
1) Except as permitted in Sentence (3), the structural frame of an awning and its connections to the supporting building shall be designed in conformance with Part 4 of Division B of Book I (General) of this Bylaw.
2) The structural frame of an awning and its connections to the supporting building shall be noncombustible.
3) A fabric covered retractable awning shall be designed to withstand wind, rain, snow, and seismic design loads applied to the closed awning.

1.8.7.4. Clearances
1) The horizontal distance from the outer edge of an awning measured to the outer face of the street curb shall be no less than 600 mm.
2) No portion of an awning shall be less than 2.75 m above the level of the street surface or established building grade, except that if the street surface or established building grade below the awning slopes more than 0.1 m over the length of the awning, the vertical clearance may be no less than 2.6 m, except that a soft fringe attached to the awning and made of canvas or cloth may have a clearance of no less than 2.3 m.

1.8.7.5. Combustible Material Requirements
1) Combustible materials used in awnings shall conform to the appropriate requirements for resistance to fire as set out in CAN/ULC-S109, "Flame Tests of Flame-Resistant Fabrics and Films", or NFPA 701, “Standard Method of Fire Tests for Flame Propagation of Textiles and Films.”
2) Combustible materials shall not be used in an awning which is above the second storey of a building.
3) Combustible materials shall not be used in an awning which is attached to an exterior wall required to be of noncombustible construction.

1.8.7.6. Vertical Height
1) The vertical dimensions of the front and sides of an awning shall not exceed 3.65 m at any point, unless otherwise permitted by the Chief Building Official.

1.8.7.7. Awning Not To Span Unprotected Openings
1) An awning shall not span unprotected openings in separate fire compartments.

1.8.8. Canopies
1.8.8.1. Canopy Defined
1) In this Subsection, a canopy means a structure encroaching in a street that provides pedestrian weather protection and has a covering of glass, metal or other rigid material on a fixed detachable rigid frame that is attached to and entirely supported by a building.

1.8.8.2. Requirements for Materials
1) A canopy shall be
   a) constructed of noncombustible materials, except as provided in Sentence (2) and Clause (3)(c),
   b) supported entirely by the building to which the canopy is attached, and
Division C: Administrative Provisions

Part 1 – General

Vancouver Building Bylaw 2019

1.8.3. Clearances
1) The vertical distance from the lowest point of a canopy to the street surface shall be no less than 2.75 m.
2) The horizontal distance from the outer edge of a canopy to the outer face of the street curb shall be no less than 750 mm.
3) A canopy shall be no less than 600 mm from an adjoining property line or from the production of the property line into the street, unless the canopy is constructed entirely of noncombustible materials.
4) Despite the provisions of Sentence (3), if a property line is adjacent to a lane, a canopy shall be located no less than 600 mm from the production of the property line into the street.
5) A canopy shall be no less than 600 mm from a utility pole or lamp standard.

1.8.4. Vertical Dimensions of Canopy
1) Unless otherwise accepted by the Chief Building Official, the vertical dimensions of the front and sides of a canopy shall not exceed 3.65 m at any point.

1.8.5. Canopy Not to Span Unprotected Openings
1) A canopy shall not span unprotected openings in separate fire compartments.

1.8.6. Canopy Drainage System
1) Unless otherwise permitted by the Chief Building Official, a canopy roof shall be provided with a drainage system conforming to Part 2 of Division B of Book II (Plumbing Systems) of this By-law and connected to the building storm water system.
2) Downpipes for canopies shall not encroach more than 75 mm in the street.

1.8.7. Structural Design of Canopies
1) A canopy shall be designed to
   a) support the expected loads due to weather, and
   b) withstand seismic design loads

1.8.8. Solar Shading Device
1.8.9.1. Solar Shading Device Defined
1) In this Subsection, a solar shading device means a structure encroaching in a street, that prevents solar heat gain through windows and has a fixed detachable rigid frame that is attached to and entirely supported by a building.

1.8.9.2. Requirements for Materials
1) A solar shading device shall be
   a) constructed of noncombustible materials, except as provided in Sentence (2) and Clause (3)(c),
   b) supported entirely by the building to which the solar shading device is attached, and
   c) constructed so that its removal conforms to Sentence 1.8.3.3.(1).
2) Despite Clause (1)(a), if the building or the exterior wall to which the solar shading device is attached is of combustible construction, a solar shading device may be constructed of combustible materials.

3) The solar shading device shall
   a) if constructed of glass, use wired or laminated safety glass,
   b) if constructed of metal, shall be no less than 0.56 mm in thickness, or
   c) if constructed of wood plank, shall be no less than 60 mm in thickness, sheathed on the top and the soffit with metal or other noncombustible material, and constructed and fire stopped to the satisfaction of the Chief Building Official.

4) Solar shading devices shall be of noncombustible construction where installed on an exposing wall face required to be noncombustible in accordance with Division B, Subsection 3.2.3.7.

1.8.9.3. Clearances

1) The horizontal distance from the outer edge of a solar shading device to the outer face of the street curb shall be no less than 600 mm.

2) For the purposes of this Article 1.8.9.3., the height of a solar shading device shall be determined by vertical measurement from the lowest point of the encroachment to the street level immediately below.

3) The maximum projection of a solar shading device into a street which is at least 10 m wide, shall be
   a) 500mm for a solar shading device located between 2.75 and 5.2m above the street,
   b) 915mm for a solar shading device located between 5.2m and 7.62m above the street, and
   c) 1370mm for a solar shading device located more than 7.62m above the street except that a solar shading device must also conform to the requirements of Sentence 1.8.9.3.(1).

4) A solar shading device may encroach in a street which is less than 10 m wide, if
   a) it is located no less than 7.62 m above the street,
   b) it does not encroach more than 915 mm beyond the property line, and
   c) it does not interfere with overhead public utilities.

5) A solar shading device shall be no less than 600 mm from an adjoining property line or from the production of the property line into the street, unless the solar shading device is constructed entirely of noncombustible materials.

6) Despite the provisions of Sentence (5), if a property line is adjacent to a lane, a solar shading device shall be located no less than 600 mm from the production of the property line into the street.

1.8.9.4. Solar Shading Device Not to Span Unprotected Openings

1) A solar shading device shall not span unprotected openings in separate fire compartments.

1.8.9.5. Structural Design of Solar Shading Device

1) A solar shading device shall be designed to
   a) support the expected loads due to weather,
   b) withstand seismic design loads, and
   c) shed snow and ice in a manner that minimizes risk to persons and property below.

1.8.10. Mechanical Apparatus

1.8.10.1. Clearances

1) Exterior hose connections for fire-fighting equipment, ventilation intakes and outlets, chimneys and air conditioning units shall not encroach in a street unless permitted by the City Engineer.

2) Fire alarm bells and fire gongs may encroach up to 300 mm in a street, except that such encroachments shall be located no less than 2.6 m above the street surface or established building grade.

1.8.11. Emergency Exits

1.8.11.1. Stairways and Fire Escapes
1) The Chief Building Official may permit stairways and balconies for fire escapes to encroach in a street, except that the lowest part of such stairways and balconies shall be no less than 5.2 m above the street surface.

1.8.11.2. Emergency Exit Doors
1) Emergency exit doors may encroach no more than 300 mm in a street which is no less than 10 m in width.
2) Despite Sentence (1), the City Engineer may permit an emergency exit door to encroach in a street which is less than 10 m in width, provided that such door does not encroach more than 300 mm in the street.

Section 1.9. Temporary Occupancy of a Street for Construction Purposes

1.9.1. General Requirements

1.9.1.1. Permit Required Prior to Occupancy of Street
1) No person shall occupy a street or the air space above a street in connection with, or incidental to the construction or maintenance of any building, without first obtaining a street use permit from the City Engineer.

1.9.1.2. Permit Required Prior to Excavation in Street
1) No person shall excavate or backfill any part of a street without first obtaining a street use permit from the City Engineer.

1.9.1.3. Liability Disclaimer
1) An application for a street use permit shall contain an undertaking by the owner to save harmless the City against all claims, liabilities, judgments, costs and expenses in consequence of, or in any way incidental to the granting of such permit, in a form satisfactory to the Director of Legal Services.

1.9.2. Overhead Construction

1.9.2.1. Permit Required for Overhead Construction
1) No person shall cause a swing scaffold or construction hoisting device to occupy the air space above a street without first obtaining a street use permit from the City Engineer.

1.9.2.2. Prevention of Public Entry
1) The street under a swing scaffold or construction hoisting device shall be fenced, roped off or otherwise protected against public entry to the satisfaction of the City Engineer.

1.9.3. Public Safety

1.9.3.1. Construction Site Protection of the Public Required
1) No person shall construct, alter or repair any building unless fencing, boarding, barricades or covered walkways as required by Part 8 of Division B of Book I (General) of this By-law have first been erected on or adjacent to the street, to the satisfaction of the Chief Building Official.
2) The Chief Building Official may modify the requirements of Sentence (1) if satisfied that the location of the construction is sufficiently protected or remote from areas frequented by the public.

1.9.3.2. Permit Required for Fencing, Boarding, Barricades or Covered Walkways
1) No person shall erect fencing, boarding, barricades or covered walkways on a street, without first obtaining a street use permit from the City Engineer.

Section 1.10. Addressing Buildings and Parcels of Land

1.10.1. Address Numbering System

1.10.1.1. Numeric Addresses
   1) Addressing of buildings, suites within a building or parcels of land shall be numeric.

1.10.1.2. East/West Addresses
   1) East/West addresses shall run in series, commencing with the unit block and increasing in numeric value in a westerly direction from the west side of Ontario Street or the west side of Carrall Street and commencing with the unit block and increasing in numeric value in an easterly direction from the east side of Ontario Street or the east side of Carrall Street.
   2) Buildings on the north side of streets running in an east or west direction shall have odd numbers, and buildings on the south side of such streets shall have even numbers.

1.10.1.3. North/South Addresses
   1) North/South addresses shall run in series, commencing with the unit block and increasing in numeric value in a northerly direction from the north side of Dundas Street and commencing with the unit block and increasing in numeric value in a southerly direction from the south side of Dundas Street.
   2) Buildings on the west side of streets running in a north or south direction shall have odd numbers, and buildings on the east side of such streets shall have even numbers.

1.10.1.4. Multiple Suite Addresses
   1) Where a building with a non-continuous public corridor or direct exterior access contains multiple addressable suites, addresses of suites on floor areas shall be assigned in an increasing numeric order commencing from the point of entry as determined by the Chief Building Official and moving in a direction as determined by the Chief Building Official.
   2) Where a building with a continuous public corridor contains multiple addressable suites, addresses of suites on floor areas shall be assigned in an increasing numeric order commencing from the point of entry as determined by the Chief Building Official and moving in a direction as determined by the Chief Building Official.

1.10.1.5. Principal Buildings
   1) Except as permitted by Sentence (2), every building, or substantive portion of a building that is provided with a separate exterior principle access designed such that it will function as a separate and distinct entity, on a site shall be assigned a separate numeric street address where sufficient numeric street addresses are available.
   2) In the case where there is an insufficient number of numeric street addresses available, the Chief Building Official may assign the same street number to one or more adjacent buildings on a site provided
      a) that suite numbers are assigned between the affected buildings in a simple and logical manner that makes the location of each suite self-evident,
      b) sufficient and clear signage is provided and visible on approach so as to make clear what sequence of suite number assignment is,
      c) a principle fire department access acceptable to the Chief Building Official and the fire department will be provided to the site, and
      d) a graphic map is provided at the principle fire department access that shows the location of each of the buildings and suites.
1.10.1.6. Exterior Principal Suite Entry

1) Every suite with an exterior principal entry shall be assigned a separate numeric street address.
2) Where sufficient numeric street addresses are not available for every suite with an exterior principal entry, an additional suite number shall be assigned to every suite.
SCHEDULE E-1

OWNER'S UNDERTAKING

Notes:

i) This letter must be submitted after completion of the project but before the occupancy permit is issued or a final inspection is made by the Chief Building Official.

ii) This letter is endorsed by: Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.

iii) In this letter the words in italics have the same meaning as in the Building By-law.

To: The Chief Building Official

Re:

Name of Project (Client):

Address of Property (Client):

In consideration of the City accepting and processing an application for a building permit for the project identified above, and as required by the Building By-law, the following representations, warranties and indemnities are given to the City by the owner:

1. [If an individual is the owner]

   ( ) I am the owner of the above property.

   or

   [If a corporation is the owner]

   ( ) _____________________________ is the owner of the above property

   (Name of Corporation)

2. The owner will comply with and cause those employed for this project to comply with all applicable by-laws of the City and other statutes and regulations in force in the City relating to the development, work, undertaking or permission in respect of which this letter is submitted.

3. The owner fully understands the requirements herein, and acknowledges responsibility for carrying out the work, or gives assurance that the work will be carried out, in accordance with all by-laws governing the construction of the building. The owner understands and acknowledges that the issuance of any permit, including an occupancy permit, or the inspection or approval of passage of work by the City, is not a representation or warranty that any by-law has been complied with and the owner remains responsible at all times for compliance. The owner has read and understands Article 1.3.2.1. and Article 1.4.1.5. of Division C Book I and Book II of the Building By-law, which are set out below.

4. The owner hereby agrees to indemnify and save harmless the City and its employees from all claims, liability, judgments, costs and expenses of every kind including negligence which may result from the failure to comply fully with all by-laws, statutes and regulations relating to any work or undertaking in respect of which this letter is submitted.

5. Where the words "work" or "undertaking" are used herein, the owner understands this to include all trade work, including but not limited to, electrical, plumbing, mechanical, gas and other works necessary to complete the contemplated construction.

6. I am authorized to give these representations, warranties, assurances and indemnities to the City.

**Building By-law, Division C, Article 1.3.2.1 Intent**

1) This By-Law sets standards in the general public interest. It is enacted and retains on the understanding and specifically expressed condition that it creates no duty whatsoever on the City, the Chief Building Official or any employee of the City to enforce its provisions, or on the further condition that a failure to administer or enforce its provisions, or the incomplete or inadequate administration or enforcement of its provisions, shall not give rise to a cause of action in favour of any person whatsoever. The issuance of any permit, including an occupancy permit, is not a representation, warranty or assurance that this By-Law or any other enactment has been complied with, and the issuance thereof in error shall not give rise to a cause of action. Accordingly, words in this By-Law defining the responsibilities and authority of the Chief Building Official shall be construed as internal administrative directions which do not create a duty.

**Building By-law, Division C, Article 1.4.1.5. Compliance with By-law and other enactments**

1) The owner shall comply with this By-law and all other applicable enactments.

2) The owner shall ensure that all work, construction, or occupancy is carried out in accordance with this By-law and all other applicable enactments.

3) The owner shall ensure that the occupancy of a building or part of a building complies with the occupancy permit.

4) The issuance of a permit, the acceptance of plans and supporting documents submitted for a permit, or the making of inspections by the Chief Building Official shall not relieve the owner of a building from the full responsibility for carrying out the work or having the work carried out in accordance with this By-law and all other applicable enactments.

5) The owner shall ensure that all underground storage tanks on the subject property that are intended for the storage of heating oil but have not been used for over 3 years are removed and any associated contamination is remediated to the applicable standards as prescribed in the Contaminated Sites Regulation. All work must be completed in accordance with the requirements of the Vancouver Fire By-law.
SCHEDULE E-2

OWNER’S AND TENANTS UNDERTAKING
[to be used when a tenant is carrying out the project]

To: The Chief Building Official

Re: ____________________________
   Name of Project
   ____________________________
   Address of Property

In consideration of the City accepting and processing an application for a building permit for the project identified above, and as required by the Building By-law, the following representations, warranties and indemnities are given to the City by the owner and the tenant.

1. [If an individual is the owner] ( ) I am the owner of the above property
   or
   [If a corporation is the owner]
   ( ) ____________________________ is the owner of the above property.
   (Name of Corporation)

[If an individual is the tenant]
   ( ) I am the owner of the above property
   or
   [If a corporation is the tenant]
   ( ) ____________________________ is the owner of the above property.
   (Name of Corporation)

2. The owner and the tenant will comply with and cause those employed for this project to comply with all applicable by-laws of the City and other statutes and regulations in force in the City relating to the development, work, undertaking or permission in respect of which this letter is submitted.

3. The owner and the tenant fully understands the requirements herein, and acknowledges responsibility for carrying out the work, or gives assurance that the work will be carried out, in accordance with all by-laws governing the construction of the building. The owner understands and acknowledges that the issuance of any permit, including an occupancy permit, or the inspection or approval or passage of work by the City, is not a representation or warranty that any by-law has been complied with and the owner remains responsible at all times for compliance. The owner has read and understands Article 1.3.2.1. and Article 1.4.1.6. of Division C Book I and Book II of the Building By-law, which are set out below.
4. The owner and the tenant hereby agree to indemnify and save harmless the City and its employees from all claims, liabilities, judgments, costs and expenses of every kind including negligence which may result from the failure to comply fully with all bylaws, statutes and regulations relating to any work or undertaking in respect of which this letter is submitted.

5. Where the words "work" or "undertaking" are used herein, the owner and the tenant understand this to include all trade work, including but not limited to: electrical, plumbing, mechanical, gas and other works necessary to complete the contemplated construction.

6. The owner and the tenant are authorized to give these representations, warranties, assurances and indemnities to the City.

Building By-law, Division C, Article 1.3.2.1 Intent

1) This By-Law sets standards in the general public interest. It is enacted and related on the understanding and specifically expressed condition that it entrusts no duty whatsoever on the City, the Chief Building Official or any employee of the City to enforce its provisions, or on the further condition that a failure to administer or enforce its provisions, or the incomplete or inadequate administration or enforcement of its provisions, shall not give rise to a cause of action in favour of any person whatsoever. The issuance of any permit, including an occupancy permit, is not a representation, warranty or statement that this By-Law or any other enactment has been complied with, and the issuance thereof to error shall not give rise to a cause of action. Accordingly, words in this By-law defining the responsibilities and authority of the Chief Building Official shall be construed as internal administrative directions which do not create a duty.

Building By-law, Division C, Article 1.4.1.5. Compliance with By-law and other enactments

1) The owner shall comply with this By-law and all other applicable enactments.

2) The owner shall ensure that all work, construction, or occupancy is carried out in accordance with this By-law and all other applicable enactments.

3) The owner shall ensure that the occupancy of a building or part of a building complies with the occupancy permit.

4) The issuance of a permit, the acceptance of plans and supporting documents submitted for a permit, or the making of inspections by the Chief Building Official shall not relieve the owner of a building from the full responsibility for carrying out the work or having the work carried out in accordance with this By-law and all other applicable enactments.

5) The owner shall ensure that all underground storage tanks or the subject property that are intended for the storage of heating oil but have not been used for over 2 years are removed and any associated contamination is remediated to the applicable standards as prescribed in the Contaminated Sites Regulation. All work must be completed in accordance with the requirements of the Vancouver Fire By-law.

Vancouver Building Bylaw 2019

Division C 1-36
Schedule of Fees

PART A – BUILDING

1. The fees hereinafter specified shall be paid to the City with respect to and upon the application for the issue of a PERMIT as follows:

   (a) Except as provided for in Clause (b) for the CONSTRUCTION of any BUILDING, or part thereof:
       When the estimated cost of the work, being the valuation referred to in Article 1.6.2.3. of Book I, Division C and Book II, Division C of this By-law, does not exceed $5,000 or for the first $5,000 of the estimated cost of the work ........................................................................................................................ $158.00
       For each $1,000, or part thereof, by which the estimated cost of the work exceeds $5,000 but does not exceed $50,000 .................................................................................................................... $10.10
       For each $1,000, or part thereof, by which the estimated cost of the work exceeds $50,000 .......................................................... $5.10
   
   (b) For the installation, CONSTRUCTION, re-construction, ALTERATION or repair of, or ADDITION to:
       (i) any CHIMNEY, FIREPLACE, INCINERATOR, VENTILATING SYSTEM, AIR-CONDITIONING .. SYSTEM, or HEATING SYSTEM, the fee shall be in accordance with Clause (a), except that a fee shall not be charged when the cost of such work is less than $500
       (ii) any PHOTOVOLTAIC PANELS, and related roof ALTERATION or repair........................ $100.00
   
   (c) For a permit for temporary OCCUPANCY of a part of a STREET, or of the AIR SPACE immediately ABOVE a part of a STREET, in accordance with Section 1.9. of Book I, Division C and Book II, Division C of this By-law, the daily fee shall be for each 10 m² or part thereof, of STREET or of AIR SPACE part thereof, of STREET or of AIR SPACE immediately above such STREET to be occupied $3.20
       Subject to a minimum fee of........................................................................................................ $110.00
       Flat fee for each portable toilet................................................................. $110.00
   
   (d) For an OCCUPANCY PERMIT not required by this By-law but requested.......................... $228.00
   
   (e) For the demolition of a BUILDING, not including a ONE-FAMILY DWELLING, which has at any time since November 1, 1986 provided RESIDENTIAL OCCUPANCY, subject to Section 3:
       For each DWELLING UNIT ................................................................. $1,150.00
       For each sleeping room in a multiple conversion dwelling, hotel or other BUILDING, which is or has been a principal dwelling or residence of a person, family or household........................................ $1,150.00
   
   (f) For the demolition of a ONE-FAMILY DWELLING, which has at any time since November 1, 1986 provided RESIDENTIAL OCCUPANCY, subject to Section 3 ................................................ $1,150.00
   
   (g) For the repair of building walls pursuant to requirements of Book I, Division B, Part 5 for any residential building................................................................. Nil

2. The fees hereinafter specified shall be paid to the City as follows:

   (a) For a required permit inspection for compliance with this By-Law which cannot be carried out during normal working hours and where there is a request to carry out the inspection after hours, the fee to be based on the time actually spent in making such inspection, at a minimum inspection time of four (4) hours, including traveling time:
       For each hour or part thereof................................................................. $311.00
   
   (b) For a plan review where an applicant requests in writing that the review be carried out during overtime:
       For each hour or part thereof ................................................................. $311.00
   
   (c) For each special inspection of a BUILDING or structure to determine compliance with this By-law, and in respect of which no specific fee is otherwise prescribed, the fee to be based on the time actually spent in making the inspection:
       For each hour or part thereof ................................................................. $206.00
(d) For each REINSPECTION made necessary due to faulty work or materials or incomplete work requested to be inspected ................................................................. $206.00
(e) For each inspection of a drainage tile system:
   For a one- or two-family residence .......................................................................................... $212.00
   For all other drain tile inspections:
   When the estimated cost of the CONSTRUCTION of the BUILDING, being the valuation referred to in Article 1.6.2.3. of Book I, Division C and Book II, Division C does not exceed $500,000 ........ $414.00
   When the estimated cost of the work exceeds $500,000 but does not exceed $1,000,000 ...... $827.00
   When the estimated cost of the work exceeds $1,000,000 .................................................. $1,034.00
(f) For the special search of records pertaining to a BUILDING to advise on the status of outstanding orders and other matters concerning the BUILDING:
   For a residential building containing not more than 2 principal dwelling units .................................. $265.00
   For all other BUILDINGS .................................................................................................... $532.00
(g) To access plans (electronic or on microfilm) or documents for viewing or copying ....................... $45.10
(h) For each microfilm image or electronic file copied ..................................................................... $12.40
(i) For a request to renumber a BUILDING .................................................................................. $984.00
(j) For the extension of a BUILDING PERMIT where requested in writing by an applicant pursuant to Article 1.6.7.1. of Book I, Division C and Book II, Division C ........................................................................................................................................ $50% of the original BUILDING PERMIT fee to a maximum of $380.00
(k) For the extension of a building permit by Council where requested in writing by an applicant pursuant to Article 1.6.7.4. of Book I, Division C and Book II, Division C .......................................................... $2,490.00
(l) For an evaluation of plans, specifications, building materials, procedures or design methods for the purpose of revisions to an application or a permit in accordance with Article 1.5.2.13. and Section 1.6.6. of Book I, Division C and Book II, Division C
   where the PERMIT relates to a ONE-FAMILY DWELLING or a SECONDARY SUITE ........ $206.00
   plus for each hour, or part thereof, exceeding one hour .......................................................... $206.00
   where the PERMIT relates to any other BUILDING ............................................................... $623.00
   plus for each hour, or part thereof, exceeding one hour .......................................................... $311.00
(m) For each RE-OCCUPANCY PERMIT after rectification of an UNSAFE CONDITION and related By-law violations ........................................................................................................ $379.00
(n) For review of plans, specifications, building materials, procedures or design methods for the purpose of acceptance of an alternative solution for new construction under Article 2.3.2.1. of Book 1, Division C for each application .......................................................... $871.00
(o) For an evaluation of plans, specifications, building materials, procedures or design methods for the purpose of acceptance of existing conditions with mitigating features, for each application ... $498.00
(p) For review by the alternative solution review panel ....................................................................... $2,790.00
(q) For the evaluation of a resubmission or revised submission made under Clauses (n) or (o) of this Section 2........................................................................................................................... $311.00

3. Upon written application of the payor and on the advice of the Acting General Manager of Community Services, the Director of Finance shall refund to the payor, or a designate of the payor, the fees paid pursuant to Clauses (e) and (f) of Section 1:
   (a) for all demolished dwelling units in a building that will be replaced by a social housing or co-operative development that has received a Project Commitment Letter from the British Columbia Housing Management Commission or the Canada Mortgage and Housing Corporation; and
   (b) for each demolished dwelling unit that has been replaced by a dwelling unit occupied by rental tenants and not created pursuant to the Strata Property Act.
### PART B - PLUMBING

Every applicant for a Plumbing PERMIT shall, at the time of application, pay to the City the fees set out hereunder:

1. **INSTALLATIONS**

   For the Installation of:
   - One, two or three FIXTURES .............................................................. $206.00
   - Each additional FIXTURE ................................................................. $64.70

   **Note:** For the purpose of this schedule the following shall also be considered as FIXTURES:
   - Every "Y" intended for future connection;
   - Every ROOF DRAIN, swimming pool, dishwasher, and interceptor;
   - Every vacuum breaker in a lawn sprinkler system; and
   - Every back-flow preventer

   **Alteration of Plumbing** (no FIXTURES involved):
   - For each 30 m of piping or part thereof .............................................. $302.00
   - For each 30 m of piping or part thereof, exceeding the first 30 m .......... $84.00
   - Connection of the City water supply to any hydraulic equipment .......... $114.00

2. **INSPECTIONS OF FIRELINE SYSTEMS:**

   **Hydrant & Sprinkler System:**
   - First two inspections for each 30 m of water supply pipe or part thereof ....... $302.00
   - Each additional inspection for each 30 m of water supply pipe or part thereof .... $124.00

   **Sprinklers:**
   - First head, one- or two-family dwelling .............................................. $344.00
   - First head, all other buildings ............................................................ $731.00
   - First head, renovations to existing sprinkler systems ......................... $213.00
   - Each additional head, all buildings (no limit on number) ..................... $3.80

   **Firelines:**
   - Hose Cabinets ................................................................. $39.80
   - Hose Outlets ................................................................. $39.80
   - Wet & Dry Standpipes .......................................................... $39.80
   - Standpipes ................................................................. $39.80
   - Dual Check Valve In-flow Through Devices ....................................... $39.80
   - Backflow Preventer ........................................................ $206.00

   **Wet & Dry Line Outlets:**
   - Each connection ................................................................. $39.80
   - **NOTE:** A Siamese connection shall be considered as two dry line outlets.
   - Each Fire Pump ............................................................. $321.00
   - Each Fire Hydrant ........................................................... $99.00

3. **REINSPECTIONS**

   For each REINSPECTION made necessary due to faulty work or materials or incomplete work requested to be inspected ................................................................. $206.00

4. **SPECIAL INSPECTIONS**

   Each inspection to establish fitness of any existing fixture for each hour or part thereof ............ $206.00
   An inspection outside normal working hours and at a minimum inspection time of four (4) hours, including traveling time, for each hour or part thereof ................................................................. $311.00

5. **BUILDING SEWER INSPECTIONS**

   First two inspections for each 30 m of BUILDING SEWER or part thereof .............. $302.00
   Each additional inspection for each 30 m of BUILDING SEWER or part thereof ............ $124.00
PART C – OPERATING PERMITS
Every applicant for an OPERATING PERMIT shall, at the time of application, pay to the City the fee set out hereunder:
For each OPERATING PERMIT ....................................................................................................................... $00.00
Notes to Part 1
Administrative Provisions

This Appendix is included for explanatory purposes only and does not form Part of the requirements except as defined in Division A Sentence 1.1.3.1.(1). The numbers that introduce each Appendix Note correspond to the applicable requirements in this Division.

A-1.3.3.5. Unsafe Conditions Although words such as alteration, occupancy, building and unsafe conditions are defined in Article 1.4.1.2. of Division A, such words as removal and relocation contained here and in the definitions are adequately defined in dictionaries and need not be defined herein.

A-1.3.3.6. Work on Public Property The appropriate government authority may be federal, provincial or city, depending on the nature of the public property.

A-1.3.3.7. Changes in Ground Elevation and Limiting Distance If a new or existing building is built as close to a boundary line as the regulations permit, moving the property boundary could result in contravention of the By-law in regards to spatial separations. In those circumstances, this Subsection would not apply.

A-1.4.1.10. Project Directory This Subsection requires the owner to inform the Chief Building Official of changes in responsibilities of certain employees. It is not intended to limit the owner’s right to change the constructor, engineer, architect or inspection or testing agency, but rather to let the building official know of any such change so that construction will not be held up because of any misunderstanding as to who is responsible. See Letters of Assurance at the end of Part 2 of Division C.

A-1.4.1.15. Tests to Establish Compliance Where a manufacturer, fabricator or erector is required to conform to specified requirements, such as those referenced by Articles 4.3.1.2. and 4.3.3.1. of Division B, Book I, it is intended that proof of such compliance be filed with the Chief Building Official. See Letters of Assurance at the end of Part 2 of Division C.

A-1.4.1.19.(1) Uncovering Work The requirement to uncover and replace work will normally apply only if Article 1.4.1.17. has not been complied with, that is, if work requiring inspection has been covered prematurely. Complete uncovering may not be necessary. Here, again, the judgment of the designated official is required to determine if partial uncovering, test holes or similar actions will be sufficient to indicate compliance, the purpose being to promote compliance not to penalize the constructor.

A-1.6.2.2. Application Requirements In addition to the information required by this provision, further information is required by Subsection 2.3.4. of Division C, Structural and Foundation Drawings and Calculations, and Subsection 2.3.5. of Division C, Heating, Ventilating, Air-Conditioning and Energy Utilization Drawings and Specifications.

A-1.6.7.1.(1) Permit Expiry The owner must provide documentation to establish that the work has not been substantially discontinued for 6 months.

A-1.7.1.2. Occupancy Permit An occupancy permit is required for a temporary occupancy.
Part 2
Administrative Provisions

Section 2.1. Application

2.1. Application

2.1.1. Application

1) This Part applies to all buildings covered in this By-law. (See Article 1.1.1.1. of Division A.)

Section 2.2. Administration

2.2. Administration

2.2.1. Conformance with Administrative Requirements

1) This By-law is made pursuant to Section 306 of the Vancouver Charter.

2.2.1.2. Structural Design

1) Except as required in Sentence (2), for a design carried out in accordance with Part 4 of Division B, the designer shall be a registered professional skilled in the work concerned. (See Note A-2.2.1.2.(1).)

2) For the design of a Part 3 Division B building, carried out in accordance with Part 4 of Division B, the designer shall be a registered professional designated by the Association of Professional Engineers and Geoscientists of British Columbia as a Designated Structural Engineer (Struct. Eng.) and shall
   a) assume overall responsibility for the design work and field reviews of the primary structural components of a building that falls within the scope of Article 1.3.3.2. of Division A of Division A,
   b) apply his or her professional (P.Eng.) seal and Struct. Eng. stamp, sign and date the plans and supporting documents prepared by, or under the supervision of the Designated Structural Engineer, and
   c) apply his or her professional (P.Eng.) seal and Struct. Eng. stamp and sign and date the Letters of Assurance described in Subsection 2.2.7.

2.2.2. Information Required for Proposed Work

2.2.2.1. General Information Required

1) Sufficient information shall be provided to show that the proposed work will conform to this By-law and whether or not it may affect adjacent property.

2) Plans shall be drawn to scale and shall indicate
   a) the nature and extent of the work or proposed occupancy in sufficient detail to establish that, when completed, the work and the proposed occupancy will conform to this By-law,
   b) the applicable edition of the By-law,
   c) whether the building is designed under Part 3 or Part 9,
   d) the major occupancy classifications of the building,
   e) the building area and building height,
   f) the number of streets the building faces,
g) the accessible entrances, work areas and washrooms, and
h) the accessible facilities particular to the occupancies.

3) When proposed work is changed during construction, information on the changes shall comply with the requirements of this Section for proposed work.

2.2.2. Site Plans

1) Site plans shall be referenced to an up-to-date survey and, when required to prove compliance with this Code, a copy of the survey shall be provided.

2) Site plans shall show
   a) by dimensions from property lines, the location of the proposed building,
   b) the similarly dimensioned location of every adjacent existing building on the property,
   c) existing and finished ground levels to an established datum at or adjacent to the site,
   d) the access routes for firefighting, and
   e) the accessible paths of travel to the building from
      i) the sidewalk, roadway or street, and
      ii) if provided, exterior parking stalls for persons with disabilities and exterior passenger-loading zones, and
   f) the exterior entrances and key plan for each storey indicating the location and number of suites.

2.2.2.3. Information Required on Building Plans for Addressing Purposes

1) Architectural floor plans provided for addressing purposes shall
   a) measure 280 mm by 430 mm,
   b) identify the location and designated street number of the principal entrance of a building and the location and designated suite number of all interior and exterior suite entrances.

2.2.3. Fire Protection and Plumbing Components

2.2.3.1. Information Required for Fire Protection Components

1) Information shall be submitted to show the major components of fire protection including
   a) the division of the building by firewalls,
   b) the building area,
   c) the degree of fire separation of storeys, shafts and special rooms or areas, including the location and rating of closures in fire separations,
   d) the source of information for fire-resistance ratings of elements of construction (to be indicated on large-scale sections),
   e) the location of exits, and
   f) fire detection, supression and alarm systems.

2.2.3.2. Plans of Sprinkler Systems

1) Before a sprinkler system is installed or altered, plans showing full details of the proposed sprinkler system and essential details of the building in which it is to be installed shall be drawn to an indicated scale.

2.2.3.3. Information Required on Plumbing Drawings and Related Documents

1) If the Chief Building Official requires an application for a permit in respect of plumbing systems, plumbing drawings and related documents submitted with the application shall show
   a) the location and size of every building drain and of every trap and cleanout fitting that is on a building drain,
   b) the size and location of every soil-or-waste pipe, trap and vent pipe, and
   c) a layout of the potable water distribution system, including pipe sizes and valves.
2.2.4. Structural and Foundation Drawings and Calculations

2.2.4.1. Application
   1) This Subsection applies only to buildings covered in Part 4 of Division B. (See Article 1.3.3.2. of Division A.)

2.2.4.2. Professional Seal and Signature of Designer
   1) Structural drawings and related documents submitted with the application to build shall be dated and shall bear the authorized professional seal and signature of the designer as defined in Sentence 2.2.1.2.(1).

2.2.4.3. Information Required on Structural Drawings
   1) Structural drawings and related documents submitted with the application to build shall indicate, in addition to those items specified in Article 2.2.4.6. and in Part 4 of Division B applicable to the specific material,
      a) the name and address of the person responsible for the structural design,
      b) the date of issue of the By-law and standards to which the design conforms,
      c) the dimensions, location and size of all structural members in sufficient detail to enable the design to be checked,
      d) sufficient detail to enable the dead loads to be determined, and
      e) all effects and loads, other than dead loads, used for the design of the structural members and exterior cladding.

2.2.4.4. Drawings of Parts or Components
   1) Structural drawings of parts or components including guards designed by a person other than the designer of the building shall be dated and shall bear the authorized professional seal and signature of the designer of such parts or components.

2.2.4.5. Design Calculations and Analysis
   1) The calculations and analysis made in the design of the structural members, including parts and components, of a building shall be available for inspection upon request.

2.2.4.6. Information Required on Foundation Drawings
   1) Foundation drawings submitted with the application to build or excavate shall be provided to indicate
      a) the type and condition of the soil or rock, as well as the groundwater conditions, as determined by the subsurface investigation,
      b) the factored bearing pressures on the soil or rock, the factored loads when applicable and the design loads applied to foundation units, and
      c) the earth pressures and other loads applied to the supporting structures of supported excavations.
   2) When required, evidence that justifies the information on the drawings shall be submitted with the application to excavate or build.

2.2.4.7. Altered Conditions
   1) Where conditions as described under Sentences 4.2.2.4.(1) and (2) of Division B are encountered, or where foundation units or their locations are altered, this information shall be recorded on appropriate drawings or new “as constructed” drawings.
2.2.5. Drawings and Specifications for Environmental Separators and Other Assemblies Exposed to the Exterior

2.2.5.1. Application
1) This Subsection applies to building materials, components and assemblies to which Part 5 of Division B applies. (See Article 1.3.3.2. of Division A.)

2.2.5.2. Information Required on Drawings and Specifications
1) Information shown on drawings and in specifications shall be clear and legible, and shall contain sufficient details to demonstrate conformance with this By-law. (See Note A-2.2.6.2.(1).)

2.2.6. Heating, Ventilating and Air-conditioning Drawings and Specifications

2.2.6.1. Application
1) This Subsection applies only to buildings covered in Part 6 of Division B. (See Article 1.3.3.2. of Division A.)

2.2.6.2. Information Required on Drawings
1) The information shown on architectural drawings and on drawings for heating, ventilating and air-conditioning systems shall be clear and legible and shall contain all necessary details to demonstrate conformance with this By-law. (See Note A-2.2.6.2.(1).)

2.2.7. Professional Design and Review
(See Note A-2.2.7.)

2.2.7.1. Application
1) The requirements of this Subsection apply to
   a) buildings within the scope of Part 3 of Division B,
   b) buildings within the scope of Part 9 of Division B that are designed with common egress systems for the occupants and require the use of firewalls according to Article 1.3.3.4. of Division A, and
   c) the following, in respect of buildings within the scope of Part 9 of Division B other than buildings described in Clause (b),
      i) structural components that are not within the scope of Part 9 of Division B (See Note A-2.2.7.1.(1)(c)(i).),
      ii) geotechnical conditions at building sites that are not within the scope of Part 9 of Division B,
      iv) standpipe and hose systems designed to NFPA 14, “Installation of Standpipe and Hose Systems”,
   d) a building that is designed according to Article 1.3.3.5. of Division A,
   e) a building that is within the scope of Part 5 of Division B,
   f) additions which are subject to Part 11 of Division B, and
   g) a change of major occupancy which is subject to Part 11 of Division B.

2.2.7.2. Responsibilities
1) Before the construction of or the alteration to a building, the owner shall
2.2.7.2.  Administrative Provisions

a) retain a coordinating registered professional to coordinate all design work and field reviews of the registered professionals of record required for the project in order to ascertain that (See Note A-2.2.7.2.(1)(a).)
   i) the design will substantially comply with the Building By-law and other applicable City By-laws, and
   ii) the construction of the project will substantially comply with the Building By-law and other applicable enactments respecting safety, not including the construction safety aspects, and

b) if a building permit is required, deliver to the Chief Building Official letters in the forms set out in Schedules A and B, and (See the end of Division C and Note A-2.2.7.2.(1)(a) and (b).)

c) provide reasonable and timely written notice of any work or excavation that would directly or indirectly affect private property adjacent to the excavation site, to the owner of the affected property, and deliver a copy of the notice to the Chief Building Official. (See Note A-2.2.7.2.(1)(c).)

2) If an occupancy permit or final inspection from an Chief Building Official is required and before an owner occupies or receives permission to occupy the building, the owner or coordinating registered professional shall deliver to that authority letters in the forms set out in Schedules C-A and C-B (See the end of Division C and Note A-2.2.7.2.(2).)

2.2.7.3.  Registered Professional Responsibilities

(See Note A-2.2.7.3.)

1) A registered professional of record who signs a letter, the form of which is set out in a Schedule to this Subsection, and an owner who signs or has an agent sign a letter the form of which is set out in a Schedule to this Subsection, shall comply with this Subsection, Part 1, and the provisions of the letter that apply to the person signing.

2) A registered professional of record or coordinating registered professional who is responsible for a field review shall keep a record of the field review and of any corrective action taken as a result of the field review and shall submit monthly summary reports to the Chief Building Official.

3) A registered professional of record who is retained to undertake design work and field reviews and who is required to provide letters pursuant to Clause 2.2.7.2.(1)(b) shall
   a) place his or her professional seal or stamp on the plans submitted by him or her in support of the application for a building permit, after ascertaining that they substantially comply with the Building By-law and other applicable enactments respecting safety,
   b) provide to the Chief Building Official a letter in the form of Schedule C-B (See the end of Division C) after ascertaining that the components of the project for which the registered professional of record is responsible are constructed so as to substantially comply, in all material respects, with
      i) the plans and supporting documents prepared by the registered professional of record, and
      ii) the requirements of the Building By-law and other applicable enactments respecting safety, not including construction safety aspects.

2.2.7.4.

1) An owner must not terminate the appointment of a coordinating registered professional or registered professional of record unless
   a) the owner immediately replaces the coordinating registered professional or registered professional of record, or
   b) the owner has complied with Clause (1)(b) and Sentence (2) of Article 2.2.7.2. by delivering letters in the forms set out in Schedule A, B, C-A and C-B, as applicable, to the Chief Building Official.

2) In respect of a project to which this Subsection applies,
a) if the coordinating registered professional ceases to be retained at any time before the completion of the project, both the owner and the coordinating registered professional shall notify the Chief Building Official, and
b) if a registered professional of record ceases to be retained at any time before the completion of the project, both the coordinating registered professional and the registered professional of record shall notify the Chief Building Official.

3) Notification under Sentences (1) and (2) shall be made,
a) if possible, before the coordinating registered professional or registered professional of record, as the case may be, ceases to be retained, or
b) if advance notice is not possible, as soon as possible.

2.2.7.5. Reserved.

2.2.8. Deleted.

2.2.9. Buildings on Designated Flood Plains

2.2.9.1. Exemptions from Flood Construction Level Requirements

1) Flood construction level requirements do not apply to:

a) alteration of an existing building, not including reconstruction as defined in this By-law. (See A-11.2.1.2. of Div C),
b) alteration of an existing building to increase the building area by less than 25 per cent of the total building area existing as of July 29, 1999, if
   i) the number of dwelling units is not increased,
   ii) there is no further encroachment into setbacks required by this By-law, and
   iii) there is no further reduction in the flood construction level,
c) enclosed parking areas, including bicycle and residential storage areas, in a multiple dwelling, if there is
   i) an unobstructed non-mechanized means of pedestrian ingress and egress to the areas, above the flood construction level, and
   ii) a sign posted at all entry points warning of the risk of flood damage,
d) buildings and portions of buildings used as a carport or garage,
e) non-residential accessory buildings, and
f) loading facilities used for water oriented industry.

2.2.9.2. Design Considerations on Designated Flood Plains

1) For buildings constructed on designated flood plains, the building designer shall comply with by-law requirements regarding construction materials and service equipment installations below flood construction level requirements, to the satisfaction of the Chief Building Official. (See Article 1.5.2.11. of Division C.)

2.2.9.3. Construction Considerations on Designated Flood Plains

1) For buildings constructed on designated flood plains, construction of the buildings to flood construction level requirements shall be achieved, to the satisfaction of the Chief Building Official, by
   a) the structural elevation of the floor system of the building
   b) the use of adequately compacted fill, or
   c) a combination of structural elevation and compacted fill.
2) No person shall install furnaces, electrical switchgear, electrical panels, fire protection systems or other fixed building services susceptible to flood damage, below the flood construction level, unless such services
are protected from flood damage and accessible for servicing during a flood, to the satisfaction of the Chief Building Official.
3) No person shall store hazardous or toxic substances below the flood construction level.
4) All piping, wiring and conduit penetrations shall be water stopped and sealed to prevent water seepage into the building.

2.2.9.4. Setback Requirements on Designated Flood Plains
1) Subject to the provisions of this By-law, no building, structural support or fill shall be constructed or located within
   a) 30 m of the natural boundary of the Fraser River,
   b) 15 m of the natural boundary of Burrard Inlet, English Bay or False Creek,
   c) 5 m of the natural boundary of Still Creek,
   d) 7.5 m of any structure erected for flood protection or seepage control, or
   e) in the case of a building, structural support, or fill located on a bluff in a designated flood plain,
   where the toe of the bluff is subject to erosion or is closer than 15 m from the natural boundary, a setback measuring 3.0 times the height of the bluff as measured from the toe to the crest of the bluff.

2.2.9.5. Increase of Flood Construction Level and Setback Requirements on Designated Flood Plains
1) The Chief Building Official may increase the flood construction level requirements or the setback requirements in this By-law if, in the opinion of the Chief Building Official, a higher flood construction level or a greater setback is necessary as the result of a site-specific geological or hydrological feature.

2.2.9.6. Relaxation of Flood Construction Level and Setback Requirements on Designated Flood Plains
1) The Chief Building Official may relax the flood construction level requirements in this By-law in accordance with Article 1.5.2.11., if
   a) the owner demonstrates to the satisfaction of the Chief Building Official, that, due to existing site characteristics and the location of existing infrastructure, it is impractical to meet the flood construction level requirements,
   b) the owner demonstrates to the satisfaction of the Chief Building Official, the proposed construction methods are designed to mitigate flood damage, and
   c) the owner provides a report, to the satisfaction of the Chief Building Official, stamped by a professional engineer, certifying that the habitable space in the building will be safe during a flood if a lower flood construction level is applied.

2) The Chief Building Official may relax the setback requirements in this By-law in accordance with Article 1.5.2.11., if
   a) the owner demonstrates to the satisfaction of the Chief Building Official, that, due to existing site characteristics and the location of existing infrastructure, it is impractical to meet the setback requirements,
   b) if considered necessary by the Chief Building Official, the owner agrees to construct erosion protection works to mitigate flood damage and erosion, and
   c) the owner provides a report, to the satisfaction of the Chief Building Official, stamped by a professional engineer, certifying that the habitable space in the building will be safe during a flood if a reduced setback requirement is applied.

Section 2.3. Alternative Solutions

2.3.1. Alternative Solutions
(See Note A-2.3.1.)
2.3.1.1. Application
1) For the purposes of Clause 1.2.1.1.(1)(b) of Division A, on written request by the owner of a building or an authorized agent of that owner, the Chief Building Official shall accept a measure as an alternate solution to an acceptable solution for the building if satisfied that
   a) the measure will achieve at least the level of performance required by Clause 1.2.1.1.(1)(b) of Division A, and
   b) the acceptable solution does not expressly require conformance to a provincial enactment other than the Building By-law.

2.3.1.2. Documentation
1) The Chief Building Official may require a person requesting the use of an alternative solution to provide documentation to demonstrate that the proposed alternative solution will achieve at least the level of performance required by Clause 1.2.1.1.(1)(b) of Division A.
2) The documentation referred to in Sentence (1) shall include
   a) a Code analysis outlining the analytical methods and rationales used to determine that a proposed alternative solution will achieve at least the level of performance required by Clause 1.2.1.1.(1)(b) of Division A, and
   b) information concerning any special maintenance or operational requirements, including any building component commissioning requirements, that are necessary for the alternative solution to achieve compliance with the By-law after the building is constructed.
3) The Code analysis referred to in Clause (2)(a) shall identify the applicable objectives, functional statements and acceptable solutions, and any assumptions, limiting or restricting factors, testing procedures, engineering studies or performance parameters that will support a Code compliance assessment.
4) The Code analysis referred to in Clause (2)(a) shall include information about the qualifications, experience and background of the person or persons taking responsibility for the design.
5) The information provided under Sentence (3) shall be in sufficient detail to convey the design intent and to support the validity, accuracy, relevance and precision of the Code analysis.
6) Where more than one person is responsible for the design of a building or facility that includes a proposed alternative solution, the person requesting the use of the alternative solution shall identify a single person to co-ordinate the preparation of the design, Code analysis and documentation referred to in this Article.

2.3.1.3 Alternative Solution Expiry
1) The Chief Building Official may rescind a request or application made pursuant to the requirements of this Subsection if in the opinion of the Chief Building Official
   a) there has been no substantial progress or activity by the owner of a building or an authorized agent of that owner to demonstrate that the level of performance specified by Clause 1.2.1.1.(1)(b) of Division A will be achieved,
   b) the work to install measures describe in the alternative solution although commenced is not continuously and actively carried out thereafter, or
   c) the work to install measures describe in the alternative solution has been substantially discontinued for a period of 6 months.

2.3.2 Additional Requirements for Fire and Life Safety Alternative Solutions
2.3.2.1. Design Criteria
1) Alternative solutions, as described in Article 2.3.1.2., shall be based upon an acceptable report sealed by an acceptable registered professional and provided to the Chief Building Official, which shall include
   a) a thorough description of the building,
   b) an analysis of the building that identifies all deviations from the requirements of this By-law,
c) the life safety principles considered in developing the proposed alternative solutions and their rationale, based upon NRC fire research reports and other approved agencies where applicable,
d) a proposal for alternative solutions,
e) an evaluation of the proposed alternative solutions based upon generally recognized studies,
f) evidence of reliable performance of the proposed alternative solutions,
g) a method of monitoring the design of the proposed alternative solutions, and
h) a commitment to perform field review of the proposed alternative solutions.

2) The report described in Sentence (1) shall be sufficiently detailed to permit evaluation of the proposed alternative solutions.

3) Upon acceptable of a proposed alternative solution by the Chief Building Official, the registered professional who has placed their seal on the report shall
   a) submit a letter to the Chief Building Official, assuring that the alternative solution, as installed, will perform as represented in the report, and
   b) at the request of the Chief Building Official, submit an acceptable field commissioning and testing report.

2.3.3. Alternative Solution Review Panel

2.3.3.1. Request for Review by Alternative Solution Review Panel

1) An applicant may apply to the Chief Building Official to request the appointment of an alternative review panel to review an alternative solution application.

2) An applicant who requests the appointment of an alternative review panel must pay the fees set out in the Fee Schedule.

3) At the request of the applicant, the Chief Building Official may appoint an alternative solution review panel of up to three experts to review the alternative solution application, to hear from the applicant and City staff and to advise the applicant and the Chief Building Official regarding the proposed solution.

4) A decision of an alternative solution review panel is not binding on the Chief Building Official.
CONFIRMATION OF COMMITMENT BY OWNER
AND COORDINATING REGISTERED PROFESSIONAL

To: The Chief Building Official

Re: 

Name of Project (PMW)

Address of Project (PMW)

The undersigned has retained _____________________________ as a coordinating registered professional to coordinate the design work and field reviews of the registered professional(s) of record required for this project. The coordinating registered professional shall coordinate the design work and field reviews of the registered professional(s) of record required for the project in order to ascertain that the design will substantially comply with the Building By-law and other applicable enactments respecting safety and that the construction of the project will substantially comply with the Building By-law and other applicable enactments respecting safety, not including the construction safety aspects.

“field reviews” are defined in the Building By-law to mean those reviews of the work

(a) at a project site of a development to which a building permit relates, and

(b) where applicable, at fabrication locations where building components are fabricated for use at the project site

that a registered professional in his or her professional discretion considers necessary to ascertain whether the work substantially complies in all material respects with the plans and supporting documents prepared by the registered professional of record for which the building permit is issued.

The owner and the coordinating registered professional have read Subsection 2.2.7, Division C of the Building By-law. The owner and the coordinating registered professional each acknowledge their responsibility to notify the Chief Building Official of the date the coordinating registered professional ceases to be retained by the owner before the date the coordinating registered professional ceases to be retained or, if that is not possible, then as soon as possible. The coordinating registered professional acknowledges the responsibility to notify the Chief Building Official of the date a registered professional of record ceases to be retained before the date the registered professional of record ceases to be retained or, if that is not possible, then as soon as possible.

1 it is the responsibility of the coordinating registered professional to ascertain which registered professionals are required, and to initial each Schedule B prior to submission to the Chief Building Official.
BUILDING BY-LAW 2019 – CITY OF VANCOUVER

SCHEDULE A - continued

The owner and the coordinating registered professional understand that where the coordinating registered professional or a registered professional of record ceases to be retained at any time during construction, work on the above project will cease until such time as:

(a) a new coordinating registered professional or registered professional of record, as the case may be, is retained, and
(b) a new letter in the form set out in Schedule A or in the forms set out in Schedules B, as the case may be, is filed with the Chief Building Official.

The undersigned coordinating registered professional certifies that he or she is a registered professional as defined in the Building By-law, and agrees to coordinate the design work and field reviews of the registered professionals of record required for the project as outlined in the attached Schedules B including coordination and integration of functional testing of fire protection and life safety systems. (See A-22.7.3 in Appendix A.)

Coordinating Registered Professional

Name (Print):

Address (Print):

Phone No. and Email address:

Owner

Name (Print):

Address (Print):

Name of Agent or Signing Officer if applicable (Print):

Date

Owners or Owner’s appointed agent’s Signature.

(if owner is a corporation the signature of a signing officer must be given here. If the signature is that of the agent, a copy of the document that appoints the agent must be attached.)

(If the Coordinating Registered Professional is a member of a firm, complete the following.)

I am a member of the firm,

and I sign this letter on behalf of the firm.

(Print name of firm)

This letter must be signed by the owner or the owner’s appointed agent and by the coordinating registered professional. An agent’s letter of appointment must be attached. If the owner is a corporation, the letter must be signed by a signing officer of the corporation and the signing officer must set forth his or her position in the corporation.

The Building By-law defines a registered professional to mean:

(a) a person who is registered or licensed to practise as an architect under the Architects Act, or
(b) a person who is registered or licensed to practise as a professional engineer under the Engineers and Geoscientists Act.
SCHEDULE B

ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEW

Notes:
1) This letter must be submitted prior to the commencement of construction activities of the components identified below. A separate letter must be submitted by each registered professional of record.
2) This letter is endorsed by: Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.
3) In this letter the words in italics have the same meaning as in the Building By-law.

To: The Chief Building Official

Re: ____________________________

Name of Project (Print):

Address of Project (Print):

The undersigned hereby gives assurance that the design of the
(components of the plans and supporting documents prepared by this registered professional in support of the application for the building permit as outlined below substantially comply with the Building By-law and other applicable enactments respecting safety except for construction safety aspects.

The undersigned hereby undertakes to be responsible for field reviews of the above referenced components during construction as indicated on the "SUMMARY OF DESIGN AND FIELD REVIEW REQUIREMENTS" below.

__________________________

CRP’s Initials

1 of 4
The undersigned also undertakes to notify the Chief Building Official in writing as soon as possible if the undersigned’s contract for field review is terminated at any time during construction.
I certify that I am a registered professional as defined in the Building By-law.

Coordinating Registered Professional

Coordinating Registered Professional’s Name (Print):

Address (Print):

Phone No. and Email address:

(if the Coordinating Registered Professional is a member of a firm, complete the following.)

I am a member of the firm ________________________

and I sign this letter on behalf of the firm ________________________ (Print name of firm)

Note: This letter must be signed by the owner or the owner’s appointed agent and by the coordinating registered professional. An agent’s letter of appointment must be attached. If the owner is a corporation, the letter must be signed by a signing officer of the corporation and the signing officer must set forth his or her position in the corporation.
The Building By-law defines a registered professional to mean

(a) a person who is registered or licensed to practise as an architect under the Architects Act, or
(b) a person who is registered or licensed to practise as a professional engineer under the Engineers and Geoscientists Act.

### Division C: Administrative Provisions

**Part 2 – Administrative Provisions**

---

**SCHEDULE B - continued**

**SUMMARY OF DESIGN AND FIELD REVIEW REQUIREMENTS**

(Initials applicable discipline below and cross out and initial only those items not applicable to the project.)

#### ARCHITECTURAL

1. Fire resisting assemblies
2. Fire separations and their continuity
3. Glares, including tightness and operation
4. Egress systems, including access to egress within suites and floor areas
5. Performance and physical safety features (guardrails, handrails, etc.)
6. Structural capacity of architectural components, including anchorage and seismic restraint
7. Sound control
8. Landscaping, screening and site grading
9. Provisions for firefighting access
10. Access requirements for persons with disabilities
11. Elevating devices
12. Functional testing of architecturally related fire emergency systems and devices
13. Development Permit and conditions therein
14. Interior signage, including acceptable materials, dimensions and locations
15. Review of all applicable shop drawings
16. Interior and exterior finishes
17. Tankproofing and/or waterproofing of walls and slabs below grade
18. Roofing and flashings
19. Wall cladding systems
20. Condensation control and cavity ventilation
21. Exterior glazing
22. Integration of building envelope components
23. Environmental separation requirements (Part 5)
24. Building envelope, Part 10 requirements (ASHRAE, NECD, ZEBP, etc.)

#### STRUCTURAL

2.1 Structural capacity of structural components of the building, including anchorage and seismic restraint
2.2 Structural aspects of deep foundations
2.3 Review of all applicable shop drawings
2.4 Structural aspects of unbonded post-tensioned concrete design and construction

#### MECHANICAL

2.1 HVAC systems and devices, including high building requirements where applicable
2.2 Fire dampers at required fire separations
2.3 Continuity of fire separations at HVAC penetrations
2.4 Functional testing of mechanically related fire emergency systems and devices
2.5 Maintenance manuals for mechanical systems
2.6 Structural capacity of mechanical components, including anchorage and seismic restraint
2.7 Review of all applicable shop drawings
2.8 Mechanical systems, Part 10 requirements (ASHRAE, NECD, ZEBP, etc.)

---

**GRP’s Initial**

SCHEDULE C-A

ASSURANCE OF COORDINATION OF PROFESSIONAL FIELD REVIEW

Notes:
1. This letter must be submitted after completion of the project but before the occupancy permit is issued or a final inspection is made, by the Chief Building Official.
2. This letter is endorsed by: Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.
3. In this letter the words in italics have the same meaning as in the building by-law.

To: The Chief Building Official

Name of Jurisdiction (Print)

Re:

Name of Project (Print)

Address of Project (Print)

(The coordinating registered professional shall complete the following)

Name (Print)

Address (Print)

Phone No. and Email Address (Print)

I hereby give assurance that

a) I have fulfilled my obligations for coordination of field reviews of the registered professionals of record required for the project as outlined in Subsection 2.2.7, Division C of the Building By-law and in the previously submitted Schedule A, “CONFIRMATION OF COMMITMENT BY OWNER AND BY COORDINATING REGISTERED PROFESSIONAL.”

b) I have coordinated the functional testing of the fire protection and life safety systems to ascertain that they substantially comply in all material respects with
 i) the applicable requirements of the Building By-law and other applicable enactments respecting safety, not including construction safety aspects, and
 ii) the plans and supporting documents submitted in support of the application for the building permit;

c) I am a registered professional as defined in the Building By-law.

If the registered professional is a member of a firm, complete the following:

I am a member of the firm (Print name of firm)

Note: The above letter must be signed by a coordinating registered professional, who is also a registered professional. The Building By-law defines a registered professional to mean

a) a person who is registered or licensed to practise as an architect under the Architects Act, or

b) a person who is registered or licensed to practise as a professional engineer under the Engineers and Geoscientists Act.
ASSURANCE OF PROFESSIONAL FIELD REVIEW
AND COMPLIANCE

Notes:

i) This letter must be submitted after completion of the project but prior to final inspection by the Chief Building Official. A separate letter must be submitted by each registered professional of record.

ii) This letter is endorsed by Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.

iii) In this letter the words in italics have the same meaning as in the Building By-law.

To: The Chief Building Official

Name of Jurisdiction (Print):

Re:

BUILDING BY-LAW 2019 – CITY OF VANCOUVER

SCHEDULE C-D

COMPLETION OF BUILDING ENVELOPE PROFESSIONAL REVIEW

Notes:
I) This letter must be submitted after the completion of the project at final inspection.
II) This letter is endorsed by: Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.
III) In this letter the words in italics have the same meaning as in the Building By-law.

To: The Chief Building Official

Name of Registered Professional signing for ‘Architectural’ Items of Schedule B letters (Print):

Address of Project (Print):

City

Postal Code

Telephone (Print): Email

Name (Print): Address of (Print):

The undersigned Building Envelope Professional has been retained with respect to the above referenced project, and gives a commitment of responsibility for Building Envelope Professional design review and enhanced field review for components and assemblies as required in Article 5.1.2.2. In Part 5 of Division B, of the Building By-law, and as the Building Envelope Professional in their professional discretion considers to be necessary, for the project designed by:

Name of registered professional signing for ‘Architectural’ items of Schedule B letters (Print)

who is providing the Chief Building Official with Schedule B ‘ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEW’ letter covering ‘Architectural’ items. The undersigned will sign and provide copies of all reports to the registered professional responsible for Architectural items, and copies of these reports shall also be available on site, for review by the City of Vancouver District Building Inspector. The undersigned undertakes to notify the Chief Building Official in writing as soon as practical if their contract is terminated at any time.

(Name of Firm)

If the Building Envelope Professional is a member of a firm, complete the following.

I am a member of the firm; ____________________________ and I sign this letter on behalf of the firm.

NOTE: The above letter must be signed by a Building Envelope Professional. The Building By-Law defines a Building Envelope Professional to mean a person who is a member of the Architectural Institute of British Columbia or the Association of Professional Engineers and Geoscientists of British Columbia.

1 of 1
COMMITMENT FOR BUILDING ENVELOPE PROFESSIONAL REVIEW

Notes:
I) This letter must be submitted before issuance of a building permit.
II) This letter is endorsed by: Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.
III) The words in italics have the same meaning as in the Building By-law.

To: The Chief Building Official

Address of Project (Print):

The undersigned Building Envelope Professional has been retained with respect to the above referenced project, and gives a commitment of responsibility for Building Envelope Professional design review and enhanced field review for components and assemblies as required in Article 5.1.2.2. In Part 5 of Division B, of the Building By-law, and as the Building Envelope Professional in their professional discretion considers to be necessary, for the project designed by:

Name of registered professional signing for "Architectural" items of Schedule B letters (Print):

who is providing the Chief Building Official with Schedule B 'ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEW' letter covering 'Architectural' items. The undersigned will sign and provide copies of all reports to the registered professional responsible for Architectural items, and copies of these reports shall also be available on site, for review by the City of Vancouver District Building Inspector. The undersigned undertakes to notify the Chief Building Official in writing as soon as practical if their contract is terminated at any time.

Address of (Print):

City   Postal Code:

Telephone (Print):

Email:

(if the Building Envelope Professional is a member of a firm, complete the following.)

I am a member of the firm; _______ _______ and I sign this letter on behalf of the firm.

(Print Name of Firm)

NOTE: The above letter must be signed by a Building Envelope Professional. The Building By-Law defines a Building Envelope Professional to mean a person who is a member of the Architectural Institute of British Columbia or the Association of Professional Engineers and Geoscientists of British Columbia.
Notes to Part 2 Administrative Provisions

A-2.2.1.2.(1) Structural Design. Part 4 of Division B is written on the assumption that structural design will be carried out by a registered professional who is qualified to perform such design. Sentence 2.2.1.2.(1) is not intended to imply that a registered professional may not also be required in the application of requirements in other Parts of the Building By-law.

A-2.2.6.2.(1) Information Required on Drawings and Specifications. Examples of information that should be shown on architectural drawings and drawings for heating, ventilating and air-conditioning systems are:

(a) the name, type and location of the building,
(b) the name of the owner,
(c) the name of the architect,
(d) the name of the engineer or designer,
(e) the north point,
(f) the dimensions and height of all rooms,
(g) the intended use of all rooms,
(h) the details or description of the wall, roof, ceiling and floor construction, including insulation,
(i) the details or description of the windows and outside doors, including the size, weatherstripping, storm sashes, sills and storm doors,
(j) the size and continuity of all pipes, ducts, shafts, flues and fire dampers,
(k) the location, size, capacity and type of all principal units of equipment,
(l) the size, shape and height of all chimneys and gas vents,
(m) the size and location of all combustion air and ventilation openings, and
(n) the location and fire-resistance rating of required fire separations.

A-2.2.7. Professional Design and Review. This Subsection provides for the use of what are generally called Letters of Assurance. The letters themselves, known as Schedules A, B, C-A and C-B and located at the end of Division C, are intended to put on paper the responsibilities of the owner and the various registered professionals in a construction project. The Letters of Assurance do not impose any additional responsibilities on the registered professionals nor are they intended to alter the roles and responsibilities of the authorities having jurisdiction.

The Schedules have been very carefully scrutinized by the City of Vancouver, Province of British Columbia, Union of BC Municipalities, Building Officials’ Association of British Columbia, Architectural Institute of British Columbia, Engineers & Geoscientists British Columbia and their respective legal counsel. The precise wording in the letters is extremely critical and must not be modified. Any notations on these Schedules which are absolutely necessary to suit a particular project must be clearly and legibly marked in ink on the copies.

It is typical that the registered professional responsible for the design is also responsible for the field review. There are instances where this is not the case and having a different registered professional doing the field reviews is unavoidable. Schedule C-B requires that the registered professional who provides the field review provide assurance that the building as finally constructed is in substantial conformance with the By-law. In the event that another registered professional is to provide field review, the field reviewer takes on the responsibility to confirm that the construction substantially complies with the plans and supporting documents that were submitted for the building permit. The responsibility for code compliance of the design remains with the original registered professional who undertook the design. In this event, the Schedule C-B must be modified by the field reviewer by crossing out and initialing Clause (b)(i) and providing the effective transition date.

Note that Schedules A, B, C-A & C-B, as required by Subsection 2.2.7., must be signed, sealed and submitted to the Chief Building Official, as applicable for each specific project. Conditional or qualified Schedules are not typically acceptable. Any fire and life safety issue relative to the Schedule B disciplines is to be remedied before the
Schedules C-A / C-B are released, not accommodated by conditions or qualifications placed on the Schedule or by any attached document. See the Guide to Letters of Assurance, available from the Building and Safety Standards Branch Web site, for more details.

A-2.2.7.1.(1)(c)(i) Structural Components. The reference to “structural components of buildings that fall within the scope of Part 4” includes the situation where a building is classified under Part 9 due to its size and occupancy but also contains some structural components (such as beams supporting concentrated loads) which must be designed under Part 4. In this situation only Schedules B and C-B for the structural components are required. Schedule A and Schedules B, C-A and C-B relating to non-structural components are not required.

A-2.2.7.2.(1)(a) Coordinating Registered Professional. The coordinating registered professional is responsible to ascertain that all Code related aspects which are relevant to the project are clearly identified by each of the registered professionals in the collection of Schedules B. If a registered professional of record has crossed out any item on their Schedule B, the coordinating registered professional must confirm this item is not applicable to the project or resolve the issue with the registered professional of record.

A-2.2.7.2.(1)(b) Schedule B. The purpose of Schedule B is to clearly identify the appropriate registered professional of record who has the overall responsibility in each discipline for compliance with the various By-law related aspects of the project. Detailed design of certain building components may be undertaken by other registered professionals. The registered professional of record is responsible for monitoring the design work and field review of the other registered professionals within their discipline for components listed in Schedule B. In the event that the other registered professionals provide design and field review, the registered professional of record must be satisfied that such design and field reviews have been performed and is responsible for Schedule C-B.

A-2.2.7.2.(1)(c) Shoring Works in Street or Lane Where shoring works are proposed to be left in the street and/or lane permanently, an application for the proposal should be made by the owner to the City Engineer. Where the City Engineer is satisfied as to the safety and advisability of the proposal, the City Engineer may approve the basis on which the shoring works may be allowed to remain.

A-2.2.7.2.(2) Schedule C-A. Schedule C-A provides confirmation that the coordinating registered professional has completed the obligation to coordinate the various registered professionals engaged in the project. It also confirms that the testing of the interrelated fire and life safety systems, such as fire alarms and sprinklers, has been completed and the systems function as intended.

A-2.2.7.3. Demonstration of the Coordinated Fire and Life Safety Systems. The design drawings and supporting documents must clearly indicate all essential details of the Coordinated Fire and Life Safety Systems prior to the construction or the alteration to a building. Demonstration of the proper, integrated operation of the Fire and Life Safety Systems must be conducted prior to occupancy.

Note that Schedules A, B, C-A & C-B, as required by Subsection 2.2.7., must be signed and sealed and submitted to the Chief Building Official, as appropriate for each specific project.

The following is an example of the steps required to coordinate the installation and testing of fire and life safety systems in buildings.

1.0. General

Referencing Schedule B:
- Item No. 1.14 "Functional Testing of Architecturally Related Fire Emergency Systems and Devices,"
- Item No. 3.4 "Functional Testing of Mechanically Related Fire Emergency Systems and Devices,"
- Item No. 4.5 "Functional Testing of Plumbing Related Fire Emergency Systems and Devices,"

Vancouver Building Bylaw 2019 Division C 2-20
Item No. 5.14 "Functional Testing of Fire Suppression Systems and Devices," and
Item No. 6.3 "Functional Testing of Electrical Related Fire Emergency Systems and Devices."
The Coordinating Registered Professional (CRP) and Registered Professionals of Record (RPRs) must
demonstrate that the Fire and Life Safety Systems' design has been coordinated prior to the issuance of the
Building Permit. That is, the CRP/RPRs must accumulate and submit the necessary documentation, such as:
• complete drawings,
• schedules,
• schematic diagrams,
• a fire alarm system sequencing description showing coordination between mechanical and electrical fire
  protection and life safety systems,
• mechanical fire protection and life safety schematic riser diagrams,
• an electrical fire alarm riser diagram,
• a motor data list coordinated with fire alarm system sequencing, and
• other documentation, as appropriate,
to demonstrate that the interface of the Fire and Life Safety Systems has been designed and coordinated so
that when built correctly they will function as an integrated system. Further, it is intended that when the
construction of the Fire & Life Safety Systems is indicated by the Contractor to be complete, the RPRs/CRP
witness the demonstration of the testing of the Fire and Life Safety Systems to confirm compliance that the
as-built systems function as intended by the design.

The required list of items will depend on the simplicity or complexity of the Project. The following is a
comprehensive list of items for Fire and Life Safety Systems for a complex project, which must be
coordinated in order to demonstrate compliance:

Notes: It is the responsibility of the Coordinating Registered Professional (CRP) and Registered
Professionals of Record (RPRs) to determine the best method of "How To" demonstrate to the Chief
Building Official (CBO) that the Fire and Life Safety Systems have been coordinated for each project. That
is, the method(s) used (i.e., charts, drawings, matrices, tables, etc.) for demonstration purposes should be
project-specific and relate only to that project.

It is not the intent of this Appendix material to dictate or produce "checklists" or other prescriptive methods
for demonstrating compliance since this is best left to the professional discretion of the appropriate
CRP/RPRs.

2.0. Design Phase — Building Permit Application Stage & Final Construction Phase — Occupancy
Permit Application Stage

2.1. Fire Protection and Life Safety Systems

2.1.1. Automatic Sprinkler Systems
• design requirements to appropriate Standard

2.1.2. Standpipe Systems
• design requirements to appropriate Standard
• Class I/Class II
• locations
• coverage
• F.D. connections

2.1.3. Fire Pump Systems
• design requirements to appropriate Standard

2.1.4. Fire Alarm Systems
• one/two stage system(s)
• no. of systems
• design requirements to appropriate Standard
• sequence of operation
• F.A. system zoning
• location of F.A. system devices
• annunciator panel (location and design criteria)
• annunciator panel shop drawings (detail design)
• sprinkler zone/waterflow device
• smoke detectors
• smoke alarms
• manual pull stations
• signals to Fire Department via an acceptable central monitoring station
• activation of ancillary devices

2.1.6. Emergency Telephone System
• each exit stair

2.1.7. Emergency Power
• design requirements to appropriate Standard
• supervisory provisions for fire alarm
• emergency electrical load
• emergency generator

2.1.8. Emergency Lighting
• exits
• access to exits
• public corridors
• other floor areas

2.1.9. Exit Signs

2.2. Additional Requirements for High Buildings

2.2.1. Interface Condition between Highrise and Lowrise Components (Measure ‘N’ Vestibules)

2.2.2. Smoke Control — Measure A
• design requirements to appropriate Standard
• venting above-grade stairs
• separation of above-grade and below-grade stairs
• venting below-grade stairs
• pressurization of below-grade stairs at bottom
• above-grade elevator shaft serving below-grade protected with a "protected" vestibule
• additional controls at CACF (annunciator panel shop drawings)

2.2.3. Smoke Venting

2.2.4. Fire Fighters’ Elevators
2.2.5. Protection of Emergency Electrical Conductors
- highrise elevator
- emergency generator(s)
- fire pump(s)
- smoke control systems
- smoke venting systems
- fire alarm and emergency voice communication systems

2.2.6. Emergency Voice Communications
- integrated with F.A. system
- audible to appropriate Standard
- zoning of speakers

3.0. Roles and Responsibilities for the Demonstration of the Coordinated Fire and Life Safety Systems

3.1.1. Design Phase
RPRs will clearly indicate on their drawings and supporting documents the details of the fire and life safety systems for each applicable item of Section 2 for their particular discipline. RPRs will also coordinate the design of the components in their system with the designs of other RPRs on the project. RPRs are to indicate what functional testing, system verification, etc., must be performed by the Contractor or subtrades and establish the documentation to be provided.
The CRP will develop the project-specific test protocol and procedures in consultation with the RPRs. The CRP will act as the facilitator for the coordination of the design of the fire and life safety systems among the various RPRs.

3.1.2. Construction Phase
The Contractor will coordinate the activities of the subtrade contractors for the installation of the fire and life safety systems in accordance with the contract documents.
RPRs will provide field reviews to ascertain that the construction of the fire and life safety systems substantially complies with their design.
RPRs will review shop drawings of the fire and life safety systems to determine that they accurately reflect their design intent. They will also coordinate their reviews with those of the other RPRs on the project.
The CRP will coordinate the shop drawing reviews and field reviews by the RPs with the objective that the entire fire and life safety system will correctly operate as an integrated system.

3.1.3. Occupancy Phase
The Contractor will coordinate the subtrade contractors for the commissioning and functional testing of the fire and life safety systems. The Contractor will also collect all of the required Occupancy Permit submission documents from the various subtrade contractors and forward them to the CRP.
The CRP will take the lead role in coordinating the activities of the RPRs required for the commissioning and functional testing of the fire and life safety systems. The CRP will distribute the test protocol and test procedures, as developed in the Design Stage, to the various parties involved in the process.
RPRs will ascertain that the appropriate commissioning and functional testing of the fire and life safety systems of the components in their disciplines have been satisfactorily completed by the subtrade...
contractors. They will also determine that the appropriate Occupancy Permit submission documents have been submitted and filled in correctly. The CRP will be responsible for collecting all of the required Occupancy Permit submission documents, reviewing them for completeness and accuracy, and forwarding them to the CBO in a complete package at least 24 hours prior to the Coordinated Final CBO Review.

3.2. Sample Summary of Roles and Responsibilities for Demonstration of the Coordinated Fire and Life Safety Systems

The following is a sample summary (only) of the roles and responsibilities for a typical highrise building with underground parking. The precise roles and responsibilities for each project will vary depending on the complexity. The CRP will ascertain that the appropriate roles and responsibilities for each project are fulfilled by the RPRs.

3.2.1. Coordinating Registered Professional

Design Phase
- Determine the appropriate RPRs required for the project and make arrangements with the owner for their services.
- Clarify the roles and responsibilities of the various RPRs.
- Coordinate the design of the fire and life safety systems by the RPRs.
- Coordinate and develop the test protocol and procedures for functional testing of the fire and life safety systems.
- Coordinate the submission of the design drawings and supporting documents for the Building Permit application.

Construction Phase
- Coordinate and monitor the field reviews of the RPRs.
- Coordinate and monitor the review of shop drawings by the RPRs.
- Facilitate the information flow among the RPRs and Contractor.

Occupancy Phase
- In conjunction with the RPRs, finalize the project-specific test protocol and procedures for the fire and life safety systems, and review the requirements with the Contractor, subtrades and RPRs.
- Finalize the list of project-specific occupancy permit submission documents and the schedule for submissions and confirm completeness with CBO.
- Organize the "Coordinated Final Consultant Review" at least one week prior to "Coordinated CBO Final Review."
- Take a lead role in coordinating the functional testing of the fire and life safety systems during the "Coordinated Final Consultant Review."
- Coordinate the RPRs' review of Occupancy Permit submission documents for completeness and accuracy.
- Coordinate Certification of Equivalencies, if applicable.
- Collect all of the required Occupancy Permit submission documents and submit them in a complete package to the CBO.
- Organize the "Coordinated CBO Final Review."
- Record any deficiencies identified at the "Coordinated CBO Final Review" and monitor RPRs' field review of the corrective actions by the subtrades.
- Assist in finalizing the list of outstanding requirements which need to be met for the issuance of the Occupancy Permit.
- Follow-up on minor deficiencies post-Occupancy.
3.2.2. Architectural Design Phase
- Establish the conceptual design for the fire and life safety systems in consultation with RPRs.
- Determine equivalency reports required and coordinate the implementation on the drawings and supporting documents.
- Clearly indicate on drawings and supporting documents:
  - Major occupancies and code classifications.
  - Fire separations and fire-resistance ratings.
- Closures:
  - Fire-protection rating
  - Temperature rise requirements
  - Amount of glazing
- Hardware for closures
  - Panic hardware
  - Hold-open devices
  - Electromagnetic locks
- Egress systems.
- Provisions for fire fighting access.
- Interior and exterior finishes.
- Elevating devices c/w integrated controls to the fire alarm panel.
- Signage coordinated with fire alarm system and annunciation.

Construction Phase
- Provide field reviews of architectural components.
- Review shop drawings for architectural components and coordinate requirements with other RPRs.
- Review shop drawings for other disciplines which may influence architectural components.

Occupancy Phase
- Ascertain that the architectural components substantially conform to the architectural drawings and supporting documents.
- Perform an active role in witnessing the functional testing of the architectural components of the fire and life safety systems.
- Coordinate the signage with the fire alarm annunciator and the fire safety plans.
- Review the architecturally-related Occupancy Permit submission documents provided by the Contractor and subtrades for completeness and accuracy.
- Prepare and forward to the CRP the architectural Schedule C-B and other assurance letters required for the Occupancy Permit.

3.2.3. Mechanical/Plumbing Design Phase
- Coordinate mechanical/plumbing clearances and functional requirements with other RPRs.
- Clearly indicate on drawings and supporting documents:
  - Details of the mechanical/plumbing components of the fire and life safety systems.
  - Schematic diagram of the smoke venting system showing all fans, ducts, motorized dampers, fusible link dampers and backdraft dampers.
  - Location and fire-protection ratings of fusible link fire dampers and fire stop flaps.
  - Location and fire-protection ratings of motorized fire dampers.
  - Location and fire-resistance ratings of fire-rated duct enclosures.
  - Fire stop systems for mechanical/plumbing penetrations of fire separations.
  - Kitchen exhaust system/suppression system.
- Mechanical fans/motorized dampers sequence of operations:
  - Describe operation under normal mode
- Describe operation under fire alarm mode
- Indicate fire alarm initiation devices that activate change of operation

Construction Phase
- Provide field reviews of mechanical/plumbing components.
- Review shop drawings for mechanical/plumbing components and coordinate requirements with other RPRs.
- Review shop drawings for other disciplines which may influence mechanical/plumbing components.

Occupancy Phase
- Ascertain that the mechanical/plumbing components substantially conform to the mechanical/plumbing drawings and supporting documents.
- Perform an active role in witnessing the functional testing of the mechanical/plumbing components of the fire and life safety systems.
- Review the mechanical/plumbing related occupancy permit submission documents provided by the Contractor and subtrades for completeness and accuracy.
- Prepare and forward to the CRP the mechanical/plumbing Schedule C-B and other assurance letters and documentation required for the Occupancy Permit.

3.2.4. Fire Suppression
The design of sprinkler systems can be accomplished by at least two possible scenarios:

Scenario 1
- The engineer of record undertakes the complete detailed design prior to the building permit application.
- The engineer of record submits Schedule B with the BP application.
- The engineer of record provides field reviews during construction and submits a Schedule C-B prior to Occupancy Permit.

Scenario 2 (where acceptable to the Chief Building Official)
- The engineer of record provides a detailed performance specification for the sprinkler design, as well as sufficient drawings to demonstrate/assure layout feasibility and interface with other components.
- The engineer of record submits Schedule B with the BP application for overall coordination of the sprinkler design. Schedule B can be annotated "For Performance Specification Only."
- The performance specifications may include a requirement that a separate sprinkler design engineer be responsible for detailed sprinkler design, preparation of sprinkler shop drawings and hydraulic calculations, letter of assurance Schedule B, (for field review during construction), and Schedule C-B (for Detailed Design) prior to Occupancy Permit.
- The engineer of record reviews the detailed sprinkler design and shop drawings to ascertain that they substantially comply with the performance specifications.
- The engineer of record provides a Schedule C-B prior to Occupancy Permit to confirm overall coordination of the sprinkler design and installation. Schedule C-B can be annotated "For Performance Specification Only." The engineer of record is entitled to rely upon the professional seal of the sprinkler design engineer for the detailed design and field review of the sprinkler system.

For purposes of this example, Scenario 2 Roles and Responsibilities are outlined below:

Design Phase by Engineer of Record
- Coordinate fire suppression spatial and functional requirements with other RPRs/CRP.
- Clearly indicate on the drawings and performance specification:
  - Fundamental design parameters for the fire suppression system to appropriate Standard.
  - Location of fire department siamese hose connections.
  - Location and size of standpipes and hose connections.
• Details of special sprinkler protection as per equivalent reports.
• Fire stop systems for pipe penetrations of fire separations.
• Zoning of the sprinkler system to be coordinated with the electrical engineer for the fire alarm
  annunciation and clearly identified in the performance specifications.

**Construction Phase by Sprinkler Design Engineer**

• Prepare, sign and seal shop drawings and hydraulic calculations, clearly indicating:
  • Details of the fire suppression components of the fire and life safety systems.
  • Schematic riser diagram of sprinkler and standpipe systems c/w all devices that will be
    connected to the fire alarm system (flow switches, tamper switches, pressure switches, freeze
    monitoring, heat trace monitoring).
  • Location of fire department siamese hose connections.
  • Location and size of standpipes and hose connections.
  • Details of special sprinkler protection as per equivalent reports.
  • Zoning of the sprinkler system to be coordinated with the electrical engineer for the fire alarm
    annunciation and clearly identified in the sprinkler shop drawings.
  • Coordinate fire suppression location and functional requirements with engineer of record/CRP.
  • Provide field reviews of fire suppression components.

**Construction Phase by Engineer of Record**

• Review shop drawings and hydraulic calculations for fire suppression components to determine
  substantial conformance to the performance specifications.
• Provide field reviews of fire suppression components to determine substantial conformance to the
  performance specifications.
• Monitor the field reviews by the Sprinkler Design Engineer to determine substantial conformance with the
  performance specifications.
• Review shop drawings for other disciplines which may influence fire suppression components.

**Occupancy Phase by the Engineer of Record**

• Ascertain that the fire suppression components substantially conform to the performance specifications.
• Perform an active role in witnessing the functional testing of the fire suppression components of the fire
  and life safety systems.
• Review the fire suppression-related Occupancy Permit submission documents by the Contractor and
  subtrades for completeness and accuracy.
• Collect the Schedule C-B from the Sprinkler Design Engineer, review for accuracy and completeness and
  forward to the CRP.
• Collect other Occupancy Permit documents from the subtrade contractor (e.g., Contractor’s Material and
  Test Certificates), review for completeness and forward to the CRP.
• Prepare and forward to the CRP the fire suppression Schedule C-B for overall coordination of the fire
  suppression system.

**Occupancy Phase by the Sprinkler Design Engineer**

• Ascertain that the fire suppression components substantially conform to the sprinkler shop drawings and
  supporting documents.
• Perform an active role in witnessing the functional testing of the fire suppression components of the fire
  and life safety systems.
• Review the fire suppression-related Occupancy Permit submission documents by the Contractor and
  subtrades for completeness and accuracy.
• Prepare and forward to the Engineer of Record the fire suppression Schedule C-B and other assurance
  letters and documentation required for the Occupancy Permit.
3.2.5. Electrical

Design Phase

- Coordinate with the CRP and RPRs the test protocol and procedures for functional testing of the fire and life safety systems.
- Details of the electrical components of the fire and life safety systems.
- Clearly indicate on drawings and supporting documents:
  - Fire Alarm System
    - Location of fire alarm annunciator panel and central alarm control facility
    - Location of fire alarm initiating devices (smoke detectors, heat detectors, manual pull stations)
    - Fire alarm riser diagram c/w ancillary device connections
    - Audibility of fire alarm signal throughout floor area
    - Zoning of fire alarm initiation devices and audible signal appliances
    - Monitoring of fire alarm
    - Routing and method of protection of emergency conductors
    - Wiring methods for equipment
    - Testing/verification requirements and the documentation to be submitted to the RPR
  - Sprinkler System
    - Coordinate design with sprinkler design engineer
    - Sprinkler system alarm initiation and monitoring to be indicated on the fire alarm riser diagram (flow, tamper, pressure, etc.)
    - Detailed diagrams for freeze protection systems (heat trace monitoring, low temperature monitoring, etc.)
  - Fire Pump Systems
    - Riser diagram to indicate monitoring of the fire pump (pump running, power failure, phase reversal, wiring details for device connections)
    - Routing and method for protection of fire pump feeders from fire and power source, so that a fire from one source will not interrupt power from the other source
    - Electrical requirements to appropriate Standard and documents to be submitted to RPR (overcurrent protection details, location of controller and transfer switches, voltage drop, etc.)
  - Kitchen Exhaust/Fire Suppression System
  - Emergency Generator
    - Generator load calculations
    - Details and wiring diagram for monitoring through the fire alarm system
    - Details for testing to appropriate Standard and documents to be submitted to RPR
  - Smoke Venting Systems
    - Coordinate design with the mechanical engineer
    - Fire alarm riser diagram to indicate smoke venting fans and motorized dampers and HVAC/exhaust fan shutdown
    - Detailed wiring diagrams for fan shut-offs, exhaust fan operation, pressurization fan operation, damper operation (opening, closing, throttling)
    - Sequence of operation of smoke venting system in a narrative form
    - Describe operation under normal mode
    - Describe operation under fire alarm mode
    - Indicate fire alarm initiating devices that activate changes of operation/sequence
    - Routing methods for protection of emergency conductors
  - Electromagnetic Locks and Hold-Open Devices
    - Coordinate design with the architect
    - Sequence of operation in both normal and fire alarm mode
Division C: Administrative Provisions

Part 2 – Administrative Provisions

Wiring diagrams for connection of devices
Locations of devices on the floor plans

Elevators
Sequence of operation in a narrative form
Wiring diagram details
Routing and method of protection of emergency conductors
Fire stop systems for electrical penetrations of fire separations
Coordinate electrical equipment location and functional requirements with other RPRs/CRP.

Construction Phase
- Provide field reviews of electrical components.
- Review shop drawings for electrical components and coordinate requirements with other RPRs.
- Review shop drawings for other disciplines which may influence electrical components.

Occupancy Phase
- Ascertaining that the electrical components substantially conform to the electrical drawings and supporting documents.
- Perform an active role in witnessing the functional testing of the electrical components of the fire and life safety systems.
- Review the electrical-related Occupancy Permit submission documents provided by the Contractor and subtrades for completeness and accuracy.
- Prepare and forward to the CRP the electrical Schedule C-B and other assurance letters and documents required for the Occupancy Permit.

4.0. Sample Occupancy Demonstration/Witnessing Flowchart

DEVELOP TESTING PROTOCOL/PROCEDURE (Design Stage)
CRP/RPRs develop Testing Demonstration/Witness Protocol
— Issue to Authorities Having Jurisdiction & Contractor

DOCUMENTATION SUBMISSION
Contractor/Subtrades submit/deliver all appropriate documentation to CRP/RPRs, including:
— The original Contractor’s Materials and Test Certificate for the sprinkler system
— Fire Pump Flow Test Certificate(s)
— Back Flow Prevention Certificate(s)
— Emergency generator commissioning and verification reports
— The original Certificate of Verification for the fire alarm system
— Appendix “A” to the fire alarm verification report
— ULC Certificate for Protective Signaling Service
— Other documentation, as appropriate

CONTRACTOR DEMONSTRATION — CONSTRUCTION COMPLETE
Contractor & Subtrades
(Mechanical, Electrical, Elevator, Sprinkler, Fire Alarm, etc.) as appropriate

COORDINATED FINAL CONSULTANT REVIEW DEMONSTRATION/WITNESSING CRP/RPRs
(Architect, Mechanical Engineer, Electrical Engineer, Sprinkler Engineer, Equivalency Consultant, etc.) as appropriate

OCCUPANCY SUBMISSION DOCUMENTS
CRP to collect all submission documents, including Schedule Cs from RPRs, and submit to CBO in a complete package

COORDINATED FINAL CBO REVIEW DEMONSTRATION/WITNESSING
Contractor, Subtrades, CRP/RPRs demonstrate to CBO (Building, Fire, Mechanical, Electrical and Sprinkler)

OP ISSUED

A-2.2.8.1.(1) Deleted.

A-2.2.8.3.(2)(c)(i) Deleted.

A-2.3.1. Alternative Solutions. Beyond the purposes of demonstrating compliance and acquiring a building permit, there are other important reasons for requiring that the proponent of an alternative solution submit project documentation (i.e. a compliance report) to the Chief Building Official and for the Chief Building Official to retain that documentation for a substantial period following the construction of a building:

• Alternative solutions made possible by objective-based codes may have special maintenance requirements, which would be described in the documentation.
• Documentation helps consultants perform code compliance assessments of existing buildings before they are sold and informs current owners or prospective buyers of existing buildings of any limitations pertaining to their future use or development.
• Documentation provides design professionals with the basic information necessary to design changes to an existing building.
• An alternative solution could be invalidated by a proposed alteration to a building. Designers and regulators must therefore know the details of the particular alternative solutions that were integral to the original design. Complete documentation should provide insight as to why one alternative solution was chosen over another.
• Documentation is the “paper trail” of the alternative solution negotiated between the designer and the regulator and should demonstrate that a rational process led to the acceptance of the alternative solution as an equivalency.
• It is possible that over time a particular alternative solution may be shown to be inadequate. It would be advantageous for a jurisdiction to know which buildings included that alternative solution as part of their design: documentation will facilitate this type of analysis.
• Project documentation provides important information to a forensic team that is called to investigate an accident or why a design failed to provide the level of performance expected.

This subject is discussed in further detail in “Recommended Documentation Requirements for Projects Using Alternative Solutions in the Context of Objective-Based Codes,” which was prepared for the CCBFC Task Group on Implementation of Objective-Based Codes and is available on NRC’s Web site.
Section 3.1. Appeals

3.1.1. BUILDING BOARD OF APPEAL

3.1.1.1. Appeal Within 30 Days

1) Any person dissatisfied with a decision of the Chief Building Official relating to matters described in Article 3.1.1.2. may appeal the decision to the Building Board of Appeal who shall have such powers relating to this By-law as are set out in this By-law and in the Building Board of Appeal By-law.

3.1.1.2. Limits of Appeal

1) An appeal lies to the Building Board of Appeal from any decision of the Chief Building Official regarding
   a) the interpretation of this By-law,
   b) the use of new construction methods or materials,
   c) upgrading existing buildings or
   d) permitting alternative proposals.

3.1.1.3. Filing of Appeal

1) An application for an appeal shall be filed with the Secretary of the Board, in writing, within 30 days of the decision which gives rise to the appeal.
2) An application for an appeal shall include
   a) the address of the building to which the decision relates,
   b) the applicable provisions of the By-law, and
   c) sufficient detail to describe the factual and technical basis for the appeal.

Section 3.2. Offences and Penalties

3.2.1. VIOLATION OF BY-LAW

3.2.1.1. Offences

1) Every person who
   a) violates any of the provisions of this By-law,
   b) suffers or permits any act or thing to be done in contravention or in violation of any of the provisions of this By-law,
   c) neglects to do or refrains from doing anything required to be done by any of the provisions of this By-law,
   d) does any act which violates any of the provisions of this By-law, or
   e) fails to comply with an order or notice given under this By-law,
   is guilty of an offence against this By-law and liable to the penalties hereby imposed.

3.2.2. FINES AND PENALTIES

3.2.2.1. Minimum Fine

1) Every person who commits an offence against this By-law is liable to a fine of no less than $250 and not more than $10,000 for each offence.

3.2.2.2. Continuing Offence

1) Every person who commits an offence of a continuing nature against this By-law is liable to a fine of not less than $250 and no more than $10,000 for each day such offence is continued.
3.2.2.3. Unsafe Condition

1) Despite the minimum fine referred to in Article 3.2.2.1., every person who permits occupancy to occur while an unsafe condition exists in or about a building or the premises is liable to a fine of no less than $500 and not more than $10,000 for each offence.

3.2.2.4. Failure to Comply with an Order

1) Despite the minimum fine referred to in Article 3.2.2.1., every person who fails to comply with an order or notice issued by the Chief Building Official is liable to a fine of no less than $500 and not more than $10,000 for each offence.

3.2.2.5. Work Without a Permit

1) Despite the minimum fine referred to in Article 3.2.2.1., every person who works without permit is liable to a fine of no less than $500 and not more than $10,000 for each offence.

3.2.2.6. Failure to Permit Entry

1) Despite the minimum fine referred to in Article 3.2.2.1., every person who fails to allow the Chief Building Official entry to a building or premises is liable to a fine of not less than $500 and not more than $10,000 for each offence.

Section 3.3. Transition Provisions

3.3.1. GENERAL

3.3.1.1. Validity of Permits Issued under Previous By-law

1) Subject to the provisions of Articles 1.5.2.4. and 3.3.1.2., buildings for which permits were obtained under By-law No. 10908 may be constructed in accordance with the provisions of that By-law.

3.3.1.2. Grace Period

1) Where an owner has applied for a permit prior to June 03, 2019, a building may be constructed in accordance with By-law No. 10908 if, in the opinion of the Chief Building Official, the owner has commenced the work authorized by the permit within 6 months of the date of issuance of the permit and the owner has continued work to completion without interruption other than work stoppages which are standard in the building industry.
Schedule 2

Book II (Plumbing Systems)
Preface

The 2019 Building By-law (hereinafter the “Building By-law”) is an objective-based code which identifies the minimum standard in the City of Vancouver for buildings to which this By-law applies. These address the same objectives of the Building By-law’s parent codes.

The Building By-law establishes standards for building materials, products and assemblies. Some standards are explicitly provided in the Building By-law while others are incorporated by reference to existing standards for materials products and assemblies which are developed and published by specialist organizations.

The Building By-law is substantially based on Book I (General) and Book II (Plumbing Systems) of the British Columbia Building Code, which in turn is substantially based on the model National Building Code of Canada 2015 and the model National Plumbing Code of Canada 2015. This model of adoption of national model codes helps promote consistency among building codes.

This Building By-law replaces the 2014 Building By-law and also contains certain transition provisions which apply to permits issued under the 2014 Building By-law. The Building By-law is regularly updated and users should ensure that the By-law is current.

Code Development

Development of Codes Canada

The Canadian Commission on Building and Fire Codes (CCBFC) is responsible for the content of the National Model Codes. The CCBFC is an independent body made up of volunteers from across the country and from all facets of the code-user community. Members of the CCBFC and its standing committees include builders, engineers, skilled trade workers, architects, building owners, building operators, fire and building officials, manufacturers and representatives of general interests.

Codes Canada (formerly named the Canadian Codes Centre) of the National Research Council (NRC) provides technical and administrative support to the CCBFC and its standing committees. NRC publishes Codes Canada and periodic revisions to the Codes to address pressing issues. However, such periodic revisions do not have legal effect until adopted into law.

British Columbia Building Code

In British Columbia, the 2018 Building Code is the legal adoption of National Model Building and Plumbing Codes under the authority of the government of the Province of British Columbia. This includes much of the National Model Codes as amended from time to time, but also includes provincially applicable requirements to address provincial priorities and concerns.

Vancouver Building By-law

This By-law consists of two Books, that set out the minimum standard for the design and construction of new buildings as applicable. It also applies to the alteration, change of use and demolition of existing buildings.

The By-law, is substantially based upon the British Columbia Building Code and establishes requirements to address five objectives, which are fully described in Division A of the By-law.
General Requirements
Building By-law - Book I (General) requirement must address at least one of the Code’s five stated objectives:

- safety
- health
- accessibility for persons with disabilities
- fire and structural protection of buildings
- environment

Code provisions do not necessarily address all the characteristics of buildings that might be considered to have a bearing on the Code’s objectives. The design of a technically sound building depends upon many factors beyond simple compliance with building regulations. Such factors include the availability of knowledgeable practitioners who have received appropriate education, training and experience and who have some degree of familiarity with the principles of good building practice and experience using textbooks, reference manuals and technical guides.

The Building By-law does not list acceptable proprietary building products. It establishes the criteria that building materials, products and assemblies must meet. Some of these criteria are explicitly stated in the By-law while others are incorporated by reference to material or product standards published by standards development organizations. Only those portions of the standards related to the objectives of this By-law are mandatory.

Plumbing Requirements
Book II (Plumbing Systems) of the Building By-law sets out technical provisions for the design and installation of new plumbing systems. It also applies to the extension, alteration, renewal and repair of existing plumbing systems. Book II (Plumbing Systems) establishes requirements to address the following four objectives, which are fully described in Division A of the Code:

- safety
- health
- protection of buildings and facilities from water and sewage damage
- environment

Code provisions do not necessarily address all the characteristics of buildings and facilities that might be considered to have a bearing on the Code’s objectives. It is not a textbook on plumbing system design or installation. The design of a technically sound plumbing system depends upon many factors beyond simple compliance with plumbing regulations. Such factors include the availability of knowledgeable practitioners who have received appropriate education, training and experience and who have some degree of familiarity with the principles of good plumbing practice and experience using textbooks, reference manuals and technical guides.

The Building By-law does not list acceptable proprietary plumbing products. It establishes the criteria that plumbing materials, products and assemblies must meet. Some of these criteria are explicitly stated in the By-law while others are incorporated by reference to material or product standards published by standards development organizations. Only those portions of the standards related to the objectives of this By-law are mandatory.
Additional Information

Numbering System
A consistent numbering system has been used throughout this By-law. The first number indicates the Part of the By-
law; the second, the Section in the Part; the third, the Subsection; and the fourth, the Article in the Subsection. The
detailed provisions are found at the Sentence level (indicated by numbers in brackets), and Sentences may be
broken down into Clauses and Subclauses. This structure is illustrated as follows:

<table>
<thead>
<tr>
<th>Level</th>
<th>Numbering</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Division</td>
</tr>
<tr>
<td>3</td>
<td>Part</td>
</tr>
<tr>
<td>3.5</td>
<td>Section</td>
</tr>
<tr>
<td>3.5.2</td>
<td>Subsection</td>
</tr>
<tr>
<td>3.5.2.1</td>
<td>Article</td>
</tr>
<tr>
<td>3.5.2.1.2</td>
<td>Sentence</td>
</tr>
<tr>
<td>3.5.2.1.2(a)</td>
<td>Clause</td>
</tr>
<tr>
<td>3.5.2.1.2(a)(i)</td>
<td>Subclause</td>
</tr>
</tbody>
</table>

Change Indication
Where a technical change or addition has been made relative to the Building By-law National Building Code (NBC)
and National Plumbing Code (NPC) 2010 edition, a vertical line has been added in the margin next to the affected
provision to indicate the approximate location of new or modified content. No change indication is provided for
renumbered or deleted content.

In addition to the above noted vertical lines, which indicate a change to the NBC or NPC that has been included in
the British Columbia Building Code (BCBC), further technical changes or additions relative to the 2012 edition of the
BCBC are identified. These changes are underlined, wherever practical. The vertical lines and underlining are for
convenience only and have no legal effect. No change indication is provided for renumbered or deleted provisions.

The term “reserved” is included in place of certain deleted National Codes content which has not been adopted. The
term “reserved” is generally used so that the numbering structure of the BCBC is aligned with the model National
Codes, easing comparability and possible future harmonization.

Unique to Vancouver Indication
All text in the By-law that is unique to Vancouver is provided with a grey background wherever practical. This
identifier was utilized to provide the user of the By-law with a means by which to differentiate the Vancouver
provisions of this By-law from those of the 2018 British Columbia Building and Plumbing Codes. Where the
provisions of Vancouver have required the deletion of the 2018 British Columbia Building and Plumbing Code text,
and no Vancouver text has replaced the deleted text, the word “deleted” has been used to alert the user that a
deletion has been made and that there is a difference from the 2018 British Columbia Building and Plumbing Codes
text.

Meaning of the words “and” and “or” between the Clauses and Subclauses of a Sentence
Multiple Clauses and Subclauses are connected by the word “and” or “or” at the end of the second last Clause or
Subclause in the series. Although this connecting word appears only once, it is meant to apply to all the preceding
Clauses or Subclauses within that series.

For example, in a series of five Clauses – a) to e) – in a By-law Sentence, the appearance of the word “and” at the
end of Clause d) means that all Clauses in the Sentence are connected to each other with the word “and.” Similarly,
in a series of five Clauses – a) to e) – in a By-law Sentence, the appearance of the word “or” at the end of Clause d)
means that all Clauses in the Sentence are connected to each other with the word “or.”
In all cases, it is important to note that a Clause (and its Subclauses, if any) must always be read in conjunction with its introductory text appearing at the beginning of the Sentence.

**Metric Conversion**

All values in this By-law, other than nominal sizes, are given in metric units. A conversion table of imperial equivalents for the most common units used in plumbing system design and installation is located at the end of the By-law.

**Parts in Division B and Professional Disciplines**

Division B is organized into Parts that are largely related to disciplines. However, this does not mean that persons of a certain discipline who are executing the design or construction of a particular building component can necessarily deal with only one Part of the Code in isolation since provisions related to that building component may be found in more than one Part.

For example:

- provisions that deal with fire safety issues related to heating, ventilating and air-conditioning systems are located in Part 3 of Division B, Fire Protection, Occupant Safety and Accessibility, and not in Part 6, Heating, Ventilating and Air-conditioning;

- structural requirements related to loads on handrails and grab bars are located in Part 3 of Division B, Fire Protection, Occupant Safety and Accessibility, while structural requirements related to loads on guards and handrails are located in Part 4, Structural Design.

For this reason, the part-based structure of Division B is not well suited for use as the basis for allocating responsibilities to different professions or as the basis for contractual arrangements.

**Relationship of the Building By-law to Standards Development and Conformity Assessment**

The development of many provisions in this By-law and the assessment of conformity to those provisions are supported by several of the member organizations of Canada’s National Standards System (NSS).

The NSS is a federation of accredited organizations concerned with standards development, certification, testing, inspection, personnel and management systems registration that is established under the auspices of the Standards Council of Canada Act. Activities of the NSS are coordinated by the Standards Council of Canada (SCC), which has accredited 8 standards development organizations, 36 certification organizations, 21 registration organizations, and 344 calibration and testing laboratories.

The SCC is a federal non-profit Crown corporation responsible for the coordination of voluntary standardization in Canada. It also has responsibilities for Canada’s activities in voluntary international standardization.
Canadian Standards
The By-law contains many references to standards published by accredited standards development organizations in Canada. As part of the accreditation requirements, these organizations adhere to the principles of consensus. This generally means substantial majority agreement of a committee comprising a balance of producer, user and general interest members, and the consideration of all negative comments. The organizations also have formal procedures for the second-level review of the technical preparation and balloting of standards prepared under their auspices. (The Canadian Commission on Building and Fire Codes (CCBFC) follows these same principles of consensus in the operation of its Code development process.)

The following organizations are accredited as standards development organizations in Canada:
- American Society for Testing and Materials International (ASTM)
- Bureau de normalisation du Québec (BNQ)
- Canadian General Standards Board (CGSB)
- Canadian Standards Association (CSA)
- ULC Standards (ULC)
- Underwriters’ Laboratories (UL)

Table 1.3.1.2. of Division B lists the standards referenced in this By-law. Standards proposed to be referenced in this By-law are reviewed to ensure their content is compatible with the Code. Thereafter, referenced standards are reviewed as needed during each Code cycle. Standards development organizations are asked to provide information on any changes in the status of their standards referenced in this By-law – withdrawals, amendments, new editions, etc. This information is passed on to the CCBFC, its standing committees, the provinces and territories, and interested stakeholders on particular issues, all of whom are given the opportunity to identify any problems associated with the changes. These bodies do not necessarily review in detail the revised standards; rather, the approach relies on the consensus process involved in the maintenance of the standards and on the extensive knowledge and backgrounds of committee members, provincial or territorial staff, NRC staff, and consulted stakeholders to identify changes in the standards that might create problems in the By-law.

Non-Canadian Standards
A number of subject areas for which the Canadian standards development organizations have not developed standards are covered in this By-law. In these cases, the Code often references standards developed by organizations in other countries, such as the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) and the National Fire Protection Association (NFPA). These standards are developed using processes that may differ from those used by the Canadian standards development organizations; nevertheless, these standards have been reviewed by the relevant standing committees and found to be acceptable in the context in which they are referenced by this By-law.

Conformity Assessment
This By-law establishes minimum measures, either within its own text or that of referenced standards. However, this By-law does not deal with the question of who is responsible for assessing conformity to the measures or how those with this responsibility might carry it out.

In Vancouver, the Chief Building Official is authorized to, by bylaw, regulate construction and to enforce the requirements of this By-law.

Those persons responsible for ensuring that a material, appliance, system or equipment meets the performance requirements of this By-law have several means available to assist them. These means vary from on-site inspection
to the use of certification services provided by accredited third-party organizations. Test reports or mill certificates provided by manufacturers or suppliers can also assist in the acceptance of products. Engineering reports may be required for more complex products.

Requirements for Registered Professionals are located in Division C of this By-law.

**Testing**
The accreditation programs of the SCC include many organizations accredited for testing and calibration that are capable of reliably testing building products to specified standards. The test results produced by these organizations can be used in the evaluation, qualification and certification of building products to Code provisions. The SCC’s Web site (www.scc.ca) lists accredited certification bodies and allows users to search the scope of accreditation for each of these organizations.

**Certification**
Certification is the confirmation by an independent organization that a product or service meets a requirement. Certification of a product, process, or system entails physical examination, testing as specified in the appropriate standards, plant examination, and follow-up unannounced plant inspections. This procedure leads to the issuing of a formal assurance or declaration, by means of a certification mark or certificate, that the product, process or system is in full conformity with specified provisions.

In some cases, a product for which no standard exists can be certified using procedures and criteria developed by the accredited certifying organization and specifically designed to measure the performance of that product. Certification bodies publish lists of certified products and companies.

**Registration**
Quality Registration Organizations assess a company’s conformance to quality assurance standards like the International Organization for Standardization ISO 9000.

**Evaluation**
An evaluation is a written opinion by an independent professional organization that a product will perform its intended function in a building. An evaluation is very often done to determine the ability of an innovative product, for which no standards exist, to satisfy the intent of a By-law requirement. Follow-up plant inspections are not normally part of the evaluation process. Several organizations, including the Canadian Construction Materials Centre (CCMC), offer such evaluation services. While the development of such an evaluation is useful to establish a basis for acceptance, this it does not mean that there will be an automatic assumption of By-law compliance by the Chief Building Official for any given material, product or assembly covered by this evaluation or that will necessarily be deemed applicable in every situation.

**Qualification**
The qualification of building products also evaluates the ability of a product to perform its intended function by verifying that it meets the requirements of a standard. Qualification normally includes some follow-up plant inspection. Some organizations publish lists of qualified products that meet the specified requirements. Some organizations qualify manufacturing and/or testing facilities for building products for compliance with the By-law and relevant standards.
Division A
Compliance, Objective and Functional Statements
Part 1
Compliance

Section 1.1. General

1.1. Application of this By-law

1.1.1. Application of this By-law

1) This By-law applies to the design, installation, extension, alteration, renewal, repair or operation of plumbing systems in and for buildings in the circumstances described in Section 1.1. of Division A of Book I (General) of this By-law. (See Note A-1.1.1.1.(1).)

2) This By-law specifies the minimum requirements for
   a) drainage systems for water-borne wastes and storm water for buildings to the point of connection with public services,
   b) venting systems,
   c) water service pipes, and
   d) water distribution systems.

3) Plumbing facilities in buildings shall be provided in accordance with Part 7 of Division B of Book I (General) of this By-law.

1.1.2. Internal References to this By-law

1.1.2.1. Book I (General) of the By-law

1) This is the second of the two Books, Book I (General) and Book II (Plumbing Systems), that together form the Building By-law.

1.1.2.2. Internal References to the By-law

1) Unless a Book is specified, references to “the Vancouver Building By-law,” “the Building By-law,” “the By-law,” “this By-law” and the like shall be read as references to the Book in which they appear.

1.1.3. Appendices, Notes and Annotations

1.1.3.1. Appendices, Notes and References to Appendices and Notes have No Legal Effect

1) The Appendices and Notes of this By-law have no legal effect, except for the Appendix Notes that are directly referenced in a Part of this By-law, being the following Notes:
   a) A-1.4.1.2.(1) Designated flood plain of Division A of Book I (General), including Figures A-1.4.1.2.(1)-C, D and E, and
   b) A-1.4.1.2.(1) Flood construction level requirements of Division A of Book I (General).

2) References in parentheses to the Appendices and Notes of this By-law have no legal effect.

Section 1.2. Compliance

1.2. Compliance with this By-law

1.2.1. Compliance with this Code

1) Compliance with this By-law shall be achieved by
   a) complying with the applicable acceptable solutions in Division B (See Note A-1.2.1.1.(1)(a).), or
b) except as required by Sentence (3), using alternative solutions, accepted by the Chief Building Official under Section 2.3 of Division C, that will achieve at least the minimum level of performance required by Division B in the areas defined by the objectives and functional statements attributed to the applicable acceptable solutions. (See Note A-1.2.1.1.(1)(b).)

2) For the purposes of compliance with this By-law as required in Clause 1.2.1.1.(1)(b), the objectives and functional statements attributed to the acceptable solutions in Division B shall be the objectives and functional statements referred to in Subsection 1.1.2. of Division B.

3) An alternative solution shall not be used in place of an acceptable solution if the acceptable solution expressly requires conformance to a provincial enactment other than Book I (General) or Book II (Plumbing Systems) of the Building By-law.

1.2.1.2. Responsibility of Owner

1) Unless otherwise specified in this By-law, the owner of a building shall be the person responsible for carrying out the provisions of this By-law in relation to that building.

2) The owner of a building is in no way relieved of full responsibility for complying with this By-law by the Chief Building Official
   a) granting a building permit,
   b) approving drawings or specifications, or
   c) carrying out inspections.

1.2.2. Materials, Appliances, Systems and Equipment

1.2.2.1. Characteristics of Materials, Appliances, Systems and Equipment

1) All materials, appliances, systems and equipment installed to meet the requirements of this By-law shall possess the necessary characteristics to perform their intended functions when installed in or serving a building.

1.2.2.2. Used Materials and Equipment

1) Used materials and equipment, including fixtures, shall not be reused unless they meet the requirements of this By-law for new materials and equipment and are otherwise satisfactory for their intended use.

1.2.3. Installation

1.2.3.1. Personnel Performing Plumbing Work

1) Personnel performing the installation, extension, alteration, renewal or repair of a plumbing system shall
   a) possess a Canadian tradesman’s qualification certification as a plumber,
   b) be an indentured apprentice supervised by a journeyman who meets the criteria set out in Clause (a), or
   c) be the registered owner and occupant or intended occupant of the single family dwelling in which plumbing work will occur.

1.2.3.2. Personnel Performing Sprinkler System Work

1) Persons performing installation, alteration or repair on a sprinkler system shall
   a) possess a British Columbia industry training credential as a sprinkler system installer, or
   b) be a trainee supervised by a Sprinkler System Installer qualified under the Industry Training Authority Act.
Section 1.3. Divisions A, B and C of this Code

1.3.1. General

1.3.1.1. Scope of Division A
   1) Division A contains the compliance and application provisions, objectives and functional statements of this By-law.

1.3.1.2. Scope of Division B
   1) Division B contains the acceptable solutions of this By-law.

1.3.1.3. Scope of Division C
   1) Division C contains the administrative provisions of this By-law.

1.3.1.4. Internal Cross-references
   1) Where the Division of a referenced provision is not specified in this By-law, it shall mean that the referenced provision is in the same Division as the referencing provision.

1.3.2. Application of Division A

1.3.2.1. Application of Parts 1, 2 and 3
   1) Parts 1, 2 and 3 of Division A apply to all plumbing systems covered in this By-law. (See Article 1.1.1.1.)

1.3.3. Application of Division B

1.3.3.1. Application of Parts 1 and 2
   1) Parts 1 and 2 of Division B apply to all plumbing systems covered in this By-law. (See Article 1.1.1.1.)

1.3.4. Application of Division C

1.3.4.1. Application of Parts 1 and 2
   1) Parts 1, 2 and 3 of Division C apply to all plumbing systems covered in this By-law. (See Article 1.1.1.1.)

Section 1.4. Terms and Abbreviations

1.4.1. Definitions of Words and Phrases

1.4.1.1. Non-defined Terms
   1) Words and phrases used in this By-law that are not included in the list of definitions in Article 1.4.1.2. shall have the meanings that are commonly assigned to them in the context in which they are used, taking into account the specialized use of terms by the various trades and professions to which the terminology applies.
   2) Where objectives and functional statements are referred to in this By-law, they shall be the objectives and functional statements described in Parts 2 and 3.
   3) Where acceptable solutions are referred to in this By-law, they shall be the provisions stated in Part 2 of Division B.
   4) Where alternative solutions are referred to in this By-law, they shall be the alternative solutions mentioned in Clause 1.2.1.1.(1)(b).
1.4.1.2. Defined Terms

1) The words and terms in italics in this By-law shall have the following meanings (an asterisk (*) following a defined word or term indicates that the definition for that word or term is taken from the Book I (General) of this By-law):

- **Acceptable** means acceptable to the Chief Building Official.
- **Accepted** means accepted by the Chief Building Official.
- **Accredited laboratory** means a laboratory approved by the BC Provincial Health Officer for drinking water microbiology testing.
- **Addition** means an alteration to any building which will increase the total aggregate floor area or the building height (in storeys).
- **Additional circuit vent** means a vent pipe that is installed between a circuit vent and a relief vent to provide additional air circulation.
- **Air admittance valve** means a one-way valve designed to allow air to enter the drainage system when the pressure in the plumbing system is less than the atmospheric pressure. (See Note A-2.2.10.16.(1) of Division B.)
- **Air break** means the unobstructed vertical distance between the lowest point of an indirectly connected soil-or-waste pipe and the flood level rim of the fixture into which it discharges. (See Note A-2.3.3.11.(2) of Division B.)
- **Air gap** means the unobstructed vertical distance through air between the lowest point of a water supply outlet and the flood level rim of the fixture or device into which the outlet discharges. (See Note A-2.6.2.9.(2) of Division B.)
- **Air space parcel** has the meaning assigned to it by the Land Title Act of British Columbia.
- **Alert** means a bell, horn, speaker, light or text display that provides audible, tactile or visible outputs, or any combination thereof.
- **Alloyed zinc** means an alloy of zinc having the corrosion resistance and physical properties of an alloy containing 0.15% titanium, 0.74% copper and 99.11% zinc, and so tempered as to be capable of being formed into the shape required for a watertight joint.
- **Alteration** means a change or extension to any matter or thing or to any occupancy regulated by this By-law.
- **Alternate water source system** means a system designed to collect, treat, and use non-potable water from alternate water sources in lieu of potable water, but excludes a system in a building used exclusively for residential occupancy containing no more than 4 principal dwelling units, and excludes the use of rain barrels of up to a cumulative capacity of 500 litres.
- **Apprentice** means a regularly indentured apprentice under the provisions of the Industry Training Authority Act of British Columbia.
- **Approved** means accepted.
- **Auxiliary water supply** means any water supply on or available to the premises other than the primary potable water supply. (See Note A-1.4.1.2.(1).)
- **Backflow** means a flowing back or reversal of the normal direction of the flow.
- **Backflow preventer** means a device or a method that prevents backflow. (See Figure A-1.4.1.2.(1)-A in Note A-1.4.1.2.(1).)
- **Back pressure** means pressure higher than the supply pressure.
- **Back-siphonage** means backflow caused by a negative pressure in the supply system. (See Figure A-1.4.1.2.(1)-B in Note A-1.4.1.2.(1).)
- **Back-siphonage preventer** (or vacuum breaker) means a device or a method that prevents back-siphonage. (See Figure A-1.4.1.2.(1)-C in Note A-1.4.1.2.(1).)
- **Backwater valve** means a check valve designed for use in a gravity drainage system.
- **Bathroom group** means one lavatory basin, one water closet and one bathtub or maximum 2 head shower drain.
**Blackwater** means waste water from water closets, urinals and other sanitary fixtures designed for carrying human waste, kitchen sinks, utility sinks, medical sinks, laboratory sinks, and industrial processes, but does not include clear-water waste.

**Bottle trap** means a trap that retains water in a closed chamber and that seals the water by submerging the inlet pipe in the liquids or by a partition submerged in the liquids.

**Branch** means a soil-or-waste pipe connected at its upstream end to the junction of 2 or more soil-or-waste pipes or to a soil-or-waste stack, and connected at its downstream end to another branch, a sump, a soil-or-waste stack or a building drain. (See Figure A-1.4.1.2.(1)-F in Note A-1.4.1.2.(1)).

**Branch vent** means a vent pipe that is connected at its lower end to the junction of 2 or more vent pipes, and at its upper end, either to another branch vent or to a stack vent, vent stack or vent header, or terminates in open air. (See Figure A-1.4.1.2.(1)-D in Note A-1.4.1.2.(1)).

**Building** means any structure used or intended for supporting or sheltering any use or occupancy, including any float home or marina and any retaining structures greater than 1.2 m in height.

**Building drain** means the lowest horizontal piping, including any vertical offset, that conducts sewage, clear-water waste or storm water by gravity to a building sewer. (See Figure A-1.4.1.2.(1)-F in Note A-1.4.1.2.(1)).

**Building sewer** means a pipe that is connected to a building drain 1 m outside a wall of a building and that leads to a public sewer or private sewage disposal system.

**Building trap** means a trap that is installed in a building drain or building sewer to prevent the circulation of air between a drainage system and a public sewer. (See Note A-2.4.5.4.(1) of Division B.)

**Business and personal services occupancy** means the occupancy or use of a building or part thereof for the transaction of business or the rendering or receiving of professional or personal services.

**Care** means the provision of services other than treatment by or through care facility management to residents who require these services because of cognitive, physical or behavioural limitations.

**Care or detention occupancy** means the occupancy or use of a building or part thereof by persons who require special care or treatment because of cognitive or physical limitations or by persons who are restrained from, or are incapable of, self-preservation because of security measures not under their control.

**Certified Professional** means a Certified Professional as defined in the Certification of Professionals By-law.

**Check valve** means a valve that permits flow in one direction but prevents a return flow.

**Chief Building Official** means the City Building Inspector, and any person authorized to act on behalf of the City Building Inspector.

**Circuit vent** means a vent pipe that serves a number of fixtures and connects to the fixture drain of the most upstream fixture.

**Cistern** means a tank for storing non-potable water as part of an alternate water source system.

**City** means the City of Vancouver.

**City Building Inspector** means the person appointed as such by City Council pursuant to the provisions of the Vancouver Charter.

**City Engineer** means the person appointed as such by City Council pursuant to the provisions of the Vancouver Charter.

**Class 1 fire sprinkler/standpipe system** means an assembly of pipes and fittings that conveys water from the water service pipe to the sprinkler/standpipe system’s outlets, is directly connected to the public water supply main only, has no pumps or reservoirs, and in which the sprinkler drains discharge to the atmosphere, to dry wells or to other safe outlets.

**Class 2 fire sprinkler/standpipe system** means a Class 1 fire sprinkler/standpipe system that includes a booster pump in its connection to the public water supply main.

**Class 3 fire sprinkler/standpipe system** means an assembly of pipes and fittings that conveys water from the water service pipe to the sprinkler/standpipe system’s outlets and is directly connected to the public water supply main as well as to one or more of the following storage facilities, which are filled from the public water supply main only: elevated water storage, fire pumps supplying water from aboveground
covered reservoirs, or pressure tanks. The water in this sprinkler/standpipe system must be maintained in potable condition. (See Note A-1.4.1.2.(1).)

**Class 4 fire sprinkler/standpipe system** means an assembly of pipes and fittings that conveys water from the water service pipe to the sprinkler/standpipe system’s outlets and is directly connected to the public water supply main (similar to Class 1 and Class 2 fire sprinkler/standpipe systems) and to an auxiliary water supply dedicated to fire department use that is located within 520 m of a pumper connection.

**Class 5 fire sprinkler/standpipe system** means an assembly of pipes and fittings that conveys water from the water service pipe to the sprinkler/standpipe system’s outlets and is directly connected to the public water supply main and also interconnected with an auxiliary water supply.

**Class 6 fire sprinkler/standpipe system** means an assembly of pipes and fittings that conveys water from the water service pipe to the sprinkler/standpipe system’s outlets and acts as a combined industrial water supply and fire protection system supplied from the public water supply main only, with or without gravity storage or pump suction tanks.

**Cleanout** means an access provided in drainage and venting systems to provide for cleaning and inspection services.

**Clear-water waste** means waste water with impurity levels that will not be harmful to health and may include cooling water and condensate drainage from refrigeration and air-conditioning equipment and cooled condensate from steam heating systems, but does not include storm water. (See Note A-1.4.1.2.(1).)

**Combined building drain** means a building drain that is intended to conduct sewage and storm water.

**Combined building sewer** means a building sewer that is intended to conduct sewage and storm water.

**Combustible** means that a material fails to meet the acceptance criteria of CAN/ULC-S114, “Test for Determination of Non-Combustibility in Building Materials.”

**Construction** means, with respect to a building: erection, repair, alteration, enlargement, addition, demolition, deconstruction, removal and excavation.

**Construction Safety Officer** means a person who has been trained specifically to understand and apply safe construction practice as it relates to the worksite and as it affects the public, neighbouring properties and utilities, and who has been retained by the owner, or the owner’s principal contractor or project manager, to coordinate all sub trade supervisors relating to construction safety at the project site.

**Construction Safety Plan** means a plan containing construction procedures and fire safety measures designed to protect workers on a project, neighbouring private property, public property, and members of the general public.

**Constructor** means a person who contracts with an owner or their authorized agent to undertake a project, and includes an owner who contracts with more than one person for the work on a project or undertakes the work on a project or any part thereof.

**Continuous vent** means a vent pipe that is an extension of a vertical section of a branch or fixture drain. (See Figure A-1.4.1.2.(1)-E in Note A-1.4.1.2.(1).)

**Cooling tower** means a cooling tower, evaporative condenser, or fluid cooler that is part of a recirculated water system incorporated into a building’s cooling, industrial process, refrigeration, or energy production system.

**Coordinating registered professional** means a registered professional retained under Clause 2.2.7.2.(1)(a) of Division C to coordinate all design work and field reviews of the registered professionals who are required for a project.

**Critical level** means the level of submergence at which the back-siphonage preventer ceases to prevent back-siphonage.

**Dead end** means a pipe that terminates with a closed fitting.

**Deconstruction** means demolition by systematic disassembly of a building resulting in the reuse, recycling or recovery of not less than 75% of all building materials, excluding materials which are hazardous or banned from landfill.

**Demolition** means the action or process of demolishing a building, and includes deconstruction.
**Designated flood** means a flood which may occur in any given year, of such magnitude as to equal a flood having a 200 year return period.

**Designated flood plain** means those lands in the City which are hereby designated, for the purposes of section 306(1)(cc) of the Vancouver Charter, as flood plains susceptible to flooding and subject to flood construction level requirements, and those lands so designated include:

(a) lands located in the proximity to the natural boundary of the Burrard Inlet, English Bay, False Creek and the Fraser River, which are located within the areas shown shaded or crosshatched on the maps attached to this By-law as Diagrams A1 and A2. (See Book I, Division A, Figure A-1.4.1.2.(1)-C for Diagram A1: Burrard Inlet, English Bay, False Creek and Fraser River flood plains and Book I, Division A, Figure A-1.4.1.2.(1)-D for Diagram A2: Burrard Inlet, English Bay, False Creek and Fraser River flood plain, wave effect zone.); and

(b) lands located in the areas shown crosshatched on the map attached to this By-law as Diagram B. (See Book I, Division A, Figure A-1.4.1.2.(1)-E for Diagram B: Still Creek flood plain and flood construction levels.)

**Designated Structural Engineer (Struct. Eng.)** means a person who is registered or licensed to practice as a professional engineer under the Engineers and Geoscientists Act of British Columbia, and a person who is designated by the Association of Professional Engineers and Geoscientists of British Columbia as a Designated Structural Engineer.

**Developed length** means the length along the centre line of the pipe and fittings. (See Note A-2.5.6.3.(1) of Division B.)

**Directly connected** means physically connected in such a way that water or gas cannot escape from the connection.

**Drainage system** means an assembly of pipes, fittings, fixtures, traps and appurtenances that is used to convey sewage, clear-water waste or storm water to a public sewer or a private sewage disposal system, but does not include subsoil drainage pipes. (See Figure A-1.4.1.2.(1)-F in Note A-1.4.1.2.(1).)

**Dual vent** means a vent pipe that serves 2 fixtures and connects at the junction of the trap arms. (See Figure A-1.4.1.2.(1)-G in Note A-1.4.1.2.(1).)

**Dwelling unit** means a suite operated as a housekeeping unit, used or intended to be used by one or more persons and usually containing cooking, eating, living, sleeping and sanitary facilities.

**E. coli** means *Escherichia coli*.

**Emergency floor drain** means a fixture for the purposes of overflow protection that does not receive regular discharge from other fixtures, other than from a trap primer. (See Note A-1.4.1.2.(1).)

**Emergency once through cooling equipment** means once through cooling equipment that is not normally operated and is only activated in the event of a sudden, unforeseen failure of an otherwise properly designed, operated and maintained primary cooling system.

**Excavation** means the space created by the removal of soil, rock or fill for the purposes of construction.

**Existing building** means a building lawfully constructed and completed under a permit before submission of the current permit application.

**Field review** means a review of the work

- at a building site, and
- where applicable, at locations where building components are fabricated for use at the building site that a registered professional in his or her professional discretion considers necessary to ascertain whether the work substantially complies in all material respects with the plans and supporting documents prepared by a registered professional.

**Fire separation** means a construction assembly that acts as a barrier against the spread of fire. (See Book I, Division A, Note A-1.4.1.2.(1).)

**Fire service pipe** means a pipe that conveys water from a public water main or private water source to the inside of a building for the purpose of supplying the fire sprinkler or standpipe systems.

**Fixture** means a receptacle, appliance, apparatus or other device that discharges sewage or clear-water waste, and includes a floor drain.

**Fixture drain** means the pipe that connects a trap serving a fixture to another part of a drainage system.
Fixture outlet pipe* means a pipe that connects the waste opening of a fixture to the trap serving the fixture. (See Figure A-1.4.1.2.(1)-H in Note A-1.4.1.2.(1).

Fixture unit (as applying to drainage systems) means the unit of measure based on the rate of discharge, time of operation and frequency of use of a fixture that expresses the hydraulic load that is imposed by that fixture on the drainage system.

Fixture unit (as applying to water distribution systems) means the unit of measure based on the rate of supply, time of operation and frequency of use of a fixture or outlet that expresses the hydraulic load that is imposed by that fixture or outlet on the supply system.

Float home* means any structure incorporating a flotation system, intended for use or occupancy or being used or occupied for residential purposes, containing one dwelling unit only, and not primarily intended for, or useable in, navigation, but does not include any water craft designed or intended for navigation.

Flood construction level* means the minimum elevation of the underside of a floor system, or of the top of a concrete slab, of a building which is used or may be used for habitation, business, or for the storage of goods which may be damaged by flood water.

Flood construction level requirements* means

(a) on the Burrard Inlet, English Bay, False Creek and Fraser River flood plains:
   (i) for buildings located within the areas shown shaded or crosshatched on the map attached to this By-law, the underside of a floor system or the top of a concrete slab of a buildings used for habitation, business or storage of goods, shall not be lower than 4.6m Greater Vancouver Regional District datum. (See Book I, Division A, Figure A-1.4.1.2.(1)-C for Diagram A1: Burrard Inlet, English Bay, False Creek and Fraser River flood plains); and
   (ii) for buildings located in the areas shown shaded or crosshatched on the map attached to this By-law, an additional elevation allowance above 4.6 m may be required for wave run-up, at a level as determined by a Professional Engineer and to the satisfaction of the Chief Building Official. (See Book I, Division A, Figure A-1.4.1.2.(1)-D for Diagram A2: Burrard Inlet, English Bay, False Creek and Fraser River flood plain wave effect zone); and

(b) on the Still Creek flood plain:
   (i) the underside of a floor system or the top of a concrete slab of any buildings used for habitation, business or storage of goods shall not be lower than the applicable elevation shown on the map attached to this By-law. (See Book I, Division A, Figure A-1.4.1.2.(1)-E for Diagram B: Still Creek flood plain and flood construction levels.)

Flood level rim means the top edge at which water can overflow from a fixture or device. (See Figure A-1.4.1.2.(1)-B in Note A-1.4.1.2.(1).

Floor drain* means a fixture used to receive water from the floor of a building.

Flow control roof drain means a roof drain that restricts the flow of storm water into the storm drainage system.

Fresh air inlet means a vent pipe that is installed in conjunction with a building trap and terminates outdoors. (See Note A-2.4.5.4.(1) of Division B.)

General Manager, Park Board* means the person appointed as such by the Park Board.

General Manager, Real Estate and Facilities Management* means the person appointed as such by City Council.

Greywater means waste water from all sources except blackwater and clear-water waste.

Groundwater* means a freestanding body of water in the ground.

Indirect service water heater* means a service water heater that derives its heat from a heating medium such as warm air, steam or hot water.

Indirectly connected means not directly connected. (See Note A-2.3.3.11.(2) of Division B.)

Individual vent means a vent pipe that serves one fixture.

Interceptor means a receptacle that is installed to prevent oil, grease, sand or other materials from passing into a drainage system.
Journeyman plumber* means a person, other than an apprentice, who holds a certificate issued pursuant to the provisions of the Industry Training Authority Act of British Columbia authorizing the person to engage in the plumbing trade.

Leader means a pipe that is installed to carry storm water from a roof to a storm building drain or sewer or other place of disposal.

Maintenance once through cooling equipment means once through cooling equipment that is not normally operated and is only activated to temporarily supplement or replace the primary cooling system during scheduled maintenance on the primary cooling system.

Marina* means any structure or installation, including marina walkways, which provides moorage space for water craft.

Marina walkway* means any surface extending over navigable water used to accommodate pedestrian traffic, and used so that water craft and float homes may lie alongside to receive and discharge cargo and passengers.

Metering fixture means a self-closing plumbing fixture that dispenses a specific volume of water for each actuation cycle.

Nominally horizontal means at an angle of less than 45° with the horizontal. (See Figure A-1.4.1.2.(1)-J in Note A-1.4.1.2.(1).)

Nominally vertical means at an angle of not more than 45° with the vertical. (See Figure A-1.4.1.2.(1)-J in Note A-1.4.1.2.(1).)

Noncombustible* means that a material meets the acceptance criteria of CAN/ULC-S114, “Test for Determination of Non-Combustibility in Building Materials.”

Non-recirculating liquid ring pump means a vacuum pump that uses water to cool the pump or to create a seal and recirculates less than 60% of the water that passes through the pump.

Occupancy* means the use or intended use of a building or part thereof for the shelter or support of persons, animals or property.

Offset means the piping that connects the ends of 2 pipes that are parallel. (See Figure A-1.4.1.2.(1)-K in Note A-1.4.1.2.(1).)

Offset relief vent means a relief vent that provides additional air circulation upstream and downstream of an offset in a soil-or-waste stack. (See Note A-2.5.4.4.(1) of Division B.)

Once through cooling equipment means equipment that produces a cooling effect by transfer of heat to water that is only circulated once through the equipment and is then discharged, and includes but is not limited to commercial and industrial air conditioners, refrigerators, freezers, coolers and ice machines.

Operating permit* means permission or authorization in writing by the Chief Building Official to install or retain existing equipment or systems for which an operating permit is required under this By-law.

Owner* means a registered owner, a holder of an agreement for sale and purchase and, in the case of Crown-owned lands, owner shall mean the occupier.

Perimeter drainage water means water collected from the foundation of a structure.

Permit* means permission or authorization in writing by the Chief Building Official to perform work regulated by this By-law and, in the case of an occupancy permit, to occupy any building or part thereof, but does not include an operating permit.

Plumbing contractor* means a person licensed as a contractor pursuant to the License By-law and who is either a plumber or a person who employs a plumber on a full time basis.

Plumbing fixture means any installed receptacle, device or appliance, including floor drains and roof drains and swimming pools, which are supplied with water or which receive liquid or liquid-borne wastes and discharge such wastes into the drainage system to which they may be directly or indirectly connected, except that industrial or commercial tanks, vats and similar processing equipment are not plumbing fixtures, but may be connected to or discharge into traps or plumbing fixtures which are in compliance with or otherwise provided for in this By-law.

Plumbing system* means a drainage system, a venting system and a water system or parts thereof. (See Figure A-1.4.1.2.(1)-L in Note A-1.4.1.2.(1).)

Potable means safe for human consumption.
Pre-rinse spray valve means a handheld device for use with commercial dishwashing and ware washing equipment that sprays water on dishes, flatware, and other food service items for the purpose of removing food residue before cleaning and sanitizing the items.

Private sewage disposal system* means a privately owned plant for the treatment and disposal of sewage (such as a septic tank with an absorption field).

Private use (as applying to the classification of plumbing fixtures) means fixtures in residences and apartments, in private bathrooms of hotels, and in similar installations in other buildings for one family or an individual.

Private water supply system* means an assembly of pipes, fittings, valves, equipment and appurtenances that supplies water from a private source to a water distribution system.

Project* means any construction, alteration or demolition operation.

Public sewer connection means that part of the public sewer which connects or is intended to connect a building sewer with any public sewer.

Public use (as applying to the classification of plumbing fixtures) means fixtures in general washrooms of schools, gymnasiums, hotels, bars, public comfort stations and other installations where fixtures are installed so that their use is unrestricted.

Registered professional* means
• a person who is registered or licensed to practise as an architect under the Architects Act, or
• a person who is registered or licensed to practise as a professional engineer under the Engineers and Geoscientists Act.

Registered professional of record* means a registered professional retained to undertake design work and field reviews in accordance with Subsection 2.2.7. of Division C.

Re-occupancy permit* means permission or authorization in writing by the Chief Building Official to re-occupy any building or part thereof in respect of which the Chief Building Official has issued an order to cease occupancy because of an unsafe condition.

Residential occupancy* means the occupancy or use of a building or part thereof by persons for whom sleeping accommodation is provided but who are not harboured for the purpose of receiving care or treatment and are not involuntarily detained.

Roof drain means a fitting or device that is installed in the roof to permit storm water to discharge into a leader.

Sanitary building drain means a building drain that conducts sewage to a building sewer from the most upstream soil-or-waste stack, branch or fixture drain serving a water closet.

Sanitary building sewer means a building sewer that conducts sewage.

Sanitary drainage system* means a drainage system that conducts sewage.

Sanitary sewer means a sewer that conducts sewage.

Self-closing plumbing fixture means a plumbing fixture that closes automatically upon the deactivation of a mechanical or electronic control mechanism.

Separate system area means an area in which the City Engineer has required the separate disposal of storm water and sewage.

Service water heater* means a device for heating water for plumbing services.

Sewage* means any liquid waste other than clear-water waste or storm water.

Sewer* means an underground drain or conduit to remove waste water and organic refuse.

Shower head means any fitting that transmits water for the purposes of showering and includes rain heads, rain tiles, rain systems, waterfalls, body sprays and jets. A hand-held shower shall be considered a shower head.

Size means the nominal diameter by which a pipe, fitting, trap or other similar item is commercially designated.

Soil-or-waste pipe or waste pipe means a pipe in a sanitary drainage system.

Soil-or-waste stack means a vertical soil-or-waste pipe that passes through one or more storeys, and includes any offset that is part of the stack.
Sprinkler contractor* means a person licensed as a contractor pursuant to the License By-law and who is either a sprinkler system installer or a person who employs a sprinkler system installer on a full-time basis.

Sprinkler system* means an automatic fire extinguishing system designed to the National Fire Protection Association 13, 13D or 13R standard and all applicable associated sprinkler standards, and which consists of a system of devices and equipment designed to automatically detect a fire and discharge water or another approved fire extinguishing agent in the area of or onto a fire.

Sprinkler system installer* means a person who has successfully completed an accredited program as a Sprinkler System Installer under the Industry Training Authority Act and Industry Training Regulation of British Columbia.

Stack vent means a vent pipe that connects the top of a soil-or-waste stack to a vent header or to outside air. (See Figure A-1.4.1.2.(1)-G in Note A-1.4.1.2.(1).)

Storage-type service water heater* means a service water heater with an integral hot water storage tank.

Storey for the purposes of Book II of this By-law, means the interval between 2 successive floor levels, including mezzanine floors that contain plumbing fixtures, or between a floor level and roof.

Storm building drain* means a building drain that conducts storm water and is connected at its upstream end to a leader, sump or catch basin, and at its downstream end to a building sewer or a designated storm water disposal location.

Storm building sewer means a building sewer that conveys storm water.

Storm drainage system means a drainage system that conveys storm water.

Storm sewer means a sewer that conveys storm water.

Storm water* means water that is discharged from a surface as a result of rainfall or snowfall.

Street* means a public road, highway, bridge, viaduct, lane, and sidewalk, and any other way normally open to the use of the public, but does not include a private right-of-way on private property and, for the purposes only of Part 3 and Part 9 of this By-law, a street which is less than 9 m in width or a lane or sidewalk.

Subsoil drainage pipe* means a pipe that is installed underground to intercept and convey subsurface water.

Suite* means a single room or series of rooms of complementary use, operated under a single tenancy, and includes dwelling units, individual guest rooms in motels, hotels, boarding houses, rooming houses and dormitories as well as individual stores and individual or complementary rooms for business and personal services occupancies. (See Book I, Division A, Note A-1.4.1.2.(1).)

Sump* means a receptacle installed between the storm or combined sewer and the building storm system to intercept the flow of debris into the building or public sewer and to prevent the outflow of sewer gas.

Trade waste system means a system of drainage pipes from floor drains and hub drains located in food display areas that are intercepted by a trade waste sump and backwater valve before entering the sanitary building drain.

Trap* means a fitting or device that is designed to hold a liquid seal that will prevent the passage of gas but will not materially affect the flow of a liquid.

Trap arm means that portion of a fixture drain between the trap weir and the vent pipe fitting. (See Note A-2.5.6.3.(1) of Division B.)

Trap dip means the lowest part of the upper interior surface of a trap.

Trap seal depth means the vertical distance between the trap dip and the trap weir. (See Note A-2.2.3.1.(1) and (3) of Division B.)

Trap standard means the trap for a fixture that is integral with the support for the fixture.

Trap weir means the highest part of the lower interior surface of a trap. (See Note A-2.2.3.1.(1) and (3) of Division B.)

Treatment* means the provision of medical or other health-related intervention to persons, where the administration or lack of administration of these interventions may render them incapable of evacuating to a safe location without the assistance of another person. (See Book I, Division A, Note A-1.4.1.2.(1).)

Unsafe condition* means any condition that could cause undue hazard or risk to the life, limb or health of any person authorized, expected or anticipated to be on or about the premises, building or construction.
**Vacuum breaker** (See back-siphonage preventer).

**Vent header** means a vent pipe that connects any combination of stack vents or vent stacks to outside air. (See Figure A-1.4.1.2.(1)-I in Note A-1.4.1.2.(1).)

**Vent pipe** means a pipe that is part of a venting system.

**Vent stack** means a vent pipe that is connected at its upper end to a vent header or that terminates in outside air and is connected at its lower end to the soil-or-waste stack at or below the lowest soil-or-waste pipe connection. (See Figure A-1.4.1.2.(1)-G in Note A-1.4.1.2.(1).)

**Venting system* means an assembly of pipes and fittings that connects a drainage system with outside air for circulation of air and the protection of trap seals in the drainage system. (See Figures A-1.4.1.2.(1)-F and A-1.4.1.2.(1)-G in Note A-1.4.1.2.(1).)

**Waste pipe** (See soil-or-waste pipe).

**Water craft* means any boat, hull, barge, or houseboat which is afloat, whether self-propelled or not, and includes pleasure and commercial craft.

**Water distribution system* means an assembly of pipes, fittings, valves and appurtenances that conveys water from the water service pipe or private water supply system to water supply outlets, fixtures, appliances and devices.

**Water service pipe* means a pipe that conveys water from a public water main or private water source to the inside of the building.

**Water system* means a private water supply system, a water service pipe, a water distribution system or parts thereof.

**Wet vent** means a soil-or-waste pipe that also serves as a vent pipe and extends from the most downstream wet-vented fixture connection to the most upstream fixture connection. (See Note A-2.5.8.1.(2) of Division B.)

**Yoke vent** means a vent pipe that is connected at its lower end to a soil-or-waste stack and at its upper end to a vent stack or to a branch vent connected to a vent stack. (See Note A-2.5.4.3. of Division B.)

### 1.4.2. Symbols and Other Abbreviations

#### 1.4.2.1. Symbols and Other Abbreviations

1) The symbols and other abbreviations in this By-law shall have the meanings assigned to them in this Article and Article 1.3.2.1. of Division B.

- 1 in 50 ............ slope of 1 vertical to 50 horizontal
- ABS ................ acrylonitrile-butadiene-styrene
- AL .................. aluminum
- cm² ............... square centimetre(s)
- CPVC ............ chlorinated polyvinyl chloride
- CRP .............. coordinating registered professional
- ° .................. degree(s)
- °C ................ degree(s) Celsius
- diam............... diameter
- DWV ........... drain, waste and vent
- h ............... hour(s)
- in ................. inch(es)
- Inc. ................. Incorporated
- kg/m³ ............ kilogram(s) per cubic metre
- kPa .............. kilopascal(s)
- L ................. litre(s)
- Lpf ............ litre(s) per flush
- L/s ............. litre(s) per second
- m ............... metre(s)
Section 1.5. Referenced Documents and Organizations

1.5.1. Referenced Documents

1.5.1.1. Application of Referenced Documents

1) Except as provided in Sentence (2), the provisions of documents referenced in this By-law, and of any documents referenced within those documents, apply only to the extent that they relate to:
   a) plumbing systems, and
   b) the objectives and functional statements attributed to the applicable acceptable solutions in Division B where the documents are referenced.

(See Note A-1.5.1.1.(1).)

2) Where a provision of this By-law references the Fire By-law, the NECB, or Book I (General) of this By-law, the applicable objectives and functional statements shall include those found in that referenced document. (See Note A-2.1.1.2.(6).)

1.5.1.2. Conflicting Requirements

1) In case of conflict between the provisions of this By-law and those of a referenced document, the provisions of this By-law shall govern.

1.5.1.3. Applicable Editions

1) Where documents are referenced in this By-law, they shall be the editions designated in Subsection 1.3.1. of Division B.

1.5.2. Organizations

1.5.2.1. Abbreviations of Proper Names

1) The abbreviations of proper names in this By-law shall have the meanings assigned to them in Article 1.3.2.1. of Division B.
Notes to Part 1
Compliance

A-1.1.1.1.(1) Application to Existing Buildings.
(See Part 11 of Division B of Book I (General) of the Building By-law)

A-1.2.1.1.(1)(a) By-law Compliance via Acceptable Solutions. If a plumbing system design (e.g., material, component, assembly or system) can be shown to meet all provisions of the applicable acceptable solutions in Division B (e.g., it complies with the applicable provisions of a referenced standard), it is deemed to have satisfied the objectives and functional statements linked to those provisions and thus to have complied with that part of the By-law. In fact, if it can be determined that a design meets all the applicable acceptable solutions in Division B, there is no need to consult the objectives and functional statements in Division A to determine its compliance.

A-1.2.1.1.(1)(b) By-law Compliance via Alternative Solutions. Where a design differs from the acceptable solutions in Division B, then it should be treated as an “alternative solution.” A proponent of an alternative solution must demonstrate that the alternative solution addresses the same issues as the applicable acceptable solutions in Division B and their attributed objectives and functional statements. However, because the objectives and functional statements are entirely qualitative, demonstrating compliance with them in isolation is not possible. Therefore, Clause 1.2.1.1.(1)(b) identifies the principle that Division B establishes the quantitative performance targets that alternative solutions must meet. In many cases, these targets are not defined very precisely by the acceptable solutions – certainly far less precisely than would be the case with a true performance code, which would have quantitative performance targets and prescribed methods of performance measurement for all aspects of building performance. Nevertheless, Clause 1.2.1.1.(1)(b) makes it clear that an effort must be made to demonstrate that an alternative solution will perform as well as a design that would satisfy the applicable acceptable solutions in Division B – not “well enough” but “as well as.”

In this sense, it is Division B that defines the boundaries between acceptable risks and the “unacceptable” risks referred to in the statements of the By-law’s objectives, i.e., the risk remaining once the applicable acceptable solutions in Division B have been implemented represents the residual level of risk deemed to be acceptable by the broad base of Canadians who have taken part in the consensus process used to develop the Model Building Code.

Level of Performance
Where Division B offers a choice between several possible designs, it is likely that these designs may not all provide exactly the same level of performance. Among a number of possible designs satisfying acceptable solutions in Division B, the design providing the lowest level of performance should generally be considered to establish the minimum acceptable level of performance to be used in evaluating alternative solutions for compliance with the By-law.

Sometimes a single design will be used as an alternative solution to several sets of acceptable solutions in Division B. In this case, the level of performance required of the alternative solution should be at least equivalent to the overall level of performance established by all the applicable sets of acceptable solutions taken as a whole.

Each provision in Division B has been analyzed to determine what it is intended to achieve. The resultant intent statements clarify what undesirable results each provision seeks to preclude. These statements are not a legal component of the By-law, but are advisory in nature, and can help By-law users establish performance targets for alternative solutions. They are published as part of the online Code subscriptions and as a separate
Areas of Performance
A subset of the acceptable solutions in Division B may establish criteria for particular types of designs (e.g., certain types of materials, components, assemblies, or systems). Often such subsets of acceptable solutions are all attributed to the same objective: Sanitation for example. In some cases, the designs that are normally used to satisfy this subset of acceptable solutions might also provide some benefits that could be related to some other objective: Protection of the Building or Facility from Water and Sewage Damage for example. However, if none of the applicable acceptable solutions are linked to Objective OP5, Protection of the Building or Facility from Water and Sewage Damage, it is not necessary that alternative solutions proposed to replace these acceptable solutions provide a similar benefit related to Protection of the Building or Facility from Water and Sewage Damage. In other words, the acceptable solutions in Division B establish acceptable levels of performance for compliance with the By-law only in those areas defined by the objectives and functional statements attributed to the acceptable solutions.

Applicable Acceptable Solutions
In demonstrating that an alternative solution will perform as well as a design that would satisfy the applicable acceptable solutions in Division B, its evaluation should not be limited to comparison with the acceptable solutions to which an alternative is proposed. It is possible that acceptable solutions elsewhere in the By-law also apply. The proposed alternative solution may be shown to perform as well as the most apparent acceptable solution, which it is replacing, but may not perform as well as other relevant acceptable solutions. For example, an innovative piping material may perform adequately in a drainage system but may not meet combustibility requirements elsewhere in the By-law. All applicable acceptable solutions should be taken into consideration in demonstrating the compliance of an alternative solution.

A-1.4.1.2.(1) Defined Terms.

Auxiliary Water Supply
The auxiliary water supply may include water from a secondary potable water supply or from any natural source, such as a well, lake, spring, stream or harbour. It may also include waste water (but not sanitary drainage) from industrial processes, such as cooling towers, or from storm retention ponds. These sources may be polluted or contaminated and constitute an unacceptable water source over which the primary water purveyor does not have sanitary control. It is generally accepted that there are two categories of auxiliary water supply:

- any public potable water supply over which the primary water purveyor does not have sanitary control,
- any private water supply, other than the primary potable water supply, that is on or available to the premises.

Class 3 Fire Sprinkler/Standpipe Systems
In Class 3 fire sprinkler/standpipe systems, water is supplied to the storage facilities from the public water supply and is maintained in potable condition. Class 3 fire sprinkler/standpipe systems resemble Class 1 fire sprinkler/standpipe systems in all other respects.

Clear-Water Waste
Examples of clear-water waste are the waste waters discharged from a drinking fountain, cooling jacket, air conditioner or relief valve outlet.

Emergency Floor Drains
There are two types of floor drains. One is an emergency floor drain installed to avoid flooding in a building from any pipe or fixture failure. The other encompasses floor drains installed to receive discharge from specific pieces of equipment; this type is defined as a fixture.
Illustrations for Defined Terms

(a) Reduced pressure backflow preventer

(b) Assembly of differential valves and check valves used as a backflow preventer

Figure A-1.4.1.2.(1)-A
Backflow Preventer
Figure A-1.4.1.2.(1)-B
Back-siphonage

Notes to Figure A-1.4.1.2.(1)-B:

(1) Figure A-1.4.1.2.(1)-B shows a situation that is fairly common in old buildings. If the bathtub is filled to a level above the faucet outlet, or if the flush valve of the water closet is faulty, and if the faucet at the sink or lavatory on the lower floor is opened, water can be drawn (siphoned) from the bathtub or the water closet into the water system when the pressure in the water system is low or the water supply has been shut off.

(2) Back-siphonage can be prevented in the above situations by providing an air gap or a back-siphonage preventer (See Subsection 2.6.2. of Division B).
Figure A-1.4.1.2.(1)-C
Back-siphonage Preventer

Figure A-1.4.1.2.(1)-D
Branch Vent

Note to Figure A-1.4.1.2.(1)-D:
(1) See also the definitions of header and drainage system in Article 1.4.1.2.

Figure A-1.4.1.2.(1)-E
Continuous Vent
Figure A-1.4.1.2.(1)-F
Drainage System
Division A: Compliance, Objectives and Functional Statements

Part 1 – Compliance

Figure A-1.4.1.2.(1)-G
Venting System
Figure A-1.4.1.2.(1)-H
Fixture Outlet Pipe and Trap Arm

Figure A-1.4.1.2.(1)-I
Vent Header

Note to Figure A-1.4.1.2.(1)-I:
(1) Although a vent header is similar to a branch vent, it serves the special purpose of connecting the tops of stack vents or vent stacks. To make certain that it is adequate for that purpose, it is made larger than a branch vent. The developed length used to determine its size is the total length from the most distant soil-or-waste pipe to outside air, rather than the shorter length used to size a branch vent.

Nominally Horizontal and Nominally Vertical
Figure A-1.4.1.2.(1)-K
Offset
A-1.5.1.1.(1) Application of Referenced Documents. Documents referenced in the By-law may contain provisions covering a wide range of issues, including issues that are unrelated to the objectives and functional statements stated in Parts 2 and 3 of Division A respectively; e.g. conservation of water resources. Sentence 1.5.1.1.(1) is intended to make it clear that, whereas referencing these documents in the By-law generally has the effect of making the provisions of those documents part of the By-law, provisions that are unrelated to plumbing systems or to the objectives and functional statements attributed to the provisions in Division B where the document is referenced are excluded.

Furthermore, many documents referenced in the By-law contain references to other documents, which may also, in turn, refer to other documents. These secondary and tertiary referenced documents may contain provisions that are unrelated to plumbing systems or to the objectives and functional statements of the By-law: such provisions – no matter how far down the chain of references they occur – are not included in the intent of Sentence 1.5.1.1.(1).
Part 2
Objectives

Section 2.1. Application

2.1. Application

2.1.1. Application

1) This Part applies to all plumbing systems covered in this By-law. (See Article 1.1.1.1.)

2.1.1.2. Application of Objectives

1) The objectives described in this Part apply
   a) to all plumbing systems covered in this By-law (See Article 1.1.1.1.), and
   b) only to the extent that they relate to compliance with this By-law as required in Article 1.2.1.1.

Section 2.2. Objectives

2.2. Objectives

2.2.1. Objectives

2.2.1.1. Objectives

1) The objectives of this By-law are as follows (See Note A-2.2.1.1.(1)).:

OS Safety
An objective of this By-law is to limit the probability that, as a result of the design or installation of the plumbing system, a person in or adjacent to the building or facility will be exposed to an unacceptable risk of injury.

OS1 Fire Safety
An objective of this By-law is to limit the probability that, as a result of the design or installation of the plumbing system, a person in or adjacent to the building or facility will be exposed to an unacceptable risk of injury due to fire. The risks of injury due to fire addressed in this By-law are those caused by –

OS1.1 – fire or explosion occurring
OS1.4 – fire safety systems failing to function as expected

OS2 Structural Safety
An objective of this By-law is to limit the probability that, as a result of the design or installation of the plumbing system, a person in or adjacent to the building will be exposed to an unacceptable risk of injury due to structural failure. The risks of injury due to structural failure addressed in this By-law are those caused by –

OS2.1 – loads bearing on the building elements that exceed their load-bearing capacity

OS3 Safety in Use
An objective of this By-law is to limit the probability that, as a result of the design or installation of the plumbing system, a person in or adjacent to the building or facility will be exposed to an unacceptable risk of injury due to hazards. The risks of injury due to hazards addressed in this By-law are those caused by –

OS3.1 – tripping, slipping, falling, contact, drowning or collision
OS3.2 – contact with hot surfaces or substances
OS3.4 – exposure to hazardous substances
OH Health
An objective of this By-law is to limit the probability that, as a result of the design or installation of the plumbing system, a person will be exposed to an unacceptable risk of illness.

OH1 Indoor Conditions
An objective of this By-law is to limit the probability that, as a result of the design or installation of the plumbing system, a person in the building or facility will be exposed to an unacceptable risk of illness due to indoor conditions. The risks of illness due to indoor conditions addressed in this By-law are those caused by –

OH1.1 – inadequate indoor air quality

OH2 Sanitation
An objective of this By-law is to limit the probability that, as a result of the design or installation of the plumbing system, a person in the building or facility will be exposed to an unacceptable risk of illness due to unsanitary conditions. The risks of illness due to unsanitary conditions addressed in this By-law are those caused by –

OH2.1 – exposure to human or domestic waste
OH2.2 – consumption of contaminated water
OH2.3 – inadequate facilities for personal hygiene
OH2.4 – contact with contaminated surfaces

OH5 Hazardous Substances Containment
An objective of this By-law is to limit the probability that, as a result of the design or installation of the plumbing system, the public will be exposed to an unacceptable risk of illness due to the release of hazardous substances from the building or facility.

OP Protection of the Building or Facility from Water and Sewage Damage

OP5 Protection of the Building or Facility from Water and Sewage Damage
An objective of this By-law is to limit the probability that, as a result of the design or installation of the plumbing system, the building or facility will be exposed to an unacceptable risk of damage due to the leakage of service water or sewage.

OE Environment
An objective of this By-law is to limit the probability that, as a result of the design, construction or renovation of the building or of the plumbing system, the environment will be affected in an unacceptable manner.

OE1 Energy Efficiency and Water Use
An objective of this By-law is to limit the probability that, as a result of the design construction or renovation of the building, the use of energy will be inefficient or the use of water will be excessive. The risks of inefficient energy use or excessive water use addressed in this By-law are those caused by –

OE1.2 – excessive use of water by plumbing fixtures and water distribution systems
Notes to Part 2

Objectives

A-2.2.1.1.(1) Objectives.

Listing of objectives
Any gaps in the numbering sequence of the objectives are due to the fact that there is a master list of objectives covering the three principal By-law Documents – the Building By-law Book I (General), Building By-law Book II (Plumbing Systems) and the Fire By-law – but not all objectives are pertinent to all By-laws.

The building or facility
Where the term “the building or facility” is used in the wording of the objectives, it refers to the building or facility for which compliance with the Building By-law Book II (Plumbing Systems) is being assessed.
Part 3
Functional Statements

Section 3.1. Application

3.1. Application

3.1.1. Application

1) This Part applies to all plumbing systems covered in this By-law. (See Article 1.1.1.1.)

3.1.1.2. Application of Functional Statements

1) The functional statements described in this Part apply
   a) to all plumbing systems covered in this By-law (See Article 1.1.1.1.), and
   b) only to the extent that they relate to compliance with this By-law as required in Article 1.2.1.1.

Section 3.2. Functional Statements

3.2. Functional Statements

3.2.1. Functional Statements

1) The objectives of this By-law are achieved by measures, such as those described in the acceptable solutions in Division B, that are intended to allow the plumbing system to perform the following functions (See Note A-3.2.1.1.(1).):
   F01 To minimize the risk of accidental ignition.
   F02 To limit the severity and effects of fire or explosions.
   F20 To support and withstand expected loads and forces.
   F21 To limit or accommodate dimensional change.
   F30 To minimize the risk of injury to persons as a result of tripping, slipping, falling, contact, drowning or collision.
   F31 To minimize the risk of injury to persons as a result of contact with hot surfaces or substances.
   F40 To limit the level of contaminants.
   F41 To minimize the risk of generation of contaminants.
   F43 To minimize the risk of release of hazardous substances.
   F45 To minimize the risk of the spread of disease through communal shower facilities.
   F46 To minimize the risk of contamination of potable water.
   F62 To facilitate the dissipation of water and moisture from the building.
   F70 To provide potable water.
   F71 To provide facilities for personal hygiene.
   F72 To provide facilities for the sanitary disposal of human and domestic wastes.
   F75 To minimize obstacles for future modification to provide access (See Sentence 3.1.1.2.(4) for application limitation).
   F80 To resist deterioration resulting from expected service conditions.
   F81 To minimize the risk of malfunction, interference, damage, tampering, lack of use or misuse.
   F82 To minimize the risk of inadequate performance due to improper maintenance or lack of maintenance.
   F130 To limit the unnecessary demand and/or consumption of water for fixtures.
   F131 To limit the unnecessary demand and/or consumption of water for fittings.
Notes to Part 3
Functional Statements

A-3.2.1.1.(1) Listing of Functional Statements. The numbered functional statements are grouped according to functions that deal with closely related subjects. For example, the first group deals with fire risks, the second group deals with the structural properties of piping materials, etc. There may be gaps in the numbering sequence for the following reasons:

- Each group has unused numbers which allows for the possible future creation of additional functional statements within any one group.
- There is a master list of functional statements covering the three principal By-law Documents – the Building By-law Book I (General), Building By-law Book II (Plumbing Systems) and the Fire By-law – but not all functional statements are pertinent to all By-laws.
Division B
Acceptable Solutions
Part 1

General

Section 1.1. General

1.1. Application

1.1.1. Application

1) This Part applies to all plumbing systems covered in this By-law. (See Article 1.1.1. of Division A.)

1.1.2. Objectives and Functional Statements

1.1.2.1. Attribution to Acceptable Solutions

1) For the purposes of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in Division B shall be the objectives and functional statements identified in Section 2.8. (See Note A-1.1.2.1.(1).)

Section 1.2. Terms and Abbreviations

1.2. Definitions of Words and Phrases

1.2.1. Non-defined Terms

1) Words and phrases used in Division B that are not included in the list of definitions in Article 1.4.1.2. of Division A shall have the meanings that are commonly assigned to them in the context in which they are used, taking into account the specialized use of terms by the various trades and professions to which the terminology applies.

2) Where objectives and functional statements are referred to in Division B, they shall be the objectives and functional statements described in Parts 2 and 3 of Division A.

3) Where acceptable solutions are referred to in Division B, they shall be the provisions stated in Part 2.

1.2.2. Defined Terms

1) The words and terms in italics in Division B shall have the meanings assigned to them in Article 1.4.1.2. of Division A.

1.2.2. Symbols and Other Abbreviations

1.2.2.1. Symbols and Other Abbreviations

1) The symbols and other abbreviations in Division B shall have the meanings assigned to them in Article 1.4.2.1. of Division A and Article 1.3.2.1.

Section 1.3. Referenced Documents and Organizations

1.3.1. Referenced Documents

1.3.1. Effective Date

1) Unless otherwise specified herein, the documents referenced in this By-law shall include all amendments, revisions, reaffirmations, reapprovals, addenda and supplements effective to 30 June 2014.
### 1.3.1.2. Applicable Editions

1) Where documents are referenced in this By-law, they shall be the editions or versions designated in Table 1.3.1.2.

#### Table 1.3.1.2.

**Notes to Table 1.3.1.2.:**

1. Some documents may have been reaffirmed or reapproved. Check with the applicable issuing agency for up-to-date information.
2. Some titles have been abridged to omit superfluous wording.
3. By-law reference is in Division A.
4. The current version in effect.

#### 1.3.2. Organizations

**1.3.2.1. Abbreviations of Proper Names**

1. The abbreviations of proper names in this By-law shall have the meanings assigned to them in this Article.

   - **ANSI** American National Standards Institute (www.ansi.org)
   - **ASHRAE** American Society of Heating, Refrigerating and Air-Conditioning Engineers (www.ashrae.org)
   - **ASME** American Society of Mechanical Engineers (www.asme.org)
   - **ASPE** American Society of Plumbing Engineers (www.aspe.org)
   - **ASSE** American Society of Sanitary Engineering (www.asse-plumbing.org)
   - **ASTM** American Society for Testing and Materials International (www.astm.org)
   - **AWS** American Welding Society (www.aws.org)
   - **AWWA** American Water Works Association (www.awwa.org)
   - **CAN** National Standard of Canada designation
   - **CCBFC** Canadian Commission on Building and Fire Codes (see NRC)
   - **CGSB** Canadian General Standards Board (www.tpsgc-pwgsc.gc.ca/ongc-cgsb/index-eng.html)
   - **CoV** City of Vancouver (www.vancouver.ca)
   - **CSA** CSA Group (www.csagroup.org)
   - **EPA** United States Environmental Protection Agency (www.epa.gov)
   - **IAPMO** International Association of Plumbing and Mechanical Officials (www.iapmo.org)
   - **NBC** National Building Code of Canada 2015
   - **NFC** National Fire Code of Canada 2015
   - **NFPA** National Fire Protection Association (www.nfpa.org)
   - **NIST** National Institute of Standards and Technology (www.nist.gov)
   - **NPC** National Plumbing Code of Canada 2015
   - **NRC** National Research Council of Canada (www.nrc-cnrc.gc.ca)
   - **NRC-IRC** National Research Council of Canada, Institute for Research in Construction (former name of NRC Construction)
   - **NSF** NSF International (www.nsf.org)
   - **ULC** ULC Standards (canada.ul.com/ulcstandards)
Notes to Part 1

General

A-1.1.2.1.(1) Objectives and Functional Statements Attributed to Acceptable Solutions. The objectives and functional statements attributed to each By-law provision are shown in Table 2.8.1.1.

Many provisions in Division B serve as modifiers of or pointers to other provisions or serve other clarification or explanatory purposes. In most cases, no objectives and functional statements have been attributed to such provisions, which therefore do not appear in the above-mentioned table.

For provisions that serve as modifiers of or pointers to other referenced provisions and that do not have any objectives and functional statements attributed to them, the objectives and functional statements that should be used are those attributed to the provisions they reference.
Part 2
Plumbing Systems

Section 2.1. General

2.1. Application

2.1.1. Application
   1) This Part applies to all plumbing systems covered in this By-law. (See Article 1.1.1.1. of Division A.)

2.1.2. Service Connections

2.1.2.1. Sanitary Drainage Systems
   1) Except as provided in Section 2.7., every sanitary drainage system shall be connected to a public sanitary sewer, a public combined sewer or a private sewage disposal system.
   2) A combined building drain shall not be installed. (See Note A-2.1.2.1.(2.).)

2.1.2.2. Storm Drainage Systems
   1) Except as provided in Section 2.7., every storm drainage system shall be connected to a public storm sewer, a public combined sewer or a designated storm water disposal location.

2.1.2.3. Water Distribution Systems
   1) Except as provided in Section 2.7., every water distribution system shall be connected to a public water main or a potable private water supply system.

2.1.2.4. Separate Services
   1) Piping in any building connected to the public services shall be connected separately from piping of any other building, except that an ancillary building on the same property may be served by the same service. (See Note A-2.1.2.4.(1.).)

2.1.3. Location of Fixtures

2.1.3.1. Lighting and Ventilation Requirements
   1) Plumbing fixtures shall not be installed in a room that is not lighted and ventilated in accordance with the appropriate requirements in Parts 3, 6 and 9 of Division B of Book I (General) of this By-law.

2.1.3.2. Accessibility
   1) Every fixture, appliance, interceptor, cleanout, valve, device or piece of equipment shall be located so that it is readily accessible for use, cleaning and maintenance.

Section 2.2. Materials and Equipment

2.2. General

2.2.1. Exposure of Materials
   1) Where unusual conditions exist, such as excessively corrosive soil or water, only materials suited for use in such locations shall be used.
2) Materials and equipment used in a drainage system where excessively corrosive wastes or storm water are present shall be suitable for the purpose.

2.2.1.2. Restrictions on Re-Use
1) Materials and equipment that have been used for a purpose other than the distribution of potable water shall not be subsequently used in a potable water system.

2.2.1.3. Identification
1) Every length of pipe and every fitting shall
   a) have cast, stamped or indelibly marked on it the maker’s name or mark and the weight or class or quality of the product, or
   b) be marked in accordance with the relevant standard.
2) Markings required in Sentence (1) shall be visible after installation.

2.2.1.4. Pipe or Piping
1) Where the term pipe or piping is used, it shall also apply to tube or tubing unless otherwise stated.

2.2.1.5. Withstanding Pressure
1) Piping, fittings and joints used in pressure sewer, forcemain or sump pump discharge applications shall be capable of withstanding at least one and one-half times the maximum potential pressure.

2.2.1.6. Working Pressure of a Water Service Pipe
1) The working pressure rating of a water service pipe shall not be less than the maximum water main pressure at their point of connection as established by the City.

2.2.2. Fixtures

2.2.2.1. Surface Requirements
1) Every fixture shall have a smooth, hard, corrosion-resistant surface free of flaws and blemishes that may interfere with cleaning.

2.2.2.2. Conformance to Standards
1) Except as provided in Article 2.2.2.3.,
   a) fixtures shall conform to CAN/CSA-B45 Series, “Plumbing Fixtures,”
   b) vitreous china fixtures shall conform to ASME A112.19.2/CSA B45.1, “Ceramic Plumbing Fixtures,”
   c) enamelled cast-Iron fixtures shall conform to ASME A112.19.1/CSA B45.2, “Enamelled Cast Iron and Enamelled Steel Plumbing Fixtures,”
   d) porcelain-enamelled steel fixtures shall conform to ASME A112.19.1/CSA B45.2, “Enamelled Cast Iron and Enamelled Steel Plumbing Fixtures,”
   e) stainless steel fixtures shall conform to ASME A112.19.3/CSA B45.4, “Stainless Steel Plumbing Fixtures,”
   f) plastic fixtures shall conform to CSA B45.5/IAPMO Z124, “Plastic Plumbing Fixtures,”
   g) hydromassage bathtubs shall conform to ASME A112.19.7/CSA B45.10, “Hydromassage Bathtub Systems,” and
   h) macerating toilet systems shall conform to CAN/CSA-B45.9, “Macerating Systems and Related Components.”

2.2.2.3. Showers
1) Shower receptors shall be constructed and arranged so that water cannot leak through the walls or floor.
2) Not more than 6 shower heads shall be served by a single shower drain.
3) Where 2 or more shower heads are served by a shower drain, the floor shall be sloped and the drain located so that water from one head cannot flow over the area that serves another head. (See Note A-2.2.2.3.(3).)

4) Except for column showers, when a battery of shower heads is installed, the horizontal distance between 2 adjacent shower heads shall be not less than 750 mm.

2.2.4. Concealed Overflows

1) A dishwashing sink and a food preparation sink shall not have concealed overflows. (See Note A-2.2.2.4.(1).)

2.2.5. Water Closets in Public Washrooms

1) When a water closet is installed in a washroom for public use, it shall be of the elongated type and provided with a seat of the open front type.

2.2.3. Traps and Interceptors

2.2.3.1. Traps

1) Except as provided for in Sentence (2), traps shall
   a) have a trap seal depth of not less than 38 mm,
   b) be so designed that failure of the seal walls will cause exterior leakage, and
   c) have a water seal that does not depend on the action of moving parts.
   (See Note A-2.2.3.1.(1) and (3).)

2) The trap seal depth on fixtures draining to an acid waste system shall be a minimum of 50 mm.

3) Except for a floor-mounted service sink, every trap that serves a lavatory, a sink or a laundry tray shall
   a) be provided with a cleanout plug located at the lowest point of the trap and of the same material as the trap, except that a cast-iron trap shall be provided with a brass cleanout plug, or
   b) be designed so that part of the trap can be removed for cleaning purposes.
   (See Notes A-2.2.3.1.(1) and (3).)

4) A bell trap shall not be installed in a drainage system. (See Note A-2.2.3.1.(4).)

5) A drum trap shall not be used as a fixture trap unless required to serve as an interceptor and access for servicing is provided.

6) A bottle trap may be used on a laboratory sink or other fixture equipped with corrosion resistant fittings.

2.2.3.2. Interceptors

1) Interceptors shall be designed so that it can be readily cleaned.

2) Grease interceptors shall
   a) be designed so that it does not become air bound, and
   b) not have a water jacket.

3) Grease interceptors shall be selected and installed in conformance with
   a) CSA B481.0, “Material, Design, and Construction Requirements for Grease Interceptors,” and
   b) CSA B481.3, “Sizing, Selection, Location, and Installation of Grease Interceptors.”
   (See Note A-2.2.3.2.(3).)

2.2.3.3. Tubular Traps

1) Tubular metal or plastic traps conforming to ASME A112.18.2/CSA B125.2, “Plumbing Waste Fittings,” shall be used only in accessible locations.

2.2.4. Pipe Fittings

2.2.4.1. T and Cross Fittings
   (See Note A-2.2.4.1.)
1) A T fitting shall not be used in a drainage system, except to connect a vent pipe.
2) A cross fitting shall not be used in a drainage system.

2.2.4.2. Sanitary T Fittings
(See Note A-2.2.4.2.)
1) A single or double sanitary T fitting shall not be used in a nominally horizontal soil-or-waste pipe, except that a single sanitary T fitting may be used to connect a vent pipe.
2) A double sanitary T fitting shall not be used to connect the trap arms of
   a) back outlet water closets installed back-to-back, or
   b) 2 urinals where no cleanout fitting is provided above the connection.

2.2.4.3. 90° Elbows
1) Except as permitted in Sentence (2), 90° elbows of 4 inch size or less whose centre-line radius is less than the size of the pipe shall not be used to join 2 soil-or-waste pipes.
2) For sanitary drainage systems of 4 inch size or less, 90° elbows described in Sentence (1) shall only be permitted
   a) to change the direction of piping from horizontal to vertical, in the direction of flow,
   b) where a trap arm enters a wall, or
   c) to connect trap arms as permitted by Sentence 2.5.6.3.(2).

2.2.5. Non-Metallic Pipe and Fittings
(For a summary of pipe applications, see Notes A-2.2.5., 2.2.6. and 2.2.7.)

2.2.5.1. Asbestos-Cement Pipe and Fittings
1) Reserved.
2) Reserved.
3) Asbestos-cement pipe shall not be used in new construction.

2.2.5.2. Concrete Pipe and Fittings
1) Concrete pipe shall conform to
   a) CSA A257.1, “Non-Reinforced Circular Concrete Culvert, Storm Drain, Sewer Pipe, and Fittings,” or
   b) CSA A257.2, “Reinforced Circular Concrete Culvert, Storm Drain, Sewer Pipe, and Fittings.”
2) Joints with internal elastomeric gaskets shall conform to CSA A257.3, “Joints for Circular Concrete Sewer and Culvert Pipe, Manhole Sections, and Fittings Using Rubber Gaskets.”
3) Concrete fittings fabricated on the site from lengths of pipe shall not be used. (See Note A-2.2.5.2.(3).)
4) Concrete pipe shall not be used above ground inside a building.
5) Precast reinforced circular concrete manhole sections, catch basins and fittings shall conform to CSA A257.4, “Precast Reinforced Circular Concrete Manhole Sections, Catch Basins, and Fittings.”

2.2.5.3. Vitrified Clay Pipe and Fittings
1) Vitrified clay pipe and fittings shall conform to CSA A60.1-M, “Vitrified Clay Pipe.”
2) Couplings and joints for vitrified clay pipe shall conform to CSA A60.3-M, “Vitrified Clay Pipe Joints.”
3) Vitrified clay pipe and fittings shall not be used except for an underground part of a drainage system.

2.2.5.4. Polyethylene Pipe and Fittings
1) Polyethylene water pipe, tubing and fittings shall conform to Series 160 of CAN/CSA-B137.1, “Polyethylene (PE) Pipe, Tubing, and Fittings for Cold-Water Pressure Services.”
2) Polyethylene water pipe shall not be used except for a water service pipe.
2.2.5.5. Polyethylene Pipe Used Underground

1) Polyethylene pipe used underground outside a building for the rehabilitation of existing drainage systems using trenchless technology shall conform to ASTM F 714, “Polyethylene (PE) Plastic Pipe (DR-PR) Based on Outside Diameter,” and shall be HDPE 3408 and SDR 11 or heavier. (See Note A-2.2.5.5.(1).)

2.2.5.6. Crosslinked Polyethylene Pipe and Fittings

1) Crosslinked polyethylene pipe and its associated fittings used in hot and cold potable water systems shall conform to CAN/CSA-B137.5, “Crosslinked Polyethylene (PEX) Tubing Systems for Pressure Applications.” (See Note A-2.2.5.6.(1).)

2.2.5.7. PVC Pipe and Fittings

1) PVC water pipe, fittings and solvent cement shall
   a) conform to CAN/CSA-B137.3, “Rigid Polyvinylchloride (PVC) Pipe and Fittings for Pressure Applications,” and
   b) have a pressure rating of not less than 1 100 kPa.
2) PVC water pipe fittings shall conform to
   a) ASTM D 2466, “Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40,” or
   b) ASTM D 2467, “Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80.”
3) PVC injection-moulded gasketed fittings shall conform to CAN/CSA-B137.2, “Polyvinylchloride (PVC) Injection-Moulded Gasketed Fittings for Pressure Applications.”
4) PVC water pipe and fittings referred to in Sentences (1), (2) and (3) shall not be used in a hot water system.

2.2.5.8. CPVC Pipe, Fittings and Solvent Cements

1) CPVC hot and cold water pipe, fittings and solvent cements shall conform to CAN/CSA-B137.6, “Chlorinated Polyvinylchloride (CPVC) Pipe, Tubing, and Fittings for Hot- and Cold-Water Distribution Systems.”
2) The design temperature and design pressure of a CPVC piping system shall conform to Table 2.2.5.8.

2.2.5.9. Plastic Pipe, Fittings and Solvent Cement Used Underground
(See Notes A-2.2.5.9. to 2.2.5.11.)
1) Plastic pipe, fittings and solvent cement used underground outside a building or under a building in a drainage system shall conform to
   c) CAN/CSA-B181.2, “Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Drain, Waste, and Vent Pipe and Pipe Fittings,”
   d) CAN/CSA-B182.1, “Plastic Drain and Sewer Pipe and Pipe Fittings,” with a pipe stiffness not less than 320 kPa,
   e) CAN/CSA-B182.2, “PSM Type Polyvinylchloride (PVC) Sewer Pipe and Fittings,” with a pipe stiffness not less than 320 kPa,
   f) CAN/CSA-B182.4, “Profile Polyvinylchloride (PVC) Sewer Pipe and Fittings,” with a pipe stiffness not less than 320 kPa,
   g) CAN/CSA-B182.6, “Profile Polyethylene (PE) Sewer Pipe and Fittings For Leak-Proof Sewer Applications,” with a pipe stiffness of not less than 320 kPa, or
   h) CAN/CSA-B182.8, “Profile Polyethylene (PE) Storm Sewer and Drainage Pipe and Fittings,” for Type 1 joints and non-perforated pipes.

2.2.5.10. Transition Solvent Cement
(See Notes A-2.2.5.9. to 2.2.5.11.)
1) Solvent cement for transition joints shall conform to
   b) CAN/CSA-B181.2, “Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Drain, Waste, and Vent Pipe and Pipe Fittings.”
2) Transition solvent cement shall only be used for joining an ABS drainage system to a PVC drainage system.

2.2.5.11. Plastic Pipe, Fittings and Solvent Cement Used in Buildings
(See Notes A-2.2.5.9. to 2.2.5.11.)
1) Plastic pipe, fittings and solvent cement used inside or under a building in a drainage or venting system shall conform to
   c) CAN/CSA-B181.2, “Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Drain, Waste, and Vent Pipe and Pipe Fittings.”
2) Requirements for combustible piping in relation to fire safety shall conform to Sentences 3.1.5.19.(1) and 9.10.9.6.(3) to (11), and Articles 3.1.9.5. and 9.10.9.7. of Division B of Book I (General) of this By-law.
3) Where noncombustible piping pierces a fire separation or a fire stop, the requirements of fire stopping of Subsection 3.1.9., Sentence 9.10.9.6.(1) and Article 9.10.16.4. of Division B of Book I (General) of this By-law shall apply.

2.2.5.12. Polyethylene/Aluminum/Polyethylene Composite Pipe and Fittings
1) PE/AL/PE composite pipe and fittings shall conform to CAN/CSA-B137.9, “Polyethylene/Aluminum/Polyethylene (PE-AL-PE) Composite Pressure-Pipe Systems.” (See Note A-2.2.5.12.(1).)
2) Except as provided in Sentences (3) and (4), PE/AL/PE pipe and fittings shall not be used in hot water systems.
3) PE/AL/PE pipe with a pressure rating of 690 kPa or greater at 82°C shall be permitted for hot water systems.
4) PE/AL/PE pipe with a pressure rating of 690 kPa or greater at 82°C shall be used with fittings that conform to CAN/CSA-B137.10, “Crosslinked Polyethylene/Aluminum/Crosslinked Polyethylene (PEX-AL-PEX) Composite Pressure-Pipe Systems,” in hot water systems.

2.2.5.13. Crosslinked Polyethylene/Aluminum/Crosslinked Polyethylene Composite Pressure Pipe and Fittings

1) PEX/AL/PEX composite pipe and fittings used in hot and cold potable water systems shall conform to CAN/CSA-B137.10, “Crosslinked Polyethylene/Aluminum/Crosslinked Polyethylene (PEX-AL-PEX) Composite Pressure-Pipe Systems.” (See Note A-2.2.5.13.(1).)

2.2.5.14. Polypropylene Pipe and Fittings

1) Polypropylene pipe and fittings used for hot and cold potable water systems shall conform to CAN/CSA-B137.11, “Polypropylene (PP-R) Pipe and Fittings for Pressure Applications.” (See Note A-2.2.5.14.(1).)

2.2.6. Ferrous Pipe and Fittings

(For a summary of pipe applications, see Note A-2.2.5., 2.2.6. and 2.2.7.)

2.2.6.1. Cast-Iron Drainage and Vent Pipe and Fittings

1) Drainage piping, vent piping and fittings made of cast iron shall conform to CSA B70, “Cast Iron Soil Pipe, Fittings, and Means of Joining.”
2) Cast-iron soil pipe and fittings shall not be used in a water system.

2.2.6.2. Maintenance Holes and Catch Basins

1) Cast-iron frames and covers for maintenance holes and catch basins shall conform to CSA B70.1, “Frames and Covers for Maintenance Holes and Catchbasins.”

2.2.6.3. Reserved

2.2.6.4. Threaded Cast-Iron Drainage Fittings

1) Threaded cast-iron drainage fittings shall conform to ASME B16.12, “Cast Iron Threaded Drainage Fittings.”
2) Threaded cast-iron drainage fittings shall not be used in a water system.

2.2.6.5. Cast-Iron Water Pipes

4) Rubber gasket joints for cast-iron and ductile-iron pressure pipe for water shall conform to ANSI/AWWA C111/A21.11, “Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.”

2.2.6.6. Screwed Cast-Iron Water Fittings

1) Screwed cast-iron water fittings shall conform to ASME B16.4, “Gray Iron Threaded Fittings: Classes 125 and 250.”
2) Screwed cast-iron water fittings used in a water system shall be cement-mortar lined or galvanized.
3) Screwed cast-iron water fittings shall not be used in a drainage system.
2.2.6.7. Screwed Malleable Iron Water Fittings

1) Screwed malleable iron water fittings shall conform to ASME B16.3, “Malleable-Iron Threaded Fittings: Classes 150 and 300.”
2) Screwed malleable iron water fittings used in a water system shall be cement-mortar lined or galvanized.
3) Screwed malleable iron water fittings shall not be used in a drainage system.

2.2.6.8. Steel Pipe

1) Except as provided in Sentences (2) and (3), welded and seamless steel pipe shall not be used in a plumbing system.
2) Galvanized steel pipe is permitted to be used in a drainage system or a venting system above ground inside a building.
3) Galvanized steel pipe and fittings shall not be used in a water distribution system except
   a) in buildings of industrial occupancy as described in Book I (General) of this By-law, or
   b) for the repair of existing galvanized steel piping systems.
   (See Note A-2.2.6.8.(3).)
4) Galvanized steel pipe and fittings shall conform to ASTM A 53/A 53M, “Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.”

2.2.6.9. Corrugated Steel Pipe and Couplings

1) Corrugated steel pipe and couplings shall conform to CSA G401, “Corrugated Steel Pipe Products.”
2) Corrugated steel pipe shall only be used underground outside a building in a storm drainage system.
3) Couplings for corrugated steel pipe shall be constructed so that when installed they shall
   a) maintain the pipe alignment,
   b) resist the separation of adjoining lengths of pipe,
   c) prevent root penetration, and
   d) prevent the infiltration of surrounding material.

2.2.6.10. Sheet Metal Leaders

1) A sheet metal leader shall not be used except above ground outside a building.

2.2.6.11. Stainless Steel Pipe

1) Stainless steel pipe shall conform to
   a) ASME B36.19M, “Stainless Steel Pipe,”
   b) ASTM A 312/A 312M, “Seamless, Welded, and Heavily Cold Worked Stainless Steel Pipes,” and
   c) NSF/ANSI 61, “Drinking Water System Components – Health Effects.”
2) Only grade 304/304L or 316/316L stainless steel pipe shall be used.

2.2.6.12. Stainless Steel Butt Weld Pipe Fittings

1) Stainless steel butt weld pipe fittings shall conform to
   a) ASME B16.9, “Factory-Made Wrought Buttwelding Fittings,”
   b) ASTM A 403/A 403M, “Wrought Austenitic Stainless Steel Piping Fittings,” and
   c) NSF/ANSI 372, “Drinking Water System Components – Lead Content.”
2) Stainless steel butt weld pipe fittings shall be made of a material that matches the grade of the pipe material used.

2.2.6.13. Stainless Steel Pipe Flanges

1) Stainless steel pipe flanges shall conform to
   b) NSF/ANSI 372, “Drinking Water System Components – Lead Content,” and
2.2.6.14. Stainless Steel Threaded Fittings

1) Stainless steel threaded fittings shall be schedule 40s or greater conforming to NSF/ANSI 372, “Drinking Water System Components – Lead Content,” and
   a) ASTM A 182/A 182M, “Forged or Rolled Alloy and Stainless Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service,” or
   b) ASTM A 351/A 351M, “Castings, Austenitic, for Pressure-Containing Parts.”

2) Stainless steel thread fittings shall be made of a material that matches the grade of the pipe material used.

2.2.6.15. Stainless Steel Tube

1) Stainless steel tube shall conform to
   a) ASME B16.9, “Factory-Made Wrought Buttwelding Fittings,” and
   b) ASTM A 269, “Seamless and Welded Austenitic Stainless Steel Tubing for General Service.”

2) Only grade 304/304L or 316/316L stainless steel tube shall be used.

2.2.6.16. Stainless Steel Pipe and Tube

1) The use of stainless steel pipe and tube shall conform to Table 2.2.6.16.

2.2.7. Non-Ferrous Pipe and Fittings

(For a summary of pipe applications, see Note A-2.2.5., 2.2.6. and 2.2.7.)

2.2.7.1. Copper and Brass Pipe

1) Copper pipe shall conform to ASTM B 42, “Seamless Copper Pipe, Standard Sizes.”

2.2.7.2. Brass or Bronze Pipe Flanges and Flanged Fittings

1) Brass or bronze pipe flanges and flanged fittings shall conform to ASME B16.24, “Cast Copper Alloy Pipe Flanges and Flanged Fittings: Classes 150, 300, 600, 900, 1500, and 2500.”
2.2.7.3. Brass or Bronze Threaded Water Fittings
   1) Brass or bronze threaded water fittings shall conform to ASME B16.15, “Cast Copper Alloy Threaded Fittings: Classes 125 and 250.”
   2) Brass or bronze threaded water fittings shall not be used in a drainage system.

2.2.7.4. Copper Tube
   1) Copper tube shall conform to
      a) ASTM B 88, “Seamless Copper Water Tube,” or
      b) ASTM B 306, “Copper Drainage Tube (DWV).”
   2) Except as provided in Sentence (3), the use of copper tube shall conform to Table 2.2.7.4.
   3) Copper tube shall not be used for the fixture drain or the portion of the vent pipe below the flood level rim of manually flushing or waterless urinals.

2.2.7.5. Solder-Joint Drainage Fittings
   1) Solder-joint fittings for drainage systems shall conform to
      a) ASME B16.23, “Cast Copper Alloy Solder Joint Drainage Fittings: DWV,” or
      b) ASME B16.29, “Wrought Copper and Wrought Copper Alloy Solder-Joint Drainage Fittings – DWV.”
   2) Solder-joint fittings for drainage systems shall not be used in a water system.

2.2.7.6. Solder-Joint Water Fittings
   1) Except as provided in Sentence (2), solder-joint fittings for water systems shall conform to
      a) ASME B16.18, “Cast Copper Alloy Solder-Joint Pressure Fittings,” or
      b) ASME B16.22, “Wrought Copper and Copper Alloy Solder Joint Pressure Fittings.”
   2) Solder-joint fittings for water systems not made by casting or the wrought process shall conform to the applicable requirements of ASME B16.18, “Cast Copper Alloy Solder-Joint Pressure Fittings.”

2.2.7.7. Flared-Joint Fittings for Copper Water Systems
1) Flared-joint fittings for copper tube water systems shall conform to ASME B16.26, “Cast Copper Alloy Fittings for Flared Copper Tubes.”
2) Flared-joint fittings for copper tube water systems not made by casting shall conform to the applicable requirements of ASME B16.26, “Cast Copper Alloy Fittings for Flared Copper Tubes.”

2.2.7.8. Lead Waste Pipe and Fittings
1) Lead waste pipe and fittings shall not be used in a water system or as a building sewer.
2) When there is a change in size of a lead closet bend, the change shall be in the vertical section of the bend or made in a manner that prevents the retention of liquid in the bend.

2.2.8. Corrosion-Resistant Materials

2.2.8.1. Pipes and Fittings
1) Pipes and fittings to be used for drainage and venting of acid and corrosive wastes shall conform to
   a) ASTM A 518/A 518M, “Corrosion-Resistant High-Silicon Iron Castings,”
   b) ASTM C 1053, “Borosilicate Glass Pipe and Fittings for Drain, Waste, and Vent (DWV) Applications,” or
   c) CAN/CSA-B181.3, “Polyolefin and Polyvinylidene Fluoride (PVDF) Laboratory Drainage Systems.”

2.2.9. Jointing Materials

2.2.9.1. Cement Mortar
1) Cement mortar shall not be used for jointing.

2.2.9.2. Solders and Fluxes
1) Solders for solder joint fittings shall conform to ASTM B 32, “Solder Metal.”
2) Solders and fluxes having a lead content in excess of 0.2% shall not be used in a potable water system.
3) Fluxes for soldered joints shall conform to ASTM B 813, “Liquid and Paste Fluxes for Soldering of Copper and Copper Alloy Tube.”
4) Brazing alloys shall conform to ANSI/AWS A5.8M/A5.8, “Filler Metals for Brazing and Braze Welding,” BCuP range.

2.2.10. Miscellaneous Materials

2.2.10.1. Brass Floor Flanges
1) Brass floor flanges shall conform to CSA B158.1, “Cast Brass Solder Joint Drainage, Waste and Vent Fittings.”

2.2.10.2. Screws, Bolts, Nuts and Washers
1) Every screw, bolt, nut and washer shall be of corrosion-resistant materials when used
   a) to connect a water closet to a floor flange,
   b) to anchor the floor flange to the floor, or
   c) to anchor the water closet to the floor.

2.2.10.3. Cleanout Fittings
1) Every plug, cap, nut or bolt that is intended to be removable from a ferrous fitting shall be of a non-ferrous material.
2) A cleanout fitting that, as a result of normal maintenance operations, cannot withstand the physical stresses of removal and reinstallation or cannot ensure a gas-tight seal shall not be installed.
2.2.10.4. Mechanical Couplings
1) Groove- and shoulder-type mechanical couplings for pressure applications shall conform to CSA B242, “Groove- and Shoulder-Type Mechanical Pipe Couplings.”
2) Mechanical couplings for non-pressure applications shall conform to CAN/CSA-B602, “Mechanical Couplings for Drain, Waste, and Vent Pipe and Sewer Pipe.”

2.2.10.5. Saddle Hubs
1) A saddle hub or fitting shall not be installed in drainage, venting or water systems. (See Note A-2.2.10.5.(1).)

2.2.10.6. Supply and Waste Fittings
1) Supply fittings shall conform to
   a) ASME A112.18.1/CSA B125.1, “Plumbing Supply Fittings,” or
   b) CSA B125.3, “Plumbing Fittings.”
2) Supply fittings and individual shower heads shall have an integral means of limiting the maximum water flow rate to that specified in Table 2.2.10.6. (See Note A-2.2.10.6.(2).)

<p>| Table 2.2.10.6. Water Flow Rates from Supply Fittings Forming Part of Sentence 2.2.10.6.(2) |</p>
<table>

</tbody>
</table>

Notes to Table 2.2.10.6.:
(1) May be temporarily increased to a maximum flow rate of 8.3 L/min but must default to the lower flow rate upon release of the activation mechanism or closure of the faucet valve.
(2) A metering fixture faucet is limited to 1.0 L per cycle.
(3) A lavatory faucet in a health care facility is permitted a maximum flow rate of 8.3 L/min. The Chief Building Official may, for human health reasons, permit exemptions within other facilities, to a maximum flow rate of 8.3 L/min.
(4) Each pre-rinse spray valve shall be equipped with an automatic shut-off.
(5) Emergency and safety shower heads and shower heads in health care facilities and detention facilities are exempted from this requirement.
(6) A maximum flow rate of 6.8 L/min is permitted for each 500 mm of circumference. For a wash fountain with metering fixture faucets, a maximum of one metering fixture faucet is permitted for each 500 mm of circumference. A metering fixture faucet is limited to 1.0 L per cycle.

3) An automatic compensating valve serving an individual shower head addressed in Sentence (1) shall have a water flow rate equal to or less than the shower head it serves. (See Note A-2.2.10.6.(3).)
4) Where multiple shower heads installed in a public showering facility are served by one temperature control, each shower head shall be equipped with a device capable of automatically shutting off the flow of water when the shower head is not in use. (See Note A-2.2.10.6.(4) and (5).)
5) Each lavatory in a public washroom and each wash fountain shall be equipped with a device capable of automatically shutting off the flow of water when the lavatory is not in use. (See Note A-2.2.10.6.(4) and (5).)
2.2.10.7. Water Temperature Control
(See Note A-2.2.10.7.)
1) Except as provided in Sentence (2), valves supplying fixed-location shower heads shall be individual pressure-balanced or thermostatic-mixing valves conforming to ASME A112.18.1/CSA B125.1, “Plumbing Supply Fittings.”
2) Individual pressure-balanced or thermostatic-mixing valves shall not be required for shower heads having a single tempered water supply that is controlled by an automatic compensating valve conforming to CSA B125.3, “Plumbing Fittings.”
3) Mixing valves that supply shower heads shall be of the pressure-balanced, thermostatic, or combination pressure-balanced/thermostatic type capable of
   a) maintaining a water outlet temperature that does not exceed 49°C, and
   b) limiting thermal shock.
4) The temperature of water discharging into a bathtub shall not exceed 49°C.

2.2.10.8. Direct Flush Valves
1) Direct flush valves shall
   a) open fully and close positively under service pressure,
   b) complete their cycle of operation automatically,
   c) be provided with a means of regulating the volume of water that they discharge, and
   d) be provided with a vacuum breaker unless the fixture is designed so that back-siphonage cannot occur.

2.2.10.9. Drinking Fountain Bubblers
1) The orifice of drinking fountain bubblers shall
   a) be of the shielded type, and
   b) direct the water upward at an angle of approximately 45°.
2) Drinking fountain bubblers shall include a means of regulating the flow to the orifice.
3) Bubblers shall be installed only on drinking fountains. (See Note A-2.2.10.9.(3).)

2.2.10.10. Back-Siphonage Preventers and Backflow Preventers
1) Except as provided in Sentence (2), back-siphonage preventers and backflow preventers shall conform to
   a) CSA B64.0, “Definitions, General Requirements, and Test Methods for Vacuum Breakers and Backflow Preventers,”
   b) CSA B64.1.1, “Atmospheric Vacuum Breakers (AVB),”
   c) CSA B64.1.2, “Pressure Vacuum Breakers (PVB),”
   d) CSA B64.1.3, “Spill-Resistant Pressure Vacuum Breakers (SRPVB),”
   e) CSA B64.2, “Hose Connection Vacuum Breakers (HCVB),”
   f) CSA B64.2.1, “Hose Connection Vacuum Breakers (HCVB) with Manual Draining Feature,”
   g) CSA B64.2.2, “Hose Connection Vacuum Breakers (HCVB) with Automatic Draining Feature,”
   h) CSA B64.3, “Dual Check Valve Backflow Preventers with Atmospheric Port (DCAP),”
   i) CSA B64.4, “Reduced Pressure Principle (RP) Backflow Preventers,”
   j) CSA B64.5, “Double Check Valve (DCVA) Backflow Preventers,”
   k) CSA B64.6, “Dual Check Valve (DuC) Backflow Preventers,”
   l) CSA B64.7, “Laboratory Faucet Vacuum Breakers (LFVB),” or
   m) CSA B64.8, “Dual Check Valve Backflow Preventers with Intermediate Vent (DuCV),”
2) Back-siphonage preventers for tank-type water closets (anti-siphon fill valves) shall conform to CSA B125.3, “Plumbing Fittings.”

2.2.10.11. Relief Valves

2.2.10.12. Reducing Valves

2.2.10.13. Solar Domestic Hot Water

2.2.10.14. Vent Pipe Flashing
1) Flashing fabricated on-site for vent pipes shall be fabricated from
   a) copper sheet not less than 0.33 mm thick,
   b) aluminum sheet not less than 0.48 mm thick,
   c) alloyed zinc sheet not less than 0.39 mm thick,
   d) lead sheet not less than 1.73 mm thick,
   e) galvanized steel sheet not less than 0.33 mm thick, or
   f) polychloroprene (neoprene) not less than 2.89 mm thick.
2) Prefabricated flashing for vent pipes shall conform to CSA B272, “Prefabricated Self-Sealing Roof Vent Flashings.” (See Article 2.5.6.5. for location of vent pipe terminals.)

2.2.10.15. Water Hammer Arresters
1) Water hammer arresters shall conform to ANSI/ASSE 1010, “Water Hammer Arresters.”

2.2.10.16. Air Admittance Valves
1) Air admittance valves shall conform to ASSE 1051, “Individual and Branch Type Air Admittance Valves (AAVs) for Sanitary Drainage Systems.” (See Note A-2.2.10.16.(1)).

2.2.10.17. Water Treatment Systems
(See Article 2.6.2.1. and Note A-2.2.10.17.)
1) Except as provided in Sentence (3), a water treatment device or apparatus may be connected to the City water system at the discretion of the Chief Building Official and, if permitted
   a) an operating permit shall be obtained,
   b) the operating permit number assigned to a water treatment device or apparatus shall be posted on a sign or plate that is securely fastened to the water treatment device or apparatus in a location that is conspicuously visible and constructed of a durable, weather resistant material, and
   c) the Chief Building Official shall be notified within 30 days of any changes to the information that was last provided to the City with regard to the operating permit, in the form prescribed by the Chief Building Official.
2) Except as provided in Sentence (3), an existing water treatment device or apparatus shall comply with Clauses (1)(a), (b) and (c).
3) The requirements in Sentences (1) and (2) do not apply to a building used exclusively for residential occupancy containing no more than 4 principal dwelling units.

2.2.11. Building Appliances and Mechanical Systems

2.2.11.1. Building Appliances
1) Appliances listed in Table 2.2.11.1 shall comply with the applicable Energy Star program requirements.
### Table 2.2.11.1.
Appliance Energy Star Program Requirements
Forming Part of Sentence 2.2.11.1.(1)

**Notes to Table 2.2.11.1.:**

1. “Residential clothes washer” and “commercial clothes washer” are as defined by the Energy Star Program Requirements Product Specification for Clothes Washers.
2. “Residential dishwasher” is as per the definition of “dishwasher” by the Energy Star Program Requirements Product Specification for Residential Dishwashers.
3. “Commercial dishwasher” is as per the definition of “dishwashing machine” by the Energy Star Program Requirements Product Specification for Commercial Dishwashers. Dishwashers intended for laboratory applications are exempted.
4. “Commercial ice maker” is as per the definition of “automatic commercial ice maker” by the Energy Star Program Requirements Product Specification for Automatic Commercial Ice Makers.
5. “Commercial steam cooker” is as per the definition of “commercial steam cooker” by the Energy Star Program Requirements Product Specification for Commercial Steam Cookers.
6. “Combination oven” is as per the definition of “combination oven” by the Energy Star Program Requirements Product Specification for Commercial Ovens.

2) Clothes washers with a top-loading design that are designed for use in applications in which the occupants of more than one household will be using the clothes washer, such as multi-family housing common areas and coin laundries, shall not be installed.

### 2.2.11.2. Residential Landscape Irrigation Systems

1) Residential landscape irrigation systems that apply herbicides, fungicides, insecticides, fertilizers, soil amendments or other chemicals or pesticides by means of irrigation water are prohibited.

2) Where the water pressure supplied to a property exceeds 550 kPa, the residential landscape irrigation system shall be equipped with a pressure reducing valve providing a maximum supplied pressure of 415 kPa and located downstream of the backflow preventer.

### 2.2.11.3. Vehicle Wash Facilities

1) The maximum flow rate of a spray wand, foam brush or similar plumbing fixture used at a vehicle wash facility shall not exceed 11.4 L/min.

2) Where a machine cleans a vehicle at a vehicle wash facility,
   a) a water recycling system that recycles and reuses at least 60% of the water and rinse water shall be installed, used and maintained, and
   b) discharge shall be directed to an interceptor dedicated exclusively to the vehicle wash facility and designed to trap oil, gasoline, sand, grit and similar materials. (See Article 2.4.4.3.)

### 2.2.11.4. Non-recirculating Applications
1) Except as provided in Sentence (2), the City water system shall not be connected to
   a) once through cooling equipment,
   b) venturi-type flow-through vacuum generators or aspirators in which running water is used solely
      for the venturi effect,
   c) non-recirculating liquid ring pumps,
   d) non-recirculating wet-hood scrubbers,
   e) machinery powered by water,
   f) non-recirculating ponds, waterways, water features, ornamental fountains, or swimming pools,
   g) non-recirculating systems or equipment that use water for thermal conditioning of building
      surfaces or roofs, except that this does not apply to emergency fire protection of buildings, or
   h) non-recirculating systems or equipment that use water for melting or thawing. (See also
      Sentence 2.4.4.2.(2).)

2) Emergency once through cooling equipment or maintenance once through cooling equipment may be
   connected to the City water system at the discretion of the Chief Building Official or City Engineer and, if
   permitted
   a) an operating permit shall be obtained,
   b) the operating permit number assigned to the once through cooling equipment shall be posted on
      a sign or plate that is securely fastened to the once through cooling equipment in a location that is
      conspicuously visible and constructed of a durable, weather resistant material,
   c) the Chief Building Official shall be notified within 30 days of any changes to the information that
      was last provided to the City with regard to the operating permit, in the form prescribed by the Chief
      Building Official,
   d) a water meter shall be installed on the potable water supply to the once through cooling
      equipment and shall be capable of recording the volume of potable water being supplied, and
   e) the once through cooling equipment shall be capable of activating an alert whenever potable
      water is supplied to the once through cooling equipment. (See Note A-2.2.11.4.(2).)

2.2.11.5. Geoexchange Systems
1) Make-up water for a closed loop geoexchange (geothermal) ground heat exchanger shall be provided by
   a feeder tank isolated from the domestic water supply.
2) The use of a direct connection to the domestic water supply as a source of make-up water for a closed
   loop geoexchange (geothermal) ground heat exchanger is prohibited.
3) Methanol shall not be used for geoexchange (geothermal) applications.
4) An open loop geoexchange (geothermal) system serving a building used exclusively for residential
   occupancy containing no more than 4 principal dwelling units shall not be installed.
5) An open loop geoexchange (geothermal) system shall not discharge into the sewer.

Section 2.3. Piping

2.3.1. Application

2.3.1.1. General
1) This Section applies to the construction and use of joints and connections, and the arrangement,
   protection, support and testing of piping.

2.3.2. Construction and Use of Joints

2.3.2.1. Caulked Lead Drainage Joints
1) Caulked lead drainage joints shall not be used except for cast-iron pipe in a drainage system or venting
   system, or between such pipe and
a) other ferrous pipe,  
b) brass and copper pipe,  
c) a caulking ferrule, or  
d) a trap standard.

2) Every caulked lead drainage joint shall be firmly packed with oakum and tightly caulked with lead to a depth of not less than 25 mm.
3) No paint, varnish or other coating shall be applied on the lead until after the joint has been tested.
4) A length of hub and spigot pipe and pipe fittings in a drainage system shall be installed with the hub at the upstream end.

2.3.2.2. Wiped Joints
1) Wiped joints shall not be used except for sheet lead or lead pipe, or between such pipe and copper pipe or a ferrule.
2) Wiped joints in straight pipe shall  
   a) be made of solder,  
   b) have an exposed surface on each side of the joint at least 19 mm wide, and  
   c) be not less than 10 mm thick at the thickest part.
3) Wiped flanged joints shall be reinforced with a lead flange that is not less than 19 mm wide.

2.3.2.3. Screwed Joints
1) In making a screwed joint, the ends of the pipe shall be reamed or filed out to the size of the bore and all chips and cuttings shall be removed.
2) No pipe-joint cement or paint shall be applied to the internal threads.

2.3.2.4. Soldered Joints
1) Soldered joints shall be made in accordance with ASTM B 828, “Making Capillary Joints by Soldering of Copper and Copper Alloy Tube and Fittings.”

2.3.2.5. Flared Joints
1) In making a flared joint, the pipe shall be expanded with a proper flaring tool.
2) Flared joints shall not be used for hard (drawn) copper tube.

2.3.2.6. Mechanical Joints
1) Mechanical joints shall be made with compounded elastomeric rings that are held in compression by  
   a) stainless steel or cast-iron clamps, or  
   b) groove and shoulder type mechanical couplings.
(See Note A-2.3.2.6.(1).)

2.3.2.7. Cold-Caulked Joints
1) Cold-caulked joints shall not be used except for bell and spigot pipe in a water system, a drainage system or a venting system.
2) Caulking compound used in cold-caulked joints shall be applied according to the manufacturer’s directions.
3) Cold-caulked joints in a drainage system shall be firmly packed with oakum and tightly caulked with cold caulking compound to a depth of not less than 25 mm.

2.3.2.8. Stainless Steel Welded Joints
1) Stainless steel welded joints shall conform to ASME B31.9, “Building Services Piping.”
2) Butt weld pipe fittings shall be at least as thick as the wall of the pipe used.

2.3.3. Joints and Connections
2.3.3.1. Drilled and Tapped Joints
1) Drilled and tapped joints shall not be made in a soil-or-waste pipe or vent pipe and fittings unless suitable provision has been made for drilling and tapping.

2.3.3.2. Extracted Tees
1) Tees may be extracted from the wall thickness of Types K and L copper tube used in a water distribution system provided that
   a) a tool specifically designed for the purpose is used,
   b) the branch is at least one size smaller than the tube in which the tee is formed,
   c) the end of the branch incorporates a means to prevent it from penetrating into the run and thereby obstructing flow, and
   d) the joint at the tee is brazed with a filler metal having a melting point not below 540°C.

2.3.3.3. Prohibition of Welding of Pipes and Fittings
1) Cast-iron soil pipe and fittings shall not be welded.
2) Galvanized steel pipe and fittings shall not be welded.

2.3.3.4. Unions and Slip Joints
(See Note A-2.2.3.1.(1) and (3).)
1) Running thread and packing nut connections and unions with a gasket seal shall not be used downstream of a trap weir in a drainage system or in a venting system.
2) Slip joints shall not be used
   a) in a venting system, or
   b) in a drainage system, except to connect a fixture trap to a fixture drain in an accessible location.

2.3.3.5. Increaser or Reducer
1) Connections between 2 pipes of different sizes shall be made with an increaser or a reducer fitting installed so that it permits the system to be completely drained.

2.3.3.6. Dissimilar Materials
1) Adaptors, connectors or mechanical joints used to join dissimilar materials shall be designed to accommodate the required transition.

2.3.3.7. Connection of Roof Drain to Leader
1) Roof drains shall be securely connected to a leader and provision shall be made for expansion.

2.3.3.8. Connection of Floor Outlet Fixtures
1) Pedestal urinals, floor-mounted water closets and S-trap standards shall be connected to a fixture drain by a floor flange or other means of connection, except that a cast-iron trap standard may be caulked to a cast-iron pipe.
2) Except as provided in Sentence (3), floor flanges shall be brass.
3) Where cast-iron or plastic pipe is used, a floor flange of the same material is permitted to be used.
4) Floor flanges and fixtures shall be securely set on a firm base and fastened to the floor or trap flange of the fixture.
5) Joints in a floor flange or between a fixture and the drainage system shall be sealed with a resilient watertight and gas-tight seal.
6) Where a lead water-closet stub is used, the length of the stub below the floor flange shall be not less than 75 mm.

2.3.3.9. Expansion and Contraction
Division B: Acceptable Solutions

Part 2 – Plumbing Systems

(See Note A-2.3.3.9.)
1) The design and installation of every piping system shall include means to accommodate its expansion and contraction caused by temperature changes, movement of the soil, building shrinkage or structural settlement. (See Note A-2.3.3.9.(1).)

2.3.3.10. Copper Tube
1) Types M and DWV copper tube shall not be bent.

2.3.3.11. Indirect Connections
1) Where a fixture or device is indirectly connected, the connections shall be made by terminating the fixture drain above the flood level rim of a directly connected fixture to form an air break.
2) The size of the air break shall at least equal the size of the fixture drain, branch or pipe that terminates above the directly connected fixture, and it shall be not less than 25 mm. (See Note A-2.3.3.11.(2).)

2.3.3.12. Copper Joints Used Underground
1) Except as provided in Sentence (2), joints in copper tubes installed underground shall be made with either flared or compression fittings, or be brazed using a brazing alloy within the American Welding Society’s AWS-BCuP range.
2) Compression fittings shall not be used underground under a building.

2.3.4. Support of Piping

2.3.4.1. Capability of Support
1) Piping shall be provided with support that is capable of keeping the pipe in alignment and bearing the weight of the pipe and its contents.
2) Floor-mounted and wall-mounted water-closet bowls shall be securely attached to the floor or wall by means of a flange and shall be stable.
3) Wall-mounted fixtures shall be supported so that no strain is transmitted to the piping.

2.3.4.2. Independence of Support
1) Piping, fixtures, tanks or devices shall be supported independently of each other.

2.3.4.3. Insulation of Support
1) Where a hanger or support for copper tube or brass or copper pipe is of a material other than brass or copper, it shall be suitably separated and electrically insulated from the pipe or tube.
2) Where a hanger or support for stainless steel pipe or tube is of a material other than stainless steel, it shall be suitably separated and electrically insulated from the pipe or tube.

2.3.4.4. Support for Vertical Piping
1) Except as provided in Sentence (2), vertical piping shall be supported at its base and at the floor level of alternate storeys by rests, each of which can bear the weight of pipe that is between it and the rest above it.
2) The maximum spacing of supports shall be 7.5 m.

2.3.4.5. Support for Horizontal Piping
1) Nominally horizontal piping that is inside a building shall be braced to prevent swaying and buckling and to control the effects of thrust.
2) Nominally horizontal piping shall be supported as stated in Table 2.3.4.5.
3) Where PVC, CPVC or ABS plastic pipe is installed
   a) the pipe shall be aligned without added strain on the piping,
   b) the pipe shall not be bent or pulled into position after being welded, and
   c) hangers shall not compress, cut or abrade the pipe.
4) Where PEX, PP-R, PE/AL/PE or PEX/AL/PEX plastic pipe is installed, hangers shall not compress, cut or abrade the pipe.

5) Where hangers are used to support *nominally horizontal* piping, the hangers shall be
   a) supported by metal rods of not less than
      i) 6 mm diam to support piping 2 inches or less in size, and
      ii) 8 mm diam to support piping 4 inches or less in size, and
      iii) 13 mm diam to support piping over 4 inches in size, or
   b) solid or perforated metal straps of not less than
      i) 0.6 mm nominal thickness and 12 mm wide to support piping 2 inches or less in size, and
      ii) 0.8 mm nominal thickness and 18 mm wide to support piping 4 inches or less in size.

6) Where a hanger is attached to concrete or masonry, it shall be fastened by metal or expansion-type plugs that are inserted or built into the concrete or masonry.

2.3.4.6. Support for Underground Horizontal Piping
   1) Except as provided in Sentence (2), *nominally horizontal* piping that is underground shall be supported on a base that is firm and continuous under the whole of the pipe. (See Note A-2.3.4.6.(1).)
   2) *Nominally horizontal* piping installed underground that is not supported as described in Sentence (1) may be installed using hangers fixed to a foundation or structural slab provided that the hangers are capable of
      a) keeping the pipe in alignment, and
      b) supporting the weight of
         i) the pipe,
         ii) its contents, and
         iii) the fill over the pipe.

2.3.4.7. Support for Vent Pipe above a Roof
   1) Where a *vent pipe* that may be subject to misalignment terminates above the surface of a roof, it shall be supported or braced. (See Article 2.5.6.5. for location of *vent pipe* terminals.)

2.3.5. Protection of Piping

2.3.5.1. Backfilling of Pipe Trench
   1) Where piping is installed underground, the backfill shall be
      a) carefully placed and tamped to a height of 300 mm over the top of the pipe, and
      b) free of stones, boulders, cinders and frozen earth. (See Note A-2.3.5.1.(1).)

2.3.5.2. Protection of Non-Metallic Pipe
   1) Where vitrified clay is located less than 600 mm below a basement floor and the floor is constructed of other than 75 mm or more of concrete, the pipe shall be protected by a 75-mm layer of concrete installed above the pipe. (See Note A-2.3.5.2.(1).)

2.3.5.3. Isolation from Loads
   1) Where piping passes through or under a wall, it shall be installed so that the wall does not bear on the pipe.

2.3.5.4. Protection Against Freezing
   (See Note A-2.3.5.4.)
   1) Where piping may be exposed to freezing conditions, it shall be protected from the effects of freezing.
2.3.5.5. Protection from Mechanical Damage

1) Plumbing, piping and equipment exposed to mechanical damage shall be protected.

2.3.5.6. Protection from Condensation

(See Note A-2.3.5.4.)

1) Piping used as an internal leader, which may be subject to condensation, shall be installed in a manner that limits the risk of damage to the building due to condensation.

2.3.6. Testing of Drainage or Venting Systems

2.3.6.1. Tests and Inspection of Drainage or Venting Systems

1) Except in the case of an external leader, after a section of a drainage system or a venting system has been roughed in, and before any fixture is installed or piping is covered, a water pressure test or an air pressure test shall be conducted.

2) After every fixture is installed and before any part of the drainage system or venting system is placed in operation, a final test shall be carried out when requested.

3) Where a prefabricated system is assembled off the building site in such a manner that it cannot be inspected and tested on site, off-site inspections and tests shall be conducted.

4) Where a prefabricated system is installed as part of a drainage system or venting system, all other plumbing work shall be tested and inspected and a final test shall be carried out on the complete system when requested.

5) When requested, a ball test shall be made to any pipe in a drainage system.

6) Siphonic roof drains and drainage systems shall be tested in accordance with ASME A112.6.9 “Siphonic Roof Drains.”

2.3.6.2. Tests of Pipes in Drainage Systems

1) Pipes in a drainage system, except an external leader or fixture outlet pipe, shall be capable of withstanding without leakage a water pressure test, air pressure test and final test.

2) Pipes in a drainage system shall be capable of meeting a ball test.

2.3.6.3. Tests of Venting Systems

1) Venting systems shall be capable of withstanding without leakage a water pressure test, air pressure test and final test.

2.3.6.4. Water Pressure Tests

1) A water pressure test shall consist in applying a water column of at least 3 m to all joints.

2) In making a water pressure test,

   a) every opening except the highest shall be tightly closed with a testing plug or a screw cap, and

   b) the system or the section shall be kept filled with water for 15 min.

2.3.6.5. Air Pressure Tests

1) Air pressure tests shall be conducted in accordance with the manufacturer’s instructions for each piping material, and

   a) air shall be forced into the system until a pressure of 35 kPa is created, and

   b) this pressure shall be maintained for at least 15 min without a drop in pressure.

2.3.6.6. Final Tests

1) Where a final test is made,

   a) every trap shall be filled with water,

   b) the bottom of the system being tested shall terminate at a building trap, test plug or cap,
Division B: Acceptable Solutions
Part 2 – Plumbing Systems

2.3.6.7. Ball Tests
1) Where a ball test is made, a hard ball dense enough not to float shall be rolled through the pipe.
2) The diameter of the ball shall be not less than
   a) 50 mm where the size of the pipe is 3 inches or more, or
   b) 25 mm where the size of the pipe is less than 3 inches.

2.3.7. Testing of Potable Water Systems

2.3.7.1. Application of Tests
1) After a section of a potable water system has been completed, and before it is placed in operation, a water pressure test shall be conducted, except that an air pressure test may be used in freezing conditions.
2) A pressure test may be applied to each section of the system or to the system as a whole.
3) Where a prefabricated system is assembled off the building site in such a manner that it cannot be inspected and tested on site, off-site inspections and pressure tests shall be conducted.
4) Where a prefabricated system is installed as part of a water system, a) all other plumbing work shall be tested and inspected, and b) the complete system shall be pressure tested when requested.

2.3.7.2. Pressure Tests of Potable Water Systems
1) Except as required in Sentence (2), potable water systems shall be able to withstand a) without leaking, a water pressure that is at least equal to the maximum in-service pressure, or b) an air pressure of not less than 700 kPa for at least 2 h without a drop in pressure.
2) If a manufacturer states that an air pressure test is not recommended, a water pressure test shall be performed. (See Note A-2.3.7.2.(2).)

2.3.7.3. Water Pressure Tests
1) Where a water pressure test is made, all air shall be expelled from the system before fixture control valves or faucets are closed.
2) Potable water shall be used to test a potable water system.

Section 2.4. Drainage Systems

2.4.1. Application

2.4.1.1. General
1) This Section applies to sanitary drainage systems, storm drainage systems, combined building drains or combined building sewers.

2.4.2. Connections to Drainage Systems

2.4.2.1. Connections to Sanitary Drainage Systems
1) **Fixtures** shall be **directly connected** to a **sanitary drainage system**, except that
   a) **drinking fountains** are permitted to be
      i) **indirectly connected** to a **sanitary drainage system**, or
      ii) connected to a **storm drainage system** provided that where the system is subject to **backflow**, a **backwater valve** is installed in the fountain waste pipe (See Note A-2.4.2.1.(1)(a)(ii) and (e)(vi)),
   b) **drainage pans** on heating/cooling units are permitted to be connected to a **storm drainage system**, provided that where the system is subject to **backflow**, a **backwater valve** is installed,
   c) a **floor drain** is permitted to be connected to a **storm drainage system**, provided it is located where it can receive only **clear-water waste** or **storm water**,
   d) **fixtures** or appliances that discharge only **clear-water waste** are permitted to be connected to a **storm drainage system** or be drained onto a roof, and
   e) the following devices shall be **indirectly connected** to a **drainage system**:
      i) a **device** for the display, storage, preparation or processing of food or drink,
      ii) a **sterilizer**,
      iii) a **device** that uses water as a cooling or heating medium,
      iv) a **water operated device**,
      v) a **water treatment device**, or
      vi) a drain or overflow from a **water system** or a heating system. (See Note A-2.4.2.1.(1)(a)(ii) and (e)(vi)).

2) The connection of a **soil-or-waste pipe** to a **nominally horizontal soil-or-waste pipe** or to a **nominally horizontal offset** in a soil-or-waste stack shall be not less than 1.5 m measured horizontally from the bottom of a soil-or-waste stack or from the bottom of the upper vertical section of the soil-or-waste stack that
   a) receives a discharge of 30 or more **fixture units**, or
   b) receives a discharge from **fixtures** located on 2 or more storeys. (See Note A-2.4.2.1.(2).)

3) No other **fixture** shall be connected to a lead bend or stub that serves a water closet.

4) Where a change in direction of more than 45° occurs in a **soil-or-waste pipe** that serves more than one clothes washer, and in which pressure zones are created by detergent suds, no other **soil-or-waste pipe** shall be connected to it within a length less than
   a) 40 times the **size** of the **soil-or-waste pipe** or 2.44 m maximum vertical, whichever is less, before changing direction, and
   b) 10 times the **size** of the **nominally horizontal soil-or-waste pipe** after changing direction. (See Note A-2.4.2.1.(4).)

5) Where a **vent pipe** is connected into the suds pressure zone referred to in Sentence (4), no other vent pipe shall be connected to that vent pipe within the height of the suds pressure zone. (See Note A-2.4.2.1.(4).)

### 2.4.2.2. Connection of Overflows from Rainwater Tanks

1) An overflow from a rainwater tank shall not be **directly connected** to a **drainage system**.

### 2.4.2.3. Direct Connections

1) Two or more **fixture outlet pipes** that serve outlets from a single **fixture** that is listed in Clause 2.4.2.1.(1)(e) are permitted to be **directly connected** to a **branch** that
   a) has a **size** of not less than 1.25 inches, and
   b) is terminated above the **flood level rim** of a **directly connected fixture** to form an **air break**.

2) **Fixture drains** from **fixtures** that are listed in Subclauses 2.4.2.1.(1)(e)(i) and (ii) are permitted to be **directly connected** to a pipe that
   a) is terminated to form an **air break** above the **flood level rim** of a **fixture** that is **directly connected** to a **sanitary drainage system**, and
b) is extended through the roof when fixtures on 3 or more storeys are connected to it. (See Note A-2.4.2.1.(1)(a)(ii) and (e)(vi).)

3) **Fixture drains** from fixtures that are listed in Subclauses 2.4.2.1.(1)(e)(iii) to (vi) are permitted to be 
directed connected to a pipe that
   a) is terminated to form an **air break** above the **flood level rim of a fixture** that is directly connected 
to a **storm drainage system**, and
   b) is extended through the roof when fixtures on 3 or more storeys are connected to it.

2.4.3. **Location of Fixtures**

2.4.3.1. **Urinals**
   1) Urinals shall not be installed adjacent to wall and floor surfaces that are pervious to water. (See Article 3.7.2.6. of Division B of Book I (General) of this By-law.)

2.4.3.2. **Restricted Locations of Indirect Connections and Traps**
   1) Indirect connections or any **trap** that may overflow shall not be located in a crawl space or any other 
unfrequented area.

2.4.3.3. **Equipment Restrictions Upstream of Grease Interceptors**
   1) Except as provided in Sentence (2), equipment discharging waste with organic solids shall not be located 
upstream of a grease **interceptor**. (See Note A-2.4.3.3.(1).)
   2) An organic solids **interceptor** is permitted to be installed upstream of a grease **interceptor**.

2.4.3.4. **Fixtures Located in Chemical Storage Locations**
   1) A floor drain or other **fixture** located in an oil transformer vault, a high voltage room or any room where 
flammable, dangerous or toxic chemicals are stored or handled shall not be connected to a **drainage** 
system.

2.4.3.5. **Macerating Toilet Systems**
   1) A macerating toilet system shall only be installed where no connection to a gravity **sanitary drainage** 
system is available.

2.4.3.6. **Drains Serving Elevator Pits**
   1) Where a drain is provided in an elevator pit,
      a) it shall be connected directly to a sump located outside the elevator pit, and
      b) the drain pipe that connects the sump to the drainage system shall have a **backwater valve**.

2.4.4. **Treatment of Sewage and Waste**

2.4.4.1. **Sewage Treatment**
   1) Where a **fixture** or equipment discharges sewage or waste that may damage or impair the **sanitary drainage system** or the functioning of a public or private sewage disposal system, provision shall be made 
for treatment of the sewage or waste before it is discharged to the **sanitary drainage system**.

2.4.4.2. **Sewer Discharge**
   1) Sanitary and storm discharge shall conform to the Sewer and Watercourse By-law.
   2) No systems or equipment shall be installed that allow for the use of **potable** water to temper or dilute 
condensate discharged to the sewer.

2.4.4.3. **Interceptors**
1) Where a fixture discharges sewage that includes fats, oils or grease and is located in a public kitchen, in a restaurant or in a care or detention occupancy, it shall discharge through a grease interceptor. (See Note A-2.4.4.3.(1).)
2) Where the discharge from a fixture may contain oil or gasoline, an oil interceptor shall be installed. (See Article 2.5.5.2. for venting requirements for oil interceptors.)
3) Where a fixture discharges sand, grit or similar materials, an interceptor designed for the purpose of trapping such discharges shall be installed.
4) Interceptors shall have sufficient capacity to perform the service for which it is provided.

2.4.4. Neutralizing and Dilution Tanks
1) Where a fixture or equipment discharges corrosive or acid waste, it shall discharge into a neutralizing or dilution tank that is connected to the sanitary drainage system through
   a) a trap, or
   b) an indirect connection.
   (See Note A-2.4.4.4.(1).)
2) Neutralizing and dilution tanks shall have a method for neutralizing the liquid.

2.4.5. Traps
2.4.5.1. Traps for Sanitary Drainage Systems
1) Except as provided in Sentences (2) to (5) and in Article 2.4.5.2., fixtures shall be protected by a separate trap.
2) One trap is permitted to protect
   a) all the trays or compartments of a 2- or 3-compartment sink,
   b) a 2-compartment laundry tray, or
   c) 2 similar single compartment fixtures located in the same room.
   (See Note A-2.4.5.1.(2).)
3) One trap is permitted to serve a group of floor drains or sewer drains, a group of washing machines or a group of laboratory sinks if the fixtures
   a) are in the same room, and
   b) are not located where they can receive food or other organic matter.
   (See Note A-2.4.5.1.(3).)
4) An indirectly connected fixture that can discharge only clear-water waste other than a drinking fountain need not be protected by a trap. (See Clause 2.4.2.1.(1)(e) for indirect connections.)
5) An interceptor with an effective water seal of not less than 38 mm is permitted to serve as a trap. (See Note A-2.4.5.1.(5).)
6) Where a domestic dishwashing machine equipped with a drainage pump discharges through a direct connection into the fixture outlet pipe of an adjacent kitchen sink or disposal unit, the pump discharge line shall rise as high as possible to just under the counter and connect
   a) on the inlet side of the sink trap by means of a Y fitting, or
   b) to the disposal unit.

2.4.5.2. Sumps and Traps for Storm Drainage Systems
1) Where a storm drainage system is connected to a public sewer, a sump shall be installed between any opening in the system and the sewer, except that no sump is required if the opening is the upper end of a leader that terminates
   a) at a roof that is used only for weather protection,
   b) not less than 1 m above or not less than 3.5 m in any other direction from any air inlet, openable window or door, and
   c) not less than 1.8 m from a property line.
   (See Note A-2.4.5.2.(1).)
2) A floor drain that drains to a storm drainage system shall be protected by a trap that
   a) is located between the floor drain and a leader, storm building drain or storm building sewer,
   b) may serve all floor drains located in the same room, and
   c) need not be protected by a vent pipe.
3) Where freezing conditions could cause storm drainage systems to freeze due to air circulation within the
   piping, a trap with a cleanout shall be installed in a heated location.

2.4.5.3. Connection of Subsoil Drainage Pipe to a Storm Drainage System
1) A subsoil drainage pipe shall be connected to a sump. (See Note A-2.4.5.3.(1).)
2) The sump referred to in Sentence (1) shall be connected to a storm sewer or to a combined sewer.
3) The sump referred to in Sentence (1) shall not be connected to a sanitary sewer.

2.4.5.4. Location and Cleanout for Building Traps
1) Where a building trap is installed, it shall
   a) be provided with a cleanout fitting on the upstream side of and directly over the trap,
   b) be located upstream of the building cleanout, and
   c) be located
      i) inside the building as close as practical to the place where the building drain leaves the
         building, or
      ii) outside the building in a manhole.
(See Note A-2.4.5.4.(1).)

2.4.5.5. Trap Seals
1) Provision shall be made for maintaining the trap seal of a floor drain by
   a) the use of a trap seal primer,
   b) using the drain as a receptacle for an indirectly connected drinking fountain, or
   c) other equally effective means.
(See Note A-2.4.5.5.(1).)

2.4.6. Arrangement of Drainage Piping

2.4.6.1. Separate Systems
1) No vertical soil-or-waste pipe shall conduct both sewage and storm water.
2) A combined building drain shall not be installed. (See Note A-2.1.2.1.(2).)
3) There shall be no unused open ends in a drainage system and dead ends shall be so graded that water
   will not collect in them.

2.4.6.2. Location of Soil-or-Waste Pipes
1) A soil-or-waste pipe shall not be located directly above
   a) non-pressure portable water storage tanks,
   b) manholes in pressure portable water storage tanks, or
   c) food-handling or food-processing equipment.

2.4.6.3. Sumps or Tanks
(See Note A-2.4.6.3.)
1) Piping that is too low to drain into a building sewer by gravity shall be drained to a sump or receiving tank.
2) Where the sump or tank receives sewage, it shall be water- and air-tight and shall be vented.
3) Equipment such as a pump or ejector that can lift the contents of the sump or tank and discharge it into
   the building drain or building sewer shall be installed.
4) Where the equipment does not operate automatically, the capacity of the sump shall be sufficient to hold
   at least a 24 h accumulation of liquid.
5) Where there is a building trap, the discharge pipe from the equipment shall be connected to the building drain downstream of the trap.

6) The discharge pipe from every pumped sump shall be equipped with a union, a backwater valve and a shut-off valve installed in that sequence in the direction of discharge.

7) The discharge piping from a pump or ejector shall be sized for optimum flow velocities at pump design conditions.

2.4.6.4. Protection from Backflow

1) Except as permitted in Sentence (2), a backwater valve or a gate valve that would prevent the free circulation of air shall not be installed in a building drain or in a building sewer. (See Note A-2.4.6.4.(1).)

2) A backwater valve is permitted to be installed in a building drain provided that
   a) it is a “normally open” design conforming to
      i) CSA B70, “Cast Iron Soil Pipe, Fittings, and Means of Joining,”
      iii) CAN/CSA-B181.2, “Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Drain, Waste, and Vent Pipe and Pipe Fittings,” or
      iv) CAN/CSA-B182.1, “Plastic Drain and Sewer Pipe and Pipe Fittings,” and
   b) it does not serve more than one dwelling unit.

3) Except as provided in Sentences (4) and (5), where a building drain or a branch may be subject to backflow, a gate valve or a backwater valve shall be installed on every fixture drain connected to them when the fixture is located below the level of the adjoining street.

4) Where the fixture is a floor drain, a removable screw cap is permitted to be installed on the upstream side of the trap.

5) Where more than one fixture is located on a storey and all are connected to the same branch, the gate valve or backwater valve is permitted to be installed on the branch.

6) Except as provided in Sentence (7), where a storm sump is provided there shall be a backwater valve attached to the outlet pipe.

7) Notwithstanding Sentence (6), a backwater valve is not required if the storm sump and the storm sump piping are both located above the level of the next upstream manhole of the public storm sewer.

2.4.6.5. Mobile Home Sewer Service

1) A building sewer intended to serve a mobile home shall be
   a) not less than 4 inches in size,
   b) terminated above ground,
   c) provided with
      i) a tamperproof terminal connection that is capable of being repeatedly connected, disconnected and sealed,
      ii) a protective concrete pad, and
      iii) a means to protect it from frost heave, and
   d) designed and constructed in accordance with good engineering practice.

2.4.7. Cleanouts

2.4.7.1. Cleanouts for Drainage Systems

1) Sanitary drainage systems and storm drainage systems shall be provided with cleanouts that will permit cleaning of the entire system.

2) A cleanout fitting shall be provided on the upstream side and directly over every running trap.

3) Interior leaders shall be provided with a cleanout fitting at the bottom of the leader or not more than 3 m upstream from the bottom of the leader.

4) Where a cleanout is required on a building sewer 8 inches or larger in size, it shall be a manhole.
5) A building sewer shall not change direction or slope between the building and public sewer or between cleanouts, except that pipes not more than 6 inches in size may change direction
   a) by not more than 5° every 3 m, or
   b) by the use of fittings with a cumulative change in direction of not more than 45°.
6) Building drains shall be provided with a cleanout fitting conforming to Sentence 2.4.7.2.(2) that is located as close as practical to the place where the building drain leaves the building. (See Note A-2.4.7.1.(6).)
7) Soil-or-waste stacks shall be provided with a cleanout fitting
   a) at the bottom of the stack,
   b) not more than 3 m upstream of the bottom of the stack, or
   c) on a Y fitting connecting the stack to the building drain or branch.
8) A cleanout shall be provided to permit the cleaning of the piping downstream of an interceptor.
9) Cleanouts shall be installed so that the cumulative change in direction is not more than 90° between cleanouts in a drip pipe from a food receptacle or in a fixture drain serving a kitchen sink in a non-residential occupancy. (See Note A-2.4.7.1.(9).)
10) A fixture outlet pipe, a trap with a removable trap dip, or a separate cleanout shall be used as a cleanout for a fixture drain. (See Note A-2.4.7.1.(10).)
11) Building drains shall be provided with an additional cleanout for each cumulative horizontal change in direction exceeding 135°.

2.4.7.2. Size and Spacing of Cleanouts
1) Except as provided in Sentences (2) to (4), the size and spacing of cleanouts in nominally horizontal pipes of a drainage system shall conform to Table 2.4.7.2.

<table>
<thead>
<tr>
<th>Size of Drainage Pipe, inches</th>
<th>Minimum Size of Cleanout, inches</th>
<th>Maximum Spacing, m</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>One-Way Rodding</td>
</tr>
<tr>
<td>less than 3</td>
<td>Same size as drainage pipe</td>
<td>7.5</td>
</tr>
<tr>

<td>3</td>
<td>15</td>
</tr>
<tr>
<td>over 4</td>
<td>4</td>
<td>26</td>
</tr>
<tr>
<td></td>
<td></td>
<td>52</td>
</tr>
</tbody>
</table>

2) Cleanout fittings for building drains shall be at least 4 inches in size.
3) The spacing between manholes serving a building sewer
   a) 24 inches or less in size shall not exceed 90 m, and
   b) over 24 inches in size shall not exceed 150 m.
4) The developed length of a building sewer between the building and the first manhole to which the building sewer connects shall not exceed 75 m.
5) Where a building sewer connects to another building sewer other than by a manhole, the developed length between the building and the building sewer to which it connects shall not exceed 30 m.
6) Cleanouts that allow rodding in one direction only shall be installed to permit rodding in the direction of flow.

2.4.7.3. Manholes
1) A manhole, including the cover, shall be designed to support all loads imposed upon it.
2) A manhole shall be provided with
   a) a cover that provides an airtight seal if located within a building,
   b) a rigid ladder of a corrosion-resistant material where the depth exceeds 1 m, and
   c) a vent to the exterior if the manhole is located within a building.
3) A manhole shall have a minimum horizontal dimension of 1 m, except that the top 1.5 m may be tapered from 1 m down to a minimum of 600 mm at the top.
4) A manhole in a sanitary drainage system shall be channeled to direct the flow of effluent.

2.4.7.4. Location of Cleanouts
1) Cleanouts and access covers shall be located so that their openings are readily accessible for drain cleaning purposes.
2) A cleanout shall not be
   a) located in a floor assembly in a manner that may constitute a hazard, or
   b) used as a floor drain.
3) There shall be no change of direction between a cleanout fitting and the trap that it serves.
4) The piping between a cleanout fitting and the drainage system it serves shall not change direction by more than 45°.
5) Cleanouts serving fixtures in health care facilities, mortuaries, laboratories and similar occupancies, where contamination by body fluids is likely, shall be located a minimum of 150 mm above the flood level rim of the fixture.

2.4.8. Minimum Slope and Length of Drainage Pipes

2.4.8.1. Minimum Slope
1) Except as provided in Articles 2.4.10.8. and 2.4.10.9., drainage pipes that are 3 inches or less in size shall have a downward slope in the direction of flow of at least 1 in 50. (See Note A-2.4.8.1.(1).)

2.4.8.2. Length of Fixture Outlet Pipes
1) Except for fixture outlet pipes installed in conformance with Sentence 2.4.5.1.(3), the developed length of fixture outlet pipes shall not exceed 1 200 mm. (See Note A-2.4.8.2.(1).) (See also Note A-2.4.5.1.(2).)

2.4.9. Size of Drainage Pipes

2.4.9.1. No Reduction in Size
1) A soil-or-waste pipe shall be of a size not less than the size of
   a) a vent pipe that is connected to it, or
   b) the largest soil-or-waste pipe that drains into it.

2.4.9.2. Serving Water Closets
1) Drainage pipes that serve a water closet shall be not less than 3 inches in size.
2) Branch and building drains downstream of the third water closet fixture drain connection shall be not less than 4 inches in size.
3) Soil-or-waste stacks that serve more than 6 water closets shall be not less than 4 inches in size.
4) Discharge pipes serving a macerating toilet system shall be not less than ¾ inch in size.

2.4.9.3. Size of Fixture Outlet Pipes
1) Except as provided in Sentence (2), the size of fixture outlet pipes shall conform to Table 2.4.9.3.
2) The part of the fixture outlet pipe that is common to 3 compartments of a sink shall be one size larger than the largest fixture outlet pipe of the compartments that it serves. (See Note A-2.4.9.3.(2).)

</tbody>
</table>

**Notes to Table 2.4.9.3.**:

(1) See Note A-Table 2.4.9.3.

(2) No hydraulic load for emergency floor drains.

3) Where clothes washers do not drain to a laundry tray, the *trap* inlet shall be fitted with a vertical standpipe that is not less than 600 mm long measured from the *trap weir* and terminates above the *flood level rim* of the clothes washer. (See Note A-2.4.9.3.(3).)

### 2.4.9.4. Size of Building Drain and Building Sewer
1) Building drains and building sewers connected to the public sewer system downstream of the main cleanout (See Sentence 2.4.7.1.(6)) shall be not less than 4 inches in size.

2.4.9.5. Offset in Leaders
1) No change in the size of a leader with a nominally horizontal offset is required if the offset
   a) is located immediately under the roof,
   b) is not more than 6 m long, and
   c) has a slope of not less than 1 in 50.
2) If the horizontal offset is more than 6 m long, the leader shall conform to Table 2.4.10.9.

2.4.10. Hydraulic Loads
(See Note A-2.4.10. for determination of hydraulic loads and drainage pipe sizes.)

2.4.10.1. Total Load on a Pipe
1) The hydraulic load on a pipe is the total load from
   a) every fixture that is connected to the system upstream of the pipe,
   b) every fixture for which provision is made for future connection upstream of the pipe, and
   c) all roofs and paved surfaces that drain into the system upstream of the pipe.

2.4.10.2. Hydraulic Loads for Fixtures
1) The hydraulic load from a fixture that is listed in Table 2.4.9.3. is the number of fixture units set forth in the Table.
2) Except as provided in Sentence (1), the hydraulic load from a fixture that is not listed in Table 2.4.9.3. is the number of fixture units set forth in Table 2.4.10.2. for the trap of the size that serves the fixture.

2.4.10.3. Hydraulic Loads from Fixtures with a Continuous Flow
1) Except as provided in Sentence (2), the hydraulic load from a fixture that produces a continuous flow, such as a pump or an air-conditioning fixture, is 31.7 fixture units for each litre per second of flow.
2) Where a fixture or equipment that produces a continuous or semi-continuous flow drains to a combined sewer or to a storm sewer, the hydraulic load from the fixture is 900 L for each litre per second of flow.

2.4.10.4. Hydraulic Loads from Roofs or Paved Surfaces
1) Except as provided in Sentence (2), the hydraulic load in litres from a roof or paved surface is the maximum 15 min rainfall determined in conformance with Subsection 1.1.3. of Division B of Book I (General) of this By-law, multiplied by the sum of
   a) the area in square metres of the horizontal projection of the surface drained, and
   b) one-half the area in square metres of the largest adjoining vertical surface.
(See Note A-2.4.10.4.(1).)
2) Flow control roof drains may be installed, provided
   a) the maximum drain down time does not exceed 24 h,
   b) the roof structure is designed to carry the load of the stored water,
   c) one or more scuppers are installed not more than 30 m apart along the perimeter of the building so that
      i) up to 200% of the 15-minute rainfall intensity can be handled, and
      ii) the maximum depth of controlled water is limited to 150 mm,
   d) they are located not more than 15 m from the edge of the roof and not more than 30 m from adjacent drains, and
   e) there is at least one drain for each 900 m².
3) Hydraulic loads, in litres per second, for flow control roof drains and restricted paved area drains shall be determined according to rain intensity-duration frequency curves as compiled by Environment Canada using 25-year frequencies.
4) Where the height of the parapet is more than 150 mm or exceeds the height of the adjacent wall flashing,
   a) emergency roof overflows or scuppers described in Clause (2)(c) shall be provided, and
   b) there shall be a minimum of 2 roof drains.

2.4.10.5. Conversion of Fixture Units to Litres
1) Except as provided in Sentence 2.4.10.3.(2), where the hydraulic load is to be expressed in litres, fixture units shall be converted as follows:
   a) when the number of fixture units is 260 or fewer, the load is 2 360 L, and
   b) when the number of fixture units exceeds 260, the load is 9.1 L for each fixture unit.

2.4.10.6. Hydraulic Loads to Soil-or-Waste Pipes
1) Except as provided in Sentence (2), the hydraulic load that is drained to every soil-or-waste stack shall conform to Table 2.4.10.6.-A.
2) Where the nominally horizontal offset in a soil-or-waste stack is 1.5 m or more, the hydraulic load that is served by it shall conform to Table 2.4.10.6.-B or Table 2.4.10.6.-C, whichever is the less restrictive.

2.4.10.7. Hydraulic Loads on Branches
1) The hydraulic load that is drained to a branch shall conform to Table 2.4.10.6.-B.

2.4.10.8. Hydraulic Loads on Sanitary Building Drains or Sewers
1) The hydraulic load that is drained to a sanitary building drain or a sanitary building sewer shall conform to Table 2.4.10.6.-C.

2.4.10.9. Hydraulic Loads on Storm or Combined Building Drains or Sewers
1) The hydraulic load that is drained to a storm building drain, a storm building sewer or a combined building sewer shall conform to Table 2.4.10.9.

2.4.10.13. Design of Storm Sewers
1) Except as provided in Sentences 2.4.10.4.(1) and (2), and Article 2.4.10.9., storm sewers may be designed in accordance with good engineering practice.

2.4.10.14. Design of Siphonic Roof Drainage Systems
1) Siphonic roof drainage systems are to be designed in accordance with ASPE/ANSI 45 “Siphonic Roof Drainage,” and ASME A112.6.9, “Siphonic Roof Drains.”

Section 2.5. Venting Systems

2.5.1. Vent Pipes for Traps

2.5.1.1. Venting for Traps
1) Except as provided in Sentences (3) and (4), traps shall be protected by a vent pipe.
2) Drainage systems may require additional protection as provided in Subsections 2.5.4. and 2.5.5. by the installation of
   a) branch vents,
   b) vent stacks,
   c) stack vents,
   d) vent headers,
   e) fresh air inlets,
   f) relief vents,
   g) circuit vents,
   h) yoke vents,
   i) offset relief vents,
   j) additional circuit vents,
   k) wet vents,
   l) individual vents,
   m) dual vents, or
   n) continuous vents.
3) A trap that serves a floor drain need not be protected where
   a) the size of the trap is not less than 3 inches,
   b) the length of the fixture drain is not less than 450 mm, and
   c) the fall on the fixture drain does not exceed its size.
   (See Note A-2.5.1.1.(3).)
4) A trap need not be protected by a vent pipe
   a) where it serves
2.5.2. Wet Venting

2.5.2.1. Wet Venting
(See Note A-2.5.2.1.)
1) A soil-or-waste pipe is permitted to serve as a wet vent, provided
   a) the hydraulic load is in accordance with Table 2.5.8.1.,
   b) the number of wet-vented water closets does not exceed 2,
   c) where 2 water closets are installed, they are connected at the same level by means of a double sanitary T fitting if the vent pipe is vertical and by means of a double Y fitting if the vent pipe is horizontal,
   d) the water closets are installed downstream of all other fixtures,
   e) trap arms and fixture drains connected to the wet vent do not exceed 2 inches in size, except for connections from emergency floor drains in accordance with Sentence 2.5.1.1.(3),
   f) the total hydraulic load on the wet vent does not exceed the limits stated in Table 2.5.8.1. when separately vented branches or fixture drains in the same storey, having a total hydraulic load not greater than 2 fixture units, are connected to the wet vent or a wet-vented water closet trap arm,
   g) the hydraulic load of separately vented fixtures that drain into the wet vent are not included when sizing the continuous vent that serves the wet vent,
   h) where a wet vent extends through more than one storey, the total discharge from any one storey above the first storey does not exceed 4 fixture units,
   i) there is not more than one nominally horizontal offset in the wet vent, and
      i) the offset does not exceed 1.2 m for pipes 2 inches or less in size, or
      ii) the offset does not exceed 2.5 m for pipes larger than 2 inches in size,
   j) the wet-vented portion is not reduced in size except for the portion that is upstream of emergency floor drains in accordance with Sentence 2.5.1.1.(3), and
   k) the length of the wet vent is not limited.

2.5.3. Circuit Venting

2.5.3.1. Circuit Venting
(See Note A-2.5.3.1.)
1) A section of horizontal branch is permitted to be circuit-vented, provided
   a) a circuit vent is connected to it,
   b) all fixtures served by the circuit vent are located in the same storey, and
   c) no soil-or-waste stack is connected to it upstream of a circuit-vented fixture.
2) Fixtures with fixture outlet pipes less than 2 inches in size shall be separately vented or separately circuit-vented.
3) Except as provided in Sentences (4) and (5), a relief vent shall be connected to the branch that forms part of a circuit-vented system, downstream of the connection of the most downstream circuit-vented fixture.
4) A soil-or-waste pipe having a hydraulic load not greater than 6 fixture units is permitted to act as a relief vent for a branch that is circuit-vented.
5) A symmetrically connected relief vent is permitted to serve as a combined relief vent for a maximum of 2 branches that are circuit-vented, provided there are not more than 8 circuit-vented fixtures connected between the combined relief vent and each circuit vent.
6) Additional circuit vents shall be required.
a) where each cumulative horizontal change in direction of a branch served by a circuit vent exceeds 45° between vent pipe connections, or
b) where more than 8 circuit-vented fixtures are connected to a branch between vent pipe connections.

7) A soil-or-waste pipe is permitted to serve as an additional circuit vent in accordance with Sentence (6), provided the soil-or-waste pipe is sized as a wet vent in conformance with Article 2.5.8.1. and is not less than 2 inches in size.

8) Connections to circuit vents and additional circuit vents in accordance with Sentence (6) shall conform to Sentence 2.5.4.5.(1).

9) A circuit-vented branch, including the fixture drain downstream of the circuit vent connection, shall be sized in accordance with Article 2.4.10.7., except that it shall be not less than
a) 2 inches, where traps less than 2 inches in size are circuit-vented, or
b) 3 inches, where traps 2 inches in size or larger are circuit-vented.

10) Additional circuit vents shall be sized in accordance with Table 2.5.7.1. and Sentence 2.5.7.3.(1).

11) The hydraulic load on a circuit vent shall include the hydraulic load from fixtures connected to the branch served by the circuit vent, but shall not include the hydraulic load from fixtures permitted by Sentences (3), (4) and (5).

2.5.4. Vent Pipes for Soil-or-Waste Stacks

2.5.4.1. Stack Vents
1) The upper end of every soil-or-waste stack shall terminate in a stack vent.

2.5.4.2. Vent Stacks
1) Except as provided in Sentence (2), every soil-or-waste stack draining fixtures from more than 4 storeys that contain plumbing fixtures shall have a vent stack.
2) A soil-or-waste stack that serves as a wet vent does not require a vent stack.
3) The vent stack required by Sentence (1) shall be connected to a vertical section of the soil-or-waste stack at or immediately below the lowest soil-or-waste pipe connected to the soil-or-waste stack.
4) Fixtures are permitted to be connected to a vent stack, provided
   a) the total hydraulic load of the connected fixtures does not exceed 8 fixture units,
   b) at least one fixture is connected to a vertical portion of the vent stack and upstream of any other fixtures,
   c) no other fixture is connected downstream of a water closet,
   d) all fixtures are located in the lowest storey served by the vent stack, and
   e) the section of the vent pipe that acts as a wet vent conforms to the requirements regarding wet vents.

2.5.4.3. Yoke Vents
(See Note A-2.5.4.3.)
1) Except as provided in Sentence (4), where a soil-or-waste stack receives the discharge from fixtures located on more than 11 storeys, a yoke vent shall be installed
   a) for each section of 5 storeys or part thereof counted from the top down, and
   b) at or immediately above each offset or double offset.
2) The yoke vent shall be connected to the soil-or-waste stack by means of a drainage fitting at or immediately below the lowest soil-or-waste pipe from the lowest storey of the sections described in Sentence (1).
3) The yoke vent shall connect to the vent stack at least 1 m above the floor level of the lowest storey in the section described in Sentence (1).
4) A yoke vent need not be installed provided the soil-or-waste stack is interconnected with the vent stack in each storey of the section in which fixtures are located by means of a vent pipe equal in size to the branch or fixture drain or 2 inches in size, whichever is smaller.

2.5.4.4. Offset Relief Vents

1) A soil-or-waste stack that has a nominally horizontal offset more than 1.5 m long and above which the upper vertical portion of the stack passes through more than 2 storeys and receives a hydraulic load of more than 100 fixture units shall be vented by an offset relief vent connected to the vertical section immediately above the offset and by another offset relief vent
   a) connected to the lower vertical section at or above the highest soil-or-waste pipe connection, or
   b) extended as a vertical continuation of the lower section.

(See Note A-2.5.4.4.(1).)

2.5.4.5. Fixtures Draining into Vent Pipes

1) The trap arm of a fixture that has a hydraulic load of not more than 1½ fixture units may be connected to the vertical section of a circuit vent, additional circuit vent, offset relief vent or yoke vent, provided
   a) not more than 2 fixtures are connected to the vent pipe,
   b) where 2 fixtures are connected to the vent pipe, the connection is made by means of a double sanitary T fitting, and
   c) the section of the vent pipe that acts as a wet vent is not less than 2 inches in size.

(See Note A-2.5.4.5.(1).)

2.5.5. Miscellaneous Vent Pipes

2.5.5.1. Venting of Sewage Sumps

1) Every sump that receives sewage shall be provided with a vent pipe that is connected to the top of the sump. (See Article 2.5.7.7. for sizing of these vents.)

2.5.5.2. Venting of Oil Interceptors

(See Note A-2.5.5.2.) (See also Article 4.3.5.2. of Division B of the NFC.)

1) Every oil interceptor shall be provided with 2 vent pipes that
   a) connect to the interceptor at opposite ends,
   b) extend independently to outside air, and
   c) terminate not less than 2 m above ground and at elevations differing by at least 300 mm.

2) Adjacent compartments within an oil interceptor shall be connected to each other by a vent opening.

3) Where a secondary receiver for oil is installed in conjunction with an oil interceptor, it shall be vented in accordance with the manufacturer’s recommendations, and the vent pipe shall
   a) in no case be less than 1½ inches in size,
   b) extend independently to outside air, and
   c) terminate not less than 2 m above ground.

4) The vent pipes referred to in Sentence (1) are permitted to be one size smaller than the largest connected drainage pipe but not less than 1¼ inches in size, or can be sized in accordance with the manufacturer’s recommendations.

5) A vent pipe that serves an oil interceptor and is located outside a building shall be not less than 3 inches in size in areas where it may be subject to frost closure.

2.5.5.3. Venting of Drain Piping and Dilution Tanks for Corrosive Waste

1) Venting systems for drain piping or dilution tanks conveying corrosive waste shall extend independently and terminate in outside air. (See Article 2.5.7.7. for sizing of these vents.)

2.5.5.4. Fresh Air Inlets
1) Where a building trap is installed, a fresh air inlet not less than 4 inches in size shall be connected upstream and within 1.2 m of the building trap and downstream of any other connection. (See Note A-2.4.5.4.(1).)

2.5.5. Provision for Future Installations
1) Where provision is made for a fixture to be installed in the future, the drainage system and venting system shall be sized accordingly and provision shall be made for the necessary future connections.
2) Except as required in Sentence 2.5.7.7.(2), where a plumbing system is installed in a building, every storey in which plumbing is or may be installed, including the basement of a single-family dwelling, shall have extended into it or passing through it a vent pipe that is at least 1½ inches in size for the provision of future connections.

2.5.6. Arrangement of Vent Pipes

2.5.6.1. Drainage of Vent Pipes
1) Vent pipes shall be installed without depressions in which moisture can collect.

2.5.6.2. Vent Pipe Connections
1) Vent pipes shall be installed in a nominally vertical position where it is practical to do so.
2) Except for wet vents, where a vent pipe is connected to a nominally horizontal soil-or-waste pipe, the connection shall be above the horizontal centre line of the soil-or-waste pipe. (See Note A-2.5.6.2.(2).)
3) Unused vent pipes installed for future connections shall be permanently capped with an end cleanout or an adapter and plug.

2.5.6.3. Location of Vent Pipes
1) Except as provided in Sentences (2) and (3), vent pipes that protect a fixture trap shall be located so that
   a) the developed length of the trap arm is not less than twice the size of the fixture drain,
   b) the total fall of the trap arm is not greater than its inside diameter, and
   c) the trap arm does not have a cumulative change in direction of more than 135°.
   (See Note A-2.5.6.3.(1).)
2) The trap arm of water closets, of S-trap standards or of any other fixture that also discharges vertically and depends on siphonic action for its proper functioning shall not have a cumulative change in direction of more than 225°. (See Note A-2.5.6.3.(2).)
3) A vent pipe that protects a water closet or any other fixture that also depends on siphonic action for its proper functioning shall be located so that the distance between the connections of the fixture drain to the fixture and the vent pipe does not exceed
   a) 1 m in the vertical plane, and
   b) 3 m in the horizontal plane.
   (See Note A-2.5.6.3.(3).)
4) The maximum length of every trap arm shall conform to Table 2.5.6.3.

Table 2.5.6.3.
Length of Trap Arm

5) The vent pipe from a water closet or any fixture that has an integral siphonic flushing action may be connected to the vertical leg of its drainage pipe.

2.5.6.4. Connection of Vents above Fixtures Served
1) Except for a wet vent, every vent pipe shall extend above the flood level rim of every fixture that it serves before being connected to another vent pipe.
2) No vent pipe shall be connected in such a manner that a blockage in a soil-or-waste pipe would cause waste to drain through the vent pipe to the drainage system.

2.5.6.5. Terminals
1) Except as provided in Sentence (3), the upper end of every vent pipe that is not terminated in outside air shall be connected to a venting system that terminates through a roof to outside air.
2) The upper end of every vent pipe that is terminated in outside air, other than a vent pipe that serves an oil interceptor or a fresh air inlet, shall be extended above the roof.
3) A vent pipe is permitted to be erected outside a building, provided that
   a) no single change in direction of the vent pipe exceeds 45°,
   b) all parts of the vent pipe are nominally vertical,
   c) in areas where the vent pipe may be subject to frost closure, it is increased to not less than 3 inches in size before penetrating a wall or roof, and
   d) where the building is 4 storeys or less in height, the vent pipe terminates above the roof of the building.
4) Except for a fresh air inlet, where a vent pipe is terminated in outside air, the terminal shall be located
   a) not less than 1 m above or not less than 3.5 m in any other direction from every air inlet, openable window or door,
   b) not less than 2 m above or not less than 3.5 m in any other direction from a roof that supports an occupancy,
   c) not less than 2 m above ground, and
   d) not less than 1.8 m from every property line.
(See Note A-2.5.6.5.(4).)
5) Where a vent pipe passes through a roof, it shall
   a) be terminated high enough to prevent the entry of roof drainage but not less than 150 mm above the roof or above the surface of storm water, which could pond on the roof (See Note A-2.5.6.5.(4)), and
   b) be provided with flashing to prevent the entry of water between the vent pipe and the roof (See Article 2.2.10.14.).
6) Where a vent pipe passes through a roof and may be subject to frost closure, it shall be protected from frost closure by
   a) increasing its diameter at least one size, but not less than 3 inches in size, immediately before it penetrates the roof,
   b) insulating the pipe, or
   c) protecting it in some other manner.
(See Article 2.3.4.7.)

2.5.7. Minimum Size of Vent Pipes

2.5.7.1. General
1) The size of every vent pipe shall conform to Table 2.5.7.1.

### Table 2.5.7.1.
**Minimum Permitted Size of Vent Pipe Based on Size of Trap Served**
Forming Part of Sentences 2.5.7.1.(1) and 2.5.8.2.(1)

#### 2.5.7.2. Size Restriction
1) The size of a branch vent, stack vent, vent stack or vent header shall be not less than the size of the vent pipe to which it is connected.
2) Building drains shall be provided with at least one vent that is not less than 3 inches in size.

#### 2.5.7.3. Additional Circuit Vents and Relief Vents
1) Except as provided in Article 2.5.7.1. and Sentence 2.5.3.1.(7), the minimum size of an additional circuit vent or relief vent installed in conjunction with a circuit vent is permitted to be one size smaller than the required size of the circuit vent, but need not be larger than 2 inches.
2) The size of the soil-or-waste pipe acting as a relief vent in accordance with Sentence 2.5.3.1.(4) shall be in conformance with Tables 2.4.10.6.-A, 2.4.10.6.-B or 2.5.8.1., and Article 2.5.7.1., whichever size is the largest considering the hydraulic load drained into the soil-or-waste pipe.

#### 2.5.7.4. Offset Relief Vents
1) Except as provided in Article 2.5.7.1., the minimum size of an offset relief vent is permitted to be one size smaller than the size of the stack vent.

#### 2.5.7.5. Yoke Vents
1) Yoke vents required by Sentence 2.5.4.3.(1) are permitted to be one size smaller than the size of the smallest pipe to which they are connected.

#### 2.5.7.6. Vent Pipes for Manholes
1) The minimum size of a vent pipe that serves a manhole within a building shall be 2 inches.

#### 2.5.7.7. Vents for Sewage Sumps, Dilution Tanks and Macerating Toilet Systems
1) Except as provided in Sentences (2) and (3), the minimum size of the vent pipe for a sewage sump or dilution tank shall be one size smaller than the size of the largest branch or fixture drain draining to the sump.
2) The size of every vent pipe for a sewage sump or dilution tank shall be not less than 2 inches, but need not be greater than 4 inches.
3) The size of a vent pipe for a macerating toilet system with a sump shall be not less than 1½ inches.
2.5.8. **Sizing of Vent Pipes**
(See Note A-2.5.8. for an explanation on the sizing of vent pipes.)

2.5.8.1. **Hydraulic Loads Draining to Wet Vents**
1) The hydraulic load that drains to a wet vent shall conform to Table 2.5.8.1.
2) When determining the size of a wet vent, the hydraulic load from the most downstream fixture or symmetrically connected fixtures shall not be included. (See Note A-2.5.8.1.(2).)

### Table 2.5.8.1.

2.5.8.2. **Individual Vents and Dual Vents**
1) The size of individual vents and dual vents shall be determined using Table 2.5.7.1. based on the largest trap served.
2) When sizing an individual vent or a dual vent, the length is not taken into consideration.

2.5.8.3. **Branch Vents, Vent Headers, Continuous Vents and Circuit Vents**
(See Note A-2.5.8.3. and 2.5.8.4.)
1) Branch vents, vent headers, circuit vents and continuous vents shall be sized in accordance with Table 2.5.8.3., unless they are individual vents or dual vents.
2) For the purposes of Table 2.5.8.3., the length of a branch vent shall be its developed length from the most distant soil-or-waste pipe connection to a vent stack, stack vent, vent header or outside air.
3) For the purposes of Table 2.5.8.3., the length of a vent header shall be its developed length from the most distant soil-or-waste pipe connection to outside air.
4) For the purposes of Table 2.5.8.3., the length of a circuit vent shall be its developed length from the horizontal soil-or-waste pipe connection to a vent stack, stack vent, vent header or outside air.
5) For the purposes of Table 2.5.8.3., the length of a continuous vent shall be its developed length from the vertical soil-or-waste pipe connection to a vent stack, stack vent, vent header or outside air.
Table 2.5.8.3.

2.5.8.4. Vent Stacks or Stack Vents
(See Note A-2.5.8.3. and 2.5.8.4.)
1) A vent stack or stack vent shall be sized in accordance with Table 2.5.8.4. based on
   a) the length of the vent stack or stack vent, and
   b) the total hydraulic load that is drained to the lowest section of soil-or-waste stack or stacks
      served by the vent pipe, plus any additional vent loads connected to the vent stack or stack vent.
2) For the purposes of Table 2.5.8.4., the length of a stack vent or vent stack shall be its developed length
   from its lower end to outside air.
3) The minimum size of a vent stack or stack vent shall be one-half the size of the soil-or-waste stack at its
   base.
4) A stack vent serving a wet vent stack that is over 4 storeys high shall extend the full size of the wet vent
   to outside air.
5) Every building sewer shall be provided with at least one vent that is not less than 3 inches in size.

**Notes to Table 2.5.8.4.:**

(1) Soil-or-waste stacks shall be sized using Table 2.4.10.6.-A.

#### 2.5.8.5. Lengths of Other Vent Pipes

1) When sizing an additional circuit vent, offset relief vent, relief vent, yoke vent, and the vent pipe for an interceptor, dilution tank, sewage tank, sump, or manhole, length is not taken into consideration.

#### 2.5.9. Air Admittance Valves

(See Note A-2.2.10.16.(1.).)

1) Individually vents and dual vents are permitted to terminate with a connection to an air admittance valve as provided in Articles 2.5.9.2. and 2.5.9.3. (See also Sentence 2.2.10.16.(1.).)

#### 2.5.9.1. Air Admittance Valve as a Vent Terminal

1) Air admittance valves shall only be used to vent
   a) fixtures located in island counters,
   b) fixtures that may be affected by frost closure of the vent due to local climatic conditions,
   c) fixtures in one- and two-family dwellings undergoing renovation, or
   d) installations where connection to a vent may not be practical.

2) Air admittance valves shall be located
   a) not less than 100 mm above the fixture drain being vented,
   b) within the maximum developed length permitted for the vent, and
   c) not less than 150 mm above insulation materials.

#### 2.5.9.3. Installation Conditions

1) Air admittance valves shall not be installed in supply or return air plenums, or in locations where they may be exposed to freezing temperatures.
2) Air admittance valves shall be installed in accordance with the manufacturer's installation instructions.
3) Air admittance valves shall be rated for the size of vent pipe to which they are connected.
4) Installed air admittance valves shall be
   a) accessible, and
   b) located in a space that allows air to enter the valve.
5) Drainage systems shall have at least one vent that terminates to the outdoors in conformance with Sentence 2.5.6.5.(1).

Section 2.6. Potable Water Systems

2.6.1. Arrangement of Piping

2.6.1.1. Design
   1) Fixtures supplied with separate hot and cold water controls shall have the hot water control on the left and the cold on the right.
   2) In a hot water distribution system of a developed length of more than 30 m or supplying more than 4 storeys, the water temperature shall be maintained by
      a) recirculation, or
      b) a self-regulating heat tracing system.

2.6.1.2. Drainage
   1) A water distribution system shall be installed so that the system can be drained or blown out with air.

2.6.1.3. Shut-off Valves
   1) Water service pipes shall be provided with an accessible shut-off valve located as close as possible to where the water service pipe enters the building.
   2) Pipes that convey water from a gravity water tank or from a private water supply system shall be fitted with a shut-off valve at the source of supply.
   3) Except for risers that serve only one dwelling unit, risers shall be provided with a shut-off valve located at the source of supply.
   4) Every fixture shall be fitted with a shut-off valve, located on each water supply serving the fixture.
   5) In buildings of residential occupancy that contain more than one dwelling unit, a shut-off valve shall be installed where the water supply enters each dwelling unit, so that, when the water supply to one suite is shut off, the water supply to the remainder of the building is not interrupted. (See Note A-2.6.1.3.(5).)
   6) Deleted.
   7) Pipes that supply water to a hot water tank shall be provided with a shut-off valve located close to the tank.

2.6.1.4. Protection for Exterior Water Supply
   1) Pipes that pass through an exterior wall to supply water to the exterior of the building shall be provided with
      a) a frost-proof hydrant, or
      b) a stop-and-waste cock located inside the building and close to the wall.

2.6.1.5. Check Valves
   1) A check valve shall be installed at the building end of a water service pipe where the pipe is made of plastic that is suitable for cold water use only.

2.6.1.6. Flushing Devices
1) Flushing devices that serve water closets or urinals shall have sufficient capacity and be adjusted to deliver at each operation a volume of water that will thoroughly flush the fixture or fixtures they serve.
2) Where a manually operated flushing device is installed, it shall serve only one fixture.
3) Except as provided in Sentence (4), water closets and urinals shall have an integral means of limiting the maximum amount of water used in each flush cycle to that specified in Table 2.6.1.6.

### Table 2.6.1.6.

<table>
<thead>
<tr>
<th>Fixtures</th>
<th>Maximum Water Usage per Flush Cycle, Lpf</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water closets(1)</td>
<td>4.8</td>
</tr>
<tr>
<td>Urinals</td>
<td>1.9</td>
</tr>
</tbody>
</table>

Notes to Table 2.6.1.6.: 
(1) The full flush mode of a dual-flush toilet shall not exceed 4.8 L.

4) A maximum flush cycle of 6.0 L may be permitted for a water closet where, in the opinion of the Chief Building Official, the existing plumbing system cannot accommodate and cannot be updated to accommodate the required flush cycle.
5) Except where installed in buildings not intended to be occupied year-round, flush-tank-type urinals shall be equipped with a device capable of preventing flush cycles when they are not in use. (See Note A-2.6.1.6.(5).)

### 2.6.1.7. Relief Valves
1) In addition to the requirements in Sentence (2), the hot water tank of a storage-type service water heater shall be equipped with a pressure-relief valve
   a) designed to open when the water pressure in the tank reaches the rated working pressure of the tank, and
   b) so located that the pressure in the tank shall not exceed the pressure at the relief valve by more than 35 kPa under any condition of flow within the distribution system.
2) The hot water tank of a storage-type service water heater shall be equipped with a temperature-relief valve with a temperature-sensing element
   a) located within the top 150 mm of the tank, and
   b) designed to open and discharge sufficient water from the tank to keep the temperature of the water in the tank from exceeding 99°C under all operating conditions.
3) A pressure-relief valve and temperature-relief valve may be combined where Sentences (1) and (2) are complied with.
4) Indirect service water heaters shall be equipped with a) a pressure-relief valve, and
   b) a temperature-relief valve on every storage tank that forms part of the system.
5) Pipes that convey water from a temperature-relief, pressure-relief or combined temperature- and pressure-relief valve shall
   a) be of a size at least equal to the size of the outlet of the valve,
   b) be rigid, slope downward from the valve, and terminate with an indirect connection above a floor drain, sump, or other safe location, with an air break of not more than 300 mm,
   c) have no thread at its outlet, and
   d) be capable of operating at a temperature of not less than 99°C.
   (See Note A-2.6.1.7.(5).)
6) The temperature-relief valve required in Clause (4)(b) shall
   a) have a temperature-sensing element located within the top 150 mm of the tank, and
b) be designed to open and discharge sufficient water to keep the temperature of the water in the tank from exceeding 99°C under all operating conditions.

7) No shut-off valve shall be installed on the pipe between any tank and the relief valves or on the discharge lines from such relief valves.

8) A vacuum-relief valve shall be installed when any tank may be subject to back-siphonage.

9) Storage-type service water heaters that are located in a ceiling or roof space, or over a floor of wood construction, shall be installed within a corrosion-resistant watertight drain pan, as described in Sentence (10).

10) The drain pan referred to in Sentence (9) shall
   a) be not less than 50 mm larger than the tank and have side walls not less than 25 mm high,
   b) be drained by a pipe two sizes larger than the relief valve discharge pipe, and
   c) have a drain that is located directly under the relief valve discharge pipe and that discharges directly to a floor drain or other acceptable location.

2.6.1.8. Solar Domestic Hot Water Systems

1) Systems for solar heating of potable water shall be installed in conformance with CAN/CSA-F383, "Installation of Packaged Solar Domestic Hot Water Systems."

2.6.1.9. Water Hammer

1) Provision shall be made to protect the water distribution system from the adverse effects of water hammer. (See Note A-2.6.1.9.(1).)

2.6.1.10. Mobile Home Water Service

1) A water service pipe intended to serve a mobile home shall
   a) be not less than ¾ inch in size,
   b) terminate above ground, and
   c) be provided with
      i) a tamperproof terminal connection that is capable of being repeatedly connected, disconnected and sealed,
      ii) a protective concrete pad,
      iii) a means to protect it from frost heave, and
      iv) a curb stop and a means of draining that part of the pipe located above the frost line when not in use.

2.6.1.11. Thermal Expansion

1) Protection against thermal expansion shall be required when a check valve is required by Article 2.6.1.5., a backflow preventer by Article 2.6.2.6., or a pressure-reducing valve by Article 2.6.3.3. (See Note A-2.6.1.11.(1).)

2.6.1.12. Service Water Heaters

1) Thermostat controls for electric storage-type service water heaters shall be set at a temperature of 60°C. (See Note A-2.6.1.12.(1).)

2.6.2. Protection from Contamination

2.6.2.1. Connection of Systems

1) Except as provided in Sentence (2), connections to potable water systems shall be designed and installed so that non-potable water or substances that may render the water non-potable cannot enter the system.
Division B: Acceptable Solutions  
Part 2 – Plumbing Systems

2) A water treatment device or apparatus shall not be installed unless it can be demonstrated that the device or apparatus will not introduce substances into the system that may endanger health. (See Article 2.2.10.17.)

3) Backflow preventers shall be selected and installed in conformance with CSA B64.10, “Selection and Installation of Backflow Preventers.” (See Note A-2.6.2.1.(3).)

4) Backflow preventers shall be maintained and field tested in conformance with the Water Works By-law.

2.6.2.2. Back-Siphonage

1) Portable water connections to fixtures, tanks, vats or other devices not subject to pressure above atmospheric and containing other than potable water shall be installed so as to prevent back-siphonage in conformance with Sentence (2).

2) Except as provided in Sentence 2.6.2.10.(2), back-siphonage shall be prevented by the installation of
   a) an air gap,
   b) an atmospheric vacuum breaker,
   c) a pressure vacuum breaker,
   d) a spill-resistant pressure vacuum breaker,
   e) a hose connection vacuum breaker,
   f) a dual check valve backflow preventer with atmospheric port,
   g) a double check valve assembly,
   h) a reduced pressure principle backflow preventer,
   i) a dual check valve backflow preventer,
   j) a laboratory faucet type vacuum breaker, or
   k) a dual check valve backflow preventer with vent.

2.6.2.3. Backflow Caused by Back Pressure

1) Portable water connections to fixtures, tanks, vats, boilers or other devices containing other than potable water and subject to pressure above atmospheric shall be arranged to prevent backflow caused by back pressure in conformance with Sentences (2) and (3).

2) Except as provided in Article 2.6.2.4., backflow caused by back pressure of non-toxic substances into a potable water system shall be prevented by the installation of
   a) an air gap,
   b) a dual check valve backflow preventer with atmospheric port,
   c) a dual check valve backflow preventer,
   d) a dual check valve backflow preventer with vent,
   e) a double check valve assembly, or
   f) a reduced pressure principle backflow preventer.

3) Backflow caused by back pressure of toxic substances into a potable water system shall be prevented by the installation of
   a) an air gap, or
   b) a reduced pressure principle backflow preventer.

2.6.2.4. Backflow from Fire Protection Systems

1) Backflow caused by back-siphonage or back pressure from fire sprinkler systems where water treatment is not added shall be prevented by the installation of a double check valve assembly or an approved dual check valve when the building is sprinklered to NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes” and a flow through system is installed.

2) Backflow caused by back-siphonage or back pressure from fire sprinkler or standpipe systems where water treatment is added shall be prevented by the installation of a reduced pressure principal backflow preventer. (See Note A-2.6.2.4.(2).)

3) Deleted.

4) Deleted.
2.6.2.5. Separation of Water Supply Systems
1) No private water supply system shall be interconnected with a public water supply system.

2.6.2.6. Premise Isolation
1) In addition to the backflow preventer required by this Subsection for buildings or facilities where a potentially severe health hazard may be caused by backflow, the potable water system shall be provided with premise isolation by the installation of a reduced pressure principle backflow preventer. (See Note A-2.6.2.6.(1).)

2.6.2.7. Hose Bibb
1) Where a hose bibb is installed outside a building, inside a garage or in an area where there is an identifiable risk of contamination, the potable water system shall be protected against backflow through the hose bibb.

2.6.2.8. Cleaning of Systems
1) A newly installed part of a potable water system shall be cleaned and then flushed with potable water before the system is put into operation.

2.6.2.9. Air Gap
1) Air gaps shall not be located in a noxious environment.
2) Air gaps shall be not less than 25 mm high and at least twice the diameter of the opening of the water supply outlet in height. (See Note A-2.6.2.9.(2).)

2.6.2.10. Vacuum Breakers
1) Where the critical level is not marked on an atmospheric vacuum breaker, pressure vacuum breaker, or spill-resistant pressure vacuum breaker, the critical level shall be taken as the lowest point on the device.
2) Where an atmospheric vacuum breaker is installed, it shall be located on the downstream side of the fixture control valve or faucet so that it will be subject to water supply pressure
   a) only when the valve or faucet is open, and
   b) for periods of continuous use not exceeding 12 h.
   (See Note A-2.6.2.10.(2).)
3) An atmospheric vacuum breaker shall be installed so that the critical level is at least the distance specified by the manufacturer at which the device will operate safely but not less than 25 mm above
   a) the flood level rim of a fixture or tank, or
   b) the highest point open to atmosphere in an irrigation system.
4) A pressure vacuum breaker or spill-resistant pressure vacuum breaker shall be installed so that the critical level is not less than 300 mm above
   a) the flood level rim of a fixture or tank, or
   b) the highest point open to atmosphere in an irrigation system.

2.6.2.11. Tank-Type Water Closets
1) Tank-type water closets shall be provided with a back-siphonage preventer in conformance with Sentence 2.2.10.10.(2).

2.6.2.12. Backflow Preventers
1) No bypass piping or other device capable of reducing the effectiveness of a backflow preventer shall be installed in a water supply system.

2.6.3. Size and Capacity of Pipes
(See Note A-2.6.3.)
2.6.3.1. Design, Fabrication and Installation
(See Note A-2.6.3.1.)
1) Water distribution systems shall be designed to provide peak demand flow when the flow pressures at the supply openings conform to the plumbing supply fitting manufacturer’s specifications.
2) Potable water systems shall be designed, fabricated and installed in accordance with good engineering practice, such as that described in the ASHRAE Handbooks and ASPE Data Books. (See Note A-2.6.3.1.(2).)
3) In one- and two-family dwelling units and manufactured homes, multi-purpose systems that combine potable water systems and residential fire sprinkler systems shall be designed, fabricated and installed in accordance with NFPA 13D, “Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes.”

2.6.3.2. Hydraulic Load
1) Except as provided in Sentence (3), the hydraulic load of a fixture or device that is listed in Table 2.6.3.2.-A shall be the number of fixture units given in the Table.
2) Except as provided in Sentences (1) and (3), the hydraulic load of a fixture that is not listed in Table 2.6.3.2.-A is the number of fixture units listed in Table 2.6.3.2.-D.
3) Where fixtures are supplied with both hot and cold water, the hydraulic loads for maximum separate demands shall be 75% of the hydraulic load of the fixture units given in Tables 2.6.3.2.-A and 2.6.3.2.-D when using a detailed engineering design method.
4) The hydraulic load of urinals and water closets with direct flush valves shall be the number of fixture units listed in Tables 2.6.3.2.-B and 2.6.3.2.-C. (See Note A-2.6.3.2.(4).)

Part 2 – Plumbing Systems

#### Table 2.6.3.2.-A

| Water closet, 6 LPF or less with flush tank | ½ | 2.2 | – | 2.2 | 2.2 | – | 2.2 |
| Water closet, greater than 6 LPF with flush tank | ¾ | 3 | – | 3 | 5 | – | 5 |
| Water closet, with direct flush valve | 1 | (6) | – | (6) | (6) | – | (6) |

**Notes to Table 2.6.3.2.-A:**

1. The fixture unit values in this Table are not applicable in certain assembly occupancies because of surges in use by the occupants. For such occupancies, refer to specific design information.
2. For fixtures not indicated in this Table, refer to Table 2.6.3.2.-D.
3. Bathroom group is based on a ½-inch size bathtub supply pipe.
4. Add additional fixture to the fixture load for bathroom group.
5. Refer to manufacturer’s recommendations.
6. For fixture unit values for fixtures with direct flush valves, see Sentence 2.6.3.2.(4) and Tables 2.6.3.2.-B and 2.6.3.2.-C.

#### Table 2.6.3.2.-B

**Sizing of Water Distribution Systems for Urinals with Direct Flush Valves**  
Forming Part of Sentences 2.6.3.2.(4) and 2.6.3.4.(5)

2.6.3.3. Static Pressure
1) Where the static pressure at any fixture may exceed 550 kPa, a pressure-reducing valve shall be installed to limit the maximum static pressure at the fixture to 550 kPa.

2.6.3.4. Size
1) Water service pipes shall be sized according to the peak demand flow but shall not be less than 3/8 inch size.
2) Except as provided in Sentence (3), the size of a supply pipe that serves a fixture shall conform to Table 2.6.3.2.-A.
3) For fixtures listed in Table 2.6.3.2.-A that are permitted to have a supply pipe 3/8 inch in size, a connector not more than 750 mm long and not less than 6.3 mm inside diameter may be used to supply water to the fixture.
4) Reserved.
5) Where both hot and cold water is supplied to fixtures in residential buildings containing one or two dwelling units or row houses with separate water service pipes, the water system may be sized in accordance with Table 2.6.3.4., where
   a) the hydraulic loads for maximum separate demands on water distribution system piping are not less than 100% of the total hydraulic load of the fixture units given in Table 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C or 2.6.3.2.-D for private use,
   b) the minimum water pressure at the entry to the building is 200 kPa, and
   c) the total maximum length of water system is 90 m.
(See Note A-2.6.3.4.(5).)

### Table 2.6.3.4.
Water Pipe Sizing for Buildings Containing One or Two Dwelling Units or Row Houses with Separate Water Service Pipes

</tbody>
</table>

**Notes to Table 2.6.3.4.:**
(1) Table 2.6.3.4. is not intended to limit water velocities that are permitted by Sentence 2.6.3.5.(1).

### 2.6.3.5. Velocity

1) The maximum permitted water velocities shall be those recommended by the pipe and fitting manufacturer.

### Section 2.7. Non-Potable Water Systems

#### 2.7.1. Connection

**2.7.1.1. Not Permitted**

1) A non-potable water system shall not be connected to a potable water system.

#### 2.7.2. Piping Identification

**2.7.2.1. Piping Identification**

1) All non-potable water distribution system piping shall be purple in colour and conform to the requirements of NSF-rw and NSF/ANSI 14, “Plastics Piping System Components and Related Materials.”

2) All other non-potable water piping shall conform to the requirements of CAN/CSA-B128.1, “Design and Installation of Non-Potable Water Systems.”

#### 2.7.3. Location

**2.7.3.1. Pipes**

1) Non-potable water piping shall not be located
   a) where food is prepared in a food-processing plant,
   b) above food-handling equipment,
   c) above a non-pressurized potable water tank, or
   d) above a cover of a pressurized potable water tank.

**2.7.3.2. Outlets**

1) An outlet from a non-potable water system shall not be located where it can discharge into
   a) a sink or lavatory,
   b) a fixture into which an outlet from a potable water system is discharged, or
   c) a fixture that is used for the preparation, handling or dispensing of food, drink or products that are intended for human consumption.

(See Note A-2.7.3.2.(1).)

#### 2.7.4. Alternate Water Source Systems Installed Prior to January 1, 2019

**2.7.4.1. Requirements for Alternate Water Source Systems Installed Prior to January 1, 2019**
1) An operating permit shall be obtained.
2) The operating permit number assigned to the alternate water source system shall be posted on a sign or plate that is securely fastened to the alternate water source system in a location that is conspicuously visible and constructed of a durable, weather resistant material.
3) The Chief Building Official shall be notified within 30 days of any changes to the information that was last provided to the City with regard to the operating permit, in the form prescribed by the Chief Building Official.
4) Water quality shall comply with the water quality standards, testing, documentation, and reporting requirements set out in Articles 2.7.7.1. and 2.7.7.2.
5) If a test result shows that the water quality fails to meet any of the standards set out in Table 2.7.7.1., the response set out in Table 2.7.4.1. shall be undertaken.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Test Result</th>
<th>Required Response</th>

</tr>
</tbody>
</table>

6) The alternate water source system shall be maintained in accordance with any manufacturer’s specifications.
7) If the alternate water source system is in use, cross connection control tests shall be performed as required by CAN/CSA-B128.1, “Design and Installation of Non-Potable Water Systems.”

2.7.4.2. No Other Requirements
1) Alternate water source systems installed prior to January 1, 2019 need not comply with any other requirements set out in Subsections 2.7.5. through 2.7.8.

2.7.5. Alternate Water Source Systems

2.7.5.1. Alternate Water Sources
1) An alternate water source system shall collect only rainwater from roof surfaces or similar areas that do not allow the passage of vehicular traffic and are above grade, and where hydrocarbon-based fuels, hazardous materials, or fertilizers are not stored or used on such surfaces, or clear-water waste, or both.
2) An alternate water source system shall not collect perimeter drainage water, groundwater, storm water, greywater, or blackwater.

2.7.5.2. Mandatory and Optional Uses
1) An alternate water source system shall use treated non-potable water in lieu of potable water for the mandatory uses set out in Table 2.7.5.2.
2) An alternate water source system may use treated non-potable water in lieu of potable water for the optional uses set out in Table 2.7.5.2.
3) Non-potable water shall not be used in lieu of potable water for any other uses.

<table>

### 2.7.5.3. Occupancy

1) Before occupancy of a building is permitted, an alternate water source system shall be commissioned in accordance with Article 2.7.5.4., and an operating permit shall be obtained in accordance with Article 2.7.5.5.

### 2.7.5.4. Commissioning

1) In order to commission an alternate water source system
a) the non-potable water shall be tested by an accredited laboratory for E. coli weekly for a period of 4 weeks with samples being drawn from the sampling port as referenced in Sentence 2.7.6.9.(1), and test results shall be provided to the Chief Building Official,
b) written confirmation that the alternate water source system operates in conformance with the operating manual shall be provided to the Chief Building Official by the registered professional of record, and a cross connection control test shall be performed and witnessed by the Chief Building Official.

### 2.7.5.5. Operating Permit

1) An operating permit shall be obtained for an alternate water source system.
2) The operating permit number assigned to the alternate water source system shall be posted on a sign or plate that is securely fastened to the alternate water source system in a location that is conspicuously visible and constructed of a durable, weather resistant material.
3) The Chief Building Official shall be notified within 30 days of any changes to the information that was last provided to the City with regard to the operating permit, in the form prescribed by the Chief Building Official.

### 2.7.5.6. Continued Operation

1) Once an operating permit has been issued, an alternate water source system shall operate continuously unless written approval to discontinue its use has been obtained from the Chief Building Official or City Engineer.
2.7.6. Design

2.7.6.1. Professional Design
1) An alternate water source system shall be designed by a registered professional and shall be designed to prioritize the use of non-potable water.

2.7.6.2. Pipe Sizing
1) Except as required by Sentence (2), non-potable distribution piping shall be sized according to Subsection 2.6.3.
2) Dwelling units within a building with an alternate water source system shall be equipped with a) tank type water closets, and b) non-potable distribution piping sized in conformance with the IAPMO Water Demand Calculator.

2.7.6.3. Continuity of Supply
1) A secondary water supply shall be provided.

2.7.6.4. Backflow Prevention
1) An air gap at least two times the size of the discharge opening shall be installed for the potable water make-up supply.

2.7.6.5. Removal of Particulates and Impurities
1) Provision shall be made upstream of the cistern to remove the accumulation of particulates and impurities before they enter the cistern.

2.7.6.6. Cistern Security
1) Cisterns shall be secured to prevent tampering and unintended or unauthorized entry either by a lockable device or another approved method, and all penetrations shall be sealed to prevent insect or vermin entry.

2.7.6.7. Minimum Withdrawal Level
(See Note A-2.7.6.7, 2.7.6.8. and 2.7.6.9.)
1) Water shall be withdrawn a minimum of 0.3 m from the base of the cistern.

2.7.6.8. Water Metering Requirements
(See Note A-2.7.6.7, 2.7.6.8. and 2.7.6.9.)
1) A water meter shall be installed and located within 1.5 m of the potable water make-up supply and shall be capable of recording the volume of potable water being supplied.
2) A water meter shall be installed and located on the non-potable water outlet prior to distribution and shall be capable of recording the volume of non-potable water being supplied to the distribution piping.

2.7.6.9. Water Quality Sampling Locations
(See Note A-2.7.6.7, 2.7.6.8. and 2.7.6.9.)
1) A sampling port, and provision for continuous in-line measurements required in order to conform with Table 2.7.7.1., shall be installed and located downstream of the water meter at the non-potable water outlet and prior to distribution.

2.7.6.10. Alerts
1) All monitoring devices referred to in Sentence 2.7.6.9.(1) above shall be capable of activating an alert that is designed to activate continuously for the duration of the alert condition whenever the water quality fails to meet the standards set out in Table 2.7.7.1.
2.7.6.11. Power Interruption
1) If a building is required to have an emergency system generator, provision shall be made for the continued operation of any mandatory uses for non-potable water listed in Table 2.7.5.2. in the event of a power interruption.

2.7.7. Water Quality Standards

2.7.7.1. Water Quality Standards, Testing, and Documentation
1) Water quality shall meet the standards set out in Table 2.7.7.1.
2) Water quality shall be tested as set out in Table 2.7.7.1.
3) All test results shall be documented as set out in Table 2.7.7.1., and documentation shall be retained for no less than 24 months.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

2.7.7.2. Water Quality Reporting
1) Water quality reports containing all documentation required by Sentence 2.7.7.1.(3) shall be submitted to the Chief Building Official before the end of the third month following the issuance of an operating permit, and then every 3 months thereafter.

2.7.7.3. Required Response to Failure to Meet Water Quality Standards
1) If a test result shows that the water quality fails to meet a standard set out in Table 2.7.7.1., the response set out in Table 2.7.7.3 shall be undertaken.

<table>
<thead>
<tr>

1. Immediately supply the alternate water source system with **potable** water only;
2. Immediately notify the **Chief Building Official**; and
3. Take the appropriate corrective action as set out in the operating manual.

### Turbidity

| > 15 NTU (Nephelometric Turbidity Units) |

### Temperature

| > 25°C |

---

### 2.7.8. Operating Manual and Maintenance

#### 2.7.8.1. Operating Manual

1. An operating manual shall be supplied to the owner or representative of the owner by the designer of the alternate water source system and shall be stamped by a registered professional of record, and shall include the following:
   a. address and location of the alternate water source system,
   b. system designer contact details,
   c. a simplified process flow diagram,
   d. a schematic of the entire system showing locations of all system components,
   e. instructions on operating, maintaining, and inspecting the system,
   f. required frequency of maintenance and inspections,
   g. instructions on deactivating and restarting the system for repair or other purposes,
   h. details on the corrective action that shall be taken if the water quality fails to meet the standards set out in Table 2.7.7.1., and
   i. safety data sheets.

#### 2.7.8.2. Maintenance

1. **Alternate water source systems** shall be maintained in accordance with the operating manual and any manufacturer’s specifications.
2. Cross connection control tests shall be performed as required by CAN/CSA-B128.1, “Design and Installation of Non-Potable Water Systems.”
3. A maintenance log shall be maintained and shall include:
   a. the address and location of the alternate water source system,
   b. the name and contact information of the owner,
   c. a record of inspections and any maintenance performed within the last 24 months,
   d. details of any changes or alterations made to the system at any time after commissioning,
   e. a record of water quality test results as set out in Article 2.7.7.1., including the name of the person and company conducting the test,
   f. copies of water quality reports prepared and submitted in accordance with Article 2.7.7.2 within the last 24 months, and
   g. if a water quality test fails to meet a standard defined in Table 2.7.7.1., a description of the extent of the deviation from the standard, the corrective action taken, a record of any required notification, and the outcome of the corrective action, including all applicable dates and times.

#### 2.7.8.3. Request for Operating Manual or Maintenance Log

1. The operating manual and the maintenance log shall be made available on such request to the **Chief Building Official** or **City Engineer**.

---

### Section 2.8. Objectives and Functional Statements
2.8.1. Objectives and Functional Statements

2.8.1.1. Attribution to Acceptable Solutions

1) For the purposes of compliance with this By-law as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 2.8.1.1. (See Note A-1.1.2.1.(1).)

Notes to Table 2.8.1.1.:

(1) See Parts 2 and 3 of Division A.

Notes to Part 2

Plumbing Systems

A-2.1.2.1.(2) Combined Building Drains. Combined building drains may have proven acceptable on the basis of past performance in some localities and their acceptance under this Code may be warranted.

A-2.1.2.4.(1) Service Piping. The layout as shown in Figure A-2.1.2.4.(1)(c) may require special legal arrangements in some jurisdictions to ensure that access can be provided to all parts of the service pipes.
Figure A-2.1.2.4.(1)  
Service Piping  
A-2.2.2.3.(3)  Shower Drainage (Plan View).
Division B: Acceptable Solutions

Part 2 – Plumbing Systems

Vancouver Building Bylaw 2019

Division B

Acceptable Solutions

Figure A-2.2.3.(3)
Shower Drainage (Plan View)

A-2.2.2.4.(1) Concealed Overflows. The use of concealed overflows does not preclude the use of a standing waste.

A-2.2.3.1.(1) and (3) Trap Seal Depth and Trap Connections.

A-2.2.3.1.(4) Prohibited Traps. Except for an S-trap standard, the S trap shown in Figure A-2.2.3.1.(4)(b) is prohibited by Clause 2.5.6.3.(1)(b), which limits the fall on fixture drains. Crown vented traps shown in Figure A-2.2.3.1.(4)(c) are prohibited by Clause 2.5.6.3.(1)(a), which requires that the distance from the trap weir to the vent be not less than twice the size of the fixture drain.

Figure A-2.2.3.1.(4)
Prohibited Traps

A-2.2.3.2.(3) Grease Interceptors. CSA B481.4, “Maintenance of Grease Interceptors,” is considered to represent good practice regarding procedures for the maintenance of grease interceptors.

A-2.2.4.1. T Fittings in Drainage Systems. The use of a cross fitting in a drainage system is prohibited, but such fitting may be used in a venting system to connect 4 vent pipes. In a drainage system, a T fitting can only be used as shown in Figure A-2.2.4.1.(a), and cannot be used as shown in Figure A-2.2.4.1.(b) because the T or cross fitting would change the direction of flow in the drainage system.
A-2.2.4.2. Sanitary T Fittings in Drainage Systems. A sanitary T fitting may be used to change the direction of flow in a drainage system from horizontal to vertical, but may not be used to change the direction of flow in a nominally horizontal drainage system. A combination Y and 1/8th bend fitting may also be used as shown in Figure A-2.2.4.2.(b).

#### A-2.2.5.2.(3) Concrete Fittings.

Concrete fittings fabricated on the site from lengths of pipe may have proven acceptable on the basis of past performance in some localities and their acceptance under this Code may be warranted.

#### A-2.2.5.5.(1) Polyethylene Pipe Used Underground.

Joints within the high-density polyethylene pipe (HDPE) shall be heat-fused according to the manufacturer’s instructions. Joints between HDPE pipes and other materials shall be made with a suitable hubless coupling.

#### A-2.2.5.6.(1) Crosslinked Polyethylene Pipe and Fittings.

There are some special installation requirements for the use of crosslinked polyethylene pipe and its associated fittings. Reference should, therefore, be made to the installation information in CAN/CSA-B137.5, “Crosslinked Polyethylene (PEX) Tubing Systems for Pressure Applications.”

#### A-2.2.5.9. to 2.2.5.11. Solvent Cement.

#### A-2.2.5.12.(1) Polyethylene/Aluminum/Polyethylene Composite Pipe and Fittings.

There are some special installation requirements for the use of polyethylene/aluminum/polyethylene composite pipe and fittings. Reference should, therefore, be made to the installation information in CAN/CSA-B137.9, “Polyethylene/Aluminum/Polyethylene (PE-AL-PE) Composite Pressure-Pipe Systems.”

#### A-2.2.5.13.(1) Crosslinked Polyethylene/Aluminum/Crosslinked Polyethylene Composite Pressure Pipe and Fittings.

There are some special installation requirements for the use of crosslinked polyethylene/aluminum/crosslinked polyethylene composite pipe and fittings. Reference should, therefore, be made to the installation information in CAN/CSA-B137.10, “Crosslinked Polyethylene/Aluminum/Crosslinked Polyethylene (PEX-AL-PEX) Composite Pressure-Pipe Systems.”

#### A-2.2.5.14.(1) Polypropylene Pipe and Fittings.

There are some special installation requirements for the use of polypropylene pipe and fittings. Reference should, therefore, be made to the installation information in CAN/CSA-B137.11, “Polypropylene (PP-R) Pipe and Fittings for Pressure Applications.”
**A-2.2.6.8.(3) Galvanized Steel Pipe.** The use of galvanized steel pipe and fittings in a water distribution system may have proven acceptable on the basis of past performance in some localities and its acceptance under this Code may be warranted.

**A-2.2.10.4.(1) Fittings in Pressure Piping Applications** Piping used in pressure applications are to be grooved and constructed using tools specifically designed for that piping material. It is important that all groove profiles are to meet the fitting manufacturer’s guidelines and conform to CSA-B242 “Groove and Shoulder-Type Mechanical Pipe Couplings.” Overly shallow roll grooved or cut connections may result in reduced working pressures at the joint or the failure of the connection due to insufficient engagement of the coupling or from slippage at the joint. Conversely, grooves or cuts that are overly deep may result in failures of the pipe stemming from corrosion or stress concentrations at the joints.

**Figure A-2.2.10.4.(1)**
Insufficient Key Engagement of Fitting in Roll Grooved Connection

**A-2.2.10.5.(1) Saddle Hubs or Fittings.** Saddle hubs or fittings may have proven acceptable on the basis of past performance in some localities and their acceptance under this Code may be warranted.

**A-2.2.10.6.(2) Supply Fittings and Individual Shower Heads.** Flow restriction devices within supply fittings should not be removed. Due to the low flow rate of public lavatory faucets, design consideration should be given to the wait time for hot water to be delivered to each fixture.

**A-2.2.10.6.(3) Automatic Compensating Valves.** When replacing a shower head, the appropriate shower valve with a suitable compensating feature matching the flow rate should be chosen to decrease the possibility that users will suffer thermal shock. The water flow rate of automatic compensating mixing valves can be found in ASSE 1016/ASME 112.1016/CSA B125.16, “Performance Requirements for Automatic Compensating Valves for Individual Showers and Tub/Shower Combinations.”

**A-2.2.10.6.(4) and (5) Automatic Shut-off of Water Flow.** Examples of water shut-off devices include occupant sensors and self-closing valves.

**A-2.2.10.7. Hot Water Temperature.** Hot water delivered at 60°C will severely burn human skin in 1 to 5 seconds. At 49°C, the time for a full thickness scald burn to occur is 10 minutes. Children, the elderly and persons with disabilities are particularly at risk of scald burns. Compliance with Article 2.2.10.7. will reduce the risk of scalding in showers and bathtubs, and reduce the risk of thermal shock from wall-mounted shower heads. These requirements apply to all occupancies, not just residential occupancies. The water outlet temperature at other fixtures, such as lavatories, sinks, laundry trays or bidets, is not addressed by Article 2.2.10.7., but a scald risk may exist at such fixtures nonetheless.
A-2.2.10.9.(3)  Bubblers.  Bubblers installed on other than drinking fountains may have proven acceptable on the basis of past performance in some localities and their acceptance under this Code may be warranted.

A-2.2.10.16.(1)  Air Admittance Valve.  An air admittance valve is a device that is closed by gravity and seals the vent terminal at zero differential pressure (no flow conditions) and under positive internal pressures. The valve allows air to enter the drainage system without the use of a vent extended to outside air and prevents trap siphonage.

The material of the diaphragm can be damaged by exposure to acidic or corrosive fumes in the ambient atmosphere; therefore, air admittance valves should not be installed in locations where there is a potential for exposure to such fumes.

A-2.2.10.17.  Water Treatment Systems.  The potential risk for substances to be introduced into the drinking water that may endanger health must be considered. All proposals to install water treatment devices shall address:

• Seismic and environmental concerns,
• Monitoring and tampering detection,
• Protection of the city water supply and interface with the existing distribution system,
• Notification of end users and record keeping,
• Chemical storage and security and
• Spill containment and procedures in the event of an equipment malfunction such as incorrect dosing.

For proposed new installations, the Chief Building Official will require:

• A technical report from a registered professional with appropriate qualifications and training identifying the context of installation, performance specifications of the proposed equipment, and the technical basis for the installation and means to protect the general public and end users,
• A piping diagram of the proposed water distribution system showing the type of existing piping and equipment, and
• A letter from the owner(s) stating that all end users have been informed of the proposal to introduce such chemicals into the drinking water and a sign has been posted in a conspicuous place 30 days before the proposed date of installation detailing the scope of the installation, the name of the chemicals being introduced and the relevant safety data sheets (SDS).

A-2.2.11.4.(2)  Non-recirculating Applications.  Non-recirculating water systems, such as once-through cooling equipment, waste large volumes of drinking water. Only in exceptional circumstances will a request for an operating permit be considered, such as a life safety application for which a registered professional has formally documented that there is no practical alternative to once-through cooling.

A-2.3.2.6.(1)  Mechanical Joints.  Storm sewer blockage can cause mechanical joints at the base of leaders to fail, which results in flooding. The failure occurs because the cleanout joints at the base of the rainwater leaders are not able to withstand the water column pressure. To avoid such failures, it is necessary to ensure that storm water systems installed using mechanical joints be braced and/or restrained at the ends of branches, changes in direction and elevation, at dead ends and at other locations as required by the manufacturer to prevent the separation of joints due to internal pressure, mechanical stress or seismic events. Care should be taken to replace cleanouts properly after maintenance or testing.

A-2.3.3.9.  Linear Expansion.
Division B: Acceptable Solutions

Part 2 – Plumbing Systems

Figure A-2.3.3.9.  
Linear Expansion

Example: To determine the expansion of 20 m of ABS pipe for a temperature change from 10°C to 60°C. Temperature change = 60 – 10 = 50°C. Enter the chart at 50°C, read up to ABS line, and then across to the mm scale = 47 mm/10 m of pipe, \[ \text{change in length of 20 m of pipe} = \frac{20}{10} \times 47 = 94 \text{mm}; \]

A-2.3.3.9.(1) Expansion and Contraction. Expansion and contraction in piping systems may be accommodated in a number of ways including, but not limited to, piping design and layout, material selection, and the inclusion of expansion joints.

A-2.3.3.11.(2) Air Break.

Figure A-2.3.3.11.(2)  
Air Break

A-2.3.4.6.(1) Support for Underground Piping. See explanation for Subsection 2.3.5. for additional protection required for underground pipes. Permitted installations are shown in Figure A-2.3.4.6.(1)(a). The methods of support shown in Figure A-2.3.4.6.(1)(b) are not permitted because the base does not provide firm and continuous support for the pipe.
A-2.3.4.6.(1) Support for Underground Piping

A-2.3.5.1.(1) Backfilling of Pipe Trench. Stronger pipes may be required in deep fill or under driveways, parking lots, etc., and compaction for the full depth of the trench may be necessary.

A-2.3.5.2.(1) Protection of Underground Non-Metallic Pipes.
**Division B: Acceptable Solutions**

**Part 2 – Plumbing Systems**

**A-2.3.5.4. Protection of Piping Against Freezing.** The TIAC “Mechanical Insulation Best Practices Guide” is a comprehensive source of information on the selection, installation and proper use of thermal insulation materials. (Note that Section 4 of this Guide is not included in the scope of this Note as it contains information on proprietary products, which are not within the mandate of the Code.)

**A-2.3.7.2.(2) Pressure-Testing of Potable Water Systems.** The plastic piping manufacturer should be consulted to determine the appropriateness of using air to pressure-test the piping system.

**A-2.4.2.1.(1)(a)(ii) and (e)(vi) Indirect Connections.** See Sentence 2.4.5.1.(4) for trapping requirements for indirectly connected fixtures. See Sentence 2.4.7.1.(9) for cleanouts on drip pipes for food receptacles or display cases.

---

**Figure A-2.3.5.2.(1)**

Protection of Underground Non-Metallic Pipes

(a) Concrete floors less than 75 mm thick

(b) Concrete floor 75 mm or more thick (no protection required)

**Figure A-2.4.2.1.(1)(a)(ii) and (e)(vi)**

Indirect Connections

---

**Vancouver Building Bylaw 2019**

**Division B 2-109**
Indirect Connections

A-2.4.2.1.(2) Soil-or-Waste Pipe Connections.

Soil-or-Waste Pipe Connections

A-2.4.2.1.(4) Suds Pressure Zones. High sudsing detergents used in clothes washers produce suds that tend to disrupt the venting action of venting systems and can also spread through the lower portions of multi-storey drainage systems. The more turbulence, the greater the suds. One solution that avoids the creation of suds pressure zones involves connecting the suds-producing stack downstream of all other stacks and increasing the size of the horizontal building drain to achieve a greater flow of air and water. Using streamlined fittings, such as wyes, tends to reduce suds formation. Check valves or backwater valves in fixture outlet pipes have also been used to correct problem installations.
A-2.4.3.3.1 Waste with Organic Solids. Equipment such as garbage grinders and potato peelers produces waste with organic solids. These devices reduce most waste into small-sized particles that will flow easily through the drainage system. However, if they are located upstream of the interceptor, the particles could block the interceptor.

A-2.4.4.3.1 Grease Interceptors. Grease interceptors may be required when it is considered that the discharge of fats, oil or grease may impair the drainage system. Information on the design and sizing of grease interceptors can be found in ASPE 2012, “Plumbing Engineering Design Handbook, Volume 4, Chapter 8, Grease Interceptors.”

A-2.4.4.4.1 Bio-hazardous Waste. Chemically loaded and bio-hazardous wastes can be dangerous to private or public sewer systems and hazardous to people. The treatment of corrosive and acid waste is mandated by this Code. The treatment of chemically loaded effluents is usually regulated by sewage collecting and treatment authorities. The treatment of bio-hazardous waste should follow “good engineering practice,” such as that described in Laboratory Biosafety Guidelines published by Health Canada. It should be noted that bio-hazardous waste disposal systems require specific engineering expertise and remain outside the scope of this Code.

A-2.4.5.1.2 Trapping of Sinks and Laundry Trays.
Division B: Acceptable Solutions

Part 2 – Plumbing Systems

Figure A-2.4.5.1.(2)
Trapping of Sinks and Laundry Trays

Notes to Figure A-2.4.5.1.(2):
(1) See Sentence 2.4.9.3.(2).
(2) The developed length of the fixture outlet pipe shall not exceed 1 200 mm. See Article 2.4.8.2.

A-2.4.5.1.(3) Single Traps for Fixture Groups.

Figure A-2.4.5.1.(3)
Single Traps for Fixture Groups

A-2.4.5.1.(5) Location of Trap or Interceptor. An interceptor that replaces a trap must be vented in the same way as the trap it replaces. (See Note A-2.4.2.1.(1)(a)(ii) and (e)(vi).) Where an interceptor other than an oil interceptor serves a group of fixtures requiring more than one trap, each fixture must be properly trapped and vented. (See Article 2.5.5.2. for venting of oil interceptors.)
A-2.4.5.2.(1) **Untrapped Leader.** When an untrapped leader drains to a combined building sewer, clearance requirements are the same as for vent terminals. (See also Note A-2.5.6.5.(4).)

A-2.4.5.3.(1) **Subsoil Drainage Connections.** This Code does not regulate the installation of subsoil drainage pipes, but does regulate the connection of such pipes to the plumbing system. The intent of this Article is to place a trap between the subsoil drainage pipe and the sanitary drainage system. The cleanout must be installed in accordance with Sentence 2.4.7.1.(2). A trap or sump may be provided specifically for the subsoil drains, or advantage may be taken of the trap of a floor drain or storm water sump as shown in Figure A-2.4.5.3.(1).

A-2.4.5.4.(1) **Location of Building Traps.**
A-2.4.5.5.1 Maintaining Trap Seals. Periodic manual replenishment of the water in a trap is considered to be an equally effective means of maintaining the trap seal in floor drains in residences. Under pressure differential conditions, special measures are necessary to maintain trap seals.

A-2.4.6.3 Arrangement of Piping at Sump. In most installations, controls will be installed in conjunction with a float to automatically empty the sump. If such controls are not provided, the capacity of the sump should equal the maximum inflow to the sump that is expected to occur during any 24 h period.
A-2.4.6.4.(1) **Backwater Valve or Gate Valve.** The installation of a backwater valve or a gate valve in a building drain or in a building sewer may have proven acceptable on the basis of past performance in some localities, and their acceptance under this Code may be warranted.

A-2.4.7.1.(6) **Cleanouts for Drainage Systems.** To accommodate the limitations of sewer cleaning equipment, the cleanout should be located as close as possible to the exterior wall of the building, either inside or outside, and be accessible for sewer cleaning equipment.

A-2.4.7.1.(9) **Cleanouts for Food Receptacle Drip Pipes.**

- **Figure A-2.4.7.1.(9)**

  - Cleanouts for Food Receptacle Drip Pipes

  **Note to Figure A-2.4.7.1.(9):**
  
  (1) See Article 2.4.2.1.

A-2.4.7.1.(10) **Cleanouts for Fixture Drains.** A trap cleanout plug cannot be used as a cleanout for a fixture drain.

A-2.4.8.1.(1) **Minimum Slope.** Although slopes below 1 in 100 are permitted for pipes over 4 inches, they should be used only where necessary. Steeper slopes and higher velocities will help to keep pipes clean by moving heavier solids that might tend to clog the pipes.

A-2.4.8.2.(1) **Island Fixture Installation.**
Division B: Acceptable Solutions

Part 2 – Plumbing Systems

Figure A-2.4.8.2.(1)
Island Fixture Installation(3)

Notes to Figure A-2.4.8.2.(1):
(1) Vent size to be in accordance with Article 2.5.6.3.
(2) Length of A depends on trap size. Fall cannot exceed size.
(3) See also Article 2.5.1.1.

A-Table 2.4.9.3. Hydraulic Loads for Laundry Traps and Floor Drains. When determining the hydraulic load on a pipe, no allowance need be made for a load from a domestic clothes washer when discharged to a laundry tray since the hydraulic load from the laundry tray is sufficient. Also no hydraulic load is required from a floor drain in a washroom since it is for emergency use only.

A-2.4.9.3.(2) Continuous Wastes. Fixture outlet pipes that are common to 2 or 3 compartments or fixtures are sometimes referred to as continuous wastes and are not considered to be branches. (See also Note A-2.4.5.1.(2).)

A-2.4.9.3.(3) Standpipe Illustration.

Figure A-2.4.9.3.(3)
Standpipe Installation for Clothes Washers

Hydraulic Loads
The hydraulic load that is imposed by a fixture is represented by a factor called a fixture unit. Fixture units are dimensionless and take into account the rate of discharge, time of discharge and frequency of discharge of the fixture.

Confusion often arises when attempts are made to convert fixture units to litres per second because there is no straightforward relationship between the two. The proportion of the total number of fixtures that can be expected to discharge simultaneously in a large system is smaller than in a small system. For example, doubling the number of fixtures in a system will not double the peak flow that the system must carry, although of course the flow will be increased somewhat. Figure A-2.4.10.-A shows the relationship that was used in constructing the tables of capacities of stacks, branches, sanitary building drains and sanitary building sewers (Tables 2.4.10.6.-A to 2.4.10.6.-C).

Although the curve in Figure A-2.4.10.-A was used to prepare the Code tables, it was not included in the National Plumbing Code. Instead, a single approximate conversion factor is given in the Code so that a continuous flow from a fixture may be converted from litres per second to fixture units in order to determine the total hydraulic load on the sanitary drainage system. The conversion factor, which is given in Sentence 2.4.10.3.(1), is 31.7 fixture units per litres per second. The discharge from a continuous flow fixture in litres per second when multiplied by 31.7 gives the hydraulic load in fixture units, and that load is added to the fixture unit load from other fixtures to give the total load that the sanitary drainage pipe must carry.

The hydraulic load that is produced by storm water runoff depends both on the size of the area that is drained and local rainfall intensity. The capacities of storm drainage pipes and combined sewers in Tables 2.4.10.9., 2.4.10.10. and 2.4.10.11. have been expressed in terms of the number of litres that they can carry when the local rainfall intensity is 1 mm in 15 min. The hydraulic load for a particular location is obtained by simply multiplying the rainfall intensity figure given in Appendix C of Division B of the NBC by the actual area drained as specified in Sentence 2.4.10.4.(1).

![Figure A-2.4.10.-A](image)

**Figure A-2.4.10.-A**

**Relationship between Fixture Units and Demand**

In the case of restricted-flow drains, the hydraulic load from storm water runoff must be calculated using manufacturer discharge flow rates of specific drains in the case of roofs, and water-flow restrictors in the case of paved areas.

When plumbing fixtures are connected to a combined sewer, the hydraulic load from the fixtures must be converted from fixture units to litres or, in the case of continuous flow, from litres per second to litres so that
these loads can be added to the hydraulic loads from roofs and paved surfaces. As already pointed out, the relationship between fixture units and litres per second and, consequently, the relationship between fixture units and litres is not straightforward, and an approximate conversion factor has been adopted. The conversion factor given in Sentence 2.4.10.5.(1) is 9.1 L/fixture unit, except where the load is less than 260 fixture units in which case a round figure of 2 360 L is to be used. In the case of continuous-flow fixtures that are connected to combined sewers or storm sewers, the conversion factor given in Sentence 2.4.10.3.(2) is 900 L per L/s. This conversion factor is not an approximation but an exact calculation. The conversion factors given in Sentences 2.4.10.3.(1) and 2.4.10.5.(1) are designed to convert in one direction only, and must not be used to convert from fixture units to litres per second in the one instance, nor from litres to fixture units in the other instance. In summary, it should be noted that
(a) in sanitary drainage systems, all hydraulic loads are converted to fixture units, and
(b) in storm drainage systems or combined drainage systems, all hydraulic loads are converted to litres.

Procedure for Selecting Pipe Sizes
The following is an outline, with examples, of the procedures to be followed in determining the size of each section of drainage piping.
(1) Sanitary drainage pipes, such as branches, stacks, building drains or building sewers:
(a) Determine the load in fixture units from all fixtures except continuous-flow fixtures;
(b) Determine the load in litres per second from all continuous-flow fixtures and multiply the number of litres per second by 31.7 to obtain the number of fixture units;
(c) Add loads (a) and (b) to obtain the total hydraulic load on the pipe in fixture units; and
(d) Consult the appropriate table from Table 2.4.10.6.-A, 2.4.10.6.-B or 2.4.10.6.-C to select the pipe size.
(Note that no pipe size may be smaller than that permitted in Subsection 2.4.9.)

(2) Storm drainage pipes, such as gutters, leaders, horizontal pipes, building drains or building sewers:
(a) Determine the area in square metres of roofs and paved surfaces according to Sentence 2.4.10.4.(1);
(b) Determine the local rainfall intensity (15 min rainfall) from Appendix C of Division B of the NBC;
(c) Multiply (a) by (b) to obtain the hydraulic load in litres;
(d) If a fixture discharges a continuous flow to the storm system, multiply its load in litres per second by 900 to obtain the hydraulic load in litres;
(e) If flow control roof drains are used, compute the discharge rate based on rain intensity, retention duration, accumulation height and roof area from the roof drain manufacturers’ data;
(f) Add loads (c) or (e), and (d) to obtain the total hydraulic load on the pipe in litres; and
(g) Consult the appropriate table from Table 2.4.10.9., 2.4.10.10. or 2.4.10.11. to select the pipe or gutter size.
(Note that no pipe may be smaller than that permitted in Subsection 2.4.9.)

(3) Combined drainage pipes, such as building sewers:
(a) Determine the total load in fixture units from all fixtures except continuous-flow fixtures;
(b) If the fixture unit load exceeds 260, multiply it by 9.1 to determine the equivalent hydraulic load in litres. If the fixture unit load is 260 or fewer fixture units, the hydraulic load is 2 360 L;
(c) Obtain the hydraulic load from roofs and paved surfaces in the same manner as for storm drains (See 2(a), (b), (c) and (e));
(d) Obtain the hydraulic load in litres from any continuous-flow source that is connected to the sanitary or storm drainage system in the same manner as for storm drainage pipes (See 2(d));
(e) Add hydraulic loads (b), (c) and (d) to obtain the total hydraulic load on the pipe in litres; and
(f) Consult Table 2.4.10.9. to select the pipe size.

(Note that no pipe may be smaller than that permitted in Subsection 2.4.9.)

Examples
Example 1: Determination of the size of storm drainage components for the building shown in Figures A-2.4.10.-B and A-2.4.10.-C

Step No. 1: Determine the hydraulic load from the roofs.
Area drained by gutter = 162 m²
Area drained by roof drain = 230.4 m²
If the local rainfall intensity is 25 mm:
- the load on the gutter (leader No. 2) is (25 × 162) = 4050 L
- the load on the roof drain (leader No. 1) is (25 × 230.4) = 5760 L
If the local rainfall intensity is 15 mm:
- the load on the gutter (leader No. 2) is (15 × 162) = 2430 L
- the load on the roof drain (leader No. 1) is (15 × 230.4) = 3456 L

Step No. 2: Determine the size of storm drainage components.
Using the appropriate hydraulic loads, the size of storm drainage components can be determined from Tables 2.4.10.9., 2.4.10.10. and 2.4.10.11. These values are tabulated in Table A-2.4.10. for rainfall intensities of 25 mm and 15 mm in 15 min.
Table A-2.4.10.
Storm Drainage Pipe Sizes (Example 1)

Example 2: Determination of the size of drainage pipes for buildings
Figure A-2.4.10.-D represents an office building with washrooms for men and women, a drinking fountain and cleaner’s closet on each typical floor. The equipment room with facilities is located in the basement. The building is 18 m by 30 m and is to be built in Kitchener, Ontario.

A. Hydraulic Load per Typical Floor
5 WC @ 6 = 30 fixture units
2 UR @ 1½ = 3 fixture units
4 LAV @ 1½ = 6 fixture units
2 FD @ 3 = 6 fixture units
1 FS @ 3 = 3 fixture units
1 DF @ 1 = 1 fixture unit
49 fixture units
The reader is left to calculate the size of the branches, one of which must be 4 inches and another 3 inches (See Subsection 2.4.9.). Therefore the smallest part of the stack must be 4 inches.

B. Hydraulic Load on Stack
5 storeys @ 49 fixture units = 245 fixture units
Table 2.4.10.6.-A permits 4-inch pipe. Use 4-inch pipe.

C. Hydraulic Load on Basement Branch
1 WC @ 6 = 6 fixture units
1 LAV @ 1 = 1 fixture unit
2 FD @ 3 = 6 fixture units
1 FS @ 3 = 3 fixture units
Semi-continuous Flow
0.23 L/s × 31.7 = 7 fixture units
  23 fixture units
Table 2.4.10.6.-B permits 3-inch pipe. Use 3-inch pipe.

D. Hydraulic Load on Building Drain
From soil-or-waste stack  245 fixture units
From basement branch  23 fixture units
  268 fixture units
Referring to Table 2.4.10.6.-C, at a slope of 1 in 50, a 4-inch pipe will carry 240 fixture units.
Referring to Table 2.4.10.6.-C, at a slope of 1 in 25, a 4-inch pipe will carry 300 fixture units.
For practical reasons, use a 4-inch pipe at a slope of not less than 1 in 32.

E. Storm Load
Area of roof 18 × 30 = 540 m²
Rainfall intensity for Kitchener, taken from Appendix C of Division B of the NBC, is 28 mm in 15 min
Total hydraulic storm load = 28 × 540 = 15 120 L
Storm load on each roof drain = 15 120/2 = 7 560 L

F. Size of Horizontal Leaders
Referring to Table 2.4.10.9., at a slope of 1 in 25, a 4-inch pipe will carry a load of 8 430 L.
Referring to Table 2.4.10.9., at a slope of 1 in 100, a 5-inch pipe will carry a load of 7 650 L.
Referring to Table 2.4.10.9., at a slope of 1 in 133, a 6-inch pipe will carry a load of 10 700 L.
Therefore, use a 5-inch pipe at a slope of 1 in 100.
G. Size of Vertical Leader
Table 2.4.10.11. would permit a 5-inch pipe (19 500 L) but this size is not readily available. For practical reasons, use a 6-inch pipe.

H. Size of Storm Building Drains
Since a drainage pipe cannot be any smaller than any upstream pipes, the storm building drain must be at least 6 inches. Referring again to Table 2.4.10.9., a 6-inch pipe will carry a hydraulic load of 17 600 L at a slope of 1 in 50. Therefore use a 6-inch pipe at a slightly higher slope.

I. Size of Combined Building Sewer
(a) Total sanitary load excluding semi-continuous flow 260 fixture units converted to litres
(Clause 2.4.10.5.(1)(b)) \times 9.1 = 2366 L
(b) Semi-continuous flow 0.23 L/s converted to litres
(Sentence 2.4.10.3.(2)) \times 900 = 207 L
(c) Storm load 15 120 L
Total hydraulic load 17 693 L
Referring to Table 2.4.10.9., at a slope of 1 in 50, a 6-inch pipe will carry 17 600 L.
Referring to Table 2.4.10.9., at a slope of 1 in 25, a 6-inch pipe will carry 24 900 L.
Therefore, use a 6-inch pipe at a slope of not less than 1 in 32.

A-2.4.10.4.(1) Rainfall Intensities. Climate information on rainfall intensities for various cities can be found in Appendix C of Division B of the NBC.

When calculating the hydraulic load from a roof or paved surface, it should be noted that a 1 mm depth of water on 1 m² of surface is equivalent to 1 L.

A-2.5.1.1.(3) Trapping of Floor Drains.

Figure A-2.5.1.1.(3)
Trapping of Floor Drains

Example of Circuit Venting Described in Sentence 2.5.3.1.(8)

Figure A-2.5.3.1.-K
Example of Circuit Venting Described in Sentence 2.5.3.1.(9)

Note to Figure A-2.5.3.1.-K:
(1) The drain is sized as a branch. The size of the drain should be increased as the load increases.
Notes to Figure A-2.5.3.1.-L:
(1) The relief vent and the additional circuit vent are one size smaller than the circuit vent.
(2) See Sentence 2.5.7.3.(1).
Figure A-2.5.3.1.-M
Example of Circuit Venting Described in Sentence 2.5.3.1.(11)

Note to Figure A-2.5.3.1.-M:
(1) When sizing the circuit vent, do not include fixtures with a hydraulic load of 2 fixture units that are connected downstream of the most downstream water closets.
A-2.5.4.3. **Yoke Vent.** In Ontario, yoke vents have traditionally been referred to as modified stack vents.

![Diagram of Yoke Vent](image)

**Figure A-2.5.4.3. Yoke Vent**

A-2.5.4.4.(1) **Offset Relief Vents.** When an offset is greater than 1.5 m, it must be sized the same way as a branch or building drain (See Sentence 2.4.10.6.(2)). An offset relief vent is required at points A and B or A and C in Figure A-2.5.4.4.(1).
Figure A-2.5.4.4.(1) Offset Relief Vents

A-2.5.4.5.(1) **Fixture Connections to Vent Pipes.** When one or more fixture drains are connected to a vent pipe, the vent pipe becomes a wet vent. It must then conform to all the requirements that can apply to it as a drainage pipe and a vent pipe.
A-2.5.5.2. Venting of Oil Interceptors.

Fittings used to connect vent pipes to nominally horizontal soil-or-waste pipes are specified in Subsection 2.2.4.

Figure A-2.5.5.2. Venting of Oil Interceptors

A-2.5.6.2.(2) Vent Pipe Connections.

Fittings used to connect vent pipes to nominally horizontal soil-or-waste pipes are specified in Subsection 2.2.4.
A-2.5.6.3.(1) Vent Connection and Location of Vent Pipes.

Figure A-2.5.6.3.(1)-A
Vent Connection

Note to Figure A-2.5.6.3.(1)-A:
(1) The vent pipe must be connected in accordance with Article 2.5.6.2.

Figure A-2.5.6.3.(1)-B
Location of Vent Pipes That Protect Fixture Traps and Maximum Change in Direction of Trap Arms

A-2.5.6.3.(2) Location of Vent Pipes.

Figure A-2.5.6.3.(2)
Location of Vent Pipes and Maximum Change in Direction of Trap Arms for Fixtures That Depend on Siphonic Action
A-2.5.6.3.(3) Length of WC Fixture Drain.

Figure A-2.5.6.3.(3)
Length of WC Fixture Drain

Note to Figure A-2.5.6.3.(3):
(1) Fall and length of WC fixture drain applies to floor-mounted and wall-hung WC's.
A-2.5.6.5.(4) Vent Terminals. No vent pipe other than a fresh air inlet may terminate within the limits indicated.

Sizing of Venting Systems. Vent pipes are connected to the drainage system and terminate outside the building. They allow air to enter and circulate and they protect the trap seals in the drainage system. Except as permitted in Subsection 2.5.1., a trap shall always be protected by a vent pipe.

**Sizing of Vent Pipes**
The sizes stated in Table 2.5.7.1. take precedence over all other venting tables.

**Sizing of Relief Vents**
Length is not taken into consideration when sizing a relief vent and an additional circuit vent. A relief vent connected to a circuit-vented branch is sized according to Sentences 2.5.7.3.(1) and (2).
An offset relief vent is sized according to Sentence 2.5.7.4.(1), which permits the offset relief vent to be one size smaller than the stack vent.
Figure A-2.5.8.
Sizing of a Venting System

Notes to Figure A-2.5.8.:
(1) All water closets are 4 fixture units each.
(2) The letters in columns 1 and 3 of Table A-2.5.8. correspond to the letters in this Figure.

#### A-2.5.8.3. and 2.5.8.4. Lengths to be Considered When Sizing Vent Pipes

---

*Vancouver Building Bylaw 2019*
Figure A-2.5.8.3. and 2.5.8.4.-A
Lengths to be Considered When Sizing Vent Pipes

Notes to Figure A-2.5.8.3. and 2.5.8.4.-A:
(1) See Article 2.5.8.2.
(2) See Article 2.5.8.3.
Figure A-2.5.8.3. and 2.5.8.4.-B
Lengths to be Considered When Sizing Vent Pipes

Notes to Figure A-2.5.8.3. and 2.5.8.4.-B:
(1) See Sentence 2.5.8.4.(2).
(2) See Sentence 2.5.8.3.(3).

A-2.6.1.3.(5) Shut-off Valves. Where multiple risers convey the water supply to dwelling units, each dwelling unit’s water distribution system shall be provided with a shut-off valve located immediately where the water piping enters the suite so as to isolate the fixtures as well as the water distribution piping serving the dwelling unit’s fixtures. Fixture stopcocks or shut-off valves located immediately adjacent to a fixture may not be adequate to protect the water distribution piping. Where a dwelling unit is served by a single shut-off valve on the water supply, additional shut-off valves may be required to achieve compliance with Sentences 2.6.1.3.(4) and (7).

A-2.6.1.6.(5) Flush-Tank-Type Urinals in Seasonal Buildings. Flush-tank-type urinals that are not in use for an extended period of time, such as those in seasonal buildings, are permitted to be set up to flush automatically at predetermined intervals. Automatic flushing prevents the depletion of the water seal due to evaporation or backflow conditions. The trap seal restricts the infiltration of gases, which can pose health and safety concerns.

A-2.6.1.7.(5) Relief Valves. If the discharge piping is longer than 2 m or more than two 90° elbows are used, the valve manufacturer’s installation instructions should be followed to ensure that the piping does not affect the relief valves’ discharge capacity.

A-2.6.1.9.(1) Water Hammer Prevention. Water hammer is a buildup of pressure in a length of horizontal or vertical pipe that occurs when a valve or faucet is closed suddenly. The longer the pipe and the greater the water
velocity, the greater the pressure exerted on the pipe, which can be many times the normal static water pressure and be sufficient to damage the piping system. Since air chambers made from a piece of vertical pipe do not provide acceptable protection, pre-manufactured water hammer arresters are required to address this potential problem. Water hammer arresters need not be installed at every valve or faucet, nor in every piping system.

A-2.6.11.(1) Thermal Expansion. To accommodate the increase in pressure caused by thermal expansion within a closed water distribution system, one of the following should be installed:

1. a suitably sized diaphragm expansion tank designed for use within a potable water system,
2. an auxiliary thermal expansion relief valve (T.E.R. valve) conforming to CSA B125.3, “Plumbing Fittings,” set at a pressure of 550 kPa or less and designed for repeated use, or
3. other means acceptable to the authority having jurisdiction.

A-2.6.12.(1) Service Water Heaters. Storing hot water at temperatures below 60°C in the hot water tank or in the delivery system may lead to the growth of legionella bacteria. Contemporary electric water heater tanks experience temperature stratification and thus tend to have legionella bacteria in the lower parts of the tank. Article 2.6.12. specifies a thermostat setting of 60°C, which addresses the concern over the growth of legionella bacteria in electric hot water storage tanks and is enforceable without introducing unnecessary complications. The growth of legionella bacteria is not a concern for other types of water heaters with different designs that use different fuels. Electrically heated water heaters are shipped with the thermostat set at 60°C. Article 2.6.12. is included in the NPC to formalize this de facto temperature setting as a requirement. The thermostats have graduated temperature markings to allow such a setting, which is not the case with gas- or oil-heated water heaters.

A-2.6.2.1.(3) Backflow Preventers. CSA B64.10.1, “Maintenance and Field Testing of Backflow Preventers,” is considered to represent good practice as regards procedures for the maintenance and field testing of backflow preventers.

A-2.6.2.4.(2) Backflow from Fire Protection Systems. The following document is considered to be good engineering practice when selecting a backflow preventer for installation on a fire protection system: AWWA M14, “Recommended Practice for Backflow Prevention and Cross-Connection Control.”

NP = Not permitted  P = Permitted
Notes to Table A-2.6.2.4.(2):
(1) The “F” indicates that the product is only recommended for use on fire sprinkler and standpipe systems.

A-2.6.2.4.(3) Deleted.

A-2.6.2.6.(1) Locations Requiring Premise Isolation. The following list is a guide to locations where premise isolation may be required:

- hospital buildings with operating, mortuary or laboratory facilities
- radioactive material processing plants
- petroleum processing facilities
- premises where inspection is restricted
- sewage treatment plants
- commercial laundries (excluding laundromats)
- plating or chemical plants
- docks and dockside facilities
- food and beverage processing plants
- steam plants
- trackside facilities for trains

An assessment of the hazard must be carried out to determine the need, if any, for a backflow prevention device.

A-2.6.2.9.(2) Installation of Air Gaps.

A-2.6.2.10.(2) Installation of Atmospheric Vacuum Breakers.

![Figure A-2.6.2.10.(2) Installation of Atmospheric Vacuum Breakers](image)

A-2.6.3. Water Systems. Subsection 2.6.3. contains performance requirements for water systems. Two widely used references for the design of water systems are:

A-2.6.3.1. Water Quality. Water destined for use as potable water can originate from a variety of sources that are generally classified as surface waters or well waters, such as lakes, rivers, streams and aquifers. In some localities, there may be seasonal variations in the water supply, and surface and well waters may be blended at times. Water composition is the primary consideration in determining the cause of corrosion in potable water systems. If the water has corrosive characteristics, water treatment may be necessary to control its corrosiveness: this may be as straightforward as adjusting the pH of the water at the treatment plant, or it may involve more extensive corrosion-control treatment methods. Water purveyors normally consult treatment specialists to develop methods suitable for specific conditions. The treatment of water from private wells may also require expert consultation. The past performance of plumbing materials and products in different localities often provides insight into what can be expected with new installations. In areas where water-related corrosion is known to occur, adjustment of water chemistry may be sufficient or it may be necessary to select alternative piping and fitting materials or more robust products.

It is important to note that not all corrosion can be attributed to water conditions: the improper design and installation of potable water systems may result in erosion corrosion, galvanic corrosion, fatigue cracking, and so forth.

A-2.6.3.1.(2) Potable Water Systems. The design procedures contained in the following documents are considered good engineering practice in the field of potable water systems:

Alternatively, the following methods, which apply to both public and private water supplies, may be used in determining the size of each section of the water system using Table A-2.6.3.1.(2)-A (Small Commercial Building Method) and Table A-2.6.3.1.(2)-F (Average Pressure Loss Method). Where these methods are considered an alternative to a detailed engineering design method, the hydraulic loads shall be the sum of the total fixture units given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D.

**Method for Small Commercial Buildings**

Information required if using this method:

a) The developed length:
   i) from the property line or private water supply system when located outside the building to the water service entry point to the building, and
   ii) from the water service entry point to the building to the most remote water outlet.

b) Minimum static pressure:
   i) the minimum static pressure available at the property line or other water source (private water supply system), or
   ii) where there is a wide fluctuation of pressure in the main throughout the day, the minimum static pressure available.

c) Pressure losses:
   i) losses for meters, pressure-reducing valves, backflow preventers, water treatment systems, and any other devices, and
   ii) losses or gains due to changes in elevation.

d) The number of fixture units (FU) as determined by using the sum of the total values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D.

e) The maximum velocities permitted in accordance with the manufacturer’s recommendations for the pipe and fittings chosen for the installation.

Note that a private water supply system must be capable of meeting the demands of the water distribution system.

**Pipe Sizing Procedures (See Figure A-2.6.3.1.(2)-A.)**

**Step 1: Water Service Piping (See Table A-2.6.3.1.(2)-B.)**

a) Obtain the total fixture units required for the installation using the sum of the total values given in
Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D and consider all other demands on the water supply.

b) Determine the minimum static pressure available at the property line or private water supply system and consider all pressure losses for the water service.

c) Select the pressure range group in Table A-2.6.3.1.(2)-A that is consistent with the minimum static pressure available including any other losses.

d) Select the length column in Table A-2.6.3.1.(2)-A that is equal to or greater than the developed length from the property line or private water supply system to the water service entry point to the building.

e) In that column, find the fixture unit value that is equal to or greater than the fixture unit demand for the installation and follow the row back to the first column to locate the water service pipe size.

f) To establish the adjusted static pressure available where the water service enters the building for sizing the water distribution system, subtract the actual static pressure losses for the water service from the minimum static pressure available at the property line.

g) The adjusted static pressure available where a private water supply system is installed should be the static pressure available from such a system at the entry to the building.

Step 2: Hot Water Piping (See Table A-2.6.3.1.(2)-C.)

a) Start with the most remote outlet in the most distant occupancy that requires hot water.

b) Use the sum of the total fixture unit values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D and work back toward the service water heater, adding in the fixture unit values as they occur.

c) Select the pressure range group in Table A-2.6.3.1.(2)-A that is consistent with the minimum static pressure available at the water service entry and any other losses (e.g. elevation or devices such as backflow preventers, etc.). Use this pressure range group for all portions (hot and cold) of the water distribution system.

d) Select the length column that is equal to or greater than the developed length from the water service entry point to the building to the most remote outlet served with either hot or cold water.

e) In that column, find the fixture unit value that is equal to or greater than the fixture unit demand at each pipe and follow the row back to the second column to locate the water distribution system pipe size.

Step 3: Cold Water Piping (See Table A-2.6.3.1.(2)-D.)

a) Start with the most remote outlet on the cold water piping using the established total developed length column and pressure range group in Table A-2.6.3.1.(2)-A and work through Steps 2(c), (d) and (e) for hot water piping.

b) Use the sum of the total fixture unit values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D and work back toward the water service entry.

c) Where the service water heater distribution pipe occurs, add in the fixture unit demand of the fixtures served only with hot water and those that have not yet been added in as served to the cold water side of the most remote fixtures requiring both a hot and cold water supply.

d) Continue by sizing the cold water main between the service water heater distribution pipe and the water service entry.

e) Add in the fixtures served with cold water only from the main within the most remote occupancy as they occur and all common distribution piping serving hot and cold water to other occupancies as they occur.

f) Complete by sizing all distribution piping served by the main within the most remote occupancy and then the other occupancies not yet sized using the previously established total developed length and pressure range group in Table A-2.6.3.1.(2)-A.

Example of Commercial and Residential Development to be Used with Water Pipe Sizing Methods

Notes to Figure A-2.6.3.1.(2)-A:

1. This example is a development with 4 commercial occupancies on the lower floor and 5 residential occupancies on the upper floor, all with separate service water heaters.

2. For the purpose of water pipe sizing:
   • the minimum adjusted pressure available at building entry is 540 kPa (78 PSI);
   • the developed length of the water service is 30 m (98 ft); and
   • the developed length of the water distribution system is 76 m (249 ft).

Average Pressure Loss Method
Information required if using this method:
  a) The developed length:
      i) from the property line or private water system when located outside the building to the water
         service entry point to the building, and
      ii) from the building entry of the water service to the most remote water outlet.
  b) Minimum static pressure:
      i) the minimum static pressure available at the property line or other water source (private water
         supply system), or
      ii) where there is a wide fluctuation of pressure in the main throughout the day, the minimum static
         pressure available.
  c) Pressure losses:
      i) losses for meters, pressure-reducing valves, backflow preventers, water treatment systems, and
      any other devices, and
      ii) losses or gains due to changes in elevation.
  d) The number of fixture units as determined by using the sum of the total values given in Tables
     2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D.
  e) The maximum velocities permitted in accordance with the manufacturer's recommendations for the
     pipe and fittings chosen for the installation.

Note: The private water supply system must be capable of meeting the demands of the water distribution system.
To use this method, calculate the pressure available for friction loss which must be 2.6 kPa per metre or more; if it is less than that, the system must be designed according to a detailed engineering design method.

Calculating Pressure Available for Friction Loss (See Figure A-2.6.3.1.(2)-B.)

a) Obtain the water service size, including pressure losses, and the design of the private water supply system if it is separate from the water distribution system.
b) To calculate the total equivalent length for the water distribution system, determine the developed length from the water service entry point to the building to the most remote water outlet, and
   i) where fitting inside diameter dimensions are at least equal to the pipe size, multiply the developed length by 1.5 to allow for friction losses, and
   ii) where insert fittings are used, apply additional losses in accordance with the fitting manufacturer’s data.
c) To determine the adjusted pressure available at the water service entry for sizing the water distribution system, deduct the pressure losses for the water service from the minimum static pressure available at the property line or private water source.
d) To obtain the pressure available for friction loss, use the minimum adjusted static pressure available at the water service entry and deduct the minimum operating pressure necessary at the most remote water outlet, and losses for meters, pressure-reducing valves, backflow preventers, water treatment systems, and any other devices. Include pressure losses or gains due to changes in elevation between the water service entry and the most remote water outlet.
e) Divide the static pressure available for friction loss by the total equivalent length to obtain the pressure available for friction loss per metre.

Pipe Sizing Procedures (See Figure A-2.6.3.1.(2)-A)

Step 1: Water Service Piping (See Table A-2.6.3.1.(2)-G)

a) Obtain the total fixture units required for the installation using the sum of the total values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D and consider all other demands on the water supply.
b) Select the water service pipe size from Table A-2.6.3.1.(2)-F using the velocity column that is consistent with the pipe and fittings chosen for the installation.
c) Determine the minimum static pressure available at the property line or private water source and...
consider all pressure losses for the water service.

d) To establish the adjusted static pressure available where the water service enters the building for sizing the water distribution system, subtract the actual static pressure losses for the water service from the minimum static pressure available at the property line.

e) The adjusted static pressure available where a private water supply system is installed should be the static pressure available from such a system at the entry to the building.

Step 2: Hot Water Piping (See Table A-2.6.3.1.(2)-H)

a) Start with the most remote outlet in the most distant occupancy that requires hot water.

b) Use the sum of the total fixture unit values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D and work back toward the service water heater, adding in the fixture unit values as they occur.

c) Size the hot water system according to Table A-2.6.3.1.(2)-F using the velocity column that is consistent with the manufacturer’s requirements for the pipe and fittings chosen when serving a hot water system.

Step 3: Cold Water Piping (See Table A-2.6.3.1.(2)-I)

a) Start with the most remote outlet requiring cold water in the most distant occupancy and working back towards the water service entry adding in the fixture unit values as they occur.

b) Obtain the fixture units using the sum of the total fixture unit values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D.

c) Size the cold water system to Table A-2.6.3.1.(2)-F using the velocity column that is consistent with the manufacturer’s requirements for the pipe and fittings chosen when serving a cold water system.

d) Where the service water heater distribution pipe occurs, add in the fixture unit demand of the fixtures served with only hot water and those that have not yet been added in as served to the cold water side of the most remote fixtures requiring both hot and cold water supply.

e) Continue by sizing the cold water main between the service water heater distribution pipe and the water service entry.

f) Add in the fixtures served with only cold water from the main within the most remote occupancy as they occur and then all common distribution piping serving hot and cold water to other occupancies as they occur.

g) Complete by sizing all distribution piping served by the main in the most remote occupancy and then the other occupancies not yet sized using Table A-2.6.3.1.(2)-F.

Notes to Table A-2.6.3.1.(2)-I:
(1) Based on 2.4 m/s velocity and adjusted static pressure at water service entry of 540 kPa.

A-2.6.3.2.(4) Sizing for Flush Valves. Distribution piping and water mains serving flush valves may be sized using the values assigned in Tables 2.6.3.2.-B and 2.6.3.2.-C, beginning with the most remote flush valve on each section of distribution piping served by the water main.

A-2.6.3.4.(5) Sizing of Water Systems. Sentence 2.6.3.4.(5) and Table 2.6.3.4. present a simplified method of water system sizing, which is permitted in buildings containing one or two dwelling units or row houses with separate water services.

**Simplified Method**
This sizing method may be used in the buildings noted, where:

a) the total developed length from the property line to the most remote fixture is not more than 90 m, and

b) the static pressure available at the water service entry to the building is not less than 200 kPa.
Where either the developed length is exceeded or the minimum static pressure required is not known, a detailed engineering design method must be used to size the water service piping. The design must ensure a minimum static pressure of 200 kPa is available at the water service entry to the building.

Information required when using this method:
   a) The total number of fixture units (FU) as determined by using the sum of the total fixture unit values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D.
   b) Where the water service also serves a fire sprinkler system, irrigation system, or any other system, these demands must be added to the water service sizing.

**Pipe Sizing Procedures**

**Step 1: Water Service Pipe**
   a) Obtain the total fixture units required for the installation using the sum of the total values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D and consider all other demands on the water supply.
   b) Determine the water service pipe size using the water velocity column in Table 2.6.3.4. that is consistent with the pipe material chosen for the installation.

**Step 2: Hot Water Piping**
   a) Start with the most remote fixture requiring a supply of hot water and work back toward the service water heater, adding in the fixture unit loads as they occur.
   b) Determine the fixture units using the sum of the total fixture unit values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D.
   c) Size the hot water system using the water velocity column in Table 2.6.3.4. that is consistent with the manufacturer's recommendations for the pipe and fittings chosen when serving a hot water system.

**Step 3: Cold Water Piping**
   a) Start with the most remote fixture requiring a supply of cold water and work back toward the water service entry, adding in the fixture unit loads as they occur.
   b) Obtain the fixture units using the sum of the total fixture unit values given in Tables 2.6.3.2.-A, 2.6.3.2.-B, 2.6.3.2.-C and 2.6.3.2.-D.
   c) Size the cold water system using the water velocity column in Table 2.6.3.4. that is consistent with the manufacturer’s recommendations for the pipe chosen when serving a cold water system.
   d) Where the service water heater distribution pipe occurs, add in the fixture unit demand of the fixtures served with only hot water and those that have not yet been added in as served to the cold water side of the fixtures requiring both a hot and cold water supply.
   e) Continue sizing the cold water main between the service water heater distribution pipe and the water service entry by adding all fixtures served with only a cold water supply as they occur.
   f) Complete by sizing all cold water distribution piping served by the main between the water heater distribution pipe and the water service entry.
Figure A-2.6.3.4.(5)-A
Determining the hydraulic needs of a fixture

Notes to Figure A-2.6.3.4.(5)-A:
(1) The fixture spout delivers a maximum of 2.0 fixture units.
(2) This would apply if only the hot side or the cold side were fully opened.
(3) The common pipe that serves both the hot and cold sides of the faucet also delivers a maximum of 2.0 fixture units even if both the hot and cold valves at the faucet are fully opened at the same time.

A-2.7.3.2.(1) Outlets from Non-Potable Water Systems. The location of outlets from non-potable water systems where they can be discharged into a sink or lavatory, a fixture into which an outlet from a potable water system is discharged, or a fixture that is used for the preparation, handling or dispensing of food, drink or products that are intended for human consumption, may have proven acceptable on the basis of past performance in some localities, and its acceptance under this Code may be warranted.

Subclause 2.7.3.2.(1)(b) would permit non-potable water to be used to supply water closets or urinals provided the fixtures are not also connected to potable water.

Schematic Example for a Non-potable Water System
Division C
Administrative Provisions
Part 1

General

Section 1.1. Application

1.1. Application

1.1.1. Application

1) This Part applies to all plumbing systems covered in this By-law. (See Article 1.1.1. of Division A.)

Section 1.2. Terms and Abbreviations

1.2.1. Definitions of Words and Phrases

1.2.1.1. Non-defined Terms

1) Words and phrases used in Division C that are not included in the list of definitions in Article 1.4.1.2. of Division A shall have the meanings that are commonly assigned to them in the context in which they are used, taking into account the specialized use of terms by the various trades and professions to which the terminology applies.

2) Where objectives and functional statements are referred to in Division C, they shall be the objectives and functional statements described in Parts 2 and 3 of Division A.

3) Where acceptable solutions are referred to in Division C, they shall be the provisions stated in Part 2 of Division B.

4) Where alternative solutions are referred to in Division C, they shall be the alternative solutions mentioned in Clause 1.2.1.1.(1)(b) of Division A.

1.2.1.2. Defined Terms

1) The words and terms in italics in Division C shall have the meanings assigned to them in Article 1.4.1.2. of Division A.

1.2.2. Symbols and Other Abbreviations

1.2.2.1. Symbols and Other Abbreviations

1) The symbols and other abbreviations in Division C shall have the meanings assigned to them in Article 1.4.2.1. of Division A.

Section 1.3. Interpretation, Intent and Prohibitions

1.3.1. General Interpretation

1.3.1.1. Interpretation

1) This By-law shall, despite any other provision herein, be interpreted in accordance with this Section.

2) The Schedules attached to this Part 1 form part of this By-law.

1.3.2. General Intent

1.3.2.1. Intent
1) This By-Law sets standards in the general public interest. It is enacted and retained on the understanding and specifically expressed condition that it creates no duty whatsoever on the City, the Chief Building Official or any employee of the City to enforce its provisions, and on the further condition that a failure to administer or enforce its provisions, or the incomplete or inadequate administration or enforcement of its provisions, shall not give rise to a cause of action in favour of any person whatsoever. The issuance of any permit, including an occupancy permit, is not a representation, warranty or statement that this By-Law or any other enactment has been complied with, and the issuance thereof in error shall not give rise to a cause of action. Accordingly, words in this By-law defining the responsibilities and authority of the Chief Building Official shall be construed as internal administrative directions which do not create a duty.

1.3.2.2. Reliance on Registered and Certified Professionals
1) The City and the Chief Building Official do not have the resources to deal with matters which fall within the expertise of registered professionals and the City and the Chief Building Official rely on letters of assurance, documents sealed with professional seals, and related documents received from registered professionals, and on field reviews carried out by or under the supervision of registered professionals, as evidence that the design and construction of buildings complies with the provisions of this By-law, including alternate solutions, and substantially complies with any other applicable enactments.
2) The City and the Chief Building Official do not have the resources to deal with matters which fall within the expertise of certified professionals and the City and the Chief Building Official rely on letters of assurance, documents stamped with professional stamps, and related documents received from certified professionals, on site reviews carried out by certified professionals, and on field reviews monitored by certified professionals as evidence that the design and construction of buildings complies with the provisions of this By-law, including alternate solutions and substantially complies with any other applicable enactments.

1.3.2.3. No Representation or Warranty
1) No person shall rely on a permit issued by the Chief Building Official or an inspection carried out by the Chief Building Official as establishing compliance with this By-Law or any other enactment or assume or conclude that this By-Law has been administered or enforced according to its terms.
2) All persons shall make such independent investigations as they deem necessary to determine whether a building complies with this By-law or any other enactment.

1.3.3. General Prohibitions
1.3.3.1. Contravention
1) No person shall fail to comply with an order or notice issued by the Chief Building Official.

1.3.3.2. No Work Without Permit
1) No person shall work or authorize or allow work to proceed on a project for which a permit is required unless a valid permit exists for the work to be done.

1.3.3.3. Deviation Needs Prior Approval
1) No person shall deviate from the plans and supporting documents forming part of the permit, without having first paid all necessary fees and obtained all necessary permits and approvals from the Chief Building Official.

1.3.3.4. No Occupancy Without Permission
1) No person shall occupy a building or authorize or allow the occupancy of a building without having first obtained the permission of the Chief Building Official.

1.3.3.5. Unsafe Conditions
(See Note A-1.3.3.5.)
Division C: Administrative Provisions

Part 1 – General

1.3.3.6. Work on Public Property
(See Note A-1.3.3.6.)
1) No person shall excavate or undertake work on public property, or erect or place any construction or work or store any materials thereon without approval having first been obtained in writing from the Chief Building Official over such public property.

1.3.3.7. Changes in Ground Elevation and Limiting Distance
(Refer to Book I (General) of this By-law.)

1.3.3.8. Compliance with By-law and Other Enactments
1) No person shall work, or authorize or allow work to proceed, or undertake any building, construction, work or occupancy which is in contravention of this By-law or any other enactment.

1.3.3.9. False Information
1) No person shall submit false or incorrect information to the Chief Building Official.

1.3.3.10. Tampering with a Posted Notice or Order
1) No person, except for the Chief Building Official, shall reverse, alter, deface, cover, remove or in any way tamper with any notice or order which has been posted on or affixed to a building pursuant to this By-law.

Section 1.4. Obligations of the Owner and Contractor

1.4.1. Obligations of the Owner

1.4.1.1. Right of Entry of Chief Building Official
1) The owner shall allow the Chief Building Official to enter any building or premises at any reasonable time for the purpose of administering and enforcing this By-law.

1.4.1.2. Permit Required
1) The owner shall obtain all permits or approvals prior to commencing the work to which they relate.

1.4.1.3. Compliance with Permit
1) The owner shall comply with all conditions of a permit or a staged permit.

1.4.1.4. Posting a Permit
1) The owner shall ensure that the permit authorizing the work, or a true copy of the permit, is posted conspicuously on the site or is affixed to the exterior of the building during the entire project.

1.4.1.5. Compliance with By-law and other enactments
1) The owner shall comply with this By-law and all other applicable enactments.
2) The owner shall ensure that all work, construction, or occupancy is carried out in accordance with this By-law and all other applicable enactments.
3) The owner shall ensure that the occupancy of a building or part of a building complies with the occupancy permit.
4) The issuance of a permit, the acceptance of plans and supporting documents submitted for a permit, or the making of inspections by the Chief Building Official shall not relieve the owner of a building from the full
responsibility for carrying out the work or having the work carried out in accordance with this By-law and all other applicable enactments.

5) The owner shall ensure that all underground storage tanks on the subject property that are intended for the storage of heating oil but have not been used for over 2 years are removed and any associated contamination is remediated to the applicable standards as prescribed in the Contaminated Sites Regulation. All work must be completed in accordance with the requirements of the Vancouver Fire By-law.

1.4.1.6. Compliance with Stop Work Order

1) The owner shall not carry out work or construction or suffer, permit or allow work or construction to be carried out in contravention of a stop work order issued by the Chief Building Official.

1.4.1.7. Compliance with Development Permit Plans

1) The owner shall ensure that the plans and supporting documents submitted for a permit conform substantially with the approved Development Permit plans and supporting documents, except that where differences exist, the owner shall make application for a “Development Permit Amendment” as required by the Zoning and Development By-law.

1.4.1.8. Owner’s Undertaking

1) The owner shall submit a completed Owner’s Undertaking letter to the Chief Building Official in support of and prior to the issuance of a permit, in the applicable form set out in Schedules E-1 and E-2 at the end of this Part.

1.4.1.9. Letters of Assurance

1) When required by this By-law, the owner shall provide to the Chief Building Official any applicable letters of assurance in the forms set out in Schedules A, B, C-A and C-B at the end of Part 2 of Division C of Books I and II of this By-law or in the forms set out in Schedules D and C-D at the end of Part 5 of Division B of Book I (General) of this By-law.

1.4.1.10. Project Directory

(See Note A-1.4.1.10.)

1) The owner shall, prior to commencing work, give notice in writing to the Chief Building Official, of the name, address, electronic mail address and telephone number of the owner, the constructor or other person in charge of the work, the designer reviewing the work, and any inspection or testing agency engaged to monitor the work.

2) During the course of the construction, the owner shall give immediate notice in writing to the Chief Building Official, of any change in employment of persons listed in the notice given pursuant to Sentence (1).

1.4.1.11. Other Notices

1) The owner shall give such other notices to the Chief Building Official as may be required by the Chief Building Official, by this By-law, or by another enactment.

1.4.1.12. Construction Safety

1) Where a Construction Safety Plan is required by Section 8.2 of Division B of Book I (General) of this By-law, the owner shall:

a) prior to commencing work, ensure that the Construction Safety Plan has been submitted to the Chief Building Official, and

b) during construction, ensure that the Construction Safety Plan is posted at all times and is amended from time to time in accordance with the requirements of this By-law.
Division C: Administrative Provisions

1.4.1.13. Plans Required on Site
1) The owner shall ensure that the plans and specifications on which the issuance of the permit was based are available at the worksite for inspection during working hours by the Chief Building Official.

1.4.1.14. Site Cleared of Debris
1) The owner shall ensure that upon completion of demolition procedures, all debris and fill is cleared and the site levelled or graded, to the satisfaction of the Chief Building Official.

1.4.1.15. Tests to Establish Compliance
(See Note A-1.4.1.15.)
1) Where required by the Chief Building Official the owner shall make or have made, at the owner’s expense, tests or inspections, as necessary to establish compliance with this By-law and shall promptly provide a copy of all such tests or inspection reports to the Chief Building Official.

1.4.1.16. Up-to-Date Survey
1) The owner shall provide to the Chief Building Official a survey, which has been certified by a registered land surveyor no more than 30 days before the date of delivery of the survey to the Chief Building Official
a) in the case of an existing building and site, if required by the Chief Building Official to substantiate the building location and size, above, at and below ground level, relative to the site,
b) in the case of an existing building and site, if required by the Chief Building Official to establish the relationship of the building to neighbouring grades, and
c) in the case of all new buildings, upon completion of foundations and footings and before any further construction, and the survey must include the elevation of a bench mark on the front of the foundation wall, to substantiate its size, location, and elevation relative to the site and to neighbouring grades.

1.4.1.17. Covering Work Prior to Inspection, Site Review or Field Review
1) The owner shall not cover work prior to inspection, site review or field review.

1.4.1.18. Request for Inspection
1) The owner shall give at least 24 hours notice to the Chief Building Official when requesting an inspection of work that is required or ordered to be inspected.

1.4.1.19. Uncovering Work
1) The owner shall uncover any work that has been covered without inspection, when required to do so by the Chief Building Official. (See Note A-1.4.1.19,(1)).
2) An owner who is required to uncover work by the Chief Building Official shall uncover and replace such work at the owner’s expense.

1.4.1.20. Reinspection
1) If the Chief Building Official discovers faulty or incomplete work or faulty materials during an inspection, the owner shall apply for a reinspection.
2) Every applicant for a reinspection of a project shall pay the applicable reinspection fees set out in the Fee Schedule, prior to the reinspection.

1.4.1.21. Report of Building, Demolition or Excavation Failure
1) When a building, demolition or excavation failure occurs which causes or has the potential to cause injury or loss of life, the owner shall
   a) immediately report the failure to the Chief Building Official,
   b) submit a report, if required to do so by the Chief Building Official, in accordance with Article 1.5.3.1., and
   c) carry out any repairs or remedial work required by the Chief Building Official.

### 1.4.1.22. Removing Unsafe Conditions
1) When a building or part thereof is in an unsafe condition, the owner shall forthwith take all necessary action to put the building in a safe condition.

### 1.4.1.23. Damage to City Property
1) The owner is responsible for the cost of repair of any damage to City property or works located thereon that occurs as a result of undertaking work for which a permit or a street use permit was required.

### 1.4.1.24. Requirements Regarding Street Addresses
(Refer to Book I (General) of this Bylaw.)

### 1.4.1.25. Requirements regarding Professional Design and Review
1) In addition to the obligations listed in this section, the owner of a building to which the provisions of Part 2 of Division C of Book I (General) of this By-law apply, shall also comply with the owner’s obligations in that Part.

### 1.4.2. Obligations of the Contractor

#### 1.4.2.1. Construction Safety
1) The contractor shall ensure that all requirements of this By-law relating to construction safety are complied with, and shall ensure that every sub-contractor of the project has retained a trades safety coordinator as required by Sentence (2).
2) Every sub-contractor shall retain a qualified trades safety coordinator whose responsibilities shall include appropriate training of all persons working for the sub-contractor at the worksite in safe construction and installation practice.
3) The trades safety coordinator shall provide certification respecting training to the Chief Building Official upon request.

#### 1.4.2.2. Work on Public Property
1) The contractor shall ensure that no excavation or other work is undertaken on public property, and that no building is erected or materials stored thereon, without first having obtained approval in writing from the appropriate government authority.

#### 1.4.2.3. Compliance with By-law and Other Enactments
1) The contractor shall ensure that all work, building, construction, or occupancy is carried out in accordance with this By-law and with all other applicable enactments.

#### 1.4.2.4. Right of Entry of Chief Building Official
1) The contractor shall allow the Chief Building Official to enter any building or premises at any reasonable time for the purpose of administering and enforcing this By-law.

#### 1.4.2.5. Compliance with Stop Work Order
1) The contractor shall not carry out work or construction, or suffer, permit or allow work or construction to be carried out, in contravention of a stop work order issued by the Chief Building Official.

**Section 1.5. Authority of the Chief Building Official**

1.5.1. Administration

1.5.1.1. Administrator

1) The Chief Building Official is authorized to administer this By-law.

1.5.1.2. Filing Documents

1) The Chief Building Official is authorized to keep copies of applications received, permits and orders issued, inspections and tests made and papers and documents connected with the administration of this By-law, for such time as is required by law.

2) Despite the provisions of Sentence (1), the Chief Building Official is authorized to keep copies of applications received, permits and orders issued, inspections and tests made and papers and documents connected with the administration of this By-law, for such time as is necessary, in the opinion of the Chief Building Official, to support the administration of this By-law.

1.5.1.3. Inspection of Records

1) The Chief Building Official is authorized to provide plans and documents filed pursuant to the provisions of this By-law for inspection, subject to the provisions of the Freedom of Information and Protection of Privacy Act.

1.5.1.4. Fees for Inspection of Records

1) The Chief Building Official shall charge a fee as set out in the Fee Schedule, payable in advance, for the inspection of records referred to in Article 1.5.1.3.

2) No refund shall be issued for any fees or portion of fees, resulting from any outstanding costs incurred by the City for the inspection of records pursuant to Article 1.5.1.4.

1.5.2. Authorities

1.5.2.1. Power of Entry

(See Note A-1.5.2.1.)

1) The Chief Building Official, and any person authorized to act on behalf of the Chief Building Official, may enter any building or premises at any reasonable time for the purpose of administering or enforcing this By-law, or immediately if there is reason to believe an unsafe condition exists.

1.5.2.2. Review of Value of Work

1) The Chief Building Official may review the value of the proposed work in an application for a permit and may substitute a different value, in accordance with Articles 1.6.2.3. and 1.6.2.4., for the purpose of determining applicable permit fees.

1.5.2.3. Construction Safety

1) The Chief Building Official may review a Construction Safety Plan and may require that the Construction Safety Plan be changed or amended.

1.5.2.4. Permit Issuance
1) The Chief Building Official shall issue a permit when the applicable requirements of this By-law have been met.

1.5.2.5. Permit Refusal

1) The Chief Building Official may refuse to issue a permit

   a) if plans or supporting documents are incomplete or do not comply with the provisions of this By-law,
   b) if plans or supporting documents contain false or incorrect information, or
   c) for any building, construction, work or occupancy that would not be permitted by this By-law or by another enactment.

2) The Chief Building Official shall provide reasons for the refusal to issue a permit, on the request of an applicant or owner.

1.5.2.6. Permit with Incomplete Application

(See Note A-1.5.2.6.)

1) The Chief Building Official may issue a permit for a building based on an incomplete application if the incomplete information is of a secondary nature and is unavailable at the time of permit issuance.

2) If the Chief Building Official issues a permit pursuant to Sentence (1) the Chief Building Official may impose conditions requiring submission of further information by a specified date.

3) The Chief Building Official may suspend or revoke a permit issued pursuant to Sentence (1), if the holder of the permit fails to comply with the conditions imposed by the Chief Building Official.

1.5.2.7. Conditions on Permits

1) The Chief Building Official may impose conditions on permits including, but not limited to, conditions regarding

   a) notifications and notices,
   b) safety,
   c) health,
   d) design requirements,
   e) construction requirements,
   f) timing of construction,
   g) deadlines for completion of construction,
   h) reviews and inspections,
   i) responsibilities of the owner, constructor, registered professional and certified professional,
   j) compliance with this By-law and other enactments,
   k) use and occupancy, and
   l) temporary buildings and occupancies.

1.5.2.8. Permits for Existing Buildings

1) The Chief Building Official may issue a permit for an existing building in accordance with the provisions of Part 11 of Division B of Book I (General) of this By-law and may impose conditions on the permit.

2) The Chief Building Official may permit an alternative solution to the alternative acceptable solutions provided in this By-law for the conversion of an existing building if

   a) the owner demonstrates, to the satisfaction of the Chief Building Official, that the level of upgrade required presents an extraordinary hardship for the owner, and
   b) the owner proposes an alternative solution which achieves the objectives of the alternative acceptable solutions prescribed by this By-law, to the satisfaction of the Chief Building Official.

1.5.2.9. Combustible Construction for Minor Repairs in Existing Buildings

(Refer to Book I (General) of this Bylaw.)
1.5.2.10. Permits for Plumbing and Sprinkler Systems

1) The Chief Building Official may issue a permit for a plumbing system or sprinkler system in accordance with the provisions of Subsection 1.6.3.

1.5.2.11. Permits in Designated Flood Plain

1) If a building is located on a designated flood plain the Chief Building Official may
   a) require plans and supporting documents to demonstrate that the elevation or design of the buildings incorporates flood construction level requirements intended to reduce the risk of flood damage,
   b) require that a covenant acknowledging the risk of flood damage be registered against the land, and
   c) withhold issuance of a permit until the requirements of the Chief Building Official have been satisfied.

2) The Chief Building Official may increase the flood construction level requirements or the setback requirements as provided in Article 2.2.9.5.

3) The Chief Building Official may relax the flood construction level requirements or the setback requirements in this By-law as provided in Article 2.2.9.6.

1.5.2.12. Permit for Staged Construction

(See Note A-1.5.2.12.)

1) Where a permit for staged construction is applied for pursuant to Subsection 1.6.5., the Chief Building Official may authorize the excavation or construction of a portion of a building, and may impose conditions to ensure compliance with this By-law, before all the plans and supporting documents for the building have been accepted, at the risk of the owner.

2) The Chief Building Official may suspend or revoke a permit issued pursuant to Subsection 1.6.5. if the holder of the permit fails to comply with the conditions imposed by the Chief Building Official.

1.5.2.13. Minor Revisions to Permit

1) The Chief Building Official may accept an application for minor revisions to an existing permit if the proposed revisions do not add or delete additional storeys or major occupancy classifications to or from the project.

1.5.2.14. Requirement for New Permit

1) The Chief Building Official may require that an applicant for revisions to an existing permit apply for a new permit, if the proposed revisions would add or delete floor area, storeys, dwelling units or major occupancy classifications to or from the project.

1.5.2.15. PermitSuspension

1) The Chief Building Official may suspend a permit by issuing an order to stop work.

1.5.2.16. Permit Revocation

1) The Chief Building Official may revoke a permit if
   a) there is a contravention of any condition under which the permit was issued,
   b) the permit was issued in error, or
   c) the permit was issued on the basis of false or incorrect information.

1.5.2.17. Permit Extension

1) The Chief Building Official may extend a permit in accordance with Subsection 1.6.7. of this Part.

1.5.2.18. Designation of Street Addresses
Division C: Administrative Provisions

Part 1 – General

1) The Chief Building Official may, at any time, number, renumber or assign a series of numbers or suite numbers to any building, or part thereof.

2) Upon the issuance of a building permit, the Chief Building Official shall designate the street address or series of suite numbers required for the building, or any portion of the building.

3) Upon registration of a parcel of land in the Land Title Office, the Chief Building Official shall designate the street address or series of numbers required for the parcel.

1.5.2.19. Renumbering of Street Addresses

1) Where an owner has requested a renumbering and has paid the applicable fees set out in the Fee Schedule, the Chief Building Official may renumber any building or suite within a building, or parcel of land.

1.5.2.20. Proof of Compliance

1) The Chief Building Official may direct that tests of materials, equipment, devices, construction methods, structural assemblies or foundations be made, or sufficient evidence or proof be submitted, at the expense of the owner, where such evidence or proof is necessary, in the opinion of the Chief Building Official, to determine whether the material, equipment, device, construction, structural assembly or foundation condition complies with this By-law.

1.5.2.21. Occupancy Permit for Building at Variance with By-law

1) The Chief Building Official may issue an occupancy permit for a building which varies in a minor respect from the requirements of this By-law if, in the opinion of the Chief Building Official, such variation will not substantially interfere with the objectives of this By-law.

1.5.2.22. Occupancy Permit Prior to Completion

1) The Chief Building Official may issue an occupancy permit to allow the occupancy of a building or a part thereof for the approved use, prior to commencement or completion of the construction or demolition work.

2) The Chief Building Official may impose conditions on an occupancy permit issued in accordance with Sentence (1).

1.5.3. Authorities Regarding Unsafe and Unsanitary Conditions

1.5.3.1. Report of Failure

1) Where any building, construction or excavation failure occurs which causes or has the potential to cause injury or loss of life, the Chief Building Official may require the owner to submit a report which includes
   a) the name and address of the owner,
   b) the address or location of the building, demolition or excavation,
   c) the name and address of the constructor,
   d) the nature of the failure,
   e) the cause of the failure,
   f) a remedial plan to correct the failure, and
   g) a plan to prevent future failure.

1.5.3.2. Hazardous Material

1) The Chief Building Official may require that any person supervising or doing work to install or remove building materials provide evidence of their training, certification or qualifications, if the installation or removal of building materials may create an unsafe condition or affect the structural safety or fire protection of a building.

1.5.3.3. Order to Remove Unsafe Condition
1) When any building, construction or excavation or part thereof is in an unsafe condition, the Chief Building Official may issue a written order to the owner, certifying the existence of an unsafe condition and requiring correction of any unsafe condition found on a building site, within a specified time.

1.5.3.4. Order to Repair Plumbing Systems
1) The Chief Building Official, if of the opinion that the plumbing system, or any part of it, in any building is defective, unsanitary or inadequate, may notify the owner or occupant thereof of such condition and may order that such plumbing system, or part thereof, be placed in a proper, safe and sanitary condition.
2) The Chief Building Official, if of the opinion that the plumbing system, or any part of it, in any building may has become dangerous or defective on account of the settlement of the building or through abuse, accident or for any other cause whatsoever, may order the owner or occupant thereof to have a plumbing contractor conduct a smoke test on the waste and vent pipes of the building to ascertain whether any dangerous or defective condition exists.

1.5.3.5. Corrective Measures
1) If the Chief Building Official has issued an order in accordance with Article 1.5.3.3. or 1.5.3.4. and an owner has failed to comply with that order, the Chief Building Official may
   a) authorize demolition, removal, posting of security guards or fire wardens, or enclosure of a building, construction, excavation or part thereof, at the expense of the owner,
   b) recover such expense in the manner set out in Article 1.5.3.6., and
   c) take such other measures as may be necessary to protect the public.

1.5.3.6. Immediate Measures
1) When immediate measures must be taken to avoid an imminent danger or risk of accident, the Chief Building Official may take such action as is appropriate, without prior notice and at the expense of the owner.
2) Where immediate security measures must be taken to limit the risk of damage, vandalism, theft, loss, or the creation of unsafe conditions, the Chief Building Official may board-up or otherwise secure a building against unauthorized entry without prior notice and at the expense of the owner.

1.5.3.7. Recovery of City Costs
1) The cost of the measures described in Articles 1.5.3.5. and 1.5.3.6. shall be recoverable from the owner
   a) in any Court of competent jurisdiction, or
   b) by entry of such cost in the real property roll with respect to the property and by collection in the same manner as the taxes shown in the real property roll.

1.5.4. Notices and Orders
1.5.4.1. Notices or Orders
1) The Chief Building Official may issue in writing such notices or orders as may be necessary to inform the owner of a contravention of this By-law, in the manner set out in this By-law.

1.5.4.2. Scope of Orders
1) The Chief Building Official may order
   a) a person to comply with the provisions of this By-law within a specified time,
   b) a person to allow the Chief Building Official to enter any building or premises at any reasonable time for the purpose of administering and enforcing this By-law,
   c) work to stop on a building or any part thereof, if such work is proceeding in contravention of a provision of this By-law or another enactment, or if there is deemed to be an unsafe condition,
   d) the removal of an unauthorized encroachment on public property,
e) the removal of any building or part thereof constructed in contravention of a provision of this By-law,
f) the cessation of any occupancy in contravention of a provision of this By-law,
g) the cessation of any occupancy if an unsafe condition exists,
h) the correction of an unsafe condition,
i) the correction of an unsanitary condition,
j) a person to provide a written assessment of a specified condition by a registered professional if there is deemed to be an unsafe condition, and
k) a person to secure a building against unauthorized entry.

1.5.4.3. Contents of Notice
1) A notice shall state the nature of any contravention and specify the date or the phase of construction by which remedial measures must be completed.

1.5.4.4. Delivery of Notice
1) A notice may be posted on a building, and may be delivered by regular mail or by hand to the person listed as the owner in the records of the Assessment Authority of British Columbia or to a representative of the owner.

1.5.4.5. Contents of Order
1) An order shall specify any contraventions of this By-law or any unsafe condition or unsanitary condition and may require demolition, removal, or compliance with this By-law, by a specified phase of construction, or within a specified time after the date of mailing or posting the order.
2) Despite Sentence (1), an order to stop work, board up or cease occupancy shall state the nature of the contravention or unsafe condition, and may order the immediate suspension of construction or of occupancy and the rectification of the contravention or unsafe condition.

1.5.4.6. Delivery of Order
1) The Chief Building Official may deliver an order
   a) by mailing the order by registered mail or by regular mail to the owner at the owner’s address as it appears on a Tax Certificate or a State of Title Certificate, and posting the order on the premises which is the subject of the order,
   b) by sending the order by electronic mail to the electronic mail address of the owner or a representative of the owner, or
   c) by delivery of the order by hand to the owner or a representative of the owner.
2) When a building is at imminent or unreasonable risk of collapse which could pose a danger to building occupants or the public, the Chief Building Official may post an order to cease occupancy on the premises which is the subject of the order, which shall be deemed to comply with the requirements of Sentence (1).
3) Delivery of an order in accordance with the provisions of Sentences (1) or (2) shall be deemed to be good and sufficient service of the order.

Section 1.6. Permits, Applications and Fees

1.6.1. Permits

1.6.1.1. When a Permit is Required
1) A permit is required before any work regulated by this By-Law is undertaken.

1.6.1.2. Construction without a Permit
1) If construction for which a permit is required has been commenced before a permit has been issued, the owner shall
   a) make application for any necessary permits in accordance with Subsection 1.6.2. of this By-law, and
   b) pay to the City, a minimum of $500 or double the fee set out in the Fee Schedule to a maximum of $20,000, whichever is the lesser amount.

2) If construction for which a permit is required has been commenced before a permit has been issued, the owner shall, if ordered to do so by the Chief Building Official,
   a) provide proof that the construction complies with this By-law and any other applicable enactments,
   b) carry out tests and investigations by independent agencies, at the cost of the owner, to determine whether or not the construction complies with this By-law,
   c) carry out tests and investigations by independent agencies, at the cost of the owner, to determine appropriate remedial measures to ensure that the construction complies with this By-law,
   d) provide to the Chief Building Official, at the cost of the owner, the results of any tests and investigations ordered by the Chief Building Official, and
   e) provide documentation to the satisfaction of the Chief Building Official to establish that all remedial measures to ensure the construction complies with this By-law have been completed.

1.6.1.3. Additional Permits
   1) In addition to a permit required by Article 1.6.1.1., other permits and supporting documents necessary for specific building components, services and uses, may be required by the Chief Building Official.

1.6.2. Application for Permit

1.6.2.1. Owner Requirement
   1) To obtain a permit, the owner shall file an application in writing in the form prescribed by the Chief Building Official.

1.6.2.2. Application Requirements
   (See Note A-1.6.2.2.)
   1) Except as otherwise provided in this By-law, every application shall
      a) describe the work, building, construction or and occupancies for which the permit is required,
      b) provide a legal description and address for the land on which the work is to be done,
      c) include plans and other supporting documents which conform with Section 2.2. of Division C,
      d) state the value of the proposed work calculated in accordance with Article 1.6.2.3.,
      e) include the requisite permit fee, in accordance with the Fee Schedule at the end of this Part,
      f) include the appropriate owner’s undertaking letter in the applicable form set out in Schedule E-1 or E-2 at the end of this Part,
      g) include any other plans or supporting documents required by the Chief Building Official to establish that the work, building, construction and occupancy complies with this By-law or any other enactment, and
      h) list the names, addresses, electronic mail addresses and telephone numbers of all owners, designers and constructors.

1.6.2.3. Valuation for Permit
   1) The value of the proposed work stated on the application for the permit shall reflect the total current monetary worth of all proposed materials, construction and work related to the building.
   2) In addition to Sentence (1), the value of the proposed work shall include the total current monetary worth of all labour and all fees and costs incurred for design, investigative testing, consulting services,
construction, construction management, contractor’s profit and overhead, sales taxes, and construction insurance related to the building.

3) The total current monetary worth referred to in Sentences (1) and (2) shall include the market value of all labour, including unpaid labour provided by an owner or volunteer, and the market value of all materials, including donated, recycled or used materials.

4) The total current monetary worth referred to in Sentences (1) and (2) shall include all components of the building, notwithstanding the fact that some components of the building may be subject to other permits and fees.

1.6.2.4. Review of Valuation by Chief Building Official

1) The Chief Building Official may review the value of the proposed work stated in an application, using the Marshall Valuation Method, and may substitute a different value for the proposed work.

1.6.2.5. Fee Schedule

1) Permit fees shall be calculated in accordance with the Fee Schedule at the end of this Part and the fees for construction without a permit are as outlined in Article 1.6.1.2.

1.6.2.6. No Refund

1) Except as permitted in Article 1.6.2.7. or Article 1.6.4.5., no permit fees or part thereof shall be refunded if
   a) construction authorized by a permit has commenced,
   b) the permit has expired pursuant to Article 1.6.7.1., or
   c) the application has lapsed as outlined in Article 1.6.2.8.

1.6.2.7. Partial Refund and Set-off

1) If construction authorized by permit has not commenced and the Chief Building Official approves, the Director of Finance may refund a portion of the fees related to the permit, after deduction of any outstanding costs incurred by the City in processing the application for the permit and in carrying out any work pursuant to Article 1.5.3.4. or Article 1.5.3.5.

1.6.2.8. Lapse of Application

1) Subject to the provisions of Article 1.6.2.9., an owner shall comply with all the necessary requirements to complete an application for a permit within 6 months after the date of receipt of the application by the Chief Building Official.

2) If an owner fails to comply with the requirements of Sentence (1), the application for a permit shall lapse.

3) An application for a permit which has lapsed is expired and shall not be renewed except in accordance with Article 1.6.2.9.

1.6.2.9. Renewal of Lapsed Application

1) The Chief Building Official may renew a lapsed application for a permit if the Chief Building Official determines that
   a) no more than 3 months have passed since the date the application lapsed, and
   b) the failure to complete the requirements of the original application for a permit was reasonable in the circumstances.

2) Despite the provisions of Sentence (1), the Chief Building Official shall not renew a lapsed application for a permit more than once.

3) An application for a permit which has been renewed pursuant to Sentence (1) must comply with any amendments to this By-law made since the date of receipt of the original application by the Chief Building Official.

1.6.3. Additional Requirements for Plumbing and Sprinkler Permits
1.6.3.1. Application Requirements
1) The Chief Building Official may issue a permit for a plumbing system or sprinkler system if the applicant is authorized to obtain such a permit in accordance with the provisions of this Section.

1.6.3.2. Permit for Plumbing System
1) The Chief Building Official shall only issue a permit to construct, extend, alter, renew or repair a plumbing system to a licensed plumbing contractor.

1.6.3.3. Permit for Sprinkler System
1) The Chief Building Official shall only issue a permit to construct, extend, alter, renew or repair a sprinkler system to a licensed sprinkler contractor.

1.6.3.4. Permit for Plumbing System to Licensed Contractor
1) Despite the provisions of Article 1.6.3.2., the Chief Building Official may issue a permit to a licensed contractor:
   a) to install sewers, sumps, catch basins, and water lines outside of a building, or
   b) to install backflow devices or other similar protection devices inside a building.

1.6.3.5. Permit for Plumbing System to Owner
1) Despite the provisions of Article 1.6.3.2., the Chief Building Official may issue a permit to the owner of a residential building with not more than one principal dwelling unit to do plumbing work in that building if the owner is the occupier of the building.

1.6.3.6. No Permit for Minor Repairs to Plumbing System
1) Despite the provisions of Article 1.6.3.1., no permit is required to repair or replace a valve, faucet, fixture, fixture outlet pipe or service water heater, to clear a stoppage, or to repair a leak, if there is no change to any other piping.

1.6.3.7. Requirement for Inspection
1) No person shall use a plumbing system or sprinkler system until it has been inspected by the Chief Building Official.

1.6.4. Applications by Certified Professionals

1.6.4.1. Applications for Permits by Certified Professionals
1) A Certified Professional may apply for a permit on behalf of an owner.

1.6.4.2. Requirements for Permit
1) A Certified Professional who applies for a permit on behalf of an owner must comply with the requirements of Section 1.6 of this By-law.

1.6.4.3. Application Review For Permit
1) The Chief Building Official may issue a permit based upon a modified review of the drawings and other supporting documents submitted with the application for a permit by a Certified Professional.

1.6.4.4. Site Review For Permit
1) A Certified Professional shall carry out detailed site reviews and shall be responsible for monitoring and follow-up necessary to support the construction authorized by the permit and to support the construction of the entire building.

1.6.4.5. Refund of Permit Fees
1) Except as otherwise determined in this Article, the Chief Building Official may refund a portion of the fees for a permit issued to a Certified Professional for the administrative costs assumed by the applicant that would have otherwise been incurred by the Chief Building Official.

2) An application for a refund of permit fees pursuant to Sentence (1) must be submitted to the Chief Building Official in writing, within 90 days following the issuance of a final occupancy permit.

3) Calculation of the administrative costs pursuant to Sentence (1) shall be determined from
   a) the prevailing fee rate(s) at the time of application for the refund, and
   b) as applicable and determined in
      i) the Schedule of Fees at the end of this Part, or
      ii) the Schedule of Fees in the “Zoning and Development Fee By-law” currently in force and effect.

4) No refund for permit fees or part thereof identified pursuant to Sentence (1) shall be issued for
   a) alterations to existing buildings, or
   b) the failure to make an application pursuant to the requirements of Sentence (2).

1.6.5. Applications for Staged Construction by Certified Professionals

1.6.5.1. Requirements for Staged Construction

1) The Chief Building Official may issue a permit to construct a building in stages if
   a) the applicant for the staged construction is a Certified Professional,
   b) the Certified Professional also applies for permission to construct the entire building,
   c) the Certified Professional submits complete plans and all supporting documents for each portion of the work for which a permit for staged construction is sought, and
   d) the Certified Professional submits all documents required pursuant to the Certification of Professionals By-law.

1.6.5.2. Owner’s Risk

1) The issuance of a staged permit creates no obligation on the Chief Building Official to issue any other staged permits or to issue a permit to construct the entire building.

2) An owner who commences construction of a building in accordance with a staged permit does so at the owner’s risk.

1.6.5.3. Owner’s Responsibility

1) An owner who fails to complete the work authorized by a permit for staged construction or who fails to comply with the conditions of a permit for staged construction shall restore the site to a safe condition, to the satisfaction of the Chief Building Official.

1.6.5.4. Application Review for Permit for Staged Construction

1) Where a Certified Professional complies with all application requirements for a permit for staged construction, the Chief Building Official may issue a permit for staged construction based upon a modified review of the drawings and other supporting documents submitted for the permit for staged construction.

1.6.5.5. Site Review of Staged Construction

1) Where a permit for staged construction is issued, the Certified Professional shall carry out detailed site reviews and shall be responsible for monitoring and follow-up necessary to support the construction authorized by the permit for staged construction and to support the construction of the entire building.

1.6.6. Revisions

1.6.6.1. Revisions to Applications

1) All applications for revisions to the original application shall comply with Article 1.6.2.2.
Division C: Administrative Provisions

2) When revisions to the original application result in an increase in the value of the proposed work, the Chief Building Official shall review the valuation and recalculate the permit fee in accordance with this By-law.

3) When application documents are either incomplete or changed to the extent that an additional plan review is necessary, an additional revision fee shall be charged in accordance with the Fee Schedule at the end of this Part.

1.6.6.2. Minor Revisions to Permits

1) All applications for minor revisions to the original permit shall comply with Article 1.6.2.2. to the extent required by the Chief Building Official.

2) When applications for minor revisions to the original permit result in an increase in the value of the proposed work, the Chief Building Official shall review the valuation and recalculate the permit fee in accordance with this By-law.

3) An additional revision fee shall be charged for applications for minor revisions to the original permit in accordance with the Fee Schedule at the end of this Part.

1.6.7. Permit Expiry and Extension

1.6.7.1. Permit Expiry

1) Except as provided in this Subsection, a permit shall expire and the rights of the owner under the permit shall terminate if in the opinion of the Chief Building Official
   a) the work authorized by the permit is not commenced within 6 months from the date of issue of the permit,
   b) the work although commenced is not continuously and actively carried out thereafter, or
   c) the work has been substantially discontinued for a period of 6 months. (See Note A-1.6.7.1.(1).)

2) Except as provided in this Subsection 1.6.7., a permit for a temporary building or occupancy shall expire and the rights of the owner under the permit shall terminate on the expiry date noted on the permit.

1.6.7.2. Application to Chief Building Official for Extension

1) An owner who wishes to seek an extension of a permit shall make application to the Chief Building Official prior to the expiry of the permit.

2) An owner who wishes to seek an extension of a permit shall submit the application in writing accompanied by the requisite extension fee.

1.6.7.3. Extension of Permit by Chief Building Official

1) If the Chief Building Official is of the opinion that substantial completion of the work has been prevented because of exceptional circumstances, the Chief Building Official may extend the permit twice only, provided that, in the meantime, no applicable amendments have been made to this By-law.

2) If the Chief Building Official is of the opinion that a building or occupancy is temporary, the Chief Building Official may extend the permit for a temporary building or occupancy twice only, provided that, in the meantime, no applicable amendments have been made to this By-law.

1.6.7.4. Application to Council for Extension

1) An owner who has been granted an extension of a permit by the Chief Building Official may make application to Council for a further extension prior to the expiry of the permit.

2) An owner who wishes to seek an extension of a permit from Council shall submit an application in writing to the Chief Building Official accompanied by the requisite extension fee.

3) The Chief Building Official shall forward to Council any application submitted in accordance with this section, together with information and advice to assist Council in considering the application.

1.6.7.5. Extension of Permit by Council
Division C: Administrative Provisions

Part 1 – General

1.6.8. Permits for Temporary Buildings, Including Tents and Air-Supported Structures

1.6.8.1. Definition of “Temporary”
1) In this Subsection, “temporary” means for a time period not exceeding twelve consecutive months.

1.6.8.2. Compliance with By-law
1) Except as otherwise provided in this Subsection or in Section 11.6, Division B, Book 1, no person shall erect a temporary building, including a tent or air-supported structure, which does not comply with this By-law.

1.6.8.3. Permit Required
1) No person shall erect, or use or occupy a temporary building, including a tent or air-supported structure without a permit.

1.6.8.4. Compliance with Permit Conditions
1) No person shall erect, or use or occupy a temporary building, including a tent or air-supported structure, in contravention of the conditions of a permit.

1.6.8.5. Application Requirements
1) The application for a permit for a temporary building, including a tent or air-supported structure, shall be accompanied by
   a) plans showing the location of the temporary building, tent or air-supported structure on the site, all other existing buildings on the same property and all other buildings on adjacent property located within at least 10 feet of the property line of the site,
   b) construction details of the building, tent or air-supported structure, and
   c) a statement by the owner indicating the intended use and intended duration of such use.
2) The application for a temporary occupancy permit for a tent or air-supported structure shall be accompanied by documentation sufficient to establish that the tent or air-supported structure complies with Subsection 3.1.6. of Division B of Book I (General) of this By-law.

1.6.8.6. Time Limited Permits for Temporary Buildings
1) The Chief Building Official may issue a permit authorizing the construction, use or occupancy of a temporary building, including a tent or air-supported structure, and may attach conditions to such permit, including conditions allowing for selective compliance with the provisions of this By-law, if the Chief Building Official determines that the construction, use or occupancy will exist for a short time, and the circumstances do not warrant complete compliance with this By-law.

1.6.8.7. Permit End Date
1) A permit for a temporary building, including a tent or air-supported structure, shall state the date after which the permit is no longer valid.

1.6.8.8. Permit Extension
1) A permit for a temporary building, including a tent or air-supported structure, may only be extended if an extension is granted by the Chief Building Official prior to the expiry of the permit.
2) An owner who wishes to seek an extension of a permit for a temporary building from the Chief Building Official shall submit an application in writing to the Chief Building Official accompanied by the requisite extension fee.
3) If the Chief Building Official is of the opinion that the temporary building complies with the life safety requirements of this By-law, the Chief Building Official may extend the permit once only, and the Chief Building Official may require documentation from registered professionals to verify that the requirements of this By-law are being met.

### 1.6.9. Operating Permits

#### 1.6.9.1. Operating Permit Required

1) No person shall install or retain existing equipment or systems for which an operating permit is required under this By-law, without an operating permit.

#### 1.6.9.2. Compliance with Permit Conditions

1) No person shall install or retain existing equipment or systems for which an operating permit is required under this By-law, in contravention of the conditions of an operating permit.

#### 1.6.9.3. Application Requirements

1) To obtain an operating permit, the owner shall file an application in writing in the form prescribed by the Chief Building Official.
2) The application for an operating permit shall be accompanied by the operating permit fees and any documentation required by the Chief Building Official to verify that the requirements of this By-law are being met.

#### 1.6.9.4. Permit Expiry

1) An operating permit shall expire and the rights of the owner under the operating permit shall terminate on the expiry date noted on the operating permit.

#### 1.6.9.5. Operating Permit Fees

1) Operating permit fees are as set out in the Schedule of Fees at the end of this Part.

### Section 1.7. Permission to Occupy Buildings

#### 1.7.1. General

#### 1.7.1.1. Occupancy Permit Required

1) Except as otherwise provided in this By-law, no person shall occupy or allow the occupancy of any building or part thereof unless the owner has obtained an occupancy permit from the Chief Building Official.
2) No person shall occupy any building for a purpose other than the occupancy stipulated in an occupancy permit issued by the Chief Building Official.

#### 1.7.1.2. Occupancy Permit

(See Note A-1.7.1.2.)

1) Every owner shall obtain an occupancy permit from the Chief Building Official prior to any a) occupancy of a building or part thereof after construction or alteration of that building, b) change in the major occupancy of any building or part thereof, or c) change in the permitted occupancy within the same Division of the major occupancy Group, where the occupant load or the fire load has increased.

#### 1.7.1.3. Exemptions from Occupancy Permit

1) Despite the requirements of Articles 1.7.1.1. and 1.7.1.2., an occupancy permit is not required for a) residential building with not more than two principal dwelling units, or
b) a change in the permitted occupancy within the same major occupancy classification provided the occupant load is not increased and no construction has taken place.

1.7.1.4. Posting of Lawful Use

1) In any building not requiring an occupancy permit, the Chief Building Official may post a notice which describes the uses to which the building may be lawfully put.

1.7.2. Occupancy Permit Process

1.7.2.1. Owner’s Obligation

1) An owner who wishes to obtain an occupancy permit shall file an application in the form required by the Chief Building Official.

1.7.2.2. Requirements for Occupancy Permit Application

1) The permit application requirements described in Article 1.6.2.2. do not apply to an application for an occupancy permit if the application includes

- a) a letter from the owner declaring that the work complies with the By-law, the necessary permits, including operating permits, have been obtained and the building conforms with the accepted plans, in any case where a professional is not required by Subsection 2.2.7., Division C, Book I,
- b) the appropriate letters of assurance in any case where a professional field review is required by Subsection 2.2.7. of Division C of Book I (General) of this By-law,
- c) the anticipated date of completion,
- d) the classification of the building,
- e) the number of storeys in the building,
- f) the gross floor area of each storey,
- g) the allowable live loads for each floor area, and
- h) an annual permit as required by the Electrical By-law.

1.7.2.3. Scheduling of Construction, Fire and Life Safety Systems Inspection

1) Prior to the issuance of an occupancy permit, the owner of a building shall call for and coordinate a final inspection of construction, fire and life safety systems in the building.

1.7.2.4. Requirements prior to Construction, Fire and Life Safety Systems Inspection

1) At least 24 hours prior to the final inspection for an occupancy permit, every owner shall submit to the Chief Building Official

- a) proof of compliance with the By-law for all materials, equipment and methods of construction,
- b) letters of assurance in the applicable forms attached as Schedules C-A and C-B, at the end of Part 2 of Division C,
- c) a contractor’s material and test certificate, certifying that the sprinkler systems have been flushed, inspected and tested,
- d) a certificate of verification and a manufacturer’s inspection report for the fire alarm system,
- e) a fire safety plan and record of installed fire safety systems, conforming to the Fire By-law, and
- f) a letter from a fire protection consultant verifying that the special devices or methods forming part of the alternative solution achieves the alternative solution.

1.7.2.5. Requirements during Construction, Fire and Life Safety Systems Inspection

1) During the final inspection of construction, fire and life safety systems in the building, the owner of the building shall make available

- a) a copy of the fire safety plan,
- b) a copy of the record of installed fire safety systems, and
c) a preventive maintenance and testing schedule and a maintenance log book for the life and fire safety systems.

1.7.2.6. Notice of Change Prior to Occupancy

1) Every owner shall give notice in writing to the Chief Building Official of any change to the owner’s address or any change in the ownership of the building which occurs
   a) prior to the issuance of an occupancy permit, or
   b) prior to the occupancy of the building.

1.7.3. Partial Occupancy Permit for Building Under Construction

1.7.3.1. Partial Occupancy Permit

1) The Chief Building Official may issue a partial occupancy permit for part of a building which is under construction if, in the opinion of Chief Building Official, such partial occupancy would not jeopardize life or property.
2) The Chief Building Official may impose conditions on a partial occupancy permit.
3) The Chief Building Official may revoke a partial occupancy permit if the permit holder fails to comply with the conditions imposed by the Chief Building Official.
4) The Chief Building Official may revoke a partial occupancy permit if the owner fails to comply with any permit relating to the building.

1.7.3.2. Owner’s Obligation regarding Unsafe Conditions

1) The owner of a building for which a partial occupancy permit has been issued shall ensure that there are no unsafe conditions in the building.

1.7.4. Temporary Occupancy Permit

1.7.4.1. Temporary Occupancy Permit

1) The Chief Building Official may issue a temporary occupancy permit for a temporary use within an existing building, or for the limited use of a building approved according to Subsection 1.6.8. or as otherwise provided in this By-law.

1.7.5. Re-Occupancy Permit

1.7.5.1. Re-occupancy Permit

1) Every owner shall obtain a re-occupancy permit from the Chief Building Official prior to any occupancy of a building or part thereof in respect of which the Chief Building Official has issued an order to cease occupancy due to an unsafe condition.

Section 1.8. Street Regulations

1.8.1. Encroachments

1.8.1.1. Encroachment Defined

1) In this Section an encroachment means a building, or a building appurtenance or fixture, including an existing areaway, a new or existing ornamental projection, awning, canopy, mechanical apparatus, or emergency exit apparatus, projecting in a street, whether above, at or below ground level.

1.8.1.2. Measurement of Encroachment
1.8.1.3. No Encroachment without Permission
1) No encroachment shall project into a street, unless permission has first been granted by the City.

1.8.1.4. Maintenance and Repair of Encroachment
1) Encroachments shall be repaired and maintained to the satisfaction of the City Engineer and the Chief Building Official.

1.8.1.5. Prohibited Encroachments
1) An encroachment shall not obstruct or interfere with
   a) public utility poles or equipment,
   b) firefighting equipment or fire rescue operations,
   c) street trees or lamp standards, or
   d) street furniture.

1.8.1.6. Compliance with Encroachment By-law
1) The Chief Building Official shall not issue a permit to construct an encroachment unless the encroachment complies with this By-law and with the Encroachment By-law.

1.8.2. Existing Encroachments

1.8.2.1. Existing Encroachments
1) An existing encroachment which complies with the Encroachment By-law and does not conform with this By-law may be continued if the encroachment is not altered.

1.8.2.2. Damage to Existing Encroachment
1) Subject to the provisions in Sentence (2), an existing encroachment which is damaged may be repaired.
2) Despite the provisions of Sentence (1) if the cost of the repair to an existing encroachment is more than 50 per cent of the current replacement cost of the damaged encroachment, the repair shall constitute a new encroachment and shall comply with the provisions of this By-law and the Encroachment By-law.

1.8.2.3. Alteration to Existing Encroachment
1) Except for signs permitted by the Sign By-law, any enlargement or alteration of an existing encroachment shall constitute a new encroachment and shall comply with the provisions of this By-law and the Encroachment By-law.

1.8.2.4. Signs
(Refer to Book I (General) of this Bylaw.)

1.8.2.5. Door Swings
(Refer to Book I (General) of this Bylaw.)

1.8.3. New Encroachments

1.8.3.1. Application
1) This Section applies to
   a) new encroachments, and
   b) alterations to existing encroachments which do not comply with the provisions of Subsection 1.8.2.
1.8.3.2. Dimensions and Clearances

1) Unless otherwise provided in this By-law, all new encroachments shall comply with the applicable construction, clearance and dimension requirements in Subsections 1.8.5. to 1.8.10.

1.8.3.3. Design and Construction of New Encroachments

1) A new encroachment shall be designed and constructed so that, in the event of its removal from the building, the building will comply with the provisions of this By-law.

1.8.3.4. Compliance with By-laws

1) A new encroachment shall comply with the provisions of this By-law and the Encroachment By-law.

1.8.3.5. Encroachments in Narrow Streets

1) Unless otherwise permitted by this Section, new encroachments or encroachments which do not comply with the provisions of Subsection 1.8.2. are not permitted in a street which is 10 m or less in width.

1.8.4. Repair or Removal of Encroachment

1.8.4.1. Removal or Repair by Owner

1) The owner of a building which encroaches in a street shall repair, alter or remove the encroachment if so ordered

a) by the Chief Building Official, in accordance with this By-law, or
b) by the City Engineer, in accordance with the Encroachment By-law.

1.8.4.2. Repair of Building after Removal of Encroachment

1) Upon removal of an encroachment from a building, the owner shall promptly repair the building and shall ensure that the building complies with this By-law.

1.8.4.3. Repair of Building at Owner’s Expense

1) If the Chief Building Official has issued an order in accordance with Article 1.8.4.1. and an owner has failed to comply with that order, the Chief Building Official may

a) authorize demolition or removal of an encroachment, posting of security guards or fire wardens, or enclosure of such encroachment, building, construction, excavation or part thereof, at the expense of the owner,
b) recover such expense in the manner set out in this By-law, and
c) take such other measures as may be necessary to protect the public.

1.8.5. Areaways

(Refer to Book I (General) of this Bylaw.)

1.8.6. Ornamental Projections and Existing Windows

(Refer to Book I (General) of this Bylaw.)

1.8.7. Awnings

(Refer to Book I (General) of this Bylaw.)

1.8.8. Canopies

(Refer to Book I (General) of this Bylaw.)
1.8.9. Solar Shading Device
(Refer to Book I (General) of this Bylaw.)

1.8.10. Mechanical Apparatus

1.8.10.1. Clearances
1) Exterior hose connections for fire-fighting equipment, ventilation intakes and outlets, chimneys and air conditioning units shall not encroach in a street unless permitted by the City Engineer.
2) Fire alarm bells and fire gongs may encroach up to 300 mm in a street, except that such encroachments shall be located no less than 2.6 m above the street surface or established building grade.

1.8.11. Emergency Exits
(Refer to Book I (General) of this Bylaw.)

Section 1.9. Temporary Occupancy of a Street for Construction Purposes

1.9.1. General Requirements

1.9.1.1. Permit Required Prior to Occupancy of Street
1) No person shall occupy a street or the air space above a street in connection with, or incidental to the construction or maintenance of any building, without first obtaining a street use permit from the City Engineer.

1.9.1.2. Permit Required Prior to Excavation in Street
1) No person shall excavate or backfill any part of a street without first obtaining a street use permit from the City Engineer.

1.9.1.3. Liability Disclaimer
1) An application for a street use permit shall contain an undertaking by the owner to save harmless the City against all claims, liabilities, judgments, costs and expenses in consequence of, or in any way incidental to the granting of such permit, in a form satisfactory to the Director of Legal Services.

1.9.2. Overhead Construction

1.9.2.1. Permit Required for Overhead Construction
1) No person shall cause a swing scaffold or construction hoisting device to occupy the air space above a street without first obtaining a street use permit from the City Engineer.

1.9.2.2. Prevention of Public Entry
1) The street under a swing scaffold or construction hoisting device shall be fenced, roped off or otherwise protected against public entry to the satisfaction of the City Engineer.

1.9.3. Public Safety

1.9.3.1. Construction Site Protection of the Public Required
1) No person shall construct, alter or repair any building unless fencing, boarding, barricades or covered walkways as required by Part 8 of Division B of Book I (General) of this By-law have first been erected on or adjacent to the street, to the satisfaction of the Chief Building Official.
2) The Chief Building Official may modify the requirements of Sentence (1) if satisfied that the location of the construction is sufficiently protected or remote from areas frequented by the public.

1.9.3.2. Permit Required for Fencing, Boarding, Barricades or Covered Walkways

1) No person shall erect fencing, boarding, barricades or covered walkways on a street, without first obtaining a street use permit from the City Engineer.

Section 1.10. Addressing Buildings and Parcels of Land
(Refer to Book I (General) of this Bylaw.)
OWNER'S UNDERTAKING

Noted:
1. This letter must be submitted after completion of the project but before the occupancy permit is issued or a final inspection is made by the Chief Building Official.
2. This letter is endorsed by Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C. and the words in italics have the same meaning as the Building By-law.

To: The Chief Building Official
Re: _______________________
______________________________

In consideration of the City accepting and processing an application for a building permit for the project identified above and as required by the Building By-law, the following representations, warranties and indemnities are given to the City by the owner.

1. If an individual is the owner
   ( ) I am the owner of the above property
   or
   [If a corporation is the owner]
   ( ) ____________________________ is the owner of the above property
   (Name of Corporation)

2. The owner will comply with and cause those employed for this project to comply with all applicable by-laws of the City and other statutes and regulations in force in the City relating to the development, work, undertaking or permission in respect of which this letter is submitted.

3. The owner fully understands the requirements herein and acknowledges responsibility for carrying out the work, or gives assurance that the work will be carried out, in accordance with all by-laws governing the construction of the building. The owner understands and acknowledges that the issuance of any permit, including an occupancy permit, or the inspection or approval or passage of work by the City, is not a representation or warranty that any by-law has been complied with and the owner remains responsible at all times for compliance. The owner has read and understands Article 1.3.2.1. and Article 1.4.1.5. of Division C Book I and Book II of the Building By-law, which are set out below.

4. The owner hereby agrees to indemnify and save harmless the City and its employees from all claims, liability, judgments, costs and expenses of every kind including negligence which may result from the failure to comply fully with all by-laws, statutes and regulations relating to any work or undertaking in respect of which this letter is submitted.

5. Where the words "work" or "undertaking" are used herein, the owner understands this to include all trade work, including but not limited to: electrical, plumbing, mechanical, gas and other works necessary to complete the contemplated construction.

6. I am authorized to give these representations, warranties, assurances and indemnities to the City.

**Building By-law, Division C, Article 1.3.2.1 Intent**

1) This By-Law sets standards in the public interest. It is enacted and retained on the understanding and specifically expressed condition that it creates no duty whatsoever on the City, the Chief Building Official or any employee of the City to enforce its provisions, and on the further condition that a failure to administer or enforce its provisions, or the incomplete or inadequate administration or enforcement of its provisions, shall not give rise to a cause of action in favour of any person whatsoever. The issuance of any permit, including an occupancy permit, is not a representation, warranty or statement that this By-Law or any other enactment has been complied with, and the issuance thereof in error shall not give rise to a cause of action. Accordingly, words in this By-Law defining the responsibilities and authority of the Chief Building Official shall be construed as internal administrative directions which do not create a duty.

**Building By-law, Division C, Article 1.4.1.5. Compliance with By-law and other enactments**

1) The owner shall comply with this By-law and all other applicable enactments.

2) The owner shall ensure that all work, construction or occupancy is carried out in accordance with this By-law and all other applicable enactments.

3) The owner shall ensure that the occupancy of a building or part of a building complies with the occupancy permit.

4) The issuance of a permit, the acceptance of plans and supporting documents submitted for a permit, or the making of inspections by the Chief Building Official shall not relieve the owner of a building from the full responsibility for carrying out the work or having the work carried out in accordance with this By-law and all other applicable enactments.

5) The owner shall ensure that all underground storage tanks on the subject property that are intended for the storage of heating oil but have not been used for over 2 years are removed and any associated contamination is remediated to the applicable standards as prescribed in the Contaminated Sites Regulation. All work must be completed in accordance with the requirements of the Vancouver Fire By-law.
SCHEDULE E-2

OWNER’S AND TENANTS UNDERTAKING
[to be used when a tenant is carrying out the project]

To. The Chief Building Official

Re. __________________________________________

Name of Project (if any)

Address of Property (if any)

In consideration of the City accepting and processing an application for a building permit for the project identified above, and as required by the Building Bye-law, the following representations, warranties and indemnities are given to the City by the owner and by the tenant.

1. [If an individual is the owner]

   ( ) I am the owner of the above property

   or

   [If a corporation is the owner]

   ( ) ___________ is the owner of the above property.

   (Name of Corporation)

[If an individual is the tenant]

( ) I am the owner of the above property

or

[If a corporation is the tenant]

( ) ___________ is the owner of the above property.

(Name of Corporation)

2. The owner and the tenant will comply with and cause those employed for this project to comply with all applicable by-laws of the City and other statutes and regulations in force in the City relating to the development, work, undertaking or permission in respect of which this letter is submitted.

3. The owner and the tenant fully understands the requirements herein, and acknowledges responsibility for carrying out the work, or gives assurance that the work will be carried out, in accordance with all by-laws governing the construction of the building. The owner understands and acknowledges that the issuance of any permit, including an occupancy permit, or the inspection or approval of passage of work by the City, is not a representation or warranty that any by-law has been complied with and the owner remains responsible at all times for compliance. The owner has read and understands Article 1.3.2.f. and Article 1.4.1.5. of Division C Book I and Book II of the Building By-law, which are set out below.
4. The owner and the tenant hereby agree to indemnify and save harmless the City and its employees from all claims, liability, judgments, costs and expenses of every kind including negligence which may result from the failure to comply fully with all bylaws, statutes and regulations relating to any work or undertaking in respect of which this letter is submitted.

5. Where the words “work” or “undertaking” are used herein, the owner and the tenant understand this to include all trade work, including but not limited to electrical, plumbing, mechanical, gas and other works necessary to complete the contemplated construction.

6. The owner and the tenant are authorized to give these representations, warranties, assurances and indemnities to the City.

Building By-law, Division C, Article 1.3.2.1 Intent

1) This By-Law sets standards in the general public interest. It is enacted and is based on the understanding and specifically expressed condition that it creates a duty wherever on the City, the Chief Building Official or any employee of the City to enforce its provisions, and on the further condition that a failure to administer or enforce its provisions, or the improper or inadequate administration or enforcement of its provisions, shall not give rise to a cause of action in favour of any person. The issuance of any permit, including an occupancy permit, is not a representation, warranty or statement that this By-Law or any other enactment has been complied with, or that the issuance thereof in error shall not give rise to a cause of action. Accordingly, words in this By-Law defining the responsibilities and authority of the Chief Building Official shall be construed as internal administrative directions which do not create a duty.

Building By-law, Division C, Article 1.4.1.5. Compliance with By-law and other enactments

1) The owner shall comply with this By-law and all other applicable enactments.

2) The owner shall ensure that all work, construction, or occupancy is carried out in accordance with this By-law and all other applicable enactments.

3) The owner shall ensure that the occupancy of a building or part of a building complies with the occupancy permit.

4) The issuance of a permit, the acceptance of plans and supporting documents submitted for a permit, or the making of inspections by the Chief Building Official shall not relieve the owner of a building from the full responsibility for carrying out the work or having the work carried out in accordance with this By-law and all other applicable enactments.

5) The owner shall ensure that all underground storage tanks or the subject property that are intended for the storage of heating oil but have not been used for over 2 years are removed and any associated contamination is remediated to the applicable standards as prescribed in the Contaminated Sites Regulation. All work must be completed in accordance with the requirements of the Vancouver Fire By-law.
## Schedule of Fees

### PART A – BUILDING

1. The fees hereinafter specified shall be paid to the City with respect to and upon the application for the issue of a PERMIT as follows:
   
   **(a)** Except as provided for in Clause (b) for the CONSTRUCTION of any BUILDING, or part thereof:
   
   When the estimated cost of the work, being the valuation referred to in Article 1.6.2.3. of Book I, Division C
   
   and Book II, Division C of this By-law, does not exceed $5,000 or for the first $5,000 of the estimated cost of the work ................................................................. $158.00
   
   For each $1,000, or part thereof, by which the estimated cost of the work exceeds $5,000 but does not exceed $50,000 ................................................................. $10.10
   
   For each $1,000, or part thereof, by which the estimated cost of the work exceeds $50,000 .... $5.10
   
   **(b)** For the installation, CONSTRUCTION, re- CONSTRUCTION, ALTERATION or repair of, or ADDITION to:
       
       (i) any CHIMNEY, FIREPLACE, INCINERATOR, VENTILATING SYSTEM, AIR- CONDITIONING SYSTEM, or HEATING SYSTEM, the fee shall be in accordance with Clause (a), except that a fee shall not be charged when the cost of such work is less than $500
       
       (ii) any PHOTOVOLTAIC PANELS, and related roof ALTERATION or repair ....................... $100.00
   
   **(c)** For a permit for temporary OCCUPANCY of a part of a STREET, or of the AIR SPACE immediately ABOVE a part of a STREET, in accordance with Section 1.9. of Book I, Division C and Book II, Division C
       
       of this By-law, the daily fee shall be for each 10 m2 or part thereof, of STREET or of AIR SPACE part thereof, of STREET or of AIR SPACE immediately above such STREET to be occupied .......... $3.20
       
       Subject to a minimum fee of ................................................................. $110.00
       
       Flat fee for each portable toilet ................................................................. $110.00
   
   **(d)** For an OCCUPANCY PERMIT not required by this By-law but requested............................ $228.00
   
   **(e)** For the demolition of a BUILDING, not including a ONE-FAMILY DWELLING, which has at any time since November 1, 1986 provided RESIDENTIAL OCCUPANCY, subject to Section 3:
       
       For each DWELLING UNIT ......................................................................................... $1,150.00
       
       For each sleeping room in a multiple conversion dwelling, hotel or other BUILDING, which is or has been a principal dwelling or residence of a person, family or household ......................................................... $1,150.00
   
   **(f)** For the demolition of a ONE-FAMILY DWELLING, which has at any time since November 1, 1986 provided RESIDENTIAL OCCUPANCY, subject to Section 3......................................................... $1,150.00
   
   **(g)** For the repair of building walls pursuant to requirements of Book I, Division B, Part 5 for any residential building ................................................................. Nil

2. The fees hereinafter specified shall be paid to the City as follows:
   
   **(a)** For a required permit inspection for compliance with this By-Law which cannot be carried out during normal working hours and where there is a request to carry out the inspection after hours, the fee to be based on the time actually spent in making such inspection, at a minimum inspection time of four (4) hours, including traveling time:
       
       For each hour or part thereof ......................................................................................... $311.00
   
   **(b)** For a plan review where an applicant requests in writing that the review be carried out during overtime:
       
       For each hour or part thereof ......................................................................................... $311.00
   
   **(c)** For each special inspection of a BUILDING or structure to determine compliance with this By-law, and in respect of which no specific fee is otherwise prescribed, the fee to be based on the time actually spent in making the inspection:
       
       For each hour or part thereof ......................................................................................... $206.00
(d) For each REINSPECTION made necessary due to faulty work or materials or incomplete work requested to be inspected ........................................... $206.00
(e) For each inspection of a drainage tile system:
   For a one- or two-family residence ........................................................... $212.00
   For all other drain tile inspections:
   When the estimated cost of the CONSTRUCTION of the BUILDING, being the valuation referred to in Article 1.6.2.3. of Book I, Division C and Book II, Division C does not exceed $500,000 ... $414.00
   When the estimated cost of the work exceeds $500,000 but does not exceed $1,000,000 ... $827.00
   When the estimated cost of the work exceeds $1,000,000 ................................ $1,034.00
(f) For the special search of records pertaining to a BUILDING to advise on the status of outstanding orders and other matters concerning the BUILDING:
   For a residential building containing not more than 2 principal dwelling units ................................ $265.00
   For all other BUILDINGS ........................................................................ $532.00
(g) For access plans (electronic or on microfilm) or documents for viewing or copying ................ $45.10
(h) For each microfilm image or electronic file copied ........................................ $12.40
(i) For a request to renumber a BUILDING ................................................... $984.00
(j) For the extension of a BUILDING PERMIT where requested in writing by an applicant pursuant to Article 1.6.7.1. of Book I, Division C and Book II, Division C ......................................................... 50 % of the original BUILDING PERMIT fee to a maximum of $380.00
(k) For the extension of a building permit by Council where requested in writing by an applicant pursuant to Article 1.6.7.4. of Book I, Division C and Book II, Division C ........................................ $2,490.00
(l) For an evaluation of plans, specifications, building materials, procedures or design methods for the purpose of revisions to an application or a permit in accordance with Article 1.5.2.13. and Section 1.6.6. of Book I, Division C and Book II, Division C
   where the PERMIT relates to a ONE-FAMILY DWELLING or a SECONDARY SUITE .......... $206.00
   plus for each hour, or part thereof, exceeding one hour ........................................ $206.00
   where the PERMIT relates to any other BUILDING ................................................ $623.00
   plus for each hour, or part thereof, exceeding one hour ........................................ $311.00
(m) For each RE-OCCUPANCY PERMIT after rectification of an UNSAFE CONDITION and related By-law violations ................................................................. $379.00
(n) For review of plans, specifications, building materials, procedures or design methods for the purpose of acceptance of an alternative solution for new construction under Article 2.3.2.1. of Book 1, Division C for each application ..................................................... $871.00
(o) For an evaluation of plans, specifications, building materials, procedures or design methods for the purpose of acceptance of existing conditions with mitigating features, for each application ... $498.00
(p) For review by the alternative solution review panel ........................................ $2,790.00
(q) For the evaluation of a resubmission or revised submission made under Clauses (n) or (o) of this Section 2 ........................................................................................................ $311.00

3. Upon written application of the payor and on the advice of the Acting General Manager of Community Services, the Director of Finance shall refund to the payor, or a designate of the payor, the fees paid pursuant to Clauses (e) and (f) of Section 1:
   (a) for all demolished dwelling units in a building that will be replaced by a social housing or co-operative development that has received a Project Commitment Letter from the British Columbia Housing Management Commission or the Canada Mortgage and Housing Corporation; and
   (b) for each demolished dwelling unit that has been replaced by a dwelling unit occupied by rental tenants and not created pursuant to the Strata Property Act.
PART B - PLUMBING

Every applicant for a Plumbing PERMIT shall, at the time of application, pay to the City the fees set out hereunder:

1. INSTALLATIONS
   For the Installation of:
   - One, two or three FIXTURES ................................................................. $206.00
   - Each additional FIXTURE ................................................................. $64.70

   Note: For the purpose of this schedule the following shall also be considered as FIXTURES:
   - Every “Y” intended for future connection;
   - Every ROOF DRAIN, swimming pool, dishwasher, and interceptor;
   - Every vacuum breaker in a lawn sprinkler system; and
   - Every back-flow preventer

   Alteration of Plumbing (no FIXTURES involved):
   - For each 30 m of piping or part thereof ........................................... $302.00
   - For each 30 m of piping or part thereof, exceeding the first 30 m .............. $84.00
   - Connection of the City water supply to any hydraulic equipment ............. $114.00

2. INSPECTIONS OF FIRELINE SYSTEMS:
   Hydrant & Sprinkler System:
   - First two inspections for each 30 m of water supply pipe or part thereof .......... $302.00
   - Each additional inspection for each 30 m of water supply pipe or part thereof .......... $124.00

   Sprinklers:
   - First head, one- or two-family dwelling ............................................ $344.00
   - First head, all other buildings ........................................................ $731.00
   - First head, renovations to existing sprinkler systems ......................... $213.00
   - Each additional head, all buildings (no limit on number) ..................... $3.80

   Firelines:
   - Hose Cabinets .................................................................................... $39.80
   - Hose Outlets ..................................................................................... $39.80
   - Wet & Dry Standpipes ....................................................................... $39.80
   - Standpipes ......................................................................................... $39.80
   - Dual Check Valve In-flow Through Devices ....................................... $39.80
   - Backflow Preventer ........................................................................... $206.00

   Wet & Dry Line Outlets:
   - Each connection ................................................................................ $39.80
   - NOTE: A Siamese connection shall be considered as two dry line outlets.
   - Each Fire Pump ............................................................................... $321.00
   - Each Fire Hydrant ............................................................................ $99.00

3. REINSPECTIONS
   For each REINSPECTION made necessary due to faulty work or materials or incomplete work requested to be inspected .......................................................... $206.00

4. SPECIAL INSPECTIONS
   Each inspection to establish fitness of any existing fixture for each hour or part thereof ........ $206.00
   An inspection outside normal working hours and at a minimum inspection time of four (4) hours, including
traveling time, for each hour or part thereof .................................................. $311.00

5. BUILDING SEWER INSPECTIONS
First two inspections for each 30 m of BUILDING SEWER or part thereof ...................... $302.00
Each additional inspection for each 30 m of BUILDING SEWER or part thereof .............. $124.00

PART C – OPERATING PERMITS

Every applicant for an OPERATING PERMIT shall, at the time of application, pay to the City the fee set out hereunder:

For each OPERATING PERMIT ....................................................................................................................... $00.00
Notes to Part 1
Administrative Provisions

This Appendix is included for explanatory purposes only and does not form Part of the requirements except as defined in Division A Sentence 1.1.3.1.(1). The numbers that introduce each Appendix Note correspond to the applicable requirements in this Division.

A-1.3.3.5. Unsafe Conditions
Although words such as alteration, occupancy, building and unsafe conditions are defined in Article 1.4.1.2. of Division A, such words as removal and relocation contained here and in the definitions are adequately defined in dictionaries and need not be defined herein.

A-1.3.3.6. Work on Public Property
The appropriate government authority may be federal, provincial or city, depending on the nature of the public property.

A-1.3.3.7. Changes in Ground Elevation and Limiting Distance
If a new or existing building is built as close to a boundary line as the regulations permit, moving the property boundary could result in contravention of the By-law in regards to spatial separations. In those circumstances, this Subsection would not apply.

A-1.4.1.10. Project Directory
This Subsection requires the owner to inform the Chief Building Official of changes in responsibilities of certain employees. It is not intended to limit the owner’s right to change the constructor, engineer, architect or inspection or testing agency, but rather to let the building official know of any such change so that construction will not be held up because of any misunderstanding as to who is responsible. See Letters of Assurance at the end of Part 2 of Division C.

A-1.4.1.15. Tests to Establish Compliance
Where a manufacturer, fabricator or erector is required to conform to specified requirements, such as those referenced by Articles 4.3.1.2. and 4.3.3.1. of Division B, Book I, it is intended that proof of such compliance be filed with the Chief Building Official. See Letters of Assurance at the end of Part 2 of Division C.

A-1.4.1.19.(1) Uncovering Work
The requirement to uncover and replace work will normally apply only if Article 1.4.1.17. has not been complied with, that is, if work requiring inspection has been covered prematurely. Complete uncovering may not be necessary. Here, again, the judgment of the designated official is required to determine if partial uncovering, test holes or similar actions will be sufficient to indicate compliance, the purpose being to promote compliance not to penalize the constructor.

A-1.6.2.2. Application Requirements
In addition to the information required by this provision, further information is required by Subsection 2.3.4. of Division C, Structural and Foundation Drawings and Calculations, and Subsection 2.3.5. of Division C, Heating, Ventilating, Air-Conditioning and Energy Utilization Drawings and Specifications.

A-1.6.7.1.(1) Permit Expiry
The owner must provide documentation to establish that the work has not been substantially discontinued for 6 months.

A-1.7.1.2. Occupancy Permit
An occupancy permit is required for a temporary occupancy.
Part 2
Administrative Provisions

Section 2.1. Application

2.1. Application
2.1.1. Application
   1) This Part applies to all plumbing systems covered in this By-law. (See Article 1.1.1.1. of Division A.)

Section 2.2. Administration

2.2. Administration
2.2.1. Conformance with Administrative Requirements
   1) This By-law is made pursuant to Section 306 of the Vancouver Charter.

2.2.2. Information Required for Proposed Work
2.2.2.1. General Information Required
   1) Sufficient information shall be provided to show that the proposed work will conform to this By-law and whether or not it may affect adjacent property.
      2) Plans shall be drawn to scale and shall indicate
         a) the nature and extent of the work or proposed occupancy in sufficient detail to establish that, when completed, the work and the proposed occupancy will conform to this By-law,
         b) the applicable edition of the By-law,
         c) whether the building is designed under Part 3 or Part 9,
         d) the major occupancy classifications of the building,
         e) the building area and building height,
         f) the number of streets the building faces,
         g) the accessible entrances, work areas and washrooms, and
         h) the accessible facilities particular to the occupancies.
   3) When proposed work is changed during construction, information on the changes shall comply with the requirements of this Section for proposed work.

2.2.2.2. Site Plans
   1) Site plans shall be referenced to an up-to-date survey and, when required to prove compliance with this Code, a copy of the survey shall be provided.
   2) Site plans shall show
      a) by dimensions from property lines, the location of the proposed building,
      b) the similarly dimensioned location of every adjacent existing building on the property,
      c) existing and finished ground levels to an established datum at or adjacent to the site,
      d) the access routes for firefighting, and
      e) the accessible paths of travel to the building from
         i) the sidewalk, roadway or street, and
         ii) if provided, exterior parking stalls for persons with disabilities and exterior passenger-loading zones, and
      f) the exterior entrances and key plan for each storey indicating the location and number of suites.
2.2.2.3. Information Required on Building Plans for Addressing Purposes
(Refer to Book I (General) of this Bylaw.)

2.2.3. Fire Protection and Plumbing Components

2.2.3.1. Information Required for Fire Protection Components
1) Information shall be submitted to show the major components of fire protection including
   a) the division of the building by firewalls,
   b) the building area,
   c) the degree of fire separation of storeys, shafts and special rooms or areas, including the location
      and rating of closures in fire separations,
   d) the source of information for fire-resistance ratings of elements of construction (to be indicated
      on large-scale sections),
   e) the location of exits, and
   f) fire detection, suppression and alarm systems.

2.2.3.2. Plans of Sprinkler Systems
1) Before a sprinkler system is installed or altered, plans showing full details of the proposed sprinkler
   system and essential details of the building in which it is to be installed shall be drawn to an indicated scale.

2.2.3.3. Information Required on Plumbing Drawings and Related Documents
1) If the Chief Building Official requires an application for a permit in respect of plumbing systems, plumbing
   drawings and related documents submitted with the application shall show
   a) the location and size of every building drain and of every trap and cleanout fitting that is on a
      building drain,
   b) the size and location of every soil-or-waste pipe, trap and vent pipe, and
   c) a layout of the potable water distribution system, including pipe sizes and valves.

2.2.4. Structural and Foundation Drawings and Calculations
(Refer to Book I (General) of this Bylaw.)

2.2.5. Drawings and Specifications for Environmental Separators and Other Assemblies Exposed to the
Exterior
(Refer to Book I (General) of this Bylaw.)

2.2.6. Heating, Ventilating and Air-conditioning Drawings and Specifications
(Refer to Book I (General) of this Bylaw.)

2.2.7. Professional Design and Review
(See Note A-2.2.7.)

2.2.7.1. Application
1) The requirements of this Subsection apply to
   a) buildings within the scope of Part 3 of Division B,
   b) buildings within the scope of Part 9 of Division B that are designed with common egress systems
      for the occupants and require the use of firewalls according to Article 1.3.3.4. of Division A, and
   c) the following, in respect of buildings within the scope of Part 9 of Division B other than buildings
      described in Clause (b),
      i) structural components that are not within the scope of Part 9 of Division B (See Note A-
         2.2.7.1.(1)(c)(i).),
ii) geotechnical conditions at building sites that are not within the scope of Part 9 of Division B,
iv) standpipe and hose systems designed to NFPA 14, “Installation of Standpipe and Hose Systems”,
d) a building that is designed according to Article 1.3.3.5. of Division A of Book I (General) of this By-law,
e) a building that is within the scope of Part 5 of Division B of Book I (General) of this By-law,
f) additions which are subject to Part 11 of Division B of Book I (General) of this By-law, and
g) a change of major occupancy which is subject to Part 11 of Division B of Book I (General) of this By-law.

2.2.7.2. Responsibilities

1) Before the construction of or the alteration to a building, the owner shall:
   a) retain a coordinating registered professional to coordinate all design work and field reviews of the registered professionals of record required for the project in order to ascertain that (See Note A-2.2.7.2.(1)(a).)
      i) the design will substantially comply with the Building By-law and other applicable City By-laws, and
      ii) the construction of the project will substantially comply with the Building By-law and other applicable enactments respecting safety, not including the construction safety aspects, and
   b) if a building permit is required, deliver to the Chief Building Official letters in the forms set out in Schedules A and B, and (See the end of Division C and Note A-2.2.7.2.(1)(a) and (b).)
   c) provide reasonable and timely written notice of any work or excavation that would directly or indirectly affect private property adjacent to the excavation site, to the owner of the affected property, and deliver a copy of the notice to the Chief Building Official. (See Note A-2.2.7.2.(1)(c).)

2) If an occupancy permit or final inspection from an Chief Building Official is required and before an owner occupies or receives permission to occupy the building, the owner or coordinating registered professional shall deliver to that authority letters in the forms set out in Schedules C-A and C-B (See the end of Division C and Note A-2.2.7.2.(2).)

2.2.7.3. Registered Professional Responsibilities

(See Note A-2.2.7.3.)

1) A registered professional of record who signs a letter, the form of which is set out in a Schedule to this Subsection, and an owner who signs or has an agent sign a letter the form of which is set out in a Schedule to this Subsection, shall comply with this Subsection, Part 1, and the provisions of the letter that apply to the person signing.

2) A registered professional of record or coordinating registered professional who is responsible for a field review shall keep a record of the field review and of any corrective action taken as a result of the field review and shall submit monthly summary reports to the Chief Building Official.

3) A registered professional of record who is retained to undertake design work and field reviews and who is required to provide letters pursuant to Clause 2.2.7.2.(1)(b) shall
   a) place his or her professional seal or stamp on the plans submitted by him or her in support of the application for a building permit, after ascertaining that they substantially comply with the Building By-law and other applicable enactments respecting safety,
b) provide to the Chief Building Official a letter in the form of Schedule C-B (See the end of Division c) after ascertaining that the components of the project for which the registered professional of record is responsible are constructed so as to substantially comply, in all material respects, with
   i) the plans and supporting documents prepared by the registered professional of record, and
   ii) the requirements of the Building By-law and other applicable enactments respecting safety, not including construction safety aspects.

2.2.7.4. Termination

1) An owner must not terminate the appointment of a coordinating registered professional or registered professional of record unless
   a) the owner immediately replaces the coordinating registered professional or registered professional of record, or
   b) the owner has complied with Clause (1)(b) and Sentence (2) of Article 2.2.7.2. by delivering letters in the forms set out in Schedule A, B, C-A and C-B, as applicable, to the Chief Building Official.

2) In respect of a project to which this Subsection applies,
   a) if the coordinating registered professional ceases to be retained at any time before the completion of the project, both the owner and the coordinating registered professional shall notify the Chief Building Official, and
   b) if a registered professional of record ceases to be retained at any time before the completion of the project, both the coordinating registered professional and the registered professional of record shall notify the Chief Building Official.

3) Notification under Sentences (1) and (2) shall be made,
   a) if possible, before the coordinating registered professional or registered professional of record, as the case may be, ceases to be retained, or
   b) if advance notice is not possible, as soon as possible.

2.2.7.5. Reserved.

2.2.8. Deleted.

2.2.9. Buildings on Designated Flood Plains

2.2.9.1. Exemptions from Flood Construction Level Requirements

1) Flood construction level requirements do not apply to:
   a) alteration of an existing building, not including reconstruction as defined in this By-law. (See A-11.2.1.2. of Div C),
   b) alteration of an existing building to increase the building area by less than 25 per cent of the total building area existing as of July 29, 1999, if
      i) the number of dwelling units is not increased,
      ii) there is no further encroachment into setbacks required by this By-law, and
      iii) there is no further reduction in the flood construction level,
   c) enclosed parking areas, including bicycle and residential storage areas, in a multiple dwelling, if there is
      i) an unobstructed non-mechanized means of pedestrian ingress and egress to the areas, above the flood construction level, and
      ii) a sign posted at all entry points warning of the risk of flood damage,
   d) buildings and portions of buildings used as a carport or garage,
   e) non-residential accessory buildings, and
   f) loading facilities used for water oriented industry.
2.2.9.2. Design Considerations on Designated Flood Plains
1) For buildings constructed on designated flood plains, the building designer shall comply with by-law requirements regarding construction materials and service equipment installations below flood construction level requirements, to the satisfaction of the Chief Building Official. (See Article 1.5.2.11. of Division C.)

2.2.9.3. Construction Considerations on Designated Flood Plains
1) For buildings constructed on designated flood plains, construction of the buildings to flood construction level requirements shall be achieved, to the satisfaction of the Chief Building Official, by
   a) the structural elevation of the floor system of the building
   b) the use of adequately compacted fill, or
   c) a combination of structural elevation and compacted fill.
2) No person shall install furnaces, electrical switchgear, electrical panels, fire protection systems or other fixed building services susceptible to flood damage, below the flood construction level, unless such services are protected from flood damage and accessible for servicing during a flood, to the satisfaction of the Chief Building Official.
3) No person shall store hazardous or toxic substances below the flood construction level.
4) All piping, wiring and conduit penetrations shall be water stopped and sealed to prevent water seepage into the building.

2.2.9.4. Setback Requirements on Designated Flood Plains
1) Subject to the provisions of this By-law, no building, structural support or fill shall be constructed or located within
   a) 30 m of the natural boundary of the Fraser River,
   b) 15 m of the natural boundary of Burrard Inlet, English Bay or False Creek,
   c) 5 m of the natural boundary of Still Creek,
   d) 7.5 m of any structure erected for flood protection or seepage control, or
   e) in the case of a building, structural support, or fill located on a bluff in a designated flood plain, where the toe of the bluff is subject to erosion or is closer than 15 m from the natural boundary, a setback measuring 3.0 times the height of the bluff as measured from the toe to the crest of the bluff.

2.2.9.5. Increase of Flood Construction Level and Setback Requirements on Designated Flood Plains
1) The Chief Building Official may increase the flood construction level requirements or the setback requirements in this By-law if, in the opinion of the Chief Building Official, a higher flood construction level or a greater setback is necessary as the result of a site-specific geological or hydrological feature.

2.2.9.6. Relaxation of Flood Construction Level and Setback Requirements on Designated Flood Plains
1) The Chief Building Official may relax the flood construction level requirements in this By-law in accordance with Article 1.5.2.11., if
   a) the owner demonstrates to the satisfaction of the Chief Building Official, that, due to existing site characteristics and the location of existing infrastructure, it is impractical to meet the flood construction level requirements,
   b) the owner demonstrates to the satisfaction of the Chief Building Official, the proposed construction methods are designed to mitigate flood damage, and
   c) the owner provides a report, to the satisfaction of the Chief Building Official, stamped by a professional engineer, certifying that the habitable space in the building will be safe during a flood if a lower flood construction level is applied.
2) The Chief Building Official may relax the setback requirements in this By-law in accordance with Article 1.5.2.11., if
Section 2.3. Alternative Solutions

2.3.1. Alternative Solutions
(See Note A-2.3.1.)

2.3.1.1. Application
1) For the purposes of Clause 1.2.1.1.(1)(b) of Division A, on written request by the owner of a building or an authorized agent of that owner, the Chief Building Official shall accept a measure as an alternate solution to an acceptable solution for the building if satisfied that
   a) the measure will achieve at least the level of performance required by Clause 1.2.1.1.(1)(b) of Division A, and
   b) the acceptable solution does not expressly require conformance to a provincial enactment other than the Building By-law.

2.3.1.2. Documentation
1) The Chief Building Official may require a person requesting the use of an alternative solution to provide documentation to demonstrate that the proposed alternative solution will achieve at least the level of performance required by Clause 1.2.1.1.(1)(b) of Division A.
2) The documentation referred to in Sentence (1) shall include
   a) a Code analysis outlining the analytical methods and rationales used to determine that a proposed alternative solution will achieve at least the level of performance required by Clause 1.2.1.1.(1)(b) of Division A, and
   b) information concerning any special maintenance or operational requirements, including any building component commissioning requirements, that are necessary for the alternative solution to achieve compliance with the By-law after the building is constructed.
3) The Code analysis referred to in Clause (2)(a) shall identify the applicable objectives, functional statements and acceptable solutions, and any assumptions, limiting or restricting factors, testing procedures, engineering studies or performance parameters that will support a Code compliance assessment.
4) The Code analysis referred to in Clause (2)(a) shall include information about the qualifications, experience and background of the person or persons taking responsibility for the design.
5) The information provided under Sentence (3) shall be in sufficient detail to convey the design intent and to support the validity, accuracy, relevance and precision of the Code analysis.
6) Where more than one person is responsible for the design of a building or facility that includes a proposed alternative solution, the person requesting the use of the alternative solution shall identify a single person to co-ordinate the preparation of the design, Code analysis and documentation referred to in this Article.

2.3.1.3 Alternative Solution Expiry
1) The Chief Building Official may rescind a request or application made pursuant to the requirements of this Subsection if in the opinion of the Chief Building Official...
Division C: Administrative Provisions

Part 2 – Administrative Provisions

Vancouver Building Bylaw 2019

2.3.2. Additional Requirements for Fire and Life Safety Alternative Solutions

2.3.2.1. Design Criteria

1) Alternative solutions, as described in Article 2.3.1.2., shall be based upon an acceptable report sealed by an acceptable registered professional and provided to the Chief Building Official, which shall include
   a) a thorough description of the building,
   b) an analysis of the building that identifies all deviations from the requirements of this By-law,
   c) the life safety principles considered in developing the proposed alternative solutions and their rationale, based upon NRC fire research reports and other approved agencies where applicable,
   d) a proposal for alternative solutions,
   e) an evaluation of the proposed alternative solutions based upon generally recognized studies,
   f) evidence of reliable performance of the proposed alternative solutions,
   g) a method of monitoring the design of the proposed alternative solutions, and
   h) a commitment to perform field review of the proposed alternative solutions.

2) The report described in Sentence (1) shall be sufficiently detailed to permit evaluation of the proposed alternative solutions.

3) Upon acceptable of a proposed alternative solution by the Chief Building Official, the registered professional who has placed their seal on the report shall
   a) submit a letter to the Chief Building Official, assuring that the alternative solution, as installed, will perform as represented in the report, and
   b) at the request of the Chief Building Official, submit an acceptable field commissioning and testing report.

2.3.3. Alternative Solution Review Panel

2.3.3.1. Request for Review by Alternative Solution Review Panel

1) An applicant may apply to the Chief Building Official to request the appointment of an alternative review panel to review an alternative solution application.

2) An applicant who requests the appointment of an alternative review panel must pay the fees set out in the Fee Schedule.

3) At the request of the applicant, the Chief Building Official may appoint an alternative solution review panel of up to three experts to review the alternative solution application, to hear from the applicant and City staff and to advise the applicant and the Chief Building Official regarding the proposed solution.

4) A decision of an alternative solution review panel is not binding on the Chief Building Official.
CONFIRMATION OF COMMITMENT BY OWNER
AND COORDINATING REGISTERED PROFESSIONAL

Notes:
1. This letter must be submitted before issuance of a building permit.
2. This letter is endorsed by the Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.
3. In this letter the words in italics have the same meaning as in the Building Bylaw.

Re: Design and Field Review of Construction
by a Coordinating Registered Professional

To: The Chief Building Official

Re: [Project Details]

The undersigned has retained _______ as a coordinating registered professional to coordinate the design work and field reviews of the registered professionals of record required for this project. The coordinating registered professional shall coordinate the design work and field reviews of the registered professionals of record required for the project in order to ascertain that the design will substantially comply with the Building By-law and other applicable enactments respecting safety and that the construction of the project will substantially comply with the Building By-law and other applicable enactments respecting safety, not including the construction safety aspects.

“Field reviews” are defined in the Building By-law to mean those reviews of the work:
(a) at a project site of a development to which a building permit relates, and
(b) where applicable, at fabrication locations where building components are fabricated for use at the project site that a registered professional in his or her professional discretion considers necessary to ascertain whether the work substantially complies in all material respects with the plans and supporting documents prepared by the registered professional of record for which the building permit is issued.

The owner and the coordinating registered professional have read Subsection 2.2.7, Division C of the Building By-law. The owner and the coordinating registered professional each acknowledge their responsibility to notify the Chief Building Official of the date the coordinating registered professional causes to be retained by the owner before the date the coordinating registered professional causes to be retained or, if that is not possible, as soon as possible. The coordinating registered professional acknowledges the responsibility to notify the Chief Building Official of the date a registered professional of record causes to be retained before the date the registered professional of record causes to be retained or, if that is not possible, as soon as possible.

It is the responsibility of the coordinating registered professional to ascertain which registered professionals are required, and to initial each Schedule B prior to submission to the Chief Building Official.
The owner and the coordinating registered professional understand that where the coordinating registered professional or a registered professional of record ceases to be retained at any time during construction, work on the above project will cease until such time as

(a) a new coordinating registered professional or registered professional of record, as the case may be, is retained, and

(b) a newsletter in the form set out in Schedule A or in the forms set out in Schedules B, as the case may be, is filed with the Chief Building Official.

The undersigned coordinating registered professional certifies that he or she is a registered professional as defined in the Building By-law, and agrees to coordinate the design work and field reviews of the registered professional of record required for the project as outlined in the attached Schedules B including coordination and integration of functional testing of fire protection and life safety systems. (See A-2.2.7.3 in Appendix A.)

Coordinating Registered Professional

Coordinating Registered Professional's Name:

Address:

Phone No. and Email address:

Owner

Owner's Name:

Address:

Name of Agent or Signing Officer if applicable:

Date:

Owner's or Owner's Appointed Agent's Signature:

If owner is a corporation, the signature of a signing officer must be given here. If the signature is that of the agent, a copy of the document that appoints the agent must be attached.

I, the Coordinating Registered Professional is a member of a firm, complete the following:

I am a member of the firm

and I sign this letter on behalf of the firm

This letter must be signed by the owner or the owner’s appointed agent and by the coordinating registered professional. An agent’s letter of appointment must be attached. If the owner is a corporation, the letter must be signed by a signing officer of the corporation and the signing officer must set forth his or her position in the corporation.

The Building By-law defines a registered professional to mean

(a) a person who is registered or licensed to practise as an architect under the Architects Act, or

(b) a person who is registered or licensed to practise as a professional engineer under the Engineers and Geoscientists Act.
### SCHEDULE B

**ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEW**

**Notes:**

i) This letter must be submitted prior to the commencement of construction activities of the components identified below. A separate letter must be submitted by each registered professional of record.

ii) This letter is endorsed by the Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.

iii) In this letter, the words in italics have the same meaning as in the Building By-law.

**To:** The Chief Building Official

**Re:**

The undersigned hereby gives assurance that the design of the (initial those of the items listed below that apply to this registered professional of record. All the disciplines will not necessarily be employed on every project.)

- [ ] ARCHITECTURAL
- [ ] STRUCTURAL
- [ ] MECHANICAL
- [ ] PLUMBING
- [ ] FIRE SUPPRESSION SYSTEMS
- [ ] ELECTRICAL
- [ ] GEOTECHNICAL — temporary
- [ ] GEOTECHNICAL — permanent

The undersigned hereby undertakes to be responsible for field reviews of the above referenced components during construction as indicated on the “SUMMARY OF DESIGN AND FIELD REVIEW REQUIREMENTS” below.

---

1 of 4
The undersigned also undertakes to notify the Chief Building Official in writing as soon as possible if the undersigned’s contract for field review is terminated at any time during construction.

I certify that I am a registered professional as defined in the Building By-law.

Coordinating Registered Professional

Coordinating Registered Professional’s Name (Print)

Address (Print)

Phone No. and Email address

[If the Coordinating Registered Professional is a member of a firm, complete the following.] I am a member of the firm and I sign this letter on behalf of the firm (Print name of firm). 

Note: This letter must be signed by the owner or the owner’s appointed agent and by the coordinating registered professional. An agent’s letter of appointment must be attached. If the owner is a corporation, the letter must be signed by a signing officer of the corporation and the signing officer must set forth his or her position in the corporation.

The Building By-law defines a registered professional to mean

(a) a person who is registered or licensed to practise as an architect under the Architects Act, or
(b) a person who is registered or licensed to practise as a professional engineer under the Engineers and Geoscientists Act.

2 of 4
SCHEDULE B - continued

SUMMARY OF DESIGN AND FIELD REVIEW REQUIREMENTS
(Initial applicable discipline below and cross out and initial only those items not applicable to the project.)

ARCHITECTURAL
1.1 Fire resisting assemblies
1.2 Fire separations and their continuity
1.3 Closures, including tightness and operation
1.4 Egress systems, including access to exit within suites and floor areas
1.5 Performance and physical safety features (guardrails, handrails, etc.)
1.6 Structural capacity of architectural components, including anchorage and seismic restraint
1.7 Sound control
1.8 Landscaping, screening and site grading
1.9 Provisions for firefighting access
1.10 Access requirements for persons with disabilities
1.11 Elevating devices
1.12 Functional testing of architecturally related fire emergency systems and devices
1.13 Development Permit and conditions therein
1.14 Interior signage, including acceptable materials, dimensions and locations
1.15 Review of all applicable shop drawings
1.16 Interior and exterior finishes
1.17 Dampproofing and/or waterproofing of walls and slabs below grade
1.18 Roofing and flashings
1.19 Wall cladding systems
1.20 Condensation control and cavity ventilation
1.21 Exterior glazing
1.22 Integration of building envelope components
1.23 Environmental separation requirements (Part 5)
1.24 Building envelope, Part 10 requirements (ASHRAE, NECB, ZEBP, etc)

STRUCTURAL
2.1 Structural capacity of structural components of the building, including anchorage and seismic restraint
2.2 Structural aspects of deep foundations
2.3 Review of all applicable shop drawings
2.4 Structural aspects of unbonded post-tensioned concrete design and construction

MECHANICAL
3.1 HVAC systems and devices, including high building requirements where applicable
3.2 Fire dampers at required fire separations
3.3 Continuity of fire separations at HVAC penetrations
3.4 Functional testing of mechanically related fire emergency systems and devices
3.5 Maintenance manuals for mechanical systems
3.6 Structural capacity of mechanical components, including anchorage and seismic restraint
3.7 Review of all applicable shop drawings
3.8 Mechanical systems, Part 10 requirements (ASHRAE, NECB, ZEBP, etc)
ASSURANCE OF COORDINATION OF PROFESSIONAL FIELD REVIEW

Notes:

i) This letter must be submitted after completion of the project but before the occupancy permit is issued or a final inspection is made by the Chief Building Official.

ii) This letter is endorsed by Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.

iii) In this letter the words in italics have the same meaning as in the Building By-law.

To: The Chief Building Official

Name of Jurisdiction (print)

Re: Name of Project (print)

Address of Project (print)

(The coordinating registered professional shall complete the following):

Name (print)

Address (print)

Phone No and a person available (print)

I hereby give assurance that:

a) I have fulfilled my obligations for coordination of field reviews of the registered professionals of record required for the project as outlined in Subsection 2.2.7, Division C of the Building By-law and in the previously submitted Schedule A, “CONFIRMATION OF COMMITMENT BY OWNER AND BY COORDINATING REGISTERED PROFESSIONAL.”

b) I have coordinated the functional testing of the fire protection and life safety systems to assure that they substantially comply in all material respects with:

i) the applicable requirements of the Building By-law and other applicable enactments respecting safety, not including construction safety aspects, and

ii) the plans and supporting documents submitted in support of the application for the building permit,

c) I am a registered professional as defined in the Building By-law.

(If the registered professional is a member of a firm, complete the following)

I am a member of the firm

and I sign this letter on behalf of the firm

(First Name of firm)

Note: The above letter must be signed by a coordinating registered professional, who is also a registered professional. The Building By-law defines a registered professional to mean:

a) a person who is registered or licensed to practise as an architect under the Architects Act, or

b) a person who is registered or licensed to practise as a professional engineer under the Engineers and Geoscientists Act.
BUILDING BY-LAW 2019 – CITY OF VANCOUVER

SCHEDULE C-B

ASSURANCE OF PROFESSIONAL FIELD REVIEW AND COMPLIANCE

Notes:

i) This letter must be submitted after completion of the project but prior to final inspection by the Chief Building Official. A separate letter must be submitted by each registered professional of record.

ii) This letter is endorsed by: Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.

iii) In this letter the words in italics have the same meaning as in the Building By-law.

To: The Chief Building Official

Name of Jurisdiction: _______________________

Re: _______________________________________

Name of Project (firm): _______________________

Address of Project (firm): _______________________

(The coordinating registered professional shall complete the following):  

Name (Print): ______________________________

Address (Print): ______________________________

Phone No. and e-mail address (Print): _____________________________________________

I hereby give assurance that:

a) I have fulfilled my obligations for coordination of field reviews as outlined in Subsection 2.2.7, Division C of the Building By-law and in the previously submitted Schedule B, “ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEW,” and

b) I have coordinated the functional testing of the fire protection and life safety systems to ascertain that they substantially comply in all material respects with:

i) the applicable requirements of the Building By-law and other applicable enactments respecting safety, not including construction safety aspects, and

ii) the plans and supporting documents submitted in support of the application for the building permit.

c) I am a registered professional as defined in the Building By-law.

(if the registered professional is a member of a firm, complete the following):

I am a member of the firm ___________________________ and I sign this letter on behalf of the firm ___________________________. (Print name of firm)

Note: The above letter must be signed by a registered professional of record, who is a registered professional. The Building By-law defines a registered professional to mean:

a) a person who is registered or licensed to practise as an architect under the Architects Act, or

b) a person who is registered or licensed to practise as a professional engineer under the Engineers and Geoscientists Act.

SCHEDULE C-D

COMPLETION OF BUILDING ENVELOPE PROFESSIONAL REVIEW

Notes:

a) This letter must be submitted after the completion of the project at final inspection.

b) This letter is endorsed by Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.

c) In this letter the words in italics have the same meaning as in the Building Bylaw.

To: The Chief Building Official

RE: Address of Project (Print)

The undersigned Building Envelope Professional has been retained with respect to the above referenced project, and gives a commitment of responsibility for Building Envelope Professional design review and enhanced field review for components and assemblies as required in Article 5.1.2.2 in Part 5 of Division B, of the Building Bylaw, and as the Building Envelope Professional in their professional diversion considers to be necessary, for the project designed by:

Name of registered professional signing for 'Architectural Item' of Schedule B letters (Print)

who is providing the Chief Building Official with Schedule B "ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEW" letter covering "Architectural Item." The undersigned will sign and provide copies of all reports to the registered professional responsible for Architectural Item, and copies of these reports shall also be available on site, for review by the City of Vancouver District Building Inspector. The undersigned undertakes to notify the Chief Building Official in writing as soon as practical if their contract is terminated at any time.

(Firm/Name)

Qualification:

City, Province: Postal Code:

Telephone: (Phone): Email:

If the Building Envelope Professional is a member of a firm, complete the following:

I am a member of the firm: ___________________________ and I sign this letter on behalf of the firm: ___________________________.

NOTE: The above letter must be signed by a Building Envelope Professional. The Building By-Law defines a Building Envelope Professional to mean a person who is a member of the Architectural Institute of British Columbia or the Association of Professional Engineers and Geoscientists of British Columbia.
SCHEDULE D

COMMITMENT FOR
BUILDING ENVELOPE PROFESSIONAL REVIEW

Notes:
(a) This letter must be submitted before issuance of a building permit.
(b) This letter is endorsed by Architectural Institute of B.C., Association of Professional Engineers and Geoscientists of B.C.
(c) In this letter the words in italics have the same meaning as in the Building By-law.

To: The Chief Building Official

RE: ____________________________________________

Address of Project (Print)

The undersigned Building Envelope Professional has been retained with respect to the above referenced project, and gives a commitment of responsibility for Building Envelope Professional design review and enhanced field review for components and assemblies as required in Article 5.1.2, in Part 5 of Division B, of the Building By-law, and as the Building Envelope Professional in their professional division considers to be necessary, for the project designed by:

______________________________________________
Name of registered professional signing for 'Architectural items' of Schedule B letters (Print)

who is providing the Chief Building Official with Schedule B ‘ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEW’ letter covering 'Architectural items'. The undersigned will sign and provide copies of all reports to the registered professional responsible for ‘Architectural items’, and copies of these records shall also be available on site, for review by the City of Vancouver District Building Inspector. The undersigned undertakes to notify the Chief Building Official in writing as soon as practical if their contract is terminated at any time.

NOTE: The above letter must be signed by a Building Envelope Professional. The Building By-Law defines a Building Envelope Professional to mean a person who is a member of the Architectural Institute of British Columbia or the Association of Professional Engineers and Geoscientists of British Columbia.

1 of 1
Notes to Part 2

Administrative Provisions

A-2.2.1.2.(1) Structural Design. Part 4 of Division B is written on the assumption that structural design will be carried out by a registered professional who is qualified to perform such design. Sentence 2.2.1.2.(1) is not intended to imply that a registered professional may not also be required in the application of requirements in other Parts of the Building By-law.

A-2.2.6.2.(1) Information Required on Drawings and Specifications. Examples of information that should be shown on architectural drawings and drawings for heating, ventilating and air-conditioning systems are:

(a) the name, type and location of the building,
(b) the name of the owner,
(c) the name of the architect,
(d) the name of the engineer or designer,
(e) the north point,
(f) the dimensions and height of all rooms,
(g) the intended use of all rooms,
(h) the details or description of the wall, roof, ceiling and floor construction, including insulation,
(i) the details or description of the windows and outside doors, including the size, weatherstripping, storm sashes, sills and storm doors,
(j) the size and continuity of all pipes, ducts, shafts, flues and fire dampers,
(k) the location, size, capacity and type of all principal units of equipment,
(l) the size, shape and height of all chimneys and gas vents,
(m) the size and location of all combustion air and ventilation openings, and
(n) the location and fire-resistance rating of required fire separations.

A-2.2.7. Professional Design and Review. This Subsection provides for the use of what are generally called Letters of Assurance. The letters themselves, known as Schedules A, B, C-A and C-B and located at the end of Division C, are intended to put on paper the responsibilities of the owner and the various registered professionals in a construction project. The Letters of Assurance do not impose any additional responsibilities on the registered professionals nor are they intended to alter the roles and responsibilities of the authorities having jurisdiction.

The Schedules have been very carefully scrutinized by the City of Vancouver, Province of British Columbia, Union of BC Municipalities, Building Officials’ Association of British Columbia, Architectural Institute of British Columbia, Engineers & Geoscientists British Columbia and their respective legal counsel. The precise wording in the letters is extremely critical and must not be modified. Any notations on these Schedules which are absolutely necessary to suit a particular project must be clearly and legibly marked in ink on the copies.

It is typical that the registered professional responsible for the design is also responsible for the field review. There are instances where this is not the case and having a different registered professional doing the field reviews is unavoidable. Schedule C-B requires that the registered professional who provides the field review provide assurance that the building as finally constructed is in substantial conformance with the By-law. In the event that another registered professional is to provide field review, the field reviewer takes on the responsibility to confirm that the construction substantially complies with the plans and supporting documents that were submitted for the building permit. The responsibility for code compliance of the design remains with the original registered professional who undertook the design. In this event, the Schedule C-B must be modified by the field reviewer by crossing out and initialing Clause (b)(i) and providing the effective transition date.
Division C: Administrative Provisions

Note that Schedules A, B, C-A & C-B, as required by Subsection 2.2.7., must be signed, sealed and submitted to the Chief Building Official, as applicable for each specific project. Conditional or qualified Schedules are not typically acceptable. Any fire and life safety issue relative to the Schedule B disciplines is to be remedied before the Schedules C-A / C-B are released, not accommodated by conditions or qualifications placed on the Schedule or by any attached document. See the Guide to Letters of Assurance, available from the Building and Safety Standards Branch Web site, for more details.

A-2.2.7.1.(1)(c)(i) Structural Components. The reference to “structural components of buildings that fall within the scope of Part 4” includes the situation where a building is classified under Part 9 due to its size and occupancy but also contains some structural components (such as beams supporting concentrated loads) which must be designed under Part 4. In this situation only Schedules B and C-B for the structural components are required. Schedule A and Schedules B, C-A and C-B relating to non-structural components are not required.

A-2.2.7.2.(1)(a) Coordinating Registered Professional. The coordinating registered professional is responsible to ascertain that all Code related aspects which are relevant to the project are clearly identified by each of the registered professionals in the collection of Schedules B. If a registered professional of record has crossed out any item on their Schedule B, the coordinating registered professional must confirm this item is not applicable to the project or resolve the issue with the registered professional of record.

A-2.2.7.2.(1)(b) Schedule B. The purpose of Schedule B is to clearly identify the appropriate registered professional of record who has the overall responsibility in each discipline for compliance with the various By-law related aspects of the project. Detailed design of certain building components may be undertaken by other registered professionals. The registered professional of record is responsible for monitoring the design work and field review of the other registered professionals within their discipline for components listed in Schedule B. In the event that the other registered professionals provide design and field review, the registered professional of record must be satisfied that such design and field reviews have been performed and is responsible for Schedule C-B.

A-2.2.7.2.(1)(c) Shoring Works in Street or Lane Where shoring works are proposed to be left in the street and/or lane permanently, an application for the proposal should be made by the owner to the City Engineer. Where the City Engineer is satisfied as to the safety and advisability of the proposal, the City Engineer may approve the basis on which the shoring works may be allowed to remain.

A-2.2.7.2.(2) Schedule C-A. Schedule C-A provides confirmation that the coordinating registered professional has completed the obligation to coordinate the various registered professionals engaged in the project. It also confirms that the testing of the interrelated fire and life safety systems, such as fire alarms and sprinklers, has been completed and the systems function as intended.

A-2.2.7.3. Demonstration of the Coordinated Fire and Life Safety Systems. The design drawings and supporting documents must clearly indicate all essential details of the Coordinated Fire and Life Safety Systems prior to the construction or the alteration to a building. Demonstration of the proper, integrated operation of the Fire and Life Safety Systems must be conducted prior to occupancy.

Note that Schedules A, B, C-A & C-B, as required by Subsection 2.2.7., must be signed and sealed and submitted to the Chief Building Official, as appropriate for each specific project.

The following is an example of the steps required to coordinate the installation and testing of fire and life safety systems in buildings.

1.0. General

Referencing Schedule B:
Division C: Administrative Provisions

Part 2 – Administrative Provisions

Item No. 1.14 "Functional Testing of Architecturally Related Fire Emergency Systems and Devices,"

Item No. 3.4 "Functional Testing of Mechanically Related Fire Emergency Systems and Devices,"

Item No. 4.5 "Functional Testing of Plumbing Related Fire Emergency Systems and Devices,"

Item No. 5.14 "Functional Testing of Fire Suppression Systems and Devices, and

Item No. 6.3 "Functional Testing of Electrical Related Fire Emergency Systems and Devices."

The Coordinating Registered Professional (CRP) and Registered Professionals of Record (RPRs) must demonstrate that the Fire and Life Safety Systems' design has been coordinated prior to the issuance of the Building Permit. That is, the CRP/RPRs must accumulate and submit the necessary documentation, such as:

- complete drawings,
- schedules,
- schematic diagrams,
- a fire alarm system sequencing description showing coordination between mechanical and electrical fire protection and life safety systems,
- mechanical fire protection and life safety schematic riser diagrams,
- an electrical fire alarm riser diagram,
- a motor data list coordinated with fire alarm system sequencing, and
- other documentation, as appropriate,

To demonstrate that the interface of the Fire and Life Safety Systems has been designed and coordinated so that when built correctly they will function as an integrated system. Further, it is intended that when the construction of the Fire & Life Safety Systems is indicated by the Contractor to be complete, the RPRs/CRP witness the demonstration of the testing of the Fire and Life Safety Systems to confirm compliance that the as-built systems function as intended by the design.

The required list of items will depend on the simplicity or complexity of the Project. The following is a comprehensive list of items for Fire and Life Safety Systems for a complex project, which must be coordinated in order to demonstrate compliance:

**Notes:** It is the responsibility of the Coordinating Registered Professional (CRP) and Registered Professionals of Record (RPRs) to determine the best method of "How To" demonstrate to the Chief Building Official (CBO) that the Fire and Life Safety Systems have been coordinated for each project. That is, the method(s) used (i.e., charts, drawings, matrices, tables, etc.) for demonstration purposes should be project-specific and relate only to that project.

It is not the intent of this Appendix material to dictate or produce "checklists" or other prescriptive methods for demonstrating compliance since this is best left to the professional discretion of the appropriate CRP/RPRs.

2.0. Design Phase — Building Permit Application Stage & Final Construction Phase — Occupancy Permit Application Stage

2.1. Fire Protection and Life Safety Systems

2.1.1. Automatic Sprinkler Systems
- design requirements to appropriate Standard

2.1.2. Standpipe Systems
- design requirements to appropriate Standard
- Class I/Class II
- locations
- coverage
• F.D. connections

2.1.3. Fire Pump Systems
• design requirements to appropriate Standard

2.1.4. Fire Alarm Systems
• one/two stage system(s)
• no. of systems
• design requirements to appropriate Standard
• sequence of operation
• F.A. system zoning
• location of F.A. system devices
• annunciator panel (location and design criteria)
• annunciator panel shop drawings (detail design)
• sprinkler zone/waterflow device
• smoke detectors
• smoke alarms
• manual pull stations
• signals to Fire Department via an acceptable central monitoring station
• activation of ancillary devices

2.1.6. Emergency Telephone System
• each exit stair

2.1.7. Emergency Power
• design requirements to appropriate Standard
• supervisory provisions for fire alarm
• emergency electrical load
• emergency generator

2.1.8. Emergency Lighting
• exits
• access to exits
• public corridors
• other floor areas

2.1.9. Exit Signs

2.2. Additional Requirements for High Buildings

2.2.1. Interface Condition between Highrise and Lowrise Components (Measure 'N' Vestibules)

2.2.2. Smoke Control — Measure A
• design requirements to appropriate Standard
• venting above-grade stairs
• separation of above-grade and below-grade stairs
• venting below-grade stairs
• pressurization of below-grade stairs at bottom
• above-grade elevator shaft serving below-grade protected with a "protected" vestibule
• additional controls at CACF (annunciator panel shop drawings)
2.2.3. Smoke Venting

2.2.4. Fire Fighters' Elevators
- fire fighting controls
- emergency recall

2.2.5. Protection of Emergency Electrical Conductors
- highrise elevator
- emergency generator(s)
- fire pump(s)
- smoke control systems
- smoke venting systems
- fire alarm and emergency voice communication systems

2.2.6. Emergency Voice Communications
- integrated with F.A. system
- audible to appropriate Standard
- zoning of speakers

3.0. Roles and Responsibilities for the Demonstration of the Coordinated Fire and Life Safety Systems

3.1.1. Design Phase
RPRs will clearly indicate on their drawings and supporting documents the details of the fire and life safety systems for each applicable item of Section 2 for their particular discipline. RPRs will also coordinate the design of the components in their system with the designs of other RPRs on the project. RPRs are to indicate what functional testing, system verification, etc., must be performed by the Contractor or subtrades and establish the documentation to be provided. The CRP will develop the project-specific test protocol and procedures in consultation with the RPRs. The CRP will act as the facilitator for the coordination of the design of the fire and life safety systems among the various RPRs.

3.1.2. Construction Phase
The Contractor will coordinate the activities of the subtrade contractors for the installation of the fire and life safety systems in accordance with the contract documents. RPRs will provide field reviews to ascertain that the construction of the fire and life safety systems substantially complies with their design. RPRs will review shop drawings of the fire and life safety systems to determine that they accurately reflect their design intent. They will also coordinate their reviews with those of the other RPRs on the project. The CRP will coordinate the shop drawing reviews and field reviews by the RPs with the objective that the entire fire and life safety system will correctly operate as an integrated system.

3.1.3. Occupancy Phase
The Contractor will coordinate the subtrade contractors for the commissioning and functional testing of the fire and life safety systems. The Contractor will also collect all of the required Occupancy Permit submission documents from the various subtrade contractors and forward them to the CRP.
The CRP will take the lead role in coordinating the activities of the RPRs required for the commissioning and functional testing of the fire and life safety systems. The CRP will distribute the test protocol and test procedures, as developed in the Design Stage, to the various parties involved in the process. RPRs will ascertain that the appropriate commissioning and functional testing of the fire and life safety systems of the components in their disciplines have been satisfactorily completed by the subtrade contractors. They will also determine that the appropriate Occupancy Permit submission documents have been submitted and filled in correctly.

The CRP will be responsible for collecting all of the required Occupancy Permit submission documents, reviewing them for completeness and accuracy, and forwarding them to the CBO in a complete package at least 24 hours prior to the Coordinated Final CBO Review.

3.2. Sample Summary of Roles and Responsibilities for Demonstration of the Coordinated Fire and Life Safety Systems

The following is a sample summary (only) of the roles and responsibilities for a typical highrise building with underground parking. The precise roles and responsibilities for each project will vary depending on the complexity. The CRP will ascertain that the appropriate roles and responsibilities for each project are fulfilled by the RPRs.

3.2.1. Coordinating Registered Professional

Design Phase
- Determine the appropriate RPRs required for the project and make arrangements with the owner for their services.
- Clarify the roles and responsibilities of the various RPRs.
- Coordinate the design of the fire and life safety systems by the RPRs.
- Coordinate and develop the test protocol and procedures for functional testing of the fire and life safety systems.
- Coordinate the submission of the design drawings and supporting documents for the Building Permit application.

Construction Phase
- Coordinate and monitor the field reviews of the RPRs.
- Coordinate and monitor the review of shop drawings by the RPRs.
- Facilitate the information flow among the RPRs and Contractor.

Occupancy Phase
- In conjunction with the RPRs, finalize the project-specific test protocol and procedures for the fire and life safety systems, and review the requirements with the Contractor, subtrades and RPRs.
- Finalize the list of project-specific occupancy permit submission documents and the schedule for submissions and confirm completeness with CBO.
- Organize the "Coordinated Final Consultant Review" at least one week prior to "Coordinated CBO Final Review."
- Take a lead role in coordinating the functional testing of the fire and life safety systems during the "Coordinated Final Consultant Review."
- Coordinate the RPRs' review of Occupancy Permit submission documents for completeness and accuracy.
- Coordinate Certification of Equivalencies, if applicable.
- Collect all of the required Occupancy Permit submission documents and submit them in a complete package to the CBO.
- Organize the "Coordinated CBO Final Review."
- Record any deficiencies identified at the "Coordinated CBO Final Review" and monitor RPRs' field review of the corrective actions by the subtrades.
- Assist in finalizing the list of outstanding requirements which need to be met for the issuance of the Occupancy Permit.
- Follow-up on minor deficiencies post-Occupancy.
3.2.2. Architectural Design Phase

- Establish the conceptual design for the fire and life safety systems in consultation with RPRs.
- Determine equivalency reports required and coordinate the implementation on the drawings and supporting documents.
  - Clearly indicate on drawings and supporting documents:
    - Major occupancies and code classifications.
    - Fire separations and fire-resistance ratings.
  - Closures:
    - Fire-protection rating
    - Temperature rise requirements
    - Amount of glazing
  - Hardware for closures
    - Panic hardware
    - Hold-open devices
    - Electromagnetic locks
  - Egress systems.
  - Provisions for fire fighting access.
  - Interior and exterior finishes.
  - Elevating devices c/w integrated controls to the fire alarm panel.
  - Signage coordinated with fire alarm system and annunciation.

Construction Phase

- Provide field reviews of architectural components.
- Review shop drawings for architectural components and coordinate requirements with other RPRs.
- Review shop drawings for other disciplines which may influence architectural components.

Occupancy Phase

- Ascertain that the architectural components substantially conform to the architectural drawings and supporting documents.
- Perform an active role in witnessing the functional testing of the architectural components of the fire and life safety systems.
- Coordinate the signage with the fire alarm annunciator and the fire safety plans.
- Review the architecturally-related Occupancy Permit submission documents provided by the Contractor and subtrades for completeness and accuracy.
- Prepare and forward to the CRP the architectural Schedule C-B and other assurance letters required for the Occupancy Permit.

3.2.3. Mechanical/Plumbing Design Phase

- Coordinate mechanical/plumbing clearances and functional requirements with other RPRs.
- Clearly indicate on drawings and supporting documents:
  - Details of the mechanical/plumbing components of the fire and life safety systems.
  - Schematic diagram of the smoke venting system showing all fans, ducts, motorized dampers, fusible link dampers and backdraft dampers.
  - Location and fire-protection ratings of fusible link fire dampers and fire stop flaps.
  - Location and fire-protection ratings of motorized fire dampers.
  - Location and fire-resistance ratings of fire-rated duct enclosures.
  - Fire stop systems for mechanical/plumbing penetrations of fire separations.
  - Kitchen exhaust system/suppression system.
  - Mechanical fans/motorized dampers sequence of operations:
    - Describe operation under normal mode
• Describe operation under fire alarm mode
• Indicate fire alarm initiation devices that activate change of operation

Construction Phase
• Provide field reviews of mechanical/plumbing components.
• Review shop drawings for mechanical/plumbing components and coordinate requirements with other RPRs.
• Review shop drawings for other disciplines which may influence mechanical/plumbing components.

Occupancy Phase
• Ascertain that the mechanical/plumbing components substantially conform to the mechanical/plumbing drawings and supporting documents.
• Perform an active role in witnessing the functional testing of the mechanical/plumbing components of the fire and life safety systems.
• Review the mechanical/plumbing related occupancy permit submission documents provided by the Contractor and subtrades for completeness and accuracy.
• Prepare and forward to the CRP the mechanical/plumbing Schedule C-B and other assurance letters and documentation required for the Occupancy Permit.

3.2.4. Fire Suppression
The design of sprinkler systems can be accomplished by at least two possible scenarios:

Scenario 1
• The engineer of record undertakes the complete detailed design prior to the building permit application.
• The engineer of record submits Schedule B with the BP application.
• The engineer of record provides field reviews during construction and submits a Schedule C-B prior to Occupancy Permit.

Scenario 2 (where acceptable to the Chief Building Official)
• The engineer of record provides a detailed performance specification for the sprinkler design, as well as sufficient drawings to demonstrate/assure layout feasibility and interface with other components.
• The engineer of record submits Schedule B with the BP application for overall coordination of the sprinkler design. Schedule B can be annotated “For Performance Specification Only.”
• The performance specifications may include a requirement that a separate sprinkler design engineer be responsible for detailed sprinkler design, preparation of sprinkler shop drawings and hydraulic calculations, letter of assurance Schedule B, (for field review during construction), and Schedule C-B (for Detailed Design) prior to Occupancy Permit.
• The engineer of record reviews the detailed sprinkler design and shop drawings to ascertain that they substantially comply with the performance specifications.
• The engineer of record provides a Schedule C-B prior to Occupancy Permit to confirm overall coordination of the sprinkler design and installation. Schedule C-B can be annotated “For Performance Specification Only.” The engineer of record is entitled to rely upon the professional seal of the sprinkler design engineer for the detailed design and field review of the sprinkler system.

For purposes of this example, Scenario 2 Roles and Responsibilities are outlined below:

Design Phase by Engineer of Record
• Coordinate fire suppression spatial and functional requirements with other RPRs/CRP.
• Clearly indicate on the drawings and performance specification:
  • Fundamental design parameters for the fire suppression system to appropriate Standard.
  • Location of fire department siamese hose connections.
  • Location and size of standpipes and hose connections.
  • Details of special sprinkler protection as per equivalent reports.
• Fire stop systems for pipe penetrations of fire separations.
• Zoning of the sprinkler system to be coordinated with the electrical engineer for the fire alarm annunciation and clearly identified in the performance specifications.

Construction Phase by Sprinkler Design Engineer
• Prepare, sign and seal shop drawings and hydraulic calculations, clearly indicating:
  • Details of the fire suppression components of the fire and life safety systems.
  • Schematic riser diagram of sprinkler and standpipe systems c/w all devices that will be connected to the fire alarm system (flow switches, tamper switches, pressure switches, freeze monitoring, heat trace monitoring).
  • Location of fire department siamese hose connections.
  • Location and size of standpipes and hose connections.
  • Details of special sprinkler protection as per equivalent reports.
  • Zoning of the sprinkler system to be coordinated with the electrical engineer for the fire alarm annunciation and clearly identified on the sprinkler shop drawings.
  • Coordinate fire suppression location and functional requirements with engineer of record/CRP.
  • Provide field reviews of fire suppression components.

Construction Phase by Engineer of Record
• Review shop drawings and hydraulic calculations for fire suppression components to determine substantial conformance to the performance specifications.
• Provide field reviews of fire suppression components to determine substantial conformance to the performance specifications.
• Monitor the field reviews by the Sprinkler Design Engineer to determine substantial conformance with the performance specifications.
• Review shop drawings for other disciplines which may influence fire suppression components.

Occupancy Phase by the Engineer of Record
• Ascertain that the fire suppression components substantially conform to the performance specifications.
• Perform an active role in witnessing the functional testing of the fire suppression components of the fire and life safety systems.
• Review the fire suppression-related Occupancy Permit submission documents by the Contractor and subtrades for completeness and accuracy.
• Collect the Schedule C-B from the Sprinkler Design Engineer, review for accuracy and completeness and forward to the CRP.
• Collect other Occupancy Permit documents from the subtrade contractor (e.g., Contractor’s Material and Test Certificates), review for completeness and forward to the CRP.
• Prepare and forward to the CRP the fire suppression Schedule C-B for overall coordination of the fire suppression system.

Occupancy Phase by the Sprinkler Design Engineer
• Ascertain that the fire suppression components substantially conform to the sprinkler shop drawings and supporting documents.
• Perform an active role in witnessing the functional testing of the fire suppression components of the fire and life safety systems.
• Review the fire suppression-related Occupancy Permit submission documents by the Contractor and subtrades for completeness and accuracy.
• Prepare and forward to the Engineer of Record the fire suppression Schedule C-B and other assurance letters and documentation required for the Occupancy Permit.

3.2.5. Electrical
Design Phase

- Coordinate with the CRP and RPRs the test protocol and procedures for functional testing of the fire and life safety systems.
- Details of the electrical components of the fire and life safety systems.
- Clearly indicate on drawings and supporting documents:
  - Fire Alarm System
    - Location of fire alarm annunciator panel and central alarm control facility
    - Location of fire alarm initiating devices (smoke detectors, heat detectors, manual pull stations)
    - Fire alarm riser diagram c/w ancillary device connections
    - Audibility of fire alarm signal throughout floor area
    - Zoning of fire alarm initiation devices and audible signal appliances
    - Monitoring of fire alarm
    - Routing and method of protection of emergency conductors
    - Wiring methods for equipment
    - Testing/verification requirements and the documentation to be submitted to the RPR
  - Sprinkler System
    - Coordinate design with sprinkler design engineer
    - Sprinkler system alarm initiation and monitoring to be indicated on the fire alarm riser diagram (flow, tamper, pressure, etc.)
    - Detailed diagrams for freeze protection systems (heat trace monitoring, low temperature monitoring, etc.)
  - Fire Pump Systems
    - Riser diagram to indicate monitoring of the fire pump (pump running, power failure, phase reversal, wiring details for device connections)
    - Routing and method for protection of fire pump feeders from fire and power source, so that a fire from one source will not interrupt power from the other source
    - Electrical requirements to appropriate Standard and documents to be submitted to RPR (overcurrent protection details, location of controller and transfer switches, voltage drop, etc.)
  - Kitchen Exhaust/Fire Suppression System
  - Emergency Generator
    - Generator load calculations
    - Details and wiring diagram for monitoring through the fire alarm system
    - Details for testing to appropriate Standard and documents to be submitted to RPR
  - Smoke Venting Systems
    - Coordinate design with the mechanical engineer
    - Fire alarm riser diagram to indicate smoke venting fans and motorized dampers and HVAC/exhaust fan shutdown
    - Detailed wiring diagrams for fan shut-offs, exhaust fan operation, pressurization fan operation, damper operation (opening, closing, throttling)
    - Sequence of operation of smoke venting system in a narrative form
    - Describe operation under normal mode
    - Describe operation under fire alarm mode
    - Indicate fire alarm initiating devices that activate changes of operation/sequence
    - Routing methods for protection of emergency conductors
  - Electromagnetic Locks and Hold-Open Devices
    - Coordinate design with the architect
    - Sequence of operation in both normal and fire alarm mode
    - Wiring diagrams for connection of devices
• Locations of devices on the floor plans
• Elevators
  • Sequence of operation in a narrative form
  • Wiring diagram details
  • Routing and method of protection of emergency conductors
    • Fire stop systems for electrical penetrations of fire separations
    • Coordinate electrical equipment location and functional requirements with other RPRs/CRP.

Construction Phase
• Provide field reviews of electrical components.
• Review shop drawings for electrical components and coordinate requirements with other RPRs.
• Review shop drawings for other disciplines which may influence electrical components.

Occupancy Phase
• Ascertain that the electrical components substantially conform to the electrical drawings and supporting documents.
• Perform an active role in witnessing the functional testing of the electrical components of the fire and life safety systems.
• Review the electrical-related Occupancy Permit submission documents provided by the Contractor and subtrades for completeness and accuracy.
• Prepare and forward to the CRP the electrical Schedule C-B and other assurance letters and documents required for the Occupancy Permit.

4.0. Sample Occupancy Demonstration/Witnessing Flowchart

DEVELOP TESTING PROTOCOL/PROCEDURE (Design Stage)
CRP/RPRs develop Testing Demonstration/Witness Protocol
— Issue to Authorities Having Jurisdiction & Contractor

||

DOCUMENTATION SUBMISSION
Contractor/Subtrades submit/deliver all appropriate documentation to CRP/RPRs, including:
— The original Contractor’s Materials and Test Certificate for the sprinkler system
— Fire Pump Flow Test Certificate(s)
— Back Flow Prevention Certificate(s)
— Emergency generator commissioning and verification reports
— The original Certificate of Verification for the fire alarm system
— Appendix “A” to the fire alarm verification report
— ULC Certificate for Protective Signaling Service
— Other documentation, as appropriate

||

CONTRACTOR DEMONSTRATION — CONSTRUCTION COMPLETE
Contractor & Subtrades
(Mechanical, Electrical, Elevator, Sprinkler, Fire Alarm, etc.) as appropriate

||

COORDINATED FINAL CONSULTANT REVIEW DEMONSTRATION/WITNESSING CRP/RPRs
Vancouver Building Bylaw 2019

Division C: Administrative Provisions

Part 2 – Administrative Provisions

(Architect, Mechanical Engineer, Electrical Engineer, Sprinkler Engineer, Equivalency Consultant, etc.) as appropriate

CRP to collect all submission documents, including Schedule Cs from RPRs, and submit to CBO in a complete package

Contractor, Subtrades, CRP/RPRs demonstrate to CBO (Building, Fire, Mechanical, Electrical and Sprinkler)

OP ISSUED

A-2.2.8.1.(1) Deleted.

A-2.2.8.3.(2)(c)(i) Deleted.

A-2.3.1. Alternative Solutions. Beyond the purposes of demonstrating compliance and acquiring a building permit, there are other important reasons for requiring that the proponent of an alternative solution submit project documentation (i.e. a compliance report) to the Chief Building Official and for the Chief Building Official to retain that documentation for a substantial period following the construction of a building:

• Alternative solutions made possible by objective-based codes may have special maintenance requirements, which would be described in the documentation.
• Documentation helps consultants perform code compliance assessments of existing buildings before they are sold and informs current owners or prospective buyers of existing buildings of any limitations pertaining to their future use or development.
• Documentation provides design professionals with the basic information necessary to design changes to an existing building.
• An alternative solution could be invalidated by a proposed alteration to a building. Designers and regulators must therefore know the details of the particular alternative solutions that were integral to the original design. Complete documentation should provide insight as to why one alternative solution was chosen over another.
• Documentation is the “paper trail” of the alternative solution negotiated between the designer and the regulator and should demonstrate that a rational process led to the acceptance of the alternative solution as an equivalency.
• It is possible that over time a particular alternative solution may be shown to be inadequate. It would be advantageous for a jurisdiction to know which buildings included that alternative solution as part of their design: documentation will facilitate this type of analysis.
• Project documentation provides important information to a forensic team that is called to investigate an accident or why a design failed to provide the level of performance expected.

This subject is discussed in further detail in “Recommended Documentation Requirements for Projects Using Alternative Solutions in the Context of Objective-Based Codes,” which was prepared for the CCBFC Task Group on Implementation of Objective-Based Codes and is available on NRC’s Web site.
Part 3
Appeals, Offences and Penalties and Transition Provisions

Section 3.1. Appeals

3.1.1. BUILDING BOARD OF APPEAL

3.1.1.1. Appeal Within 30 Days
1) Any person dissatisfied with a decision of the Chief Building Official relating to matters described in Article 3.1.1.2. may appeal the decision to the Building Board of Appeal who shall have such powers relating to this By-law as are set out in this By-law and in the Building Board of Appeal By-law.

3.1.1.2. Limits of Appeal
1) An appeal lies to the Building Board of Appeal from any decision of the Chief Building Official regarding
   a) the interpretation of this By-law,
   b) the use of new construction methods or materials,
   c) upgrading existing buildings or
   d) permitting alternative proposals.

3.1.1.3. Filing of Appeal
1) An application for an appeal shall be filed with the Secretary of the Board, in writing, within 30 days of the decision which gives rise to the appeal.
2) An application for an appeal shall include
   a) the address of the building to which the decision relates,
   b) the applicable provisions of the By-law, and
   c) sufficient detail to describe the factual and technical basis for the appeal.

Section 3.2. Offences and Penalties

3.2.1. VIOLATION OF BY-LAW

3.2.1.1. Offences
1) Every person who
   a) violates any of the provisions of this By-law,
   b) suffers or permits any act or thing to be done in contravention or in violation of any of the provisions of this By-law,
   c) neglects to do or refrains from doing anything required to be done by any of the provisions of this By-law,
   d) does any act which violates any of the provisions of this By-law, or
   e) fails to comply with an order or notice given under this By-law,
   is guilty of an offence against this By-law and liable to the penalties hereby imposed.

3.2.2. FINES AND PENALTIES

3.2.2.1. Minimum Fine
1) Every person who commits an offence against this By-law is liable to a fine of no less than $250 and not more than $10,000 for each offence.

3.2.2.2. Continuing Offence
1) Every person who commits an offence of a continuing nature against this By-law is liable to a fine of not less than $250 and no more than $10,000 for each day such offence is continued.
3.2.2.3. Unsafe Condition

1) Despite the minimum fine referred to in Article 3.2.2.1., every person who permits occupancy to occur while an unsafe condition exists in or about a building or the premises is liable to a fine of no less than $500 and not more than $10,000 for each offence.

3.2.2.4. Failure to Comply with an Order

1) Despite the minimum fine referred to in Article 3.2.2.1., every person who fails to comply with an order or notice issued by the Chief Building Official is liable to a fine of no less than $500 and not more than $10,000 for each offence.

3.2.2.5. Work Without a Permit

1) Despite the minimum fine referred to in Article 3.2.2.1., every person who works without permit is liable to a fine of no less than $500 and not more than $10,000 for each offence.

3.2.2.6. Failure to Permit Entry

1) Despite the minimum fine referred to in Article 3.2.2.1., every person who fails to allow the Chief Building Official entry to a building or premises is liable to a fine of not less than $500 and not more than $10,000 for each offence.

Section 3.3. Transition Provisions

3.3.1. GENERAL

3.3.1.1. Validity of Permits Issued under Previous By-law

1) Subject to the provisions of Articles 1.5.2.4. and 3.3.1.2., buildings for which permits were obtained under By-law No. 10908 may be constructed in accordance with the provisions of that By-law.

3.3.1.2. Grace Period

1) Where an owner has applied for a permit prior to June 03, 2019, a building may be constructed in accordance with By-law No. 10908 if, in the opinion of the Chief Building Official, the owner has commenced the work authorized by the permit within 6 months of the date of issuance of the permit and the owner has continued work to completion without interruption other than work stoppages which are standard in the building industry.
